- Absence of signs/symptoms of infection (WBC <10,000/mm$^3$, temp WNL, absence of red, draining wounds)
- Reported improvement in symptoms of infection

**Treatment of anaphylaxis:** EPINEPHrine, antihistamines, resuscitate if needed

## imipramine (Rx)

(im-ip'ra-meen)
**Impril, Novo-Pramine, Tofranil, Tofranil PM**
*Func. class.:* Antidepressant, tricyclic
*Chem. class.:* Dibenzazepine, tertiary amine

**Do not confuse:** imipramine/desipramine

**ACTION:** Blocks reuptake of norepinephrine and serotonin into nerve endings, increasing action of norepinephrine and serotonin in nerve cells; has anticholinergic effects

**Therapeutic outcome:** Decreased symptoms of depression after 2-3 wk; decreased bedwetting in children

## USES:
Depression, enuresis in children

**Unlabeled uses:** Chronic pain, migraine headaches, cluster headaches as adjunct, incontinence

## CONTRAINDICATIONS
Pregnancy, hypersensitivity to this product or carBAMazepine; acute MI

**Precautions:** Suicidal patients, severe depression, increased intraocular pressure, closed-angle glaucoma, urinary retention, cardiac/hepatic disease, hyperthyroidism, electroshock therapy, elective surgery, breastfeeding, geriatric, seizure disorders, prostatic hypertrophy, MI, hypersensitivity to tricyclics, AV block, bundle-branch block, ileus, QT prolongation

**BLACK BOX WARNING:** Children other than for enuresis; suicidal ideation

## DOSAGE AND ROUTES
### Depression
**Adult:** PO 75-100 mg/day in divided doses; may increase by 25-50 mg up to 200 mg, 200 mg/day (outpatients), 300 mg/day (inpatients); may give daily dose at bedtime
**Geriatric:** PO 30-40 mg at bedtime, may increase to 100 mg/day in divided doses
**Child ≥6 yr (unlabeled):** PO 1.5 mg/kg/day in divided doses; max 2.5 mg/kg/day

### Enuresis
**Child 6-12 yr:** PO 10-25 mg at bedtime, max 50 mg

**Available forms:** Tabs 10, 25, 50 mg; caps 75, 100, 125, 150 mg

### Implementation
**PO route**
- Do not break, crush, or chew caps
- Give with food or milk
- Store in tight container at room temp; do not freeze

## ADVERSE EFFECTS
**CNS:** *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, stimulation, weakness, insomnia, nightmares, EPS (geriatric), increased psychiatric symptoms, paresthesia, seizures, ataxia
**CV:** *Orthostatic hypotension, ECG changes, tachycardia,* hypertension, palpitations, dysrhythmias
**EENT:** Blurred vision, tinnitus, mydriasis
**ENDO:** Hyperglycemia, hypothyroidism/hyperthyroidism, goiter, SIADH
**GI:** *Diarrhea, dry mouth,* nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, jaundice, hepatitis, stomatitis, constipation, taste change, weight gain
**GU:** *Retention,* acute renal failure, impotence, decreased libido
**HEMA:** Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia
**INTEG:** Rash, urticaria, sweating, pruritus, photosensitivity, hyperpigmentation (rare)

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver by CYP2D6, extensively |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 8-16 hr |

### Pharmacodynamics
| | PO |
|---|---|
| **Onset** | 1 hr |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Alcohol: increased effects
CloNIDine: hyperpyretic crisis, seizures, hypertensive episode
CloNIDine, guanethidine: decreased effects
Gatifloxacin, levofloxacin, moxifloxacin, ziprasidone: increased QT interval

### Drug classifications
MAOIs: hyperpyretic crisis, hypertensive episode, seizures
SSRIs, SNRIs, serotonin-receptor agonists: increased serotonin syndrome, increased neuroleptic malignant syndrome; avoid concurrent use
Sympathomimetics (direct acting [EPINEPHrine]), barbiturates, benzodiazepines, CNS depressants: increased effects
Sympathomimetics (indirect acting [ePHEDrine]): decreased effects
Tricyclic antidepressants, class IA/III antidysrhythmics: increased QT interval

### Drug/herb
St. John's wort: serotonin syndrome

### Drug/lab test
Increased: serum bilirubin, blood glucose, alkaline phosphatase, LFTs
Decreased: VMA, 5-HIAA, urinary catecholamines

## NURSING CONSIDERATIONS
### Assessment
- Monitor B/P (with patient lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg,

hold product, notify prescriber; take vital signs q4hr in patients with CV disease
• Monitor blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy
• Monitor hepatic studies: AST, ALT, bilirubin
• Check weight weekly; appetite may increase with product
• **QT prolongation:** Assess ECG for flattening of T wave, bundle branch block, AV block, dysrhythmias in cardiac patients
• Assess for EPS primarily in geriatric: rigidity, dystonia, akathisia

**BLACK BOX WARNING:** Assess mental status: mood, sensorium, affect, suicidal tendencies especially in children, young adults; increase in psychiatric symptoms: depression, panic

• Monitor urinary retention, constipation; constipation is more likely to occur in children or geriatric
• **Assess for withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness, diarrhea, insomnia, restlessness; do not usually occur unless product was discontinued abruptly
• Identify alcohol consumption; if alcohol is consumed, hold dose until AM
• **Beers:** Avoid in older adults, highly anticholinergic, high risk of delirium
• **Pregnancy/breastfeeding:** Use in pregnancy if benefits outweigh fetal risk, do not breastfeed

### Patient/family education

**BLACK BOX WARNING:** Teach patient to report suicidal thoughts, behaviors immediately; more common in children, young adults

• Teach patient that therapeutic effects may take 2-3 wk
• Teach patient to use caution in driving and other activities requiring alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting position, especially geriatric; orthostatic hypotension may occur
• Teach patient to avoid alcohol ingestion, other CNS depressants during treatment
• Teach patient not to discontinue medication quickly after long-term use: may cause nausea, headache, malaise
• Teach patient to wear sunscreen or large hat, since photosensitivity occurs
• Teach patient to increase fluids, bulk in diet if constipation, urinary retention occur, especially geriatric
• Teach patient to take gum, hard sugarless candy, frequent sips of water for dry mouth

### Evaluation

**Positive therapeutic outcome**
• Decreased depression
• Absence of suicidal thoughts
• Decreased enuresis in children
• Decreased pain

## TREATMENT OF OVERDOSE:

ECG monitoring, lavage, administer anticonvulsant; sodium bicarbonate (cardiac effects)

## indacaterol

(in-da-kat'er-ol)

**Arcapta Neohaler, Onbrez Breezhal ER**

*Func. class.:* $\beta_2$-agonist, long-acting

I

**ACTION:** An agonist at $\beta_2$-receptors. These receptors are present in large numbers in the lungs and are located on bronchiolar smooth muscle. Stimulation of $\beta_2$-receptors in the lung causes relaxation of bronchial smooth muscle, which produces bronchodilation and an increase in bronchial airflow. These effects may be mediated, in part, by increased activity of adenyl cyclase, an intracellular enzyme responsible for the formation of cyclic-3′,5′-adenosine monophosphate (cAMP); has >24 times greater agonist activity at $\beta_2$-receptors (primarily in the lung) than at $\beta_1$-receptors (primarily in the heart)

**USES:** Bronchitis, chronic obstructive pulmonary disease (COPD), emphysema

## CONTRAINDICATIONS

Acute bronchospasm, acute asthma attack, status asthmaticus, acute respiratory insufficiency, monotherapy of asthma

**Precautions:** Cardiac arrhythmias, congenital long QT syndrome, diabetes mellitus, hypertension, hyperthyroidism (thyrotoxicosis, thyroid disease), hypokalemia, ischemic cardiac disease (coronary artery disease), milk protein hypersensitivity, pheochromocytoma, QT prolongation, seizure disorder, severe hepatic disease, tachycardia, torsades de pointes history, unusual responsiveness to other sympathomimetic amines; not indicated for neonates, infants, children, or adolescents under the age of 18 years, pregnancy, breastfeeding

**BLACK BOX WARNING:** Asthma-related deaths

## DOSAGE AND ROUTES

**Adult:** INH 75 mcg (contents of 1 capsule) inhaled once daily; administer at the same time every day, max 1 dose in 24 hours

### Available forms:
Powder for inhalation: 75 mcg

### Implementation
#### Inhalation route
• For oral inhalation use only; *not* to swallow the capsules; always use the Neohaler inhaler; this inhaler should not be used with any other products; do *not* use with a spacer
• To administer, use dry hands to remove a capsule from the blister pack immediately before use and place into the capsule chamber of the Neohaler inhaler; click the inhaler closed; do not place capsule into the mouthpiece; then, holding upright, depress buttons fully one time to pierce capsule; a click will be heard; have patient breathe out fully away from inhaler; place inhaler in the mouth with lips closed around the mouthpiece and buttons positioned to the left and right (not up and down), then breathe deeply, rapidly, steadily in through the inhaler. A whirring sound should be heard; if no sound is heard, check the chamber—capsule may be stuck. Gently tap the base of the device to loosen capsule if necessary. After inhalation, the patient should hold breath as long as comfortable while removing inhaler from the mouth; check the chamber to see if any powder remains in the capsule; repeat inhalation steps until no powder remains. Most patients can empty the capsule in one or two inhalations. After administration, open the chamber and discard the empty capsule
• The gelatin capsule might break into very small pieces, which can pass through the inhaler screen and reach the mouth. Accidental inhalation or ingestion of these pieces is harmless; piercing the capsule more than once increases the risk of shattering capsule; do not wash inhaler; keep it dry. A clean, dry, lint-free cloth may be used to wipe out the inhaler
• Use the new inhaler provided with each new prescription
• To avoid the spread of infection, do not share the inhaler

## ADVERSE EFFECTS
**CNS:** Headache, tremor
**CV:** Sinus tachycardia, hypertension, QT prolongation and ST-T wave changes, prolonged QTc (an increase of >60 ms from baseline), nonsustained ventricular tachycardia, supraventricular tachycardia (SVT) episodes, intermittent ectopic atrial rhythm
**ENDO:** Hyperglycemia
**GI:** Nausea, dry mouth (xerostomia)
**META:** Hypokalemia
**MS:** Muscle cramps/spasm, musculoskeletal pain
**RESP:** Paradoxical bronchospasm, cough, dyspnea, sputum purulence or volume, wheezing, nasopharyngitis, pneumonia, sinusitis and upper respiratory tract infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Steady state 12-15 days protein binding 94%-96% |
| **Metabolism** | By CYP3A4, CYP1A1, CYP2D6, UTG1A1 |
| **Excretion** | Renal 2%-6%, fecally >90% |
| **Half-life** | Terminal 45.5-126 hrs |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 5 min |
| **Peak** | 15 min |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Amoxapine, some antipsychotics (phenothiazines, pimozide, haloperidol risperiDONE, sertindole ziprasidone), arsenic trioxide, astemizole, bepridil, cisapride, citalopram, chloroquine, clarithromycin, dasatinib, dolasetron, dronedarone, droperidol, erythromycin, flecainide, halofantrine, levomethadyl, maprotiline, methadone, ondansetron, paliperidone, palonosetron, pentamidine, probucol, propafenone, some quinolones (ofloxacin, gatifloxacin, gemifloxacin, grepafloxacin, levofloxacin, moxifloxacin, sparfloxacin), ranolazine, sunitinib, terfenadine, thioridazine, troleandomycin, vorinostat, tetrabenazine: increased QT prolongation
Aminophylline, theophylline: increased hypokalemia
Furazolidone, procarbazine, rasagiline: increased cardiovascular reactions

### Drug classifications
Class IA/III antiarrhythmics, halogenated anesthetics, tricyclic antidepressants: increased QT prolongation
Corticosteroids: increased hypokalemia
MAOIs: increased cardiovascular reactions

## NURSING CONSIDERATIONS
### Assessment
**BLACK BOX WARNING:** Asthma-related death; not to be used in asthma

• **COPD, emphysema, bronchospasm:** Monitor pulmonary function tests

- **QT prolongation:** Monitor ECG, ejection fraction for QT prolongation
- **Paradoxical bronchospasm:** If paradoxical bronchospasm occurs, discontinue this medication immediately, use a short-acting beta-agonist for rescue therapy, as appropriate

### Patient/family education

- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding
- Teach patient/family to report dyspnea, wheezing, bronchospasm
- Teach patient/family not to use with other products unless approved by prescriber; there are many interactions, it is always prescribed with a short-acting beta 2 or steroidal inhaler
- Teach patient how to use neoinhaler, not to stop treatment unless approved by prescriber

**BLACK BOX WARNING:** Not to use for asthma

## indomethacin (Rx)

(in-doe-meth'a-sin)

**Indocin, Nu-Indo, Tivorbex** 🍁

*Func. class.:* NSAID (nonsteroidal antiinflammatory), antirheumatic

*Chem. class.:* Acetic acid derivative

**Do not confuse:** Indocin/Endocet, minocin/Vicodin

**ACTION:** Inhibits prostaglandin synthesis by decreasing enzyme needed for biosynthesis; analgesic, antiinflammatory, antipyretic

**Therapeutic outcome:** Decreased pain, inflammation; closure of patent ductus arteriosus (premature infants)

**USES:** Rheumatoid arthritis, ankylosing spondylitis, osteoarthritis, bursitis, tendinitis, acute gouty arthritis; closure of patent ductus arteriosus in premature infants (**IV**)

## CONTRAINDICATIONS

Pregnancy (3rd trimester) hypersensitivity, asthma, aortic coarctation, bleeding, salicylate/NSAID hypersensitivity, GI bleeding

**BLACK BOX WARNING:** Perioperative pain in CABG

**Precautions:** Pregnancy (1st trimester), breastfeeding, children, bleeding disorders, GI disorders, cardiac disorders, asthma, diabetes, acute bronchospasm, ulcerative colitis, seizures, Parkinson's disease, renal/hepatic disease, depression, neonates

**BLACK BOX WARNING:** Stroke, GI bleeding, MI, those taking NSAIDs are at greater risk of MI and stroke, even in first few weeks of therapy

## DOSAGE AND ROUTES

### Arthritis/antiinflammatory

**Adult:** PO 25-50 mg bid-tid, max 200 mg/day; SUS REL 75 mg daily; may increase to 75 mg bid

### Acute gouty arthritis

**Adult:** PO 50 mg tid; use only for acute attack, then reduce dosage

### Patent ductus arteriosus

Longer or repeated treatment courses may be necessary for very premature infants

**Infant <2 days:** **IV** 0.2 mg/kg, then 0.1 mg/kg × 2 doses at 12, 24 hr

**Infant 2-7 days:** **IV** 0.2 mg/kg, then 0.2 mg/kg × 2 doses at 12, 24 hr

**Infant >7 days:** **IV** 0.2 mg/kg, then 0.25 mg/kg × 2 doses at 12, 24 hr

**Available forms:** Caps 25, 50 mg; sus rel caps 75 mg; oral susp 5 mg/ml; inj 1-mg vials; supp 50 mg

### Implementation

**PO route**

- Swallow sus rel cap whole; do not break, crush, or chew sus rel cap
- Give with food or milk to decrease gastric symptoms and prevent ulceration
- Shake susp; do not mix with other liquids

**Rectal route**

- Have patient retain rect supp for 1 hr after insertion
- Store at room temperature

**IV route**

- Give after diluting 1 mg with 1 or 2 ml saline or sterile water for inj without preservative; give 1 or 0.5 mg/ml, respectively, do not dilute further; give over 5-35 sec to avoid dramatic shift in cerebral blood flow; avoid extravasation
- Hold dose in patent ductus arterious in oliguria <0.6 ml/kg/hr

## ADVERSE EFFECTS

**CNS:** Dizziness, drowsiness, fatigue, confusion, insomnia, anxiety, depression, *headache*

**CV:** Tachycardia, peripheral edema, palpitations, dysrhythmias, hypertension, CV thrombotic events, MI, stroke

**EENT:** Tinnitus, hearing loss, blurred vision

**GI:** *Nausea,* anorexia, *vomiting,* diarrhea, jaundice, cholestatic hepatitis, *constipation,*

flatulence, cramps, dry mouth, peptic ulcer, ulceration, perforation, GI bleeding
**GU:** Nephrotoxicity (dysuria, hematuria, oliguria, azotemia)
**HEMA:** Blood dyscrasias, prolonged bleeding
**INTEG:** Purpura, rash, pruritus, sweating

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO); erratic (RECT); complete (**IV**) |
| **Distribution** | Crosses blood-brain barrier; placenta, 99% plasma protein binding |
| **Metabolism** | Liver, extensively |
| **Excretion** | Breast milk; urine 60%, feces 33% |
| **Half-life** | 1 hr first pass, 2.6-11.2 hr second pass |

### Pharmacodynamics

| | PO | PO–ext rel | IV |
|---|---|---|---|
| **Onset** | 30 min | ½ hr | 2 day |
| **Peak** | 2 hr | Unknown | Unknown |
| **Duration** | 4-6 hr | 4-6 hr | Unknown |

## INTERACTIONS

### Individual drugs

Abciximab, aspirin, clopidogrel, eptifibatide, plicamycin, ticlopidine, tirofiban: increased bleeding risk
Cidofovir, cycloSPORINE, lithium, methotrexate, probenecid: increased toxicity
Digoxin, penicillamine, phentoin: increased effect of each specific product

### Drug classifications

Aminoglycosides: increased effects of aminoglycosides
Anticoagulants, SNRIs, SSRIs, thrombolytics: increased risk of bleeding
Antihypertensives: decreased effect of antihypertensives
Diuretics (potassium sparing): increased hyperkalemia

## NURSING CONSIDERATIONS

### Assessment

- Assess for patent ductus arteriosus: respiratory rate, character, heart sounds
- Assess for joint pain (duration, intensity, ROM), baseline and during treatment
- **Beers:** Avoid use in older adults, more likely to cause CNS effects
- Assess for confusion, mood changes, hallucinations, especially in geriatric
- Assess renal, liver, blood studies: BUN, creatinine, AST, ALT, Hgb before treatment, periodically thereafter; if renal function decreases, do not give subsequent doses

**BLACK BOX WARNING:** Assess for cardiac disease, CV, thrombotic events (MI, stroke) prior to administration, not to be used for perioperative pain in CABG surgery

**BLACK BOX WARNING:** GI bleeding/perforation: chronic use can lead to GI bleeding: use cautiously in those with a history of active GI disease

**BLACK BOX WARNING:** MI, stroke: risk may be greater with longer-term use and in those with CV risk factors

- **Pregnancy/breastfeeding:** Do not use after 30 wk gestation, use only if benefits outweigh fetal risk, <30 wk gestation, do not breastfeed, excreted in breast milk

### Patient/family education

- Advise patient to report change in vision, blurring, rash, tinnitus, black stools
- Tell patient not to use for any other condition than prescribed
- Advise patient to avoid use with OTC medications for pain unless approved by prescriber, to report use to all providers
- Advise patient to avoid hazardous activities, since dizziness or drowsiness can occur
- Instruct patient to use sunscreen to prevent photosensitivity
- Advise to take with food for GI upset
- Teach patient to report signs of GI bleeding: dark stools, hematemesis

**BLACK BOX WARNING:** MI/stroke: Teach patient to immediately report and seek medical attention for signs/symptoms of MI/stroke, discontinue product

### Evaluation

**Positive therapeutic outcome**

- Decreased stiffness
- Increased joint mobility
- Decreased pain

## inFLIXimab (Rx)

(in-fliks'ih-mab)
**Inflectra** 🍁, **Remicade, Remsima** 🍁
*Func. class.:* Antirheumatic (DMRDs), GI antiinflammatory, immunoglobulin
*Chem. class.:* Tumor necrosis factor modifiers

**Do not confuse:** **inFLIXimab**/riTUXimab, **Remicade**/Renacidin

**ACTION:** Monoclonal antibody that neutralizes the activity of tumor necrosis factor α (TNFα) that has been found in Crohn's disease; decreased infiltration of inflammatory cells

**Therapeutic outcome:** Decreased cramping and blood in stools

**USES:** Crohn's disease, fistulizing, moderate to severe; rheumatoid arthritis given with methotrexate, plaque psoriasis, ankylosing spondylitis, ulcerative colitis, psoriatic arthritis, psoriasis

## CONTRAINDICATIONS

Hypersensitivity to murines, moderate to severe HF (NYHA class III/IV)

**Precautions:** Pregnancy, breastfeeding, children, geriatric, COPD, hepatotoxicity, hematologic abnormalities, hepatitis B, Guillain-Barré syndrome, seizures, multiple sclerosis

**BLACK BOX WARNING:** Infection, neoplastic disease, TB

## DOSAGE AND ROUTES

### Crohn's disease (moderate to severe/fistulizing)/ankylosing spondylitis

**Adult/adolescent/child ≥6 yr: IV** INF 5 mg/kg initially, then repeat dose 2, 6 wk, then q8wk; q6wk (ankylosing spondylitis); may increase to 10 mg/kg if needed (adults)

### Ulcerative colitis/plaque psoriasis

**Adult/adolescent/child ≥ 6 yr:** IV infusion 5 mg/kg initially and at 2, 4 wk, then 5 mg/kg q8wk

### Rheumatoid arthritis

**Adult: IV** 3 mg/kg initially, and 2, 6 wk and q8wk thereafter, max 10 mg/kg/dose

**Available forms:** Powder for inj 100 mg

### Implementation

**Intermittent IV infusion route**

- Administer immediately after reconstitution; reconstitute each vial with 10 ml of sterile water for inj, further dilute total dose/250 ml of 0.9% NaCl inj to a total conc of between 0.4 and 4 mg/ml; use 21-G or smaller needle for reconstitution, direct sterile water at glass wall of vial, gently swirl, do not shake, may foam; allow to stand for 5 min, give within 3 hr
- Give over ≥2 hr, use polyethylene-lined inf with in-line, sterile, low-protein-bind filter
- Do not admix
- Provide refrigerated storage, do not freeze

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness, depression, vertigo, fatigue, anxiety, fever,* seizures, *chills, flulike symptoms,* demyelinating disease

**CV:** Chest pain, hypo/hypertension, tachycardia, HF, acute coronary syndrome

**GI:** *Nausea, vomiting, abdominal pain, stomatitis, constipation, dyspepsia, flatulence*

**GU:** Dysuria, frequency

**HEMA:** Anemia, leukopenia, thrombocytopenia, pancytopenia

**INTEG:** *Rash, dermatitis, urticaria,* dry skin, sweating, flushing, hematoma, pruritus, keratoderma blennorrhagicum

**MS:** Myalgia, back pain, arthralgia

**RESP:** URI, pharyngitis, bronchitis, cough, dyspnea, sinusitis

**SYST:** Anaphylaxis, fatal infections, sepsis, malignancies, immunogenicity, Stevens-Johnson syndrome, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Vascular compartment |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 9½ days |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug classifications

Live virus vaccines: do not administer live vaccines concurrently

TNF blockers (abatacept, anakinra, golimumab, rilonacept): increased infections, neutropenia; avoid concurrent use

## NURSING CONSIDERATIONS

### Assessment

- Assess GI symptoms: nausea, vomiting, abdominal pain
- Take periodic blood counts: CBC
- Assess CV status: B/P, pulse, chest pain
- **Assess for allergic reaction, anaphylaxis:** rash, dermatitis, urticaria, fever, chills, dyspnea, hypotension; discontinue if severe; administer epinephrine, corticosteroids, antihistamines; assess for allergy to murine proteins before starting therapy

**BLACK BOX WARNING:** Fatal infections: discontinue if infection occurs, do not administer to patients with active infections; identify TB before beginning treatment, a TB test should be obtained; if present, TB should be treated before giving inFLIXimab; exercise caution when switching one DMARD to another

• Report suspected adverse reactions to the FDA (1-800-FDA-1088)

**BLACK BOX WARNING:** Assess for neoplastic disease in those <18 yr, including hepatosplenic T-cell lymphoma, usually occurs in those with inflammatory bowel disease

• **Pregnancy/breastfeeding:** Does not cross the placenta during first trimester, but does second and third trimester, discontinue 8-10 wk before birth, do not breastfeed

### Patient/family education

• Instruct patient to report infusion reaction immediately
• Instruct patient to notify prescriber immediately if infection occurs
• Advise patient not to breastfeed while taking this product
• Advise patient to notify prescriber of GI symptoms, hypersensitivity reactions
• Advise patient not to operate machinery or drive if dizziness, vertigo occurs
• Teach patient to avoid live virus vaccinations, bring up to date prior to use

### Evaluation

**Positive therapeutic outcome**
• Absence of blood in stool
• Reported improvement in comfort
• Weight gain

**⚠ HIGH ALERT**

## INSULINS

**RAPID ACTING**

**insulin glulisine (Rx)**
**Apidra, Apidra SoloStar**

**insulin aspart (Rx)**
**NovoLOG, NovoLOG Flexpen, NovoLOG PenFill, NovoMix 30 🍁, NovoRapid 🍁**

**insulin (Human)**
**Afreeza**

**insulin lispro (Rx)**
**HumaLOG, HumaLOG U-200 KwikPen**

**SHORT ACTING**

**insulin, regular (OTC)**
**Humulin R 🍁, NovoLIN R, ReliOn R**

**insulin, regular concentrated (Rx)**
**Humulin RU-500**

**INTERMEDIATE ACTING**

**insulin, isophane suspension (NPH) (OTC)**
**Humulin N, NovoLIN ge NPH 🍁, NovoLIN N, NovoLIN N Prefilled, ReliOn N**

**LONG ACTING**

**insulin degludec**
**Tresiba**

**insulin detemir (Rx)**
**Levemir**

**insulin glargine (Rx)**
**Lantus, Toujeo Solostar**

**MIXTURES**

**insulin, isophane suspension and regular insulin (Rx)**
**HumaLIN 70/30, HumaLIN 30/70 🍁, NovoLIN 70/30, NovoLIN 70/30 Prefilled, ReliOn 70/30**

**isophane insulin suspension (NPH) and insulin mixtures (Rx)**
**Humulin 50/50**

**insulin lispro mixture (Rx)**
**HumaLOG KwikPen Mix 50/50, HumaLOG Mix 25 🍁, HumaLOG Mix 50 🍁, HumaLOG Mix 75/25, HumaLOG Mix 50/50**

**insulin aspart mixture (Rx)**
**NovoLOG 70/30, Novolog Mix Flexpen Prefilled Syringe 70/30**

**insulin, inhaled**
(in'soo-lin)
**Afrezza**
*Func. class.:* Antidiabetic, pancreatic hormone
*Chem. class.:* Modified structures of endogenous human insulin

**Do not confuse:** Lantus/lente/Novolog Flexipen/Novolog Humalog

**ACTION:** Decreases blood glucose; by transport of glucose into cells and the conversion of glucose to glycogen, indirectly increases blood pyruvate and lactate, decreases phosphate and potassium; insulin may be human (processed by recombinant DNA technologies)

**Therapeutic outcome:** Decreased blood glucose levels in diabetes mellitus

**USES:** Type 1 diabetes mellitus, type 2 diabetes mellitus, gestational diabetes, insulin lispro may be used in combination with sulfonylureas in children >3 yr

## CONTRAINDICATIONS

Hypersensitivity to protamine; creosol (aspart)

**Precautions:** Pregnancy

## DOSAGE AND ROUTES

### >> Insulin glulisine

**Adult/adolescent/child ≥4 yr:** SUBCUT dosage individualized, give within 15 min before or 20 min after starting a meal

**Adult: IV** dilute to 1 unit/ml in INF systems with 0.9% NaCl, using PVC Viaflex INF bags and PVC tubing, use dedicated line

### >> Insulin aspart

**Adult/adolescent/child ≥6 yr:** Intermittent SUBCUT total daily dose is given as 2-4 inj/day just prior to beginning of a meal; in general, 50%-70% of total daily insulin may be given as insulin aspart, the remainder should be intermediate or long-acting insulin; CONTINUOUS SUBCUT used with external insulin pump via cont SUBCUT insulin INF (CSII), the insulin dose should be based on the insulin dose from the previous regimen

### >> Insulin lispro

**Adult/adolescent/child ≥3 yr:** SUBCUT 15 min before meals; **continuous subcut infusion (external insulin pump)** the total daily dose should be based on the insulin dose in previous regimen, 50% of total dose can be given as meal-related boluses and the remainder as basal infusion

### >> Human regular

**Adult:** SUBCUT ½-1 hr before meals

### Insulin, isophane suspension

**Adult:** SUBCUT dosage individualized by blood, urine glucose; usual dose 7-26 units; may increase by 2-10 units/day if needed

### >> insulin degludec

**Adult:** SUBCUT dose individualized

### >> Insulin detemir

**Adult/adolescent/child ≥2 yr:** SUBCUT 1 or 2 times/day; if 1 time, give with evening meal

### >> Insulin glargine

**Adult and child ≥6 yr:** SUBCUT 10 international units/day, range 2-100 international units/day, but may go much higher

### >> Insulin, inhaled

**Adult:** INH: (type 1) the average initial dose is 0.5-0.6 unit/kg/day, usually ≥ 3 administrations/day; (type 2) the average initial dose is 0.2-0.6 unit/kg/day. When used in combination with oral hypoglycemic agents, may only need a single dose of a longer acting insulin at a dosage of 10 units or 0.2 units/kg/day.

### >> Regular insulin (ketoacidosis)

**Adult: IV** 5-10 units, then 5-10 units/hr until desired response, then switch to SUBCUT dose; **IV**/INF 2-12 units (50 units/500 ml of normal saline)

**Child: IV** 0.1 units/kg

### >> Replacement

**Adult and child:** SUBCUT 0.5-1 units/kg/day qid given 30 min before meals

**Adolescent:** SUBCUT 0.8-1.2 mg/kg/day; this dosage is used during rapid growth

**Available forms: NPH** inj 100 units/ml; **regular** inj 100 units/ml, cartridges 100 units/ml; **insulin analog** inj 100 units/ml; **isophane insulin** inj 100 units/ml, cartridges 100 units/ml; **insulin lispro** 100 units/ml, 1.5-ml cartridges; Humalog KwikPen sol for inj 100 units/ml, Humalog KwikPen 200 units/ml prefilled pen solution for injection; **insulin glulisine** inj 100 units/ml; **insulin glargine** inj 100, 300 units/ml; **insulin degludec** Solution for INJ 100 units/ml (u-100), 200 units/ml (u-200); **insulin detemir** inj 100 units/ml in 10 vials, 3-ml cartridges; **insulin aspart** inj 100 mg/ml (Flexpen, PenFill); **insulin inhaled** 4 units powder for inh

### Implementation

- Store at room temperature for <1 mo (some insulins); keep away from heat and sunlight; refrigerate all other supply; NPH, premixed insulins are cloudy; regular, rapid-acting analogs, long-acting analogs are clear; do not freeze—**IV** route, regular only

**INHALED route**

- Give by inhalation only; use at beginning of a meal (blue cartridge = 4 units of regular insulin, green cartridge = 8 units of regular insulin); multiple cartridges may be needed; for single-use only; inhaler should be discarded after 15 days; store unopened cartridge packages in refrigerator, if not refrigerated, use within 10 days
- Sealed (unopened) blister cards and strips must be used within 10 days. Cartridges left

over in an opened strip must be used within 3 days. Remove a blister card from the foil package. Tear along a perforation to remove one strip. Press the clear side of the strip to push the cartridge out. To load the cartridge, hold the inhaler level in one hand with the white mouthpiece on the top and purple base on the bottom; open the inhaler by lifting the white mouthpiece to a vertical position. Before placing the cartridge in the inhaler, both the cartridge and the inhaler should be at room temperature for 10 minutes. Hold the cartridge with the cup facing down, and line up the cartridge with the opening in the inhaler. The pointed end of the cartridge should line up with the pointed end in the inhaler. The cartridge can be placed into the inhaler; ensure that the cartridge lies flat in the inhaler. Once the cartridge is loaded, keep level.

- Remove the purple mouthpiece cover. Hold the inhaler away from the mouth and fully exhale. While keeping the head level, place the mouthpiece in the mouth and tilt the inhaler down toward the chin. Close lips around the mouthpiece to form a seal. Inhale deeply through the inhaler. Hold breath for as long as is comfortable, and at the same time remove the inhaler from the mouth. Exhale and continue to breathe normally.

**SUBCUT route**

- Give after warming to room temperature by rotating in palms to prevent injecting cold insulin; use only insulin syringes with markings or syringe matching units/ml; rotate inj sites within one area: abdomen, upper back, thighs, upper arm, buttocks; keep record of sites
- Give increased dosages if tolerance occurs
- Premixed insulins and NPH are cloudy suspensions
- Regular human insulin, rapid-acting analogs, and long-acting analogs are clear; do not use if cloudy, thick, or discolored

**CONT SUBCUT route (insulin infusion CSII)**

- Do not mix with other insulins when using a pump
- Insulin lispro 3 ml cartridges are to be used in Disetronic H-TRON plus V100 pump using Disetronic rapid inf sets; the inf set and the cartridge adapter should be changed q3day; replace 3 ml cartridge q6days

**IV route (insulin glulisine only)**

- Dilute to 1 international unit/ml in infusion systems with 0.9% NaCl using PVC viaflex inf bags and PVC tubing; use dedicated line; do not admix

**IV route (regular only)**

- When regular insulin is administered IV, monitor glucose, potassium often to prevent fatal hypoglycemia, hypokalemia
- **IV** direct, undiluted via vein, Y-site, 3-way stopcock; give at 50 units/min or less
- Give by cont inf after diluting with **IV** sol and run at prescribed rate; use **IV** inf pump for correct dosing; give reduced dose at serum glucose level of 250 mg/100 ml

**Additive compatibilities:** Bretylium, cimetidine, lidocaine, meropenem, ranitidine, verapamil

**Additive incompatibilities:** Aminophylline, amobarbital, chlorothiazide, cytarabine, DOBUTamine, PENTobarbital, PHENobarbital, phenytoin, secobarbital, sodium bicarbonate, thiopental

**Y-site compatibilities:** Amiodarone, ampicillin, ampicillin/sulbactam, aztreonam, ceFAZolin, cefoTEtan, DOBUTamine, esmolol, famotidine, gentamicin, heparin, heparin/hydrocortisone, imipenem/cilastatin, indomethacin, magnesium sulfate, meperidine, meropenem, midazolam, morphine, nitroglycerin, oxytocin, PENTobarbital, potassium chloride, propofol, ritodrine, sodium bicarbonate, sodium nitroprusside, tacrolimus, terbutaline, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vit B/C

**Y-site incompatibilities:** Nafcillin

## ADVERSE EFFECTS

**EENT:** Blurred vision, dry mouth
**INTEG:** Flushing, rash, urticaria, warmth, *lipodystrophy,* lipohypertrophy, swelling, redness
**META:** *Hypoglycemia,* rebound hyperglycemia (Somogyi effect 12-72 hr or longer)
**MISC:** Peripheral edema
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed (SUBCUT) |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver, muscle, kidney |
| **Excretion** | Kidneys |
| **Half-life** | Regular 3-5 min; NPH 10 min |

### Pharmacodynamics

| | |
|---|---|
| **Rapid acting** | |
| Insulin glulisine | Onset 15-30 min, peak ½-1½ hr, duration 3-4 hr |
| Insulin aspart | Onset 10-20 min, peak 1-3 hr, duration 3-5 hr |
| Insulin lispro | Onset 15-30 min, peak ½-1½ hr, duration 3-4 hr |
| **Short acting** | |
| Insulin regular | Onset 30 min, peak 2.5-5 hr, duration up to 6 hr |
| **Intermediate acting** | |
| Insulin, isophane suspension (NPH) | Onset 1.5-4 hr, peak 4-12 hr, duration up to 24 hr |
| **Long acting** | |
| Insulin detemir | Onset 0.8-2 hr, peak unknown, duration up to 24 hr (concentration dependent) |
| Insulin glargine | Onset 1.5 hr, no peak identified, duration ≥ 24 hr |
| Insulin degludec | Peak 12 hr, duration 42 hr after 8 doses |
| **Mixtures** | |
| Insulin, isophane suspension and regular insulin (70/30) | Onset 10-20 hr, peak 2.4 hr, duration up to 24 hr |
| Isophane insulin suspension (NPH) and insulin mixtures (50/50) | Onset ½-1 hr, peak dual, duration 10-16 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased hypoglycemia
DOBUTamine: increased insulin need
EPINEPHrine: decreased hypoglycemia
Sulfinpyrazone, tetracycline: decreased insulin need

### Drug classifications

Anabolic steroids, β-adrenergic blockers, hypoglycemics (oral), salicylates: increased hypoglycemia
Contraceptives (oral), corticosteroids, diuretics (thiazide), thyroid hormones: decreased hypoglycemia
Estrogens: increased insulin need
MAOIs: decreased insulin need

### Drug/lab test

Increased: VMA
Decreased: potassium, calcium
Interference: liver, thyroid function tests

## NURSING CONSIDERATIONS

### Assessment

- Fasting blood glucose, also Hgb A1c may be tested to identify treatment effectiveness q3mo
- Urine ketones during illness; insulin requirements may increase during stress, illness, surgery
- For hypoglycemic reaction that can occur during peak time (sweating, weakness, dizziness, chills, confusion, headache, nausea, rapid weak pulse, fatigue, tachycardia, memory lapses, slurred speech, staggering gait, anxiety, tremors, hunger)
- For hyperglycemia: acetone breath, polyuria, fatigue, polydipsia, flushed, dry skin, lethargy
- **Pregnancy/breastfeeding:** Use if clearly needed, product of choice for pregnancy, monitor blood glucose levels, cautious use in breastfeeding
- **Beers:** Avoid use of short- or rapid-acting insulin in older adults, sliding-scale insulin poses a higher risk of hypoglycemia without improvement in hyperglycemia management

### Patient/family education

- Advise patient that blurred vision occurs; not to change corrective lens until vision is stabilized 1-2 mo
- Advise patient to keep insulin, equipment available at all times; carry a glucagon kit, candy, or lump sugar to treat hypoglycemia
- Inform patient that product does not cure diabetes but controls symptoms
- Advise patient to carry emergency ID as diabetic
- Instruct patient to recognize hypoglycemia reaction: headache, tremors, fatigue, weakness
- Instruct patient to recognize hyperglycemia reaction: frequent urination, thirst, fatigue, hunger

• Teach patient the dosage, route, mixing instructions, any diet restrictions, disease process
• **Teach patient the symptoms of ketoacidosis:** nausea, thirst, polyuria, dry mouth, decreased B/P, dry, flushed skin, acetone breath, drowsiness, Kussmaul respirations
• Advise patient that a plan is necessary for diet, exercise; all food on diet should be eaten; exercise routine should not vary
• Teach patient about blood glucose testing; make sure patient is able to determine glucose level
• Advise patient to avoid OTC products unless directed by prescriber

### Evaluation

**Positive therapeutic outcome**
• Decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait
• Blood glucose level under control

## TREATMENT OF OVERDOSE:
Glucose 25 g **IV,** via dextrose 50% sol, 50 ml, or glucagon 1 mg

**⚠ HIGH ALERT**
**RARELY USED**

## insulin degludec/liraglutide
(in′su-lin de-gloo′dek/lir′a-gloo′tide)
**Xultophy**
*Func. class.:* Antidiabetic combination

## USES:
Type 2 diabetes mellitus, in combination with diet and exercise, for adults who are inadequately controlled on basal insulin (less than 50 units daily) or liraglutide (less than or equal to 1.8 mg daily)

## CONTRAINDICATIONS
Angioedema, hypoglycemia, medullary thyroid carcinoma (MTC), multiple endocrine neoplasia syndrome type 2 (MEN 2)

## DOSAGE AND ROUTES
**Adult: SUBCUT:** insulin degludec; liraglutide (Xultophy) is given as dose units. The prefilled pen can provide from 10 up to 50 dose units in a single injection in increments of 1 dose unit. Discontinue therapy with liraglutide or basal insulin before initiation of Xultophy. RECOMMENDED STARTING DOSE: 16 dose units (16 units of insulin degludec and 0.58 mg of liraglutide) subcut qday at the same time each day, with or without food. DOSE TITRATION: Titrate the dosage upward or downward by 2 dose units (2 units of insulin degludec and 0.072 mg of liraglutide) q3-4 days based on the metabolic needs, blood glucose monitoring results, and glycemic control goal until the desired fasting plasma glucose is achieved. May temporarily titrate below 16 dose units if needed. However, if the patient requires a dose that is persistently below 16 dose units or requires a dose above 50 dose units, use alternative antidiabetic products. MAX: 50 dose units (50 units insulin de-gludec and 1.8 mg liraglutide)

**⚠ HIGH ALERT**
**RARELY USED**

## insulin glargine/lixisenatide
(in′su-lin glar′gine/lix′i-sen′a-tide)
**Soliqua**
*Func. class.:* Antidiabetic

## USES:
Type 2 diabetes mellitus in combination with diet and exercise in adults inadequately controlled on basal insulin or lixisenatide

## CONTRAINDICATIONS
Angioedema, hypoglycemia

## DOSAGE AND ROUTES
**Adult: SUBCUT:** insulin glargine/lixisenatide (Soliqua) is given as dose units. The prefilled pen can provide from 15 up to 60 dose units in a single injection in increments of 1 dose unit. Discontinue therapy with lixisenatide or basal insulin before initiation of Soliqua. RECOMMENDED STARTING DOSE: In those inadequately controlled on less than 30 units of basal insulin or on lixisenatide, initiate with 15 units (15 units insulin glargine and 5 mcg lixisenatide) subcut qday within the hour before the first meal of the day. In those inadequately controlled on 30-60 units of basal insulin or on lixisenatide, initiate with 30 units (30 units insulin glargine and 10 mcg lixisenatide) subcut qday within the hour before the fi rst meal of the day. TITRATION: Titrate the dosage upward or downward by 2-4 units qwk based on response

## Interferons Beta
## interferon beta-1a (Rx)
(in-ter-feer′on)
**Avonex, Rebif**
## interferon beta-1b (Rx)
**Betaseron, Extavia**
*Func. class.:* Multiple sclerosis agent, immune modifier
*Chem. class.:* Interferon, *Escherichia coli* derivative

## ACTION:
Antiviral, immunoregulatory; action not clearly understood; biologic response-modifying

properties mediated through specific receptors on cells, inducing expression of interferon-induced gene products

**Therapeutic outcome:** Decreased symptoms of multiple sclerosis

**USES:** Ambulatory patients with relapsing or remitting multiple sclerosis

## CONTRAINDICATIONS

Hypersensitivity to natural or recombinant interferon-beta or human albumin, hamster protein, rotavirus vaccine

**Precautions:** Pregnancy, breastfeeding, children <18 yr, chronic progressive multiple sclerosis, depression, mental disorders, seizure disorders, latex allergy, autoimmune disorders, bone marrow suppression, hepatotoxicity, cardiac disease, alcoholism, chickenpox, herpes zoster

## DOSAGE AND ROUTES

### >> Interferon beta-1a

**Remitting-relapsing multiple sclerosis**

**Adult:** IM (Avonex) 30 mcg qwk; SUBCUT (Rebif) 22 or 44 mcg 3 ×/wk with each dose 48 hr apart, titrate to full dose over 4-wk period

### >> Interferon beta-1b

**Relapsing/remitting multiple sclerosis**

**Adult:** SUBCUT 0.0625 mg every other day for wk 1 and 2; then 0.125 mg every other day for wk 3 and 4; then 0.1875 mg every other day for wk 5 and 6; then 0.25 mg every other day thereafter; higher doses should not be used

**Available forms:** Beta-1a (Avonex): 33 mcg (6.6 million international units/vial) (auto-injector pen); (Rebif) 22 mcg, 44 mcg/0.5 ml; beta-1b: powder for inj 0.3 mg (9.6 m international units)

### Implementation

- Reconstitute 0.3 mg (9.6 million international units)/1.2 ml of supplied diluent (0.2 mg or 8 million international units concentration); rotate vial gently, do not shake; withdraw 1 ml using a syringe with 27-G needle; administer SUBCUT only into hip, thigh, arm; discard unused portion

### >> Interferon beta-1a

- Reconstitute with 1.1 ml of diluent, swirl, give within 6 hr
- Store in refrigerator; do not freeze
- Visually inspect parenteral products for particulate matter and discoloration prior to use

**IM route**

- Premedication with acetaminophen or ibuprofen and give at bedtime to lessen flulike symptoms
- Interferon beta-1a (Avonex) 30 mcg is equivalent to 6 million IU
- If a dose is missed, give it as soon as possible; continue the regular schedule but do not give 2 injections within 2 days of each other; all products are for single-use only. Do not re-use needles, syringes, prefilled syringes, or autoinjectors, rotate injection sites
- Check site to minimize injection site reactions
- Do not inject into an area of the body where skin is irritated, reddened, bruised, infected, or scarred
- The injection site should be checked after 2 hours for redness, edema, or tenderness
- The manufacturer of Avonex offers free training on IM use for patients and health care partners. Contact MS ActiveSource for more information (800-456-2255)

**Reconstitution and administration of Avonex lyophilized powder for IM route**

- Use aseptic technique for preparation of solution
- Sites for injection include the thigh or upper arm
- Slowly add 1.1 ml sterile water for injection, preservative-free (supplied by manufacturer) to the vial. Rapid addition of the diluent may cause foaming
- Gently swirl; do not shake. Final concentration should be 30 mcg/ml (6 million IU/ml)
- The solution should be clear to slightly yellow without particles. Discard if the reconstituted product contains particulate matter or is discolored
- Withdraw 1 ml of reconstituted solution into a syringe. Attach the sterile needle and inject IM
- A 25 gauge, 1″ needle for IM may be substituted for the 23 gauge, 1¼″ needle provided
- *Storage:* Use within 6 hours of reconstitution; store reconstituted solution refrigerated; do NOT freeze. Discard any unused solution; both drug and diluent vials are single-use only

**Administration of Avonex prefilled syringe**

- Patients may self-inject only if provider determines that it is appropriate, and with medical follow-up, and after proper training in IM injection technique
- The first injection should be performed under the supervision of an appropriately qualified person
- If self-injecting, rotate between thighs. With help from another person, may rotate between thighs and upper arms

• Wash hands prior to handling the Dose Pack
• Remove prefilled syringe from the refrigerator to warm to room temperature (usually 30 min before use). Do not use external heat sources such as hot water to warm the syringe
• Hold the syringe so the cap is facing down and the 0.5 mL mark is at eye level. Be sure the amount of liquid in the syringe is the same or very close to the 0.5 mL mark. If the correct amount of liquid is not in the syringe, do not use it and call the pharmacist
• Hold syringe upright so that the rubber cap faces up. Remove the cap by bending it at a 90 degree angle until it snaps free
• Attach the needle by pressing it onto the syringe and turning it clockwise until it locks in place. Be careful not to push the plunger while attaching the needle
• Use the alcohol wipe to clean the skin at the injection site you choose. Then, pull the protective cover straight off the needle; do not twist the cover off
• Inject intramuscularly at a 90 degree angle into the thigh or upper arm as directed by the provider
• Use gauze pad to apply pressure for a few seconds after the injection
• Dispose of used needles and syringes in a puncture-resistant container and discard appropriately
• Instruct patients to contact the health care provider if a skin reaction occurs that does not resolve in a few days
• A 25 gauge, 1″ needle for intramuscular injection may be substituted for the 23 gauge, 1¼″ needle provided by the manufacturer, if deemed appropriate by the physician
• Refer to the Patient Medication Guide for detailed instructions for preparing and giving a dose
• *Storage:* Store refrigerated, if refrigeration is unavailable, may store at 77 degrees F or less for up to 7 days; after removal from refrigerator, do not store product above 25 degrees C. If the product has been exposed to conditions other than recommended, discard the product. Do not expose to high temperatures. Do not freeze. Protect from light

**Administration of Avonex prefilled autoinjector**

• Patients may self-inject only if their provider determines that it is appropriate, and with medical follow-up, and after proper training in IM technique
• The first injection should be performed under the supervision of provider
• Remove one Administration Dose Pack from the refrigerator to warm to room temperature (about 30 min before use). Do not use external heat sources such as hot water to warm the syringe Dose Pack
• Wash hands prior to handling Dose Pack contents
• Ensure tamper-evident cap has not been removed or is loose. Then grasp the cap and bend it at a 90-degree angle until it snaps off. Pull off the sterile foil from the needle cover
• Hold the Avonex pen with the glass syringe tip pointing up. Press the needle onto the glass syringe tip. Gently turn the needle clockwise until firmly attached. Do not remove plastic cover from the needle
• Hold Pen with one hand and using other hand, hold onto the injector shield (grooved area) tightly and quickly pull up on the injector shield until the injector shield covers the needle all the way. The plastic needle cover will pop off after the injector shield has been fully extended
• When the injector shield is extended the right way, there will be a small blue rectangular area next to the oval medication display window. Check the display window and make sure the Avonex is clear and colorless
• Do not use the injection if the liquid is colored, cloudy, or has lumps or particles. Air bubbles will not affect your dose
• Do not push down on the injector shield and the blue activation button at the same time until you are ready to give injection
• Avonex pen should be injected into the upper, outer thigh
• Use the alcohol wipe to clean the skin at the injection site you choose and allow it to dry prior to injection
• Hold Pen at 90-degree angle to the injection site. Firmly push the body of the pen down against the thigh to release the safety lock. Safety lock is released when blue rectangle area above the oval medication display window is gone. Push down on blue activation button with thumb and count to 10. You will hear a click if the injection is given the right way
• After counting to 10, pull the pen straight out. Use gauze pad to apply pressure
• The circular display window on the pen will be yellow if you have received the full dose
• Cover exposed needle with pen cover. Do not hold the pen cover with your hands while inserting the needle
• Dispose of used needles and syringes in a puncture-resistant container and discard appropriately
• Instruct patients to contact the health care provider if a skin reaction occurs that does not resolve in a few days

• Refer to the Patient Medication Guide for detailed instructions for preparing and giving a dose
• *Storage:* Store at 36°-46° F (2°-8° C). If refrigeration is unavailable, may store at 77° F (25° C) or less for up to 7 days. After removal from refrigerator, do not store product above 77° F (25° C). If the product has been exposed to conditions other than recommended, discard the product and do not use. Do not expose to high temperatures. Do not freeze. Protect from light

**Subcutaneous administration**

• Give at the same time (preferably late in the afternoon or evening) on the same days of the week at least 48 hr apart
• Do not give on two consecutive days. If a dose is missed, administer the dose as soon as possible then skip the following day. Return to the regular schedule the following week
• Premedication with acetaminophen or ibuprofen may lessen the severity of flulike symptoms
• Interferon beta-1a (Rebif) 44 mcg is equivalent to 12 million IU
• Rotate injection sites. Appropriate injection sites include thigh, outer surface of upper arm, stomach, or buttocks. Do not inject into an area where the skin is irritated, reddened, bruised, or infected
• A "Starter Pack" containing a lower dose of Rebif syringes is available for the initial titration period. Patients and/or caregivers should be trained and understand appropriate preparation and administration
• The manufacturer offers complimentary services including injection training and reimbursement support. Contact MS LifeLines at 877-44-REBIF

**Injection (Rebif)**

• Interferon beta-1a (Rebif) is available in a prefilled syringe with a 29-gauge needle
• Inject subcutaneously into the outer surface of the upper arm, abdomen, thigh, or buttock. Do not inject the area near the navel or waistline. Take care not to inject intradermally
• Discard any unused solution. Prefilled syringes do not contain preservatives and are single-use only

### >> Interferon beta-1b

• Reconstitute by injecting diluent provided (1.2 ml) into vial, swirl (8 milli-international units/ml), use 27-G needle for inj
• Give acetaminophen for fever, headache; use SUBCUT route only; do not give IM or **IV**
• Store reconstituted sol in refrigerator; do not freeze; do not use sol that contains precipitate or is discolored

**Subcut route**

• The manufacturers of Betaseron and of Extavia offer materials to assist with training on subcut use: call 1-800-788-1467 (Betaseron), 1-888-669-6682 (Extavia)
• Premedication with acetaminophen or ibuprofen and use of product at bedtime may lessen the severity of flulike symptoms
• Visually inspect parenteral products for particulate matter and discoloration prior to use. Do not use if particulate matter is present

**Reconstitution**

• Add 1.2 ml of 0.54% sodium chloride injection (supplied by the manufacturer) to the vial by using the vial adapter to attach the prefilled syringe that contains the diluent. Keep the plunger depressed, and gently swirl; do not shake. If you take your thumb off the plunger, the solution may come back into the syringe before the product is fully reconstituted. If foaming occurs, allow the vial to sit until the foam settles; final concentration (250 mcg interferon beta-1b/ml, which corresponds to 8 million International Units/ml)
• If not used immediately, store in the refrigerator for up to 3 hr; do not freeze; discard any unused portion after 3 hr

**Injection**

• Withdraw the desired amount of the reconstituted solution into the syringe by turning the vial and syringe to get the vial on top. Pull the plunger back to get the desired amount of product; turn the syringe to point the needle upward, and tap the syringe and release any air bubbles. Twist the vial adapter to remove it and the vial
• Choose an injection site on the upper, back arms; abdomen; buttocks; or front thighs. Do not inject within 2 in of the navel or in a site where the skin is red, bruised, infected, broken, painful, uneven, or scabbed; rotate injection sites to minimize injection site reactions such as necrosis or localized infection
• Inject subcutaneously. Take care not to inject intradermally

## ADVERSE EFFECTS

**CNS:** *Headache, fever, pain, chills, mental changes,* depression, hypertonia, suicide attempts, seizures
**CV:** *Migraine, palpitations, hypertension,* tachycardia, peripheral vascular disorders
**EENT:** Conjunctivitis, blurred vision
**GI:** *Diarrhea, constipation, vomiting, abdominal pain*
**GU:** *Dysmenorrhea, irregular menses, metrorrhagia,* cystitis, breast pain
**HEMA:** Decreased lymphocytes, ANC, WBC, *lymphadenopathy,* anemia

**INTEG:** *Sweating, inj site reaction*
**MS:** *Myalgia,* myasthenia
**RESP:** *Sinusitis,* dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 50% is absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 8 min-4½ hr (beta-1b), 8.6 hr (beta-1a) |

### Pharmacodynamics

| | Beta-1a | Beta-1b |
|---|---|---|
| **Onset** | Up to 12 hr | Rapid |
| **Peak** | 16 hr | 2-8 hr |
| **Duration** | 4 days | Unknown |

## INTERACTIONS

### Individual drugs

Zidovudine: decreased clearance

### Drug classifications

Antiretrovirals (NNRTIs, NRTIs, protease inhibitors): increased hepatic damage
Antineoplastics: increased myelosuppression

### Drug/herb

Astragalus, echinacea, melatonin: change in immunomodulation

### Drug/lab test

Increased: liver function tests
Interference: vaccines, toxoids; avoid concurrent use

## NURSING CONSIDERATIONS

### Assessment

- Monitor blood, renal, liver function tests: CBC, differential, platelet counts, BUN, creatinine, ALT, urinalysis; if neutrophil count is $<750/mm^3$, or if AST, ALT is 10 × greater than ULN, or if bilirubin is 5 × greater than ULN, discontinue product; when neutrophil count exceeds $750/mm^3$ and liver function or renal studies return to normal, treatment may resume at 50% original dosage
- Assess for CNS symptoms: headache, fatigue, depression; if depression occurs and is severe, product should be discontinued
- Assess for multiple sclerosis symptoms
- Assess mental status: depression, depersonalization, suicidal thoughts, insomnia
- Monitor GI status: diarrhea or constipation, vomiting, abdominal pain
- Monitor cardiac status: increased B/P, tachycardia
- Assess for lupuslike symptoms
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, avoid use in breastfeeding

### Patient/family education

- Provide patient or family member with written, detailed instructions about the product; provide initial and return demonstrations on inj procedure; give information on use and disposal of product
- Inform patient that blurred vision, hearing loss, sweating may occur
- Advise female patients that irregular menses, dysmenorrhea, or metrorrhagia as well as breast pain may occur; use contraception during treatment; product may cause spontaneous abortion
- Teach patient to use sunscreen to prevent photosensitivity
- Instruct patient to notify prescriber if pregnancy is suspected
- Teach patient inj technique and care of equipment
- Instruct patient to notify prescriber of increased temp, chills, muscle soreness, fatigue

### Evaluation

**Positive therapeutic outcome**
- Decreased symptoms of multiple sclerosis

**RARELY USED**

## interferon gamma-1b (Rx)

(in-ter-feer′on)

**Actimmune**

*Func. class.:* Biologic response modifier
*Chem. class.:* Lymphokine, interleukin type

**Therapeutic outcome:** Decreased signs/symptoms of infection (serious) in chronic granulomatous disease

**USES:** Serious infections associated with chronic granulomatous disease, osteopetrosis

**Unlabeled uses:** Osteoporosis, *Mycobacterium avium* complex (MAC), ovarian cancer

## CONTRAINDICATIONS

Hypersensitivity to interferon γ, *Escherichia coli*–derived products

## DOSAGE AND ROUTES

**Adult:** SUBCUT 50 $mcg/m^2$ (1.5 million units/$m^2$) for patient with a surface area of $>0.5\ m^2$; 1.5 mcg/kg/dose for patient with a surface area of $<0.5/m^2$; give on Monday, Wednesday, Friday for 3 ×/wk dosing

**⚠ HIGH ALERT**

# ipilimumab

(ip-i-lim′ue-mab)

**Yervoy**

*Func. class.:* Antineoplastic; biologic response modifier

**ACTION:** A recombinant, human monoclonal antibody that binds to the cytotoxic T-lymphocyte–associated antigen 4 (CTLA-4); action is indirect, possibly through T-cell–mediated antitumor immune responses

**Therapeutic outcome:** Decreased spread of malignant cells

**USES:** Treatment of unresectable or metastatic malignant melanoma

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, Crohn's disease, hepatitis, immunosuppression, inflammatory bowel disease, iritis, ocular disease, organ transplant, pancreatitis, renal disease, rheumatoid arthritis, sarcoidosis, systemic lupus erythematosus, thyroid disease, ulcerative colitis, uveitis

**BLACK BOX WARNING:** Adrenal insufficiency, diarrhea, Guillain-Barre syndrome, hepatic disease, myasthenia gravis, hypo/hyperthyroidism, hypopituitarism, peripheral neuropathy, serious rash, hypophysitis

## DOSAGE AND ROUTES

**Adult and geriatric: IV** 3 mg/kg over 90 min q3wk × 4 doses. Permanently discontinue if the full treatment course is not completed within 16 wk from first dose or for severe or life-threatening adverse reactions; withhold a dose for any moderate endocrine or immune-mediated adverse reactions; if the moderate adverse reaction completely or partially resolves (Grade 0-1) and if the patient is receiving less than 7.5 mg predniSONE or equivalent per day, resume at a dose of 3 mg/kg IV every 3 wk until all 4 planned doses or 16 wk from first dose, whichever occurs earlier; if moderate adverse reactions are persistent or if the corticosteroid dose cannot be reduced to 7.5 mg predniSONE or equivalent per day, permanently discontinue

**Available forms:** Solution for inj 50 mg/10 ml, 200 mg/40 ml

### Implementation

**Intermittent IV infusion route**

- Visually inspect parenteral products for particulate matter and discoloration before using whenever solution and container permit; solution may have a pale yellow color and have translucent-to-white, amorphous particles; discard the vial if the solution is cloudy, if there is pronounced discoloration, or if particulate matter is present
- Allow vials to stand at room temperature for 5 min before infusion preparation; withdraw the required volume and transfer into an IV bag. Discard partially used vials or empty vials; dilute with 0.9% sodium chloride injection, or 5% dextrose injection, to a final concentration (1-2 mg/ml); mix diluted solution by gentle inversion; do not admix
- Give infusion over 90 min through an IV line with a low-protein binding in-line filter, do not give with other products; after each infusion, flush the line with 0.9% sodium chloride Injection, or 0.5% dextrose injection
- Store once diluted, store for no more than 24 hr refrigerated or at room temperature

## ADVERSE EFFECTS

**CNS:** Severe and fatal immune-mediated neuropathies, fatigue, fever, headache
**EENT:** Episcleritis, iritis, Uveitis
**ENDO:** Severe and fatal immune-mediated endocrinopathies
**GI:** Severe and fatal immune-mediated enterocolitis, hepatitis; pancreatitis, abdominal pain, colitis, constipation, decreased appetite, diarrhea, nausea, vomiting
**INTEG:** Severe and fatal immune-mediated dermatitis, pruritus, rash, urticaria
**MISC:** Anemia, cough, dyspnea, eosinophilia, nephritis
**SYST:** Antibody formation, Stevens-Johnson syndrome, toxic epidermal necrolysis

**BLACK BOX WARNING:** Adrenal insufficiency, diarrhea, Guillain-Barré syndrome, hepatic disease, myasthenia gravis, hyperhypothyroidism, hypopituitarism, peripheral neuropathy, serious rash

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Steady state (end of 3rd dose) |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Terminal 15.4 days |

| Pharmacodynamics | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## NURSING CONSIDERATIONS

### Assessment

- **Serious skin disorders:** Stevens-Johnson syndrome, toxic epidermal necrolysis: permanently discontinue in these or rash complicated by full thickness dermal ulceration or necrotic, bullous, or hemorrhagic manifestations like bullous rash; give systemic corticosteroids at a dose of 1-2 mg/kg/day of predniSONE or equivalent; when dermatitis is controlled, taper corticosteroids over a period of at least 1 month. Withhold in those with moderate to severe reactions; for mild to moderate dermatitis (localized rash and pruritus), give topical or systemic corticosteroids

**BLACK BOX WARNING: Immune-mediated reactions:** Assess for enterocolitis, hepatitis, dermatitis, neuropathy, endocrinopathy, before starting treatment, take LFTs, ACTH, and thyroid function tests, permanently discontinue if these occur

- **Hepatotoxicity:** Baseline and before each dose; rule out infectious or malignant causes and increase the frequency of liver function test monitoring until resolution; permanently discontinue in those with Grade 3-5 give systemic corticosteroids at a dose of 1-2 mg/kg/day of prednisone or equivalent
- **Neuropathy:** Monitor for motor or sensory neuropathy (unilateral or bilateral weakness, sensory alterations, or paresthesias) before each dose; permanently discontinue if severe neuropathy (interfering with daily activities) such as Guillain-Barré-like syndromes occur
- **Endocrinopathy:** Monitor thyroid function tests at baseline and before each dose; monitor hypophysitis, adrenal insufficiency, adrenal crisis, hyperthyroidism, hypothyroidism (fatigue, headache, mental status changes, abdominal pain, unusual bowel habits, hypotension, or nonspecific symptoms that may resemble other causes)
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Instruct patient/family to report immediately allergic reaction, skin rash, severe abdominal pain, yellowing of skin, eyes; tingling of extremities, change in bowel habits
- Discuss reason for treatment and expected results, to read medication guide
- **Vision changes:** Assess eyes for uveitis, iritis, episcleritis, corticosteroids may be used
- **Pregnancy:** Notify prescriber if pregnancy is planned or suspected, if breastfeeding to use contraception during and for 3 mo after final dose

### Evaluation

**Positive therapeutic outcome**

- Decreasing spread of malignant melanoma

## ipratropium (Rx)

(i-pra-troe'pee-um)

**Atrovent, nasal spray, Atrovent HFA**

*Func. class.:* Anticholinergic, bronchodilator

*Chem. class.:* Synthetic quaternary ammonium compound

**Do not confuse:** Atrovent/Alupent

**ACTION:** Inhibits interaction of acetylcholine at receptor sites on the bronchial smooth muscle, resulting in decreased cyclic guanosine monophosphate (cyclic GMP) and bronchodilatation

**Therapeutic outcome:** Bronchodilatation

**USES:** Bronchospasm, COPD; rhinorrhea (nasal spray)

## CONTRAINDICATIONS

Hypersensitivity to this product, atropine, bromide, soybean, or peanut products

**Precautions:** Pregnancy, breastfeeding, children <12 yr, angioedema, heart failure, surgery, acute bronchospasm, closed-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, urinary retention

## DOSAGE AND ROUTES

### Bronchospasm in chronic bronchitis/emphysema

**Adult:** INH 2 sprays (17 mcg/spray) 3-4×/day, max 12 INH/24 hr, SOL 500 mcg (1 unit dose) given 3-4×/day by nebulizer; nasal spray: 2 sprays (42 mcg/spray) 3-4×/day

**Child 5-12 yr:** NASAL 2 sprays in each nostril 3×/day

### Rhinorrhea perennial rhinitis

**Adult/child ≥6 yr: INTRANASAL** 2 sprays (43 mcg)/nostril bid or tid

**Child 5-12 yr: INTRANASAL** 2 sprays (0.03%) in each nostril 3×/day

**Available forms:** Aerosol 17 mcg/actuation; nasal spray 0.03%, 0.06%; sol for inh 0.0125% ✱, 0.02%

### Implementation

• Give after shaking container; have patient exhale, place mouthpiece in mouth, inhale slowly, hold breath, remove, exhale slowly; allow at least 1 min between inhalations
• Give this medication before other medications and allow at least 5 min between each

**Nebulizer route**

• Use solution in nebulizer with a mouthpiece rather than a face mask

**Intranasal route**

• Prime pump, initially requires 7 actuations of the pump, priming again is not necessary if used regularly; tilt head backward after dose
• Store in light-resistant container; do not expose to temperature over 86° F (30° C)

## ADVERSE EFFECTS

**CNS:** *Anxiety, dizziness, headache,* nervousness
**CV:** Palpitations
**EENT:** Dry mouth, blurred vision, nasal congestion
**GI:** *Nausea, vomiting, cramps*
**INTEG:** Rash
**RESP:** *Cough, worsening of symptoms,* bronchospasm

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Minimal |
| **Distribution** | Does not cross blood-brain barrier |
| **Metabolism** | Liver, minimal |
| **Excretion** | Unknown |
| **Half-life** | 2 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 5-15 min |
| **Peak** | 1-1½ hr |
| **Duration** | 3-6 hr |

## INTERACTIONS

### Individual drugs

Disopyramide: increased anticholinergic action

### Drug classifications

Antihistamines, phenothiazines: increased anticholinergic action
Bronchodilators (other): increased toxicity

### Drug/herb

Belladonna: increased anticholinergic effect
Green tea (large amounts), guarana: increased bronchodilator effect

## NURSING CONSIDERATIONS

### Assessment

• Monitor respiratory function: vital capacity, FEV, ABGs, lung sounds, heart rate, rhythm (baseline, during treatment); if severe bronchospasm is present, a more rapid medication is required
• Monitor for evidence of allergic reactions, paradoxical bronchospasm; withhold dose and notify prescriber; identify if patient is allergic to belladonna products or atropine; allergy to this product may occur
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

### Patient/family education

• Advise patient not to use OTC medications unless approved by prescriber; extra stimulation may occur; to use this medication before other medications and allow at least 5 min between each to prevent overstimulation
• Teach patient that compliance is necessary with number of inhalations/24 hr, or overdose may occur
• Instruct geriatric patients to use spacer device
• Teach patient the proper use of the inhaler; review package insert with patient; to avoid getting aerosol in eyes: blurring may result; to wash inhaler in warm water daily and dry; to avoid smoking, smoke-filled rooms, persons with respiratory tract infections
• Teach patient if paradoxical bronchospasm occurs to stop product immediately and notify prescriber; to limit caffeine products such as chocolate, coffee, tea, and colas
• Instruct patient on administration of dose, not to use more than prescribed; serious side effects may occur; if dose is missed, take when remembered; space other doses on new time schedule; do not double doses
• Use spacer to improve drug use if required

### Evaluation

**Positive therapeutic outcome**

• Absence of dyspnea, wheezing after 1 hr
• Improved airway exchange
• Improved ABGs

## irbesartan (Rx)

(er-be-sar′tan)
**Avapro**
*Func. class.:* Antihypertensive
*Chem. class.:* Angiotensin II receptor (type $AT_1$)

**Do not confuse:** Avapro/Anaprox

**ACTION:** Blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the $AT_1$ receptor found in tissues

**Therapeutic outcome:** Decreased B/P

**USES:** Hypertension, alone or in combination, nephropathy in patients with type 2 diabetes mellitus; proteinuria

**Unlabeled uses:** Heart failure

## CONTRAINDICATIONS

Hypersensitivity

**BLACK BOX WARNING:** Pregnancy (2nd/3rd trimesters)

**Precautions:** Pregnancy (1st trimester), breastfeeding, children <6 yr, geriatric, renal/hepatic disease, renal artery stenosis, hypersensitivity to ACE inhibitors, African descent, angioedema

## DOSAGE AND ROUTES

### Hypertension

**Adult:** PO 150 mg/day; may be increased to 300 mg/day; volume-depleted patients: start with 75 mg/day

### Nephropathy in patients with type 2 diabetes mellitus

**Adult:** PO maintenance dose 300 mg/day, start 75 mg/day

**Available forms:** Tabs 75, 150, 300 mg

### Implementation

- Administer without regard to meals
- May be used with other antihypertensives, diuretic

## ADVERSE EFFECTS

**CNS:** Dizziness, anxiety, *headache, fatigue,* syncope
**CV:** Hypotension
**GI:** *Diarrhea, dyspepsia,* hepatitis, cholestasis
**HEMA:** Thrombocytopenia
**MISC:** Edema, chest pain, rash, tachycardia, UTI, angioedema, hyperkalemia
**RESP:** *Cough, upper respiratory infection,* rhinitis, pharyngitis, sinus disorder

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Bound to plasma proteins (90%) |
| **Metabolism** | Liver (minimal) by CYP2C9 |
| **Excretion** | Feces, urine |
| **Half-life** | 11-15 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug classifications

CYP2C9 inhibitors (amiodarone, delavirdine, fluconazole, FLUoxetine, fluvastatin, fluvoxaMINE, imatinib, sulfonamides, sulfinpyrazone, voriconazole, zafirlukast): increased irbesartan level
Diuretics (potassium sparing), ACE inhibitors, potassium salt substitutes: increased hyperkalemia
NSAIDs: decreased antihypertensive effect

### Drug/herb

Astragalus, cola tree: increased or decreased antihypertensive effect
Black cohosh, goldenseal, hawthorn, kelp: increased antihypertensive effect
Guarana, khat, licorice, yohimbe: decreased antihypertensive effect

## NURSING CONSIDERATIONS

### Assessment

- Hypotension: For severe hypotension, place in supine position and give IV infusion of NS; drug may be continued after B/P is restored
- Assess B/P, pulse q4hr; note rate, rhythm, quality
- Monitor electrolytes: potassium, sodium, chloride
- Obtain baselines for renal, liver function tests before therapy begins
- Monitor for edema in feet, legs daily
- Assess for skin turgor, dryness of mucous membranes for hydration status
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Advise patient to comply with dosage schedule, even if feeling better
- Inform patient that product may cause dizziness, fainting, light-headedness
- Caution patient to rise slowly to sitting or standing position to minimize orthostatic hypotension

**BLACK BOX WARNING:** Advise patient to notify prescriber if pregnancy is suspected; pregnancy (D) 2nd/3rd trimester, (C) 1st trimester

- Teach patient not to stop product abruptly
- Teach patient to take without regard to food

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P

**⚠ HIGH ALERT**

## irinotecan (Rx)

(ear-een-oh-tee'kan)

**Camptosar**

*Func. class.:* Antineoplastic hormone

*Chem. class.:* Topoisomerase inhibitor

**ACTION:** Cytotoxic by producing damage to single-strand DNA during DNA synthesis, binds to topoisomerase I

**Therapeutic outcome:** Prevention in growth of tumor

**USES:** Metastatic carcinoma of colon or rectum, or 1st-line treatment in combination with fluorouracil (5-FU) and leucovorin for metastatic carcinoma of colon or rectum

## CONTRAINDICATIONS

Pregnancy, hypersensitivity

**Precautions:** Breastfeeding, children, geriatric, irradiation, hepatic disease

**BLACK BOX WARNING:** Myelosuppression, diarrhea

## DOSAGE AND ROUTES

**First-line treatment of colorectal cancer in combination with 5-fluorouracil:** IV dosage (with bolus 5-FU/leucovorin)

**Adult: IV** 125 mg/m$^2$ over 90 min followed by leucovorin (20 mg/m$^2$ IV bolus) and then 5-FU (500 mg/m$^2$ IV bolus) on days 1, 8, 15, and 22; the next course begins on day 43 or when toxicity has recovered to NCI grade 1 or less

**Intravenous dosage (with infusional 5-FU/leucovorin)**

**Adult: IV** 180 mg/m$^2$ over 90 min followed by leucovorin (200 mg/m$^2$ IV over 2 hr) then 5-FU bolus and continuous infusion (400 mg/m$^2$ IV bolus, then 600 mg/m$^2$ IV infusion over 22 hr); give days 1, 15, and 29, while leucovorin and 5-FU are given on days 1, 2, 15, 16, 29, and 30; the next course begins on day 43 or when toxicity has recovered to NCI grade 1 or less

**Available forms:** Inj 20 mg/ml

### Implementation

- Use cytotoxic handling precautions

**IV route**

- Premedicate with antiemetic, dexamethasone plus another antiemetic agent, such as a 5-HT$_3$ blocker, given at least 30 min before use
- Prior to beginning a course of therapy, the granulocyte count should be ≥1500, the platelet count ≥100,000 and treatment-related diarrhea should be fully resolved

**Dilution**

- Dilute appropriate dose in $D_5W$ (preferred) or NS injection to a final concentration of 0.12-2.8 mg/ml
- Store up to 24 hr at room temperature and room lighting; because of possible microbial contamination during preparation, an admixture prepared with $D_5W$ or NS should be used within 6 hr; solutions prepared with $D_5W$, refrigerated and protected from light, can be stored for up to 48 hr; avoid refrigeration if prepared with NS

**Intravenous infusion**

- Infuse intravenously over 90 min

**Irinotecan y-site compatibilities:** alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin -sulbactam, anidulafungin, argatroban, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, capreomycin, CARBOplatin, caspofungin, cefazolin, cefoTEtan, cefOXitin, cefTAZidime, ceftazidime (L-arginine), ceftizoxime, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, daunorubicin liposome, daunorubicin, dexamethasone, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, DOCEtaxel, dolasetron, dopamine, doxacurium, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, foscarnet, gallium, garenoxacin, gatifloxacin, gemtuzumab, gentamicin, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, imipenem-cilastatin, inamrinone, insulin, regular, isoproterenol, ketorolac, labetalol, lepirudin, leucovorin, levofloxacin, levoleucovorin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate,

mannitol, meperidine, meropenem, mesna, metaraminol, methadone, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoxantrone, mivacurium, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, PACLitaxel (solvent/surfactant), palonosetron, pancuronium, pantoprazole, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, polymyxin b, potassium acetate/chloride/phosphates, procainamide, prochlorperazine, promethazine e, propranolol, quiNIDine, quinupristin-dalfopristin, raNITIdine, remifentanil, riTUXimab, rocuronium, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin -clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vinorelbine, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Fever, headache, chills, dizziness
**CV:** Vasodilatation, edema, thromboembolism
**GI:** Severe diarrhea, *nausea, vomiting,* anorexia, constipation, cramps, flatus, stomatitis, dyspepsia, hepatotoxicity
**HEMA:** Leukopenia, anemia, neutropenia
**INTEG:** Irritation at site, rash, sweating, alopecia
**MISC:** Asthenia, weight loss, back pain
**RESP:** Dyspnea, increased cough, rhinitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Widely, 30%-68% bound to plasma proteins, increased risk of toxicity in those homozygous for UGT1A128 |
| **Metabolism** | Unknown |
| **Excretion** | Urine/bile |
| **Half-life** | 6-12 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual products

CarBAMazepine, PHENobarbital, phenytoin: decreased irinotecan levels
Dexamethasone: increased lymphocytopenia, hyperglycemia
Fluorouracil: increased toxicity
Prochlorperazine: increased akathisia
Radiation: increased myelosuppression, diarrhea

### Drug classifications

Anticoagulants, NSAIDs: increased bleeding risk
Antineoplastics: increased myelosuppression, diarrhea
CYP3A4 inhibitors (ketoconazole): increased irinotecan levels
CYP3A4 inducers (phenytoin, carBAMazepine, PENTobarbital): decreased irinotecan levels
Diuretics: increased dehydration

### Drug/herb

St. John's wort: decreased product level; avoid concurrent use

### Drug/lab test

Increased: ALK phos, AST, LFTs, bilirubin
Decreased: platelets, WBC, neutrophils, Hgb/Hct

## NURSING CONSIDERATIONS

### Assessment

- Assess for CNS symptoms: fever, headache, chills, dizziness

**BLACK BOX WARNING: Myelosuppression:** Assess CBC, differential, platelet count weekly; use colony-stimulating factor if WBC is $<2000/mm^3$, platelet count is $<100,000/mm^3$, Hgb $\leq 9$ g/dl, neutrophils $\leq 1000/mm^3$; notify prescriber of these results, product should be discontinued

- Assess buccal cavity for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia

**BLACK BOX WARNING:** Assess GI symptoms: frequency of stools; cramping; severe life-threatening diarrhea may occur with fluid and electrolyte imbalances; treat diarrhea within 24 hr of use with 0.25-1 mg atropine IV; treat diarrhea >24 hr of use with loperamide; diarrhea >24 hr (late diarrhea) can be fatal

- Assess early diarrhea and other cholinergic symptoms, treat with atropine; late diarrhea can be life threatening, must be treated promptly with loperamide
- **Assess signs of dehydration:** rapid respirations, poor skin turgor, decreased urine output; dry skin, restlessness, weakness
- **Assess for bone marrow depression:** bruising, bleeding, blood in stools, urine, sputum, emesis
- **Pregnancy/breastfeeding:** Do not use in pregnancy/ breastfeeding

### Patient/family education

- Advise patient to avoid foods with citric acid or hot or rough texture if stomatitis is present; to drink adequate fluids
- Advise patient to report stomatitis; any bleeding, white spots, ulcerations in mouth; tell patient to examine mouth daily, report symptoms
- Advise patient to report signs of anemia: fatigue, headache, faintness, shortness of breath, irritability, infection, rash
- Advise patient to use contraception during therapy; to report if pregnancy is planned or suspected
- Advise patient to avoid vaccinations while taking this product

**BLACK BOX WARNING:** Instruct patient to report diarrhea that occurs 24 hr after administration; severe dehydration can occur rapidly

- Teach patient to avoid salicylates, NSAIDs, alcohol; bleeding may occur; to avoid all of these products unless approved by prescriber
- Teach patient to report immediately injection site pain, irritation
- Teach patient to report vomiting, dizziness
- Teach patient that regular lab exams will be needed

### Evaluation

**Positive therapeutic outcome**

- Decrease in tumor size, decrease in spread of cancer

## iron, carbonyl

*See ferrous fumarate*

## iron dextran (Rx)

**DexFerrum, InFed, Velphoro**

*Func. class.:* Hematinic

*Chem. class.:* Ferric hydroxide complex with dextran

**Do not confuse:** Imferon/Imuran/Roferon-A/Interferon

**ACTION:** Iron is carried by transferrin to the bone marrow, where it is incorporated into hemoglobin

**Therapeutic outcome:** Prevention and resolution of iron-deficiency anemia

**USES:** Iron-deficiency anemia

### CONTRAINDICATIONS

**BLACK BOX WARNING:** Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, infants <4 mo, children, acute renal disease, asthma, rheumatoid arthritis (**IV**), all anemias excluding iron-deficiency anemia, hepatic/cardiac/renal disease, neonates, ankylosing spondylitis, lupus, hypotension

### DOSAGE AND ROUTES

**Adult and child:** IM 0.5 ml as a test dose by Z-track, then no more than the following total dose including test dose per day:

**Adult/adolescent/child (>15 kg):**

Total iron dextran dose in ml =

$$[0.0442 \times (\text{Desired Hb} - \text{observed Hb}) \times \text{LBW}] + (0.26 \times \text{LBW}),$$

max of undiluted is 100 mg (2 ml)/day

**Child (10-15 kg):**

Total iron dextran dose in ml =

$$[0.0442 \times (\text{Desired Hb} - \text{observed Hb}) \times \text{LBW}] + (0.26 \times \text{ABW}),$$

max of undiluted iron dextran is 100 mg (2 ml)/day

**Child/Infant >4 mo (5-9.9 kg):**

Total iron dextran dose in ml =

$$[0.0442 \times (\text{Desired Hb} - \text{observed Hb}) \times \text{LBW}] + (0.26 \times \text{ABW})$$

**Infants >4 mo (<5 kg):**

Total iron dextran dose in ml =

$$[0.0442 \times (\text{Desired Hb} - \text{observed Hb}) \times \text{LBW}] + (0.26 \times \text{ABW})$$

**Available forms:** Inj IM/**IV** 50 mg/ml (2 ml, 10 ml vials)

### Implementation

**IM route**

- Discontinue oral iron before parenteral; give only after test dose of 25 mg by preferred route; wait at least 1 hr before giving remaining portion
- Give IM inj deep in large muscle mass; use Z-track method and 19-G, 20-G 2-, 3-inch needle; ensure needle is long enough to place product deep in muscle; change needles after withdrawing medication and injecting to prevent skin and tissue staining

**IV route**

- Give **IV** after flushing tubing with 10 ml of 0.9% NaCl; give undiluted; give 1 ml (50 mg) or less over 1 min or more; flush line after use with 10 ml of 0.9% NaCl; patient should remain recumbent for 30-60 min to prevent orthostatic hypotension
- **IV** inj requires single-dose vial without preservative; verify on label **IV** use is approved
- Give by cont inf after diluting in 50-250 ml of 0.9% NaCl for inf; administer over 4-5 hr

- Give only with epinephrine available in case of anaphylactic reaction during dose
- Store at room temperature in cool environment

## ADVERSE EFFECTS

**CNS:** Headache, paresthesia, dizziness, shivering, weakness, seizures
**CV:** Chest pain, shock, hypotension, tachycardia
**GI:** *Nausea,* vomiting, metallic taste, abdominal pain
**HEMA:** Leukocytosis
**INTEG:** Rash, pruritus, urticaria, fever, sweating, chills, brown skin discoloration, pain at inj site, necrosis, sterile abscesses, phlebitis
**MISC:** Anaphylaxis
**RESP:** Dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed; lymphatics over wk or mo |
| **Distribution** | Crosses placenta |
| **Metabolism** | Slow; blood loss, desquamation |
| **Excretion** | Breast milk, feces, urine, bile |
| **Half-life** | 6 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Chloramphenicol: decreased reticulocyte response
Oral iron: do not use together, increased toxicity

### Drug/lab test

False increase: serum bilirubin
False decrease: serum calcium
False positive: $^{99m}$Tc diphosphate bone scan, iron test (large doses >2 ml)

## NURSING CONSIDERATIONS

### Assessment

- Observe for 1 hr after test dose
- Monitor blood studies: Hct, Hgb, reticulocytes, transferrin, plasma iron concentrations, ferritin, total iron-binding bilirubin before treatment, at least monthly

**BLACK BOX WARNING:** Assess for allergic reaction and anaphylaxis; rash, pruritus, fever, chills, wheezing; notify prescriber immediately, keep emergency equipment available

- Assess cardiac status: anginal pain, hypotension, tachycardia
- Assess for nutrition: amount of iron in diet (meat, dark green leafy vegetables, dried fruits, eggs); cause of iron loss or anemia, including salicylates, sulfonamides
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, trace amounts appear in breast milk
- Monitor pulse, B/P during **IV** administration
- Assess for toxicity: nausea, vomiting, diarrhea, fever, abdominal pain (early symptoms); cyanotic lips, nailbeds, seizures, CV collapse (late symptoms)

### Patient/family education

- Caution patient that iron poisoning may occur if increased beyond recommended level; to not take oral iron preparation or vitamins containing iron unless approved by prescriber
- Advise patient that delayed reaction may occur 1-2 days after administration and last 3-4 days (IV) or 3-7 days (IM); report fever, chills, malaise, muscle/joint aches, nausea, vomiting, backache
- Advise patient to avoid breastfeeding
- Advise patient that stools may become dark

### Evaluation

**Positive therapeutic outcome**

- Increased serum iron levels, Hct, Hgb

## TREATMENT OF OVERDOSE:

Discontinue product, treat allergic reaction, give diphenhydrAMINE or EPINEPHrine as needed for anaphylaxis; give iron-chelating product in acute poisoning

## iron polysaccharide

*See ferrous fumarate*

## iron sucrose (Rx)

**Velphro, Venofer**

*Func. class.:* Hematinic
*Chem. class.:* Ferric hydroxide complex with dextran

**ACTION:** Iron is carried by transferrin to the bone marrow, where it is incorporated into hemoglobin

**Therapeutic outcome:** Improved signs/symptoms of iron deficiency anemia; iron levels improved

**USES:** Iron deficiency anemia, hyperphosphatemia in chronic kidney disease on dialysis

## CONTRAINDICATIONS

Hypersensitivity, all anemias excluding iron deficiency anemia, iron overload

**Precautions:** Pregnancy, breastfeeding (**IV**), children, geriatric, abdominal pain, anaphylactic shock, arthralgia, chest pain, cough, diarrhea, dizziness, dyspnea, edema, increased LFTs, fever, headache, heart failure, hyper/ hypotension, infection, MS pain, nausea/vomiting, seizures, weakness

## DOSAGE AND ROUTES

**Adult: IV** 5 ml (100 mg of elemental iron) given during dialysis, most will need 1000 mg of elemental iron over 10 sequential dialysis sessions

### Hyperphosphatemia in chronic kidney disease

**Adult:** PO 500 mg tid

**Available forms:** Inj 20 mg/ml; chew tab 500 mg

### Implementation

- Give only with epinephrine, Solu-MEDROL in case of anaphylactic reaction during dose
- Do not use if particulate is present, or if sol is discolored

**IV route**

- Give directly in dialysis line by slow inj or inf; give by slow inj at 1 ml/min (5 min/vial); inf dilute each vial exclusively in a maximum of 100 ml of 0.9% NaCl, give at rate of 100 mg of iron/15 min, discard unused portions
- Store at room temperature in cool environment, do not freeze
- Do not use with other IV products

## ADVERSE EFFECTS

**CNS:** Headache, dizziness
**CV:** Chest pain, hypo/hypertension, hypervolemia, heart failure
**GI:** *Nausea, vomiting, abdominal pain*
**INTEG:** Rash, pruritus, urticaria, fever, sweating, chills
**MISC:** Anaphylaxis, hyperglycemia
**RESP:** Dyspnea, pneumonia, cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Urine |
| **Half-life** | 6 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Chloramphenicol: decreased iron sucrose
Dimercaprol, iron (oral): increased toxicity; do not use together

### Drug/lab test

Increased: glucose

## NURSING CONSIDERATIONS

### Assessment

- Monitor blood studies: Hct, Hgb, reticulocytes, transferrin, plasma iron concentrations, ferritin, total iron binding, bilirubin before treatment, at least monthly
- **Assess for allergy:** anaphylaxis, rash, pruritus, fever, chills, wheezing; notify prescriber immediately, keep emergency equipment available
- Assess cardiac status: hypotension, hypertension, hypervolemia
- **Assess for toxicity:** nausea, vomiting, diarrhea, fever, abdominal pain (early symptoms), cyanotic-looking lips and nailbeds, seizures, CV collapse (late symptoms)
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding

### Patient/family education

- Teach patient that iron poisoning may occur if increased beyond recommended level; not to take oral iron preparations
- Teach patient to report itching, rash, chest pain, headache, vertigo, nausea, vomiting, abdominal pain, joint/muscle pain, numbness, tingling

### Evaluation

**Positive therapeutic outcome**

- Increased serum iron levels, Hct, Hgb

## TREATMENT OF OVERDOSE:

Discontinue product, treat allergic reaction, give diphenhydrAMINE or epinephrine as needed, give iron-chelating product in acute poisoning

## isavuconazonium (Rx)

(eye' sa-vue-koe' na-zoe' nee-um)
**Cresemba**
*Func. class.:* Antifungal, systemic
*Chem. class.:* Triazole derivative

**ACTION:** Exerts antifungal activity by inhibiting the synthesis of ergosterol, an essential component of the fungal cell membrane. The depletion of ergosterol within the fungal cell

membrane results in increased cellular permeability causing leakage of cellular content

**Therapeutic outcome:** Decreasing signs, symptoms of infection

## USES:

*Aspergillus flavus, Aspergillus fumigatus, Aspergillus niger, Rhizopus oryzae,* Rucormycetes species; do NOT use for infections of *Candida, Blastomyces, Histoplasma V*

## CONTRAINDICATIONS

Hypersensitivity, short QT syndrome

**Precautions:** Azole hypersensitivity, pregnancy, breastfeeding, infusion-related reactions, hepatic disease

## DOSAGE AND ROUTES

### Invasive aspergillosis and invasive mucormycosis

**Adults: PO** loading dose of 2 caps (372 mg) q8hr X 6 doses. Then, 2 caps (372 mg) qday. Start maintenance dosing 12-24 hr after the last loading dose; **IV** loading dose of 372 mg q8hr X 6 doses, then 372 mg day; then 12-24 hr after the last loading dose give over 1 hr, use a 0.2- to 1.2-micron in-line filter and be administered over a minimum of 1 hr, an additional loading dose is not needed when switching to PO

**Available forms:** Caps 186 mg; powder for inj 382 mg

### Implementation

**PO route**

- Swallow whole, do not chew, crush, dissolve, open the capsules; may be used without regard to food

**IV route**

- Visually inspect for particulate matter and discoloration. The diluted solution may contain translucent to white particulates which will be removed by the in-line filter

**Reconstitution**

- Reconstitute the dry powder with 5 mL sterile water for inj, gently shake until dissolved
- Storage: The reconstituted solution may be stored below 25 degrees C (77 degrees F) for a maximum of 1 hr before further dilution

**Dilution**

- Remove 5 mL of the reconstituted solution and add it to 250 mL of either 0.9% NaCI or $D_5W$ (1.5 mg /mL)
- Gently mix the solution or roll the bag. DO NOT shake. Do not place in a pneumatic transport system
- Apply an in-line filter (0.2-1.2 micron), adhere an in-line filter reminder sticker to the infusion bag
- Give over ≤ 6 hr of dilution
- Storage: May be stored immediately after dilution at 2 to 8 degrees C (36 to 46 degrees F); administration MUST be completed within 24 hr of the time of dilution. Do NOT freeze
- Use product only after C&S confirms organism, product needed to treat condition; make sure product used in life-threatening infections
- Flush IV lines with 0.9% sodium chloride or 5% dextrose in water before and after administration of the infusion
- Must be administered through a 0.2-1.2 micron filter; give over ≥ 1 hr. Do not give by bolus. *Do not admix*

## ADVERSE EFFECTS

**CNS:** *Headache,* paresthesias, peripheral neuropathy, *hallucinations,* depression, insomnia, dizziness, fever, vertigo, tremor, confusion
**CV:** tachypnea, supraventricular tachycardia, atrial fibrillation/flutter
**EENT:** Tinnitus
**GI:** *Nausea, vomiting, anorexia, diarrhea,* cramps, hepatitis, stomatitis
**GU:** *Hypokalemia,* renal failure
**HEMA:** Anemia, eosinophilia, hypomagnesemia, thrombocytopenia, leukopenia
**INTEG:** *Burning, irritation,* pain, necrosis at injection site with extravasation, rash
**MISC:** Cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Chinese patients (levels 40% lower), protein binding >99% |
| **Metabolism** | By CYP3A4, CYP3A5, UGT, P-gp, OCT2 enzymes |
| **Excretion** | Eliminated in urine/feces |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 hrs (**PO**) |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CycloSPORINE, pimozide, quiNIDine, predniSOLONE, sirolimus, tacrolimus, warfarin, rifabutin, phenytoin: increased effects of each

### Drug classifications

Benzodiazepines, calcium channel blockers, ergots, HMG-CoA reductase inhibitors, sulfonylureas, vinca alkaloids, proton pump inhibitors, NNRTIs, protease inhibitors: increased effects of each
CYP3A4 substrates: increased effect of these
CYP3A4 inhibitors: decreased effect of these

### Drug/herb
• Do not use with St. John's wort

### Drug/lab test
Increased: AST/ALT, alk phos, creatinine, bilirubin
Decreased: Hgb/Hct, platelets, WBC

## NURSING CONSIDERATIONS
### Assessment
• **Pregnancy:** Test for pregnancy before starting treatment, pregnancy, do not breastfeed
• **Short QT syndrome:** Do not use in this condition
• Monitor VS q15-30min during first infusion; note changes in pulse, B/P
• Blood studies: Obtain CBC, potassium, sodium, calcium, magnesium, q2wk
• **Hepatotoxicity:** Identify increasing AST, ALT, alk phos, bilirubin, baseline and periodically
• **Allergic reaction:** Assess for dermatitis, rash; product should be discontinued, antihistamines (mild reaction) or epinephrine (severe reaction) administered
• **Hypokalemia:** Assess for anorexia, drowsiness, weakness, decreased reflexes, dizziness, increased urinary output, increased thirst, paresthesias
• **Ototoxicity:** Assess for tinnitus (ringing, roaring in ears), vertigo

### Patient/family education
• Teach patient that long-term therapy may be needed to clear infection (2 wk-3 mo, depending on type of infection)
• Advise patient to notify prescriber of bleeding, bruising, soft-tissue swelling, dark urine, persistent nausea or diarrhea, headache, rash, yellow skin/eyes
• Women of childbearing age should use effective contraceptive

### Evaluation
• Therapeutic response: Resolution of fungal infection, negative C&S

## isoniazid (Rx)
(eye-soe-nye'a-zid)
**Isotamine**
*Func. class.:* Antitubercular
*Chem. class.:* Isonicotinic acid hydrazide

**ACTION:** Bactericidal interference with lipid, nucleic acid biosynthesis

**Therapeutic outcome:** Resolution of TB infection

**USES:** Treatment, prevention of TB

## CONTRAINDICATIONS
Hypersensitivity

**BLACK BOX WARNING:** Acute liver disease

**Precautions:** Pregnancy, diabetic retinopathy, cataracts, ocular defects, renal disease, **IV** drug users, people >35 yr, postpartum period, HIV, neuropathy

**BLACK BOX WARNING:** Female (African descent, Hispanic), alcoholism

## DOSAGE AND ROUTES
### Treatment
**Adult/adolescent with or without HIV:** PO/IM 5 mg/kg/day up to 300 mg/day or 15 mg/kg 2-3 times per week, max 900 mg 2-3 times per week
**Child and infant HIV positive:** PO/IM 10-15 mg/kg/day; max 300 mg/day

**Available forms:** Tabs 100, 300 mg; inj 100 mg/ml; oral sol 10 mg/ml

### Implementation
• Give antiemetic for vomiting
• Provide a list of foods to avoid while taking this product
**PO route**
• Give with meals to decrease GI symptoms; absorption is better when taken on empty stomach, 1 hr before or 2 hr after meals
**IM route**
• Give inj deep in large muscle mass, massage; rotate inj sites, warm inj to room temperature to dissolve crystals

## ADVERSE EFFECTS
**Hypersensitivity:** Fever, skin eruptions, lymphadenopathy, vasculitis
**CNS:** *Peripheral neuropathy, dizziness,* memory impairment, toxic encephalopathy, seizures, psychosis, slurred speech
**EENT:** Blurred vision, optic neuritis
**GI:** *Nausea, vomiting,* epigastric distress, jaundice, fatal hepatitis
**HEMA:** Agranulocytosis, hemolytic anemia, aplastic anemia, thrombocytopenia, eosinophilia, methemoglobinemia
**MISC:** Dyspnea, vit $B_6$ deficiency, pellagra, hyperglycemia, metabolic acidosis, gynecomastia, rheumatic syndrome, systemic lupus erythematosus–like syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely |
| **Metabolism** | Liver ☠ 50% of patients may metabolize slowly, increasing toxicity; |
| **Excretion** | Kidneys |
| **Half-life** | 1-4 hr (slow acetylators); 0.5-1.5 hr (fast acetylators) |

### Pharmacodynamics

| | PO | IM |
|---|---|---|
| **Onset** | Rapid | Rapid |
| **Peak** | 1-2 hr | 45-60 min |
| **Duration** | 6-8 hr | 6-8 hr |

## INTERACTIONS

### Individual drugs

Alcohol, carBAMazepine, cycloSERINE, ethionamide, meperidine, phenytoin, rifampin, warfarin: increased toxicity

BCG vaccine, ketoconazole: decreased effectiveness

### Drug classifications

Antacids, aluminum: decreased absorption

Benzodiazepines: increased toxicity

SSRIs, SNRIs: increased serotonin syndrome

### Drug/food

Tyramine foods: increased toxicity

### Drug/lab test

Increased: LFTs, bilirubin, glucose

Decreased: platelets, granulocytes

## NURSING CONSIDERATIONS

### Assessment

- Obtain C&S tests, including sputum tests, before treatment; monitor every mo to detect resistance

**BLACK BOX WARNING:** Monitor liver function tests weekly; obtain baseline in all patients, those >35 yr and all women should be monitored periodically; monitor ALT, AST, bilirubin; increased results may indicate hepatitis; renal studies during treatment, monthly: BUN, creatinine, output, specific gravity, urinalysis, uric acid; those with fast acetylation (genetic) may metabolize product more than 5 times faster (Black, Asian, and some Caucasians are at greater risk); fatal hepatitis is a greater risk in Blacks/Hispanics after birth

- ☠ Susceptibility tests before and periodically, half of Mexicans, Blacks, Caucasians, and Indians may be slow acetylators, fast acetylators may be Asians, Eskimos
- **Pregnancy/breastfeeding:** Use during pregnancy even in first trimester for active TB, use only if benefits outweigh fetal risk for other indications, compatible with breastfeeding
- Assess mental status often: affect, mood, behavioral changes; psychosis may occur with hallucinations, confusion
- Assess hepatic status: decreased appetite, jaundice, dark urine, fatigue
- Assess for visual disturbance that may indicate optic neuritis: blurred vision, change in color perception; may lead to blindness

### Patient/family education

- Instruct patient that compliance with dosage schedule for duration is necessary; not to skip or double doses; that scheduled appointments must be kept or relapse may occur
- Caution patient to avoid alcohol while taking product or hepatotoxicity may result; to avoid ingestion of aged cheeses, fish or hypertensive crisis may result; give patient written directions on which foods to avoid while taking this medication
- **Tell patient to report peripheral neuritis:** weakness, tingling/numbness of hands/feet, fatigue; hepatotoxicity: loss of appetite, nausea, vomiting, jaundice of skin or eyes

**BLACK BOX WARNING: Fatal hepatitis:** teach patient to notify prescriber immediately of yellow skin/eyes, dark urine, loss of appetite

### Evaluation

**Positive therapeutic outcome**

- Decreased symptoms of TB
- Culture negative for TB

## TREATMENT OF OVERDOSE:

Pyridoxine

## isosorbide dinitrate (Rx)

(eye-soe-sor'bide)

**Apo-ISDN 🍁, Coradur 🍁, Dilatrate-SR, Isochron, IsoDitrate, Isordil**

## isosorbide mononitrate (Rx)

**Apo-ISMN 🍁, Ismo 🍁**

*Func. class.:* Antianginal, vasodilator

*Chem. class.:* Nitrate

**Do not confuse:** Imdur/Imuran/Inderal/K-Dur

**ACTION:** Relaxation of vascular smooth muscle, which leads to decreased preload, afterload, thus decreasing left ventricular end-diastolic pressure, and systemic vascular resistance and reducing cardiac $O_2$ demand

**Therapeutic outcome:** Relief and prevention of angina pectoris

**USES:** Treatment, prevention of chronic stable angina pectoris

## CONTRAINDICATIONS

Hypersensitivity to this product or nitrates, severe anemia, closed-angle glaucoma

**Precautions:** Pregnancy, breastfeeding, children, orthostatic hypotension, MI, HF, severe renal/hepatic disease, increased ICP, cerebral hemorrhage, acute MI, geriatrics, GI disease, syncope

## DOSAGE AND ROUTES

### Dinitrate

**Adult:** PO 5-20 mg bid-tid, initially, maintenance 10-40 mg bid-tid; SL buccal tab 2.5-5 mg; may repeat q5-10min × 3 doses; ext rel 40-80 mg q8-12hr, max 160 mg/day

### Mononitrate

**Adult:** PO (Monoket) 10-20 mg bid, 7 hr apart; (Imdur) initiate at 30-60 mg/day as a single dose, increase q3day as needed; may increase to 120 mg/day; max 240 mg/day

**Available forms:** Dinitrate: sus rel caps 40 mg; SR tabs 40 mg; tabs 5, 10, 20, 30, 40 mg; SL tabs 2.5, 5 mg; chew tabs 5, 10 mg; mononitrate: tabs (Monoket) 10, 20 mg; ext rel tabs (Imdur) 30, 60, 120 mg

### Implementation

**PO route**

- Swallow sus rel cap and ext rel tab whole; do not break, crush, or chew
- Do not swallow SL tab; tab should be dissolved under tongue
- Chew tab should be chewed thoroughly
- Give 1 hr before or 2 hr after meals with 8 oz of water

**SL route**

- Hold SL tab under tongue until dissolved (a few min); do not take anything PO when SL tab is in place
- Sustained release cap/tab: allow dosing interval >18 hr

## ADVERSE EFFECTS

**CNS:** *Vascular headache, flushing, dizziness,* weakness
**CV:** *Orthostatic hypotension,* tachycardia, collapse, syncope
**GI:** Nausea, vomiting
**INTEG:** Pallor, sweating, rash
**MISC:** Twitching, hemolytic anemia, methemoglobinemia, tolerance, xerostomia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Urine, metabolites |
| **Half-life** | Dinitrate 1 hr, mononitrate 5 hr |

### Pharmacodynamics

| | Sus rel | SL | PO |
|---|---|---|---|
| **Onset** | Up to 4 hr | 2-5 min | 15-30 min |
| **Peak** | Unknown | Unknown | Unknown |
| **Duration** | 5 hr | 2 hr | 5-6 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased hypotension
Rosiglitazone: increased myocardial ischemia; avoid concurrent use
- **Avanafil, Sildenafil, tadalafil, vardenafil:** fatal hypotension, do not use together

### Drug classifications

Antihypertensives, β-adrenergic blockers, calcium channel blockers, diuretics, phenothiazines: increased hypotension
Sympathomimetics: increased heart rate, B/P

## NURSING CONSIDERATIONS

### Assessment

- **Assess for pain:** duration, time started, activity being performed, character, intensity
- **Methemoglobinemia (rare):** assess for cyanosis of lips, nausea/vomiting, coma, shock; usually caused by high dose of product, but may occur with normal dosing
- Monitor for orthostatic B/P, pulse at baseline, during treatment and periodically thereafter
- **Beers:** Use with caution in older adults, may exacerbate episodes of syncope
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

### Patient/family education

- Teach patient that tolerance may occur if taken over long periods; to prevent, allow intervals of 12-14 hr/day without product
- Advise patient to treat headache with OTC analgesics
- Instruct patient to not skip or double doses; if dose is missed take when remembered if 2 hr before next dose (dinitrate), 6 hr before

next dose (sus rel), or 8 hr before next dose (mononitrate)
• Caution patient to avoid alcohol and OTC medications unless approved by prescriber
• Inform patient that product may be taken before stressful activity: exercise, sexual activity
• Advise patient that SL tab may sting mucous membranes
• Caution patient to avoid driving and hazardous activities if dizziness occurs
• Advise patient to comply with complete medical regimen
• Caution patient to make position changes slowly to prevent orthostatic hypotension
• Teach patient not to use with avanafil, sildenafil, tadalafil, vardenafil with nitrates; may cause serious drop in B/P
• Teach patient not to discontinue abruptly; may cause heart attack
• Teach patient to use at beginning of angina symptoms, may repeat every 15 min; if no relief seek medical attention immediately

### Evaluation

**Positive therapeutic outcome**
• Decrease in, prevention of anginal pain

**⚠ HIGH ALERT**

## ixabepilone (Rx)

(ix-ab-ep'i-lone)
**Ixempra**
*Func. class.:* Antineoplastic—miscellaneous
*Chem. class.:* Epothilone

**ACTION:** Microtubule stabilizing agent; microtubules are needed for cell division

**Therapeutic outcome:** Decreased tumor size, decreased spread of malignancy

**USES:** Breast cancer

## CONTRAINDICATIONS

Pregnancy, hypersensitivity to products with polyoxyethylated castor oil, breastfeeding, neutropenia $<1500/mm^3$, thrombocytopenia $<100,000/mm^3$

**BLACK BOX WARNING:** Hepatic disease

**Precautions:** Children, geriatric, alcoholism, bone marrow suppression, cardiac dysrhythmias, cardiac/renal disease, diabetes mellitus, peripheral neuropathy, ventricular dysfunction

## DOSAGE AND ROUTES

### Breast cancer, metastatic or locally advanced given with capecitabine, and resistant to anthracycline, taxane

**Adult: IV** INF 40 mg/$m^2$ over 3 hr q3wk plus capecitabine PO 2000 mg/$m^2$/day in 2 divided doses on days 1-14 q21day; in those with BSA $>2.2$ $m^2$, dose should be calculated for a BSA of 2.2 $m^2$

### Breast cancer, metastatic or locally advanced resistant/refractory to anthracyclines, taxanes, capecitabine

**Adult: IV** INF 40 mg/$m^2$ over 3 hr q3wk; in those with BSA $>2.2$ $m^2$, dose should be calculated for a BSA of 2.2 $m^2$

### Dosage reduction in those taking a strong CYP3A4 inhibitor

**Adult: IV** INF 20 mg/$m^2$ over 3 hr q3wk

**Available forms:** Powder for inj 15, 45 mg

### Implementation

• Premedicate with histamine antagonists 1 hr prior to use, prevents hypersensitivity
• Give antiemetic 30-60 min before giving product and prn

**IV route**
• Let kit stand at room temperature for 30 min; to reconstitute, withdraw supplied diluent (8 ml for 15 mg vials, 23.5 ml for 45 mg vials); slowly inject solution into vial; gently swirl and invert to mix, final conc 2 mg/ml; further dilute in LR in DEHP-free bags; final conc should be 0.2-0.6 mg/ml; after added, mix by manual rotation
• Diluted sol is stable for 6 hr at room temperature; inf must be completed within 6 hr
• Use in-line filter 0.2-1.2 mcm
• Give over 3 hr

## ADVERSE EFFECTS

**CNS:** *Peripheral neuropathy,* chills, fatigue, fever, flushing, headache, insomnia, impaired cognition, asthenia
**CV:** Bradycardia, *hypotension*, abnormal ECG, angina, atrial flutter, cardiomyopathy, chest pain, edema, MI, vasculitis
**GI:** *Nausea, vomiting, diarrhea,* abdominal pain, anorexia, colitis, constipation, gastritis, jaundice, GERD, hepatic failure, trismus
**GU:** Renal failure
**HEMA:** Neutropenia, thrombocytopenia, anemia, infections, coagulopathy
**INTEG:** *Alopecia,* rash, hot flashes
**META:** Hypokalemia, metabolic acidosis
**MS:** *Arthralgia, myalgia*
**RESP:** Bronchospasm, cough, dyspnea

**SYST:** *Hypersensitivity reactions,* anaphylaxis, dehydration, radiation recall reaction

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver by CYP3A4 |
| **Excretion** | Feces 65%, urine 21% |
| **Half-life** | Terminal 52 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug classifications

CYP3A4 inducers (aminoglutethimide, barbiturates, bexarotene, bosentan, carBAMazepine, dexamethasone, efavirenz, griseofulvin, modafinil, nafcillin, nevirapine, OXcarbazepine, phenytoin, rifamycin, topiramate): decreased ixabepilone levels

CYP3A4 inhibitors (amiodarone, amprenavir, aprepitant, atazanavir, chloramphenicol, clarithromycin, conivaptan, cycloSPORINE, danazol, darunavir, dalforpristan, delavirdine, diltiazem, erythromycin, estradiol, fluconazole, fluvoxaMINE, fosamprenavir, imatinib, indinavir, isoniazid, itraconazole, ketoconazole, lopinavir, miconazole, nefazodone, nelfinavir, propoxyphene, ritonavir, RU-486, saquinavir, tamoxifen, telithromycin, troleandomycin, verapamil, voriconazole, zafirlukast): increased ixabepilone level

### Drug/herb

St. John's wort: avoid use

### Drug/food

Grapefruit products: avoid use

### Drug/lab test

Increased: LFTs, bilirubin

Decreased: platelets, neutrophils, RBC, potassium

## NURSING CONSIDERATIONS

### Assessment

- Monitor CBC, differential, platelet count prior to therapy, qwk; withhold product if WBC is $<1500/mm^3$ or platelet count is $<100,000/mm^3$, notify prescriber
- Monitor temp q4hr (may indicate beginning infection)

**BLACK BOX WARNING:** Monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) prn or qmo; check for jaundiced skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

- Monitor VS during 1st hr of inf; check IV site for signs of infiltration
- **Cardiac ischemia:** Monitor cardiac function in those with cardiac function that is impaired; chest pain, ECG changes may occur
- Assess for hypersensitive reactions, anaphylaxis including hypotension, dyspnea, angioedema, generalized urticaria; discontinue inf immediately; keep emergency equipment available
- Assess effects of alopecia on body image; discuss feelings about body changes
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Teach patient to report signs of infection: fever, sore throat, flulike symptoms
- Teach patient to report signs of anemia: fatigue, headache, faintness, shortness of breath
- Teach patient to report any complaints or side effects to nurse or prescriber
- Caution patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture
- Advise patient that pain in muscles and joints 2-5 days after inf is common
- Advise patient to use nonhormonal type of contraception
- Instruct patient to avoid receiving vaccinations while on this product

### Evaluation

**Positive therapeutic outcome**

- Decreased tumor size, decreased spread of malignancy

## ketoconazole topical

*See Appendix B*

## ketoprofen (OTC, Rx)

(ke-to-proe'fen)

**Apo-Keto**

*Func. class.:* NSAID; nonopioid analgesic, antirheumatic

*Chem. class.:* Propionic acid derivative

**ACTION:** Inhibits COX-1, COX-2; analgesic, antiinflammatory, antipyretic

**Therapeutic outcome:** Decreased pain, inflammation

**USES:** Mild to moderate pain; osteoarthritis; rheumatoid arthritis; dysmenorrhea; OTC relief of minor aches, pains

### CONTRAINDICATIONS

Pregnancy, 2nd/3rd trimesters; hypersensitivity to this product, NSAIDs, salicylates

**BLACK BOX WARNING:** Perioperative pain in CABG

**Precautions:** Pregnancy (1st trimester), breastfeeding, children, geriatric, bleeding/GI/cardiac disorders, hypersensitivity to other antiinflammatory agents, asthma, severe renal/hepatic disease, ulcer disease

**BLACK BOX WARNING:** GI bleeding, MI, stroke

### DOSAGE AND ROUTES

#### Rheumatoid arthritis, osteoarthritis

**Adult:** PO 50 mg qid or 75 mg tid, max 300 mg/day or ext rel 200 mg/day

#### Renal dose/hepatic dose

**Adult:** PO GFR <25 ml/min/1.73 $m^2$, albumin <3.5 g/dl, decreased hepatic function, or ESRD, max 100 mg qday

#### Analgesic

**Adult:** PO 25-50 mg q6-8hr, max 300 mg/day

**Available forms:** Caps 50, 75 mg; ext rel caps 200 mg

#### Implementation

- Store at room temperature
- Give with antacids, milk, or food for GI upset
- Swallow whole; do not break, crush, chew, or open ext rel cap
- Give with 8 oz of water and sit upright for 30 min after dose to prevent ulceration
- Give with a full glass of water 2 hr after meals
- Give with food or milk to decrease gastric symptoms; give 30 min before or 2 hr after meals; absorption may be slowed

### ADVERSE EFFECTS

**CNS:** Dizziness, drowsiness, fatigue, confusion, insomnia, depression, headache

**CV:** Tachycardia, peripheral edema, palpitations, dysrhythmias, hypertension, CV thrombotic events, MI, stroke

**EENT:** Tinnitus, hearing loss, blurred vision

**GI:** *Nausea, anorexia, vomiting, diarrhea,* jaundice, hepatitis, constipation, flatulence, cramps, dry mouth, peptic ulcer, GI bleeding, *dyspepsia*

**GU:** Nephrotoxicity: dysuria, hematuria, oliguria, azotemia

**HEMA:** Blood dyscrasias

**INTEG:** Purpura, rash, pruritus, sweating

**SYST:** Anaphylaxis, exfoliative dermatitis Stevens-Johnson syndrome, toxic epidermal necrosis

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Not known |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 2-4 hr; 5.4 hr (ext rel) |

#### Pharmacodynamics

| | |
|---|---|
| **Onset** | Onset 2-3 hr<br>Peak 7 hr |
| **Peak** | 1-2 hr; 1-2 hr (ext rel) |
| **Duration** | Unknown |

### INTERACTIONS

#### Individual drugs

Alcohol, cidofovir: increased adverse GI reactions, toxicity

Aspirin: increased ketoprofen levels, increased adverse GI reactions

Clopidogrel, eptifibatide, ticlopidine, tirofiban: increased risk of bleeding

CycloSPORINE, lithium, methotrexate, phenytoin: increased ketoprofen levels, increased toxicity

Insulin: increased hypoglycemia

Probenecid: increased ketoconazole levels

#### Drug classifications

Anticoagulants, thrombolytics: increased risk of bleeding

Antihypertensives: decreased effect of antihypertensives

Antineoplastics: increased hematologic toxicity
Corticosteroids: increased adverse GI reactions
Diuretics: decreased effectiveness of diuretics
NSAIDs: increased adverse GI reactions
Sulfonylureas: increased hypoglycemia

### Drug/herb

Feverfew, Dong quai, garlic, ginger, ginkgo, horse chestnut, ginseng *(Panax)*: increased risk of bleeding

### Drug/lab test

Increased: bleeding time, BUN, alkaline phosphatase, AST, ALT, creatinine, LDH

## NURSING CONSIDERATIONS

### Assessment

- **Assess for pain:** type, location, intensity; ROM before and 1-2 hr after treatment
- Monitor renal, liver function tests: AST, ALT, bilirubin, creatinine, BUN, urine creatinine, CBC Hct, Hgb, pro-time if patient is on long-term therapy and q6mo
- Check I&O ratio; decreasing output may indicate renal failure (long-term therapy)
- **Assess hepatotoxicity:** dark urine, clay-colored stools, jaundice of skin and sclera, itching, abdominal pain, fever, diarrhea if patient is on long-term therapy
- Assess for allergic reactions: rash, urticaria; if these occur, product may have to be discontinued
- Assess for ototoxicity: tinnitus, ringing, roaring in ears; audiometric testing needed before, after long-term therapy
- Assess for vision changes: blurring, halos; may indicate corneal, retinal damage
- Check edema in feet, ankles, legs
- Identify prior product history; there are many product interactions

**BLACK BOX WARNING:** Assess for CV thrombotic events: MI, stroke, this product or other NSAIDs may increase, the risk

**BLACK BOX WARNING:** For GI bleeding: blood in sputum, emesis, stools

- **Beers:** Avoid chronic use in older adults unless other alternatives are not available, increased risk of GI bleeding, peptic ulcer disease

### Patient/family education

- Teach patient to report any symptoms of hepatotoxicity, renal toxicity, vision changes, ototoxicity, allergic reactions, bleeding (long-term therapy)
- Advise patient to take with 8 oz of water and sit upright for 30 min after dose to prevent ulceration, not to crush or chew ext rel products
- Caution patient not to exceed recommended dosage, acute poisoning may result; to take as prescribed; do not double dose
- Advise patient to read label on other OTC products; many contain other antiinflammatories
- Advise patient to use sunscreen, protective clothing to prevent photosensitivity
- Inform patient that the therapeutic response takes 2 wk (arthritis)
- Teach patient to report tinnitus, confusion, diarrhea, sweating, hyperventilation, blurred vision, fever, joint aches
- Caution patient to avoid alcohol ingestion; GI bleeding may occur
- Teach patient to report use to all providers
- Teach patient to report immediately rash, itching
- **Pregnancy, breastfeeding:** Teach patient to report planned or suspected; avoid breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Decreased pain
- Decreased inflammation
- Increased mobility
- Decreased fever

## ketorolac (systemic, nasal) (Rx)

(kee'toe-role-ak)

**Acular, Sprix, Toradol** 🍁

*Func. class.:* Nonsteroidal antiinflammatory (NSAID), nonopioid analgesic

*Chem. class.:* Acetic acid

**ACTION:** Inhibits prostaglandin synthesis by decreasing an enzyme needed for biosynthesis; analgesic, antiinflammatory, antipyretic effects

**Therapeutic outcome:** Decreased pain, inflammation, ocular itching

**USES:** Mild to moderate pain (short term); decreased ocular itching in seasonal allergic conjunctivitis (ophthalmic)

## CONTRAINDICATIONS

Pregnancy (3rd trimester), hypersensitivity, asthma, hepatic disease, peptic ulcer disease, CV bleeding

**BLACK BOX WARNING:** Breastfeeding, severe renal disease, labor and delivery, perioperative pain in CABG, prior to major surgery, epidural/intrathecal administration, GI bleeding, hypovolemia

**Precautions:** Pregnancy, GI/cardiac disorders, hypersensitivity to other antiinflammatory agents, CCr <25 ml/min

**BLACK BOX WARNING:** Children, geriatric, bleeding, MI, stroke

## DOSAGE AND ROUTES

**Adult/adolescent >17 yr and ≥50 kg: PO** continuation from **IM/IV** only 20 mg, then 10 mg q4-6hr prn, max 40 mg/day; nasal 1 spray (15.75 mg/spray) in each nostril (31.5 mg/spray) q6-8hr, max 4 doses/day × 5 days

**Adult/adolescent >17 yr and <50 kg: IM** (single dose) 30-60 mg, **IV** 15-30 mg; **IM/IV** (multiple dosing) 15-30 mg q6hr, max 60 mg/day × 5 day combined either **PO/IM/IV;** nasal 1 spray (15.75 mg/spray) in one nostril q6-8hr, max 4 doses/day × 5 days

### Renal dose

Do not use in advanced renal disease

### Ophthalmic route

**Adult:** 1 gtt (0.25 mg) qid × 7 days
**Child: IV** 1 mg/kg, then 0.5 mg/kg q6hr

**Available forms:** Inj 15, 30 mg/ml (prefilled syringes); ophth 0.5% sol; tabs 10 mg; nasal spray 15.75 mg/spray

### Implementation

**PO route**

- Administer to patient crushed or whole
- Max 5 days
- Give with full glass of water; give with food or milk to decrease gastric symptoms; give 30 min before or 2 hr after meals; absorption may be slowed

**Nasal route**

- Prime pump before using for the first time, point away from person/pets, pump activator 5 times, no need to re-prime
- For single use only, discard 24 hr after opening if not used
- Do not share with others
- Have patient blow nose, sit upright to spray

**IM/IV route**

- **IV** give undiluted ≥15 sec
- Give IM inj deeply into large muscle mass
- Store at room temperature, protect from light

**Y-site compatibilities:** Cisatracurium, remifentanil, SUFentanil

**Syringe incompatibilities:** Morphine, meperidine, promethazine, hydrOXYzine

**Solution compatibilities:** $D_5W$, 0.9% NaCl, LR, $D_5$, plasmalyte

## ADVERSE EFFECTS

**CNS:** Dizziness, *drowsiness,* tremors, seizures
**CV:** Hypertension, flushing, syncope, pallor, edema, vasodilatation, CV thrombotic events, MI, stroke
**EENT:** Tinnitus, hearing loss, blurred vision, transient burning/stinging
**GI:** Nausea, anorexia, vomiting, diarrhea, constipation, flatulence, cramps, dry mouth, peptic ulcer, GI bleeding, perforation, taste change, hepatitis, hepatic failure
**GU:** Nephrotoxicity: dysuria, hematuria, oliguria, azotemia
**HEMA:** Blood dyscrasias, prolonged bleeding
**INTEG:** Purpura, rash, pruritus, sweating, angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly, completely absorbed |
| **Distribution** | Bound to plasma proteins (99%) |
| **Metabolism** | Liver (<50%) |
| **Excretion** | Kidney, metabolites (92%); breast milk (6%); feces |
| **Half-life** | 6 hr (IM); increased in renal disease |

### Pharmacodynamics

| | IM | Ophth/PO |
|---|---|---|
| **Onset** | Up to 10 min | Unknown |
| **Peak** | 50 min IM; 2-3 hr PO; 0.5-2 hr nasal | Unknown; 6-8 hr nasal |
| **Duration** | 4-6 hr PO | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol, aspirin: increased GI effects
Aspirin: increased ketorolac levels, contraindicated
Cefamandole, cefoperazone, cefoTEtan, clopidogrel, eptifibatide, plicamycin, ticlopidine, tirofiban, valproic acid: increased risk of bleeding
CycloSPORINE, lithium, methotrexate, pentoxifylline, probenecid: increased toxicity

### Drug classifications

ACE inhibitors: increased renal impairment
Anticoagulants: increased effects

Antihypertensives: decreased antihypertensive effect
Salicylates, SNRIs, SSRIs, thrombolytics: increased risk of bleeding
Corticosteroids, NSAIDs, potassium products, steroids: increased GI effects
Diuretics: decreased diuretic effect
NSAIDs (other): increased ketorolac levels; contraindicated

### Drug/lab test

Increased: AST, ALT, LDH, bleeding time

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Monitor renal, hepatic, blood studies: BUN, creatinine, AST, ALT, Hgb before treatment, periodically thereafter, check for dehydration

- **Monitor for aspirin sensitivity,** asthma; these patients may be more likely to develop hypersensitivity to NSAIDs
- Assess patient's eyes: redness, swelling, tearing, itching
- **Monitor for pain:** type, location, intensity, ROM before and 1 hr after treatment
- Assess for CV thrombotic events: MI, stroke; do not use for perioperative pain in CABG

**BLACK BOX WARNING:** Assess for GI bleeding: blood in sputum, emesis, stools

**BLACK BOX WARNING:** Do not use epidurally, intrathecally; alcohol is present in the solution

- **Pregnancy/breastfeeding:** Teach patient to report if pregnancy is planned or suspected, not to breastfeed
- **Beers:** Avoid in older adults, increased risk of GI bleeding/peptic ulcer disease

### Patient/family education

- Teach patient that product must be continued for prescribed time to be effective; to avoid aspirin, alcoholic beverages, other NSAIDs, acetaminophen
- Caution patient to report bleeding, bruising, fatigue, malaise, since blood dyscrasias do occur
- Instruct patient to use caution when driving; drowsiness, dizziness may occur
- Instruct patient to take with a full glass of water to enhance absorption
- Caution patient that this product may cause eye redness, burning if soft contact lenses are worn
- Advise to report use to all health care providers, not to use with other products unless approved by prescriber; use for ≤5 days
- Instruct patient to report change in urine pattern, weight increase, edema; pain in joints, fever, blood in urine (indicates nephrotoxicity); bruising, black tarry stools (indicates bleeding)
- Caution patient not to breastfeed
- Instruct patient to report if pregnancy is planned or suspected, pregnancy (C) systemic
- **Nasal:** Instruct patient to discard within 24 hr of opening; may cause irritation; may drink water after dose

**BLACK BOX WARNING:** Instruct patient to report change in urine pattern, weight increase, edema, increased joint pain, fever, blood in urine (indicates nephrotoxicity); bruising, black tarry stools (indicates bleeding); pruritus, jaundice, nausea, right upper quadrant pain, abdominal pain (hepatotoxicity); to notify prescriber immediately

### Evaluation

**Positive therapeutic outcome**

- Decreased pain
- Decreased inflammatory response
- Increased mobility
- Decreased ocular itching

**ketorolac ophthalmic**
*See Appendix B*

**ketotifen ophthalmic**
*See Appendix B*

ketoconazole topical
ketorolac ophthalmic
ketoprofen (OTC, Rx)
ketotifen ophthalmic
ketorolac (systemic, nasal) (Rx)

**⚠ HIGH ALERT**

## labetalol (Rx)

(la-bet'a-lole)

**Trandate**

*Func. class.:* Antihypertensive, antianginal

*Chem. class.:* α- and β-blocker

**Do not confuse:** Trandate/Tridate

**ACTION:** Produces decreases in B/P without reflex tachycardia or significant reduction in heart rate through mixture of α-blocking, β-blocking effects; elevated plasma resins are reduced

**Therapeutic outcome:** Decreased B/P

**USES:** Mild to moderate hypertension; treatment of severe hypertension (**IV**), hypertensive emergency in pregnancy, subarachnoid hemorrage

**Unlabeled uses:** Hypertension in patients with pheochromocytoma, hypertension in clonidine withdrawal

## CONTRAINDICATIONS

Hypersensitivity to β-blockers, cardiogenic shock, heart block (2nd or 3rd degree), sinus bradycardia, HF, bronchial asthma

**Precautions:** Pregnancy breastfeeding, geriatric, major surgery, diabetes mellitus, thyroid/renal/hepatic disease, COPD, well-compensated heart failure, CAD, nonallergic bronchospasm, peripheral vascular disease

**BLACK BOX WARNING:** Abrupt discontinuation

## DOSAGE AND ROUTES

### Hypertension

**Adult:** PO outpatient 100 mg bid; may be given with diuretic; may increase to 200 mg bid after 2 days; may continue to increase q1-3 days; max 2400 mg/day in divided doses; inpatient 200 mg then 200-400 mg in 6-12 hr, depends on response; may increase by 200 mg bid at 1-day intervals

**Child/adolescent (unlabeled):** PO 1-3 mg/kg/day, titrate to max 10-12 mg/kg/day based on B/P; IV 0.2-1 mg/kg over 2 min, max 40 mg/dose; IV INF 0.25-3 mg/kg/hr

### Hypertensive crisis

**Adult:** IV direct 20 mg over 2 min; may repeat 20-80 mg over 2 min q10min, max 300 mg; IV Cont INF after loading dose give 1-2 mg/min until desired response or max 300 mg

**Available forms:** Tabs 100, 200, 300 mg; INJ 5 mg/ml, 20-, 40-ml vials

### Implementation

- Store in dry area at room temp; do not freeze

**PO route**

- Give before meals, at bedtime; tab may be crushed or swallowed whole; give with food to prevent GI upset, increase absorption
- Do not discontinue prior to surgery
- Store protected from light, moisture; place in cool environment
- When discontinuing IV and starting PO when B/P rises start at 200 mg, then 200-400 mg in 6-12 hr, adjust as needed
- Take apical pulse before use; if <50 bpm, withhold; notify prescriber

**Direct IV route**

- Give undiluted (5 mg/ml) over 2 min

**Continuous IV infusion route**

- Give after diluting in LR, $D_5W$, $D_5$ in 0.2%, 0.9%, 0.33% NaCl or Ringer's; infusion is titrated to patient's response; 200 mg of product/160 ml sol (1 mg/ml); 300 mg of product/240 ml sol (1 mg/ml); 200 mg of product/250 ml sol (2 mg/3 ml); use inf pump
- Keep patient recumbent during and for 3 hr after inf, monitor VS q5-15min q10min as needed

**Y-site compatibilities:** Alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, ascorbic acid injection, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, ceftaroline, cefTAZidime, ceftizoxime, chlorproMAZINE, cimetidine, CISplatin, cloNIDine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin liposome, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, HYDROmorphone, hydroxyzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, irinotecan, isoproterenol, lactated Ringer's injection, lepirudin, leucovorin, levofloxacin, lidocaine, linezolid injection, LORazepam, magnesium sulfate,

mannitol, mechlorethamine, meperidine, metaraminol, methyldopate, methyl-PREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxifloxacin, multiple vitamins injection, mycophenolate, nalbuphine, naloxone, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, polymyxin B, potassium acetate/chloride/phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, Ringer's injection, rocuronium, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zoledronic acid

**Y-site incompatibilities:** Cefoperazone, nafcillin

## ADVERSE EFFECTS

**CNS:** *Dizziness,* mental changes, drowsiness, *fatigue,* headache, catatonia, depression, anxiety, nightmares, paresthesias, lethargy

**CV:** *Orthostatic hypotension,* bradycardia, HF, chest pain, ventricular dysrhythmias, AV block, scalp tingling

**EENT:** *Tinnitus,* vision changes, sore throat, double vision, dry burning eyes, floppy iris syndrome, nasal congestion

**ENDO:** Hyperkalemia

**GI:** *Nausea, vomiting, diarrhea,* dyspepsia, taste distortion, hepatotoxicity

**GU:** Impotence, dysuria, ejaculatory failure

**HEMA:** Agranulocytosis, thrombocytopenia, purpura (rare)

**INTEG:** Rash, alopecia, urticaria, pruritus, fever, exfoliative dermatitis

**RESP:** Bronchospasm, dyspnea, wheezing

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Bioavailability 25% (PO); complete (**IV**) |
| **Distribution** | Crosses placenta, CNS |
| **Metabolism** | Liver, extensively |
| **Excretion** | Breast milk, kidneys, bile |
| **Half-life** | 6-8 hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | 30 min | 2-5 min |
| **Peak** | 1 hr | 5-15 min |
| **Duration** | 24 hr | 2-4 hr |

## INTERACTIONS

### Individual drugs

Alcohol (large amounts), cimetidine, nitroglycerin: increased hypotension

Lidocaine: decreased effect

Verapamil: increased myocardial depression

### Drug classifications

Antidepressants, tricyclics: increased tremor

Antidiabetics: increased or decreased effect, monitor blood glucose

Antihypertensives: increased hypotension

β-Blockers, bronchodilators, sympathomimetics, xanthines: decreased effects

Diuretics: increased hypotension

General anesthetics, hydantoins, class IC antidysrhythmics: increased myocardial depression

MAOIs: do not use within 2 wk

NSAIDs, salicylates: decreased antihypertensive effect

Theophyllines: decreased bronchodilatation

### Drug/herb

Hawthorn: increased antihypertensive effect

Ephedra: decreased antihypertensive effect

### Drug/lab test

Increased: ANA titer, blood glucose, alkaline phosphatase, LDH, AST, ALT, uric acid

False increase: urinary catecholamines

## NURSING CONSIDERATIONS

### Assessment

- **Hypertension:** monitor B/P at beginning of treatment, periodically thereafter; pulse q4hr; note rate, rhythm, quality: apical/radial pulse before administration; notify prescriber of any significant changes (pulse <50 bpm)
- Check for baselines in renal, liver function tests before therapy begins
- **HF:** assess for edema in feet, legs daily, monitor I&O, daily weight; check for jugular vein distention, crackles bilaterally, dyspnea, report weight gain >5 lb

**BLACK BOX WARNING:** Abrupt discontinuation: Product should be tapered to prevent adverse reactions

- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excreted in breast milk

### Patient/family education

**BLACK BOX WARNING:** Teach patient not to discontinue product abruptly, precipitate angina might occur; taper over 2 wk

- Teach patient not to use OTC products containing α-adrenergic stimulants (such as nasal decongestants, cold preparations); to avoid alcohol, smoking; to limit sodium intake as prescribed
- Teach patient that product may mask symptoms of hypoglycemia; monitor blood glucose closely
- Teach patient how to take pulse and B/P at home; advise when to notify prescriber
- Instruct patient to comply with weight control, dietary adjustments, modified exercise program
- Advise patient to carry/wear emergency ID to identify products being taken, allergies; that product controls symptoms but does not cure the condition
- **Teach patient to report symptoms of HF:** difficulty breathing, especially on exertion or when lying down, night cough, swelling of extremities, bradycardia, dizziness, confusion, depression, fever, difficulty breathing, cold extremities, confusion, rash, sore throat
- Teach patient to take product as prescribed, not to double or skip doses; take any missed doses as soon as remembered if at least 4 hr until next dose
- Advise patient to avoid driving or other hazardous activities until response is known; dizziness, drowsiness occurs
- Teach patient to take product at bedtime for 1 dose
- Teach patient to avoid hot baths, showers

### Evaluation

**Positive therapeutic outcome**
- Decreased B/P in hypertension (after 1-2 wk)
- Absence of dysrhythmias

## TREATMENT OF OVERDOSE:

Lavage, **IV** glucagon or atropine for bradycardia, **IV** theophylline for bronchospasm, digoxin, $O_2$, diuretic for cardiac failure, hemodialysis, **IV** glucose for hyperglycemia, **IV** diazepam (or phenytoin) for seizures

## lacosamide (Rx)

(la-koe'sa-mide)

**Vimpat**

*Func. class.:* Anticonvulsant

*Chem. class.:* Functionalized amino acid

**ACTION:** May act through action at sodium channels; exact action is unknown

**Therapeutic outcome:** Decrease in severity of seizures

**USES:** Partial seizures

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, allergies, renal/hepatic disease, geriatric patients, child <17 yr, acute MI, atrial fibrillation/flutter, AV block, bradycardia, cardiac disease, congenital heart disease, dehydration, depression, dialysis, hazardous activity, electrolyte imbalance, heart failure, labor, PR prolongation, sick sinus syndrome, substance abuse, suicidal ideation, syncope, torsades de pointes

## DOSAGE AND ROUTES

### Adjunctive therapy

**Adult and child ≥17 yr:** PO 50 mg bid, may increase qwk by 100 mg bid to 200-400 mg/day; **IV** 50 mg 2 ×/day, infuse over 30-60 min, may be increased 100 mg/day weekly, up to 200-400 mg/day maintenance

### Monotherapy

**Adult:** PO 100 mg bid, may increase qwk by 100 mg/day in two divided doses, increase 300-400 mg/day in two divided doses

### Renal/hepatic dose

**Adult:** PO/IV max 300 mg/day in mild to moderate hepatic disease or CCr ≤30 ml/min; do not use in severe hepatic disease; reduce dose in renal/hepatic disease in those taking strong CYP3A4, CYP2C9 inhibitors

**Available forms:** Film-coated tabs 50, 100, 150, 200 mg; **IV** 20 ml single-use vials (200 mg/20 ml), oral sol 10 mg/ml

### Implementation

- Store PO products/IV vials at room temp; sol is stable for 24 hr when mixed with compatible diluents in glass or PVC bags at room temp

**PO route**
- **Tablet:** give without regard to meals
- **Oral sol:** measure with calibrated measuring device

**IV route**
- May give undiluted or mixed in 0.9% NaCl, $D_5W$, or LR
- Infuse over 30-60 min, stable for 24 hr at room temperature
- Do not use if discolored or particulates are present; discard unused portions

## ADVERSE EFFECTS

**CNS:** Dizziness, syncope, tremor, vertigo, ataxia, drowsiness, fever, hypoesthesia, paresthesias, depression, fatigue, headache, confusion, irritability, psychological dependence, suicidal ideation, euphoria
**CV:** Atrial fibrillation/flutter, AV block, bradycardia, myocarditis, orthostatic hypotension, palpitations, PR prolongation
**EENT:** Diplopia, blurred vision, nystagmus, tinnitus
**GI:** Nausea, constipation, vomiting, hepatitis, diarrhea, dyspepsia
**HEMA:** Anemia, neutropenia, agranulocytosis
**INTEG:** Rash, erythema, inj site reaction, pruritus, xerostomia
**MS:** Asthenia, dysarthria, muscle cramps
**SYST:** Drug reaction with eosinophilia and systemic symptoms (DRESS), Stevens-Johnson syndrome, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding <15% |
| **Metabolism** | Liver |
| **Excretion** | Kidneys (95%) |
| **Half-life** | 13 hr (PO), elimination half-life 15-23 hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Unknown | Unknown |
| **Peak** | 1-4 hr (PO) | 30-60 min |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Atazanavir, dronedarone, digoxin, lopinavir, ritonavir: increase PR prolongation

### Drug classifications

β-blockers, calcium-channel blockers: increase PR prolongation
CYP2C19 inhibitors (fluconazole, isoniazid, miconazole): increase lacosamide effect

### Drug/lab test

Increased: LFTs

## NURSING CONSIDERATIONS

### Assessment

- **Assess for seizures:** duration, type, intensity, precipitating factors
- Monitor for renal function: albumin concentration
- Assess CV status: orthostatic hypotension, PR prolongation; monitor cardiac status throughout treatment; EKG before therapy (IV), AV block may occur
- **Assess mental status:** mood, sensorium, affect, memory (long, short), depression, suicidal ideation, psychological dependence
- **Pregnancy:** Enroll in UCB Antiepileptic Drugs Registry 888-233-2334, use only if benefits outweigh fetal risk, do not breastfeed, excretion unknown
- **Serious skin reactions:** Assess for rash, discontinue product at first sign of rash, DRESS, Stevens-Johnson syndrome, toxic epidermal necrolysis may occur
- **Beers:** Avoid in older adults unless safer alternatives are not available, may cause ataxia, impaired psychomotor function

### Patient/family education

- Caution patient not to discontinue product abruptly, taper over 1 wk; seizures may occur
- Teach patient to report blurred vision, nausea, dizziness, syncope; Advise patient to avoid hazardous activities until stabilized on product
- Teach patient to report rash, fever, fatigue, yellowing of skin, eyes, dark urine, may be hypersensitivity
- Instruct patient to carry emergency ID stating product use
- Advise patient to notify prescriber of suicidal thoughts or actions, syncope, cardiac changes
- Instruct patient to notify prescriber if pregnancy is planned or suspected to, enroll in pregnancy registry at 888-233-2334, www.aedpregnancyregistry.com
- Teach patient that interactions with other medications may occur, to report all OTC, Rx, herbals, supplements taken, not to use alcohol
- Give patient MediGuide for proper use and risks

### Evaluation

**Positive therapeutic outcome**
- Increased seizure control

## lactulose (Rx)

(lak'tyoo-lose)
**Cholac, Constilac, constulose, Enulose, Generlac, Kristalose**
*Func. class.:* Laxative (hyperosmotic/ammonia detoxicant)
*Chem. class.:* Lactose synthetic derivative

**Do not confuse:** lactulose/lactose

**ACTION:** Prevents absorption of ammonia in colon by acidifying stool; increases water, softens stool

**Therapeutic outcome:** Decreased constipation, decreased blood ammonia level

## USES:
Chronic constipation, portal-systemic encephalopathy in patients with hepatic disease

## CONTRAINDICATIONS
Hypersensitivity, low-galactose diet

**Precautions:** Pregnancy, breastfeeding, geriatric and debilitated patient, diabetes mellitus

## DOSAGE AND ROUTES
### Constipation
**Adult:** PO 15-30 ml/day (10-20 g), may increase to 60 ml/day prn
**Child (unlabeled):** PO 7.5 ml/day

### Hepatic encephalopathy
**Adult:** PO 30-45 ml (20-30 g) tid or qid until stools are soft; retention enema 300 ml diluted
**Infant:** PO (unlabeled) 2.5-10 ml/day in divided doses
**Child:** PO (unlabeled) 40-90 ml/day in divided doses given 3-4 ×/day

**Available forms:** Oral sol 10 g/15 ml; packets: 10, 20 g; rectal sol: 10 g/15 ml

### Implementation
**PO route**
• Give with full glass of fruit juice, water, milk to increase palatability of oral form; for rapid effect, give on empty stomach; increase fluids by 2 L/day; do not give with other laxatives; if diarrhea occurs, reduce dosage
• Kristalose: dissolve contents of packet in 4 oz of water
**Rectal route**
• Administer retention enema (no commercial product) by diluting 300 ml of lactulose/700 ml of water or of 0.9% NaCl; administer by rect balloon catheter; retain for 30-60 min; repeat if evacuated too quickly

## ADVERSE EFFECTS
**GI:** *Nausea, vomiting, anorexia, abdominal cramps, diarrhea,* flatulence, *distention, belching*
**META:** Hypernatremia

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Poorly absorbed |
| **Distribution** | Not known |
| **Metabolism** | Colonic bacteria to acids |
| **Half-life** | Unknown |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Individual drugs
Neomycin: decreased lactulose effect
NIFEdipine extended release tab: increased GI obstruction

### Drug classifications
Antiinfectives (oral), antacids: decreased lactulose effect
Laxatives: do not use together (hepatic encephalopathy)

### Drug/herb
Flax, senna: increased laxative effect

### Drug/lab test
Blood glucose (diabetic patients): increase
Blood ammonia: decrease

## NURSING CONSIDERATIONS
### Assessment
• **Stool:** Assess for amount, color, consistency
• Monitor glucose levels in diabetic patients (increases)
• **Cause of constipation:** Determine whether fluids, bulk, or exercise is missing from lifestyle
• Monitor blood, urine, electrolytes if used often by patient; may cause diarrhea, hypokalemia, hypernatremia; check I&O ratio to identify fluid loss
• Assess cramping, rectal bleeding, nausea, vomiting; if these symptoms occur, product should be discontinued; identify cause of constipation: identify whether fluids, bulk, or exercise is missing from lifestyle, replace any loss
• **Hepatic encephalopathy:** Monitor blood ammonia level 15-45 mcg/dl or 35-65 umol/L is normal range; monitor for clearing of confusion, lethargy, restlessness, irritability (hepatic encephalopathy); may decrease ammonia level by 50%, monitor sodium in higher doses
• **Pregnancy/breastfeeding:** Only if clearly needed, cautious use in breastfeeding

### Patient/family education
• Discuss with patient that adequate fluid consumption is necessary
• Teach patient that normal bowel movements do not always occur daily
• Teach patient not to use in presence of abdominal pain, nausea, vomiting; tell patient to notify prescriber of unrelieved constipation or if symptoms of electrolyte imbalance occur: muscle cramps, pain, weakness, dizziness, excessive thirst
• Teach patient not to use laxatives for long-term therapy; bowel tone will be lost
• Do not give at bedtime as a laxative; may interfere with sleep

• Notify prescriber if diarrhea occurs; may indicate overdosage

### Evaluation

**Positive therapeutic outcome**

• Decreased constipation
• Decreased blood ammonia level
• Clearing of mental state

## lamiVUDine (3TC) (Rx)

(lam-i'vue-dine)
**Epivir, Epivir-HBV, Heptovir**
*Func. class.:* Antiretroviral
*Chem. class.:* Nucleoside reverse transcriptase inhibitor (NRTI)

**Do not confuse:** lamiVUDine/LamoTRIgine

**ACTION:** Inhibits replication of HIV virus by incorporating into cellular DNA by viral reverse transcriptase, thereby terminating the cellular DNA chain

**Therapeutic outcome:** Improved symptoms of HIV infection

**USES:** HIV-1–related infection in combination with at least 2 other antiretrovirals; chronic hepatitis B (Epivir-HBV)

**Unlabeled uses:** Prophylaxis of HIV postexposure with indinavir and zidovudine

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatric, granulocyte count $<1000/mm^3$ or Hgb $<9.5$ g/dl, renal disease, pancreatitis, peripheral neuropathy

**BLACK BOX WARNING:** Severe hepatic dysfunction, lactic acidosis

## DOSAGE AND ROUTES

### HIV in combination infection

**Adult and adolescent >16 yr and ≥ 50 kg:** PO 150 mg bid or 300 mg/day; <50 kg 2 mg/kg bid
**Child 3 mo-16 yr:** PO 4 mg/kg bid; max 150 mg bid

### Renal dose

**Adult:** PO CCr 30-49 ml/min: Epivir 150 mg/day; Epivir HBV 100 mg 1st dose, then 50 mg/day; CCr 15-29 ml/min: Epivir 150 mg 1st dose, then 100 mg/day; Epivir HBV 100 mg 1st dose, then 25 mg/day; CCr 5-14 ml/min: Epivir 150 mg 1st dose, then 50 mg/day; Epivir HBV 35 mg 1st dose, then 15 mg/day; CCr <5 ml/min: Epivir 50 mg 1st dose, then 25 mg/day; Epivir HBV 35 mg 1st dose, then 10 mg/day

### Chronic hepatitis B with evidence of HBV replication and active liver inflammation

**Adult:** PO 100 mg/day
**Child/adolescent 2-17 yr:** PO 3 mg/kg/day, max 100 mg

**Available forms:** Oral sol **(Epivir)** 10 mg/ml, tabs 150, 300/mg; oral sol **(Epivir-HBV)** 5 mg/ml, tabs 100 mg

### Implementation

• Epivir and Epivir-HBV are not interchangeable
• Administer PO daily, bid without regard to meals
• Give with other antiretrovirals only, do not triple antiretrovirals with abacavir or didanosine, resistance may occur
• Store in cool environment; protect from light

## ADVERSE EFFECTS

**CNS:** *Fever, headache, malaise, dizziness, insomnia, depression, fatigue, chills,* seizures, peripheral neuropathy, paresthesia
**EENT:** Taste change, hearing loss, photophobia
**GI:** *Nausea, vomiting, diarrhea,* anorexia, cramps, dyspepsia, hepatomegaly with steatosis, pancreatitis (more common in children)
**HEMA:** Neutropenia, anemia, thrombocytopenia
**INTEG:** *Rash*
**MS:** *Myalgia, arthralgia, pain*
**RESP:** *Cough*
**SYST:** Lactic acidosis, anaphylaxis, Stevens-Johnson syndrome, immune reconstitution syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Extravascular space |
| **Metabolism** | Protein binding <36% |
| **Excretion** | Unchanged in urine |
| **Half-life** | Terminal half-life 5-7 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

AMILoride, dofetilide, entecavir, metFORMIN, memantine, procainamide, trospium, trimethoprim/sulfamethoxazole: increased level of lamiVUDine
Emtricitabine: do not combine, duplication
Other products that cause pancreatitis Increase: Pancreatitis
Sulfamethoxazole trimethoprim: Increase: Lamotrigine level

Zalcitabine: decreased both products, avoid concurrent use

### Drug/lab test

Increased: ALT, bilirubin, lipase, CK
Decreased: Hgb, neutrophil, platelet count

## NURSING CONSIDERATIONS

### Assessment

- **HIV:** Test for HIV before starting treatment; monitor blood counts q2wk; watch for neutropenia, thrombocytopenia, Hgb, CD4, viral load, lipase, triglycerides periodically during treatment; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required; assess for lessening of symptoms; if HBV is present, a higher dose of Epivir-HBV is needed
- Hepatitis B: Assess for fatigue, anorexia, pruritus, jaundice during and for several months after discontinuation; monitor liver function tests: AST, ALT, bilirubin; amylase; bilirubin, triglycerides, lipase
- **Monitor children for pancreatitis:** abdominal pain, nausea, vomiting, neuropathy, discontinuing may be required; monitor amylase, lipase, use cautiously in children

**BLACK BOX WARNING: Assess for lactic acidosis, severe hepatomegaly with steatosis:** obtain baseline liver function tests; if elevated, discontinue treatment; discontinue even if liver function tests are normal and symptoms of lactic acidosis, severe hepatomegaly develops; may be fatal, especially in women

- **Pregnancy/breastfeeding:** Epivir is a drug that is used in pregnancy to treat HIV, enroll in the Antiretroviral Pregnancy Registry at 800-258-4263, do not breastfeed

### Patient/family education

- Teach patient that GI complaints and insomnia resolve after 3-4 wk of treatment
- Tell patient that product is not a cure for AIDS but will control symptoms; compliance is needed, take as directed, to complete full course of treatment even if feeling better
- Teach patient to notify prescriber of sore throat, swollen lymph nodes, malaise, fever, peripheral neuropathy; other infections may occur
- Teach patient to report pancreatitis, immune reconstitution syndrome immediately
- Teach patient that virus is still infective, may pass AIDS virus to others
- Encourage patient to continue follow-up visits since serious toxicity may occur; blood counts must be done q2wk
- Tell patient that other products may be necessary to prevent other infections
- Teach patient that product may cause fainting or dizziness
- **Pregnancy/breastfeeding:** To enroll in the Antiretroviral Pregnancy Registry at 800-258-4263, not to breastfeed

### Evaluation

**Positive therapeutic outcome**

- Absence of infection, symptoms of HIV infection

## lamoTRIgine (Rx)

(lam-o-trye'geen)
**LaMICtal, Lamictal CD, Lamictal ODT, Lamictal XR**
*Func. class.:* Anticonvulsant—miscellaneous
*Chem. class.:* Phenyltriazine

**Do not confuse:** lamoTRIgine/lamiVUDine, LaMICtal/LamISIL/Lomotil

**ACTION:** May inhibit voltage-sensitive sodium channels, decreasing seizures

**Therapeutic outcome:** Decrease in intensity and number of seizures

**USES:** Adjunct in the treatment of partial, tonic-clonic seizures, children with Lennox-Gastaut syndrome, bipolar disorder

**Unlabeled uses:** Absence seizures

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy (cleft lip/palate in 1st trimester), breastfeeding, geriatric, renal/hepatic/cardiac disease, severe depression, suicidal ideation, blood dyscrasias, children <16 yr, serious rash

## DOSAGE AND ROUTES

**Seizures:** monotherapy
**Adult and adolescent ≥16 yr:** PO 50 mg/day for wk 1 and 2, then increase to 100 mg divided bid for wk 3 and 4; maintenance 300-500 mg/day; receiving enzyme inducing AEDs (carBAMazepine, PHENobarbital, phenytoin, primidone but not valproic acid); ext rel 50 mg/day × 1-2 wks, then 100 mg/day during wk 3-4, then 200 mg/day during wk 5, then 300 mg/day during wk 6, then 400 mg/day during wk 7; after wk 7 range is 400-600 mg/day
**Adolescent <16 yr and child:** PO 0.3 mg/kg/day wk 1 and 2, then 0.6 mg/kg/day wk 3 and 4; depends on use of AED; usual dosage 4.5-7.5 mg/kg/day, max 300 mg/day

### Monotherapy for patients taking valproate

**Adult/adolescent ≥16 yr:** receiving lamoTRIgine and valproate, without enzyme-inducing drug PO (immediate-release) stabilize on valproate and target dose of 200 mg/day lamoTRIgine; if patient is not taking lamoTRIgine 200 mg/day, increase dose by 25-50 mg/day q1-2wk to reach 200 mg/day; while maintaining lamoTRIgine 200 mg/day, decrease valproate to 500 mg/day by ≤500 mg/day/wk, maintain valproate at 500 mg/day × 1 wk, then increase lamoTRIgine to 300 mg/day, while decreasing valproate 250 mg/day × 1 wk, then discontinue valproate and increase lamoTRIgine by 100 mg/day qwk to maintenance dosage of 500 mg/day

### Seizures: multiple therapy with valproate

**Adult and adolescent ≥16 yr:** PO 25 mg every other day, then 25 mg/day wk 3-4, increase by 25-50 mg q1-2wk; maintenance 100-500 mg/day
**Adolescent <16 yr and child:** PO 0.1-0.2 mg/kg/day initially, then increase q2wk as needed to 1.5 mg/kg/day or 200 mg/day

### Bipolar disorder (Escalation regimen in those not taking carBAMazepine, or other enzyme-inducing drugs or valproate)

**Adult and adolescent ≥16 yr:** PO wk 1-2 25 mg/day; wk 3-4 50 mg/day; wk 5 100 mg/day; wk 6-7 200 mg/day; for patients taking valproic acid: wk 1-2 25 mg every other day; wk 3-4 25 mg/day; wk 5 50 mg/day; wk 6 100 mg/day; wk 7 100 mg/day

### Hepatic dose

**Adult (moderate hepatic impairment or severe without ascites):** PO reduce by 25%
**Adult (severe hepatic impairment with ascites):** PO reduce by 50%

### Depression with epilepsy (unlabeled)

**Adult:** PO 100-500 mg/day

**Available forms:** Tabs 25, 100, 150, 200 mg; chew tabs 5, 25 mg; oral disintegrating tab 25, 50, 100, 200 mg; oral disintegrating 25-50, 50-100, 25-50-100 mg titration kit; PO ext rel 25-50-100, 50-100-200 mg titration kit; PO 25-100 mg starter kit, ext rel 25, 50, 100, 250, 300 mg

### Implementation

**PO route**

- Extended-release product is not to be used for conversion to monotherapy from ≥ 2 antiepileptic products
- **Orange Starter Kit:** for those **NOT** taking carBAMazepine, phenytoin, PHENobarbital, primidone, rifampin, or valproate
- **Green Starter Kit:** for those taking carBAMazepine, phenytoin, PHENobarbital, primidone, rifampin but **NOT** valproate
- Blue Starter Kit: for those taking valproate
- Discontinue all products gradually ≥2 wk, abrupt discontinuation can increase seizures
- All forms may be given without regard to meals
- **Chewable dispersible tab:** may be swallowed whole, chewed, mixed in water or fruit juice; to mix add to small amount of liquid in a glass or spoon, tabs will dissolve in 1 min, then mix in more liquid and swirl and swallow immediately
- **Orally disintegrating tabs:** place on tongue, move around in mouth, when disintegrated, swallow; examine blister pack before use, do not use if blisters are torn or missing; do not cut tabs in half
- **Extended-release tabs:** swallow whole, do not cut, break, chew
- Give correct starter kit: severe side effects have occurred from incorrect starter kit
- Give in divided doses with or after meals to decrease adverse effects

## ADVERSE EFFECTS

**CNS:** Fever, insomnia, tremor, depression, anxiety, *dizziness,* ataxia, *headache,* suicidal ideation, seizures, poor concentration
**EENT:** Nystagmus, *diplopia, blurred vision*
**GI:** *Nausea, vomiting, anorexia,* abdominal pain, hepatotoxicity
**GU:** *Dysmenorrhea*
**HEMA:** Anemia, DIC, leukopenia, thrombocytopenia
**INTEG:** Rash (potentially life-threatening), alopecia, photosensitivity
**CV:** chest pain, palpitations
**MS:** neck pain, myalgias
**SYST:** Stevens-Johnson syndrome, angioedema, toxic epidermal necrolysis, DRESS

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed, rapid |
| **Distribution** | Protein binding 55%, crosses placenta |
| **Metabolism** | Glucuronic acid conjunction |
| **Excretion** | Excreted in breast milk |
| **Half-life** | Terminal 24 hr; 15 hr with enzyme inducers |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1.4-2.3 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Acetaminophen, carBAMazepine, OXcarbazepine, PHENobarbital, phenytoin, primidone: decreased lamoTRIgine serum concentration

Valproic acid: decreased metabolic clearance of lamoTRIgine

### Drug classifications

CYP3A4 inhibitors: decreased metabolic clearance of lamoTRIgine

Contraceptives (oral), estrogens, succinimides, rifamycins: decreased lamoTRIgine serum concentration

### Drug/herb

Ginkgo: increased anticonvulsant effect

Ginseng, santonica: decreased anticonvulsant effect

## NURSING CONSIDERATIONS

### Assessment

- Assess for rash (Stevens-Johnson syndrome or toxic epidermal necrolysis) in pediatric patients; product should be discontinued at first sign of rash, more common in those taking multiple products for seizures, rash usually occurs during 2-8 wk of therapy
- **Assess for seizure activity:** duration, type, intensity, halo before seizure
- Assess for hypersensitive reactions
- **Bipolar disorder:** suicidal thoughts/behaviors
- **DRESS:** Monitor for fever, rash, lymphadenopathy, may be with hepatitis, nephritis, myocarditis, discontinue immediately

### Patient/family education

- Caution patient not to discontinue product abruptly; seizures may occur
- Caution patient to avoid hazardous activities until stabilized on product
- Advise patient to notify prescriber of skin rash or increased seizure activity
- Instruct patient to report to prescriber if pregnancy is suspected or planned
- Teach patient to use sunscreen and protective clothing; photosensitivity occurs
- Advise patient to carry/wear emergency ID stating product use
- Advise patient to notify prescriber immediately of suicidal thoughts, behaviors
- Teach patient to notify prescriber if pregnancy is planned or suspected, use a nonhormonal contraceptive; enroll with the North American Antiepileptic Drug Pregnancy Registry at 888-233-2334 (www.aedpregnancyregistry.org), product decreases folate; avoid breastfeeding
- **Rash:** Teach patient to notify prescriber immediately if rash, fever, or swollen lymph nodes occur

### Evaluation

**Positive therapeutic outcome**

- Decrease in severity of seizures or severity of bipolar symptoms

## lansoprazole (Rx, OTC)

(lan-soe'prah-zole)

**Prevacid, Prevacid SoluTab**

*Func. class.:* Proton-pump inhibitor

*Chem. class.:* Benzimidazole

**Do not confuse:** Prevacid/Pravachol/Prinivil

**ACTION:** Suppresses gastric secretion by inhibiting hydrogen/potassium ATPase enzyme system in gastric parietal cell; characterized as gastric acid pump inhibitor since it blocks final step of acid production

**Therapeutic outcome:** Reduction in gastric pain, swelling, fullness

**USES:** Gastroesophageal reflux disease (GERD), severe erosive esophagitis, poorly responsive systemic GERD, pathologic hypersecretory conditions (Zollinger-Ellison syndrome, systemic mastocytosis, multiple endocrine adenomas); possibly effective for treatment of duodenal, gastric ulcers, maintenance of healed duodenal ulcers

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, hypomagnesemia, osteoporosis

## DOSAGE AND ROUTES

### Frequent heartburn

**Adult:** PO 15 mg qd up to 14 days

### Duodenal ulcer

**Adult:** PO 15 mg/day before meals for 4 wk, then 15 mg/day to maintain healing of ulcers; ulcers associated with ***Helicobacter pylori:*** 30 mg lansoprazole, metronidazole 500 mg bid-qid 14 days or 30 mg lansoprazole bid, 1 g amoxicillin tid, levofloxacin 500 mg qday × 14 days

### Pathologic hypersecretory conditions

**Adult:** PO 60 mg/day, may give up to 90 mg bid, administer >120 mg/day in divided doses

### GERD/esophagitis
**Adult/adolescent:** PO 15-30 mg/day × 8 wk
**Child 1-11 yr (>30 kg):** PO 30 mg/day ≤12 wk
**Child 1-11 yr (≤30 kg):** 15 mg/day ≤12 wk

### Stress gastric prophylaxis
**Adult:** NG use 30 mg oral cap or 300 mg disintegrating tab

**Available forms:** del rel caps 15, 30 mg; oral powder; orally disintegrating tabs 15, 30 mg

### Implementation
**PO route**
- Swallow del rel cap whole; do not break, crush, chew, or open
- Administer before eating
- **Oral cap:** Open cap and pour ¼ of granules into NG feeding syringe with plunger removed, slowly add water and depress plunger, repeat until all granules are used, flush tube with 15 ml water
- Place on tongue, allow to dissolve, use without regard to water
- **Oral syringe:** Dissolve 15 mg/4 ml or 30 mg/10 ml water; use extra water in syringe to remove all of the product

**NG tube**
- **Oral disintegrating tab:** Mix 30 mg tab in 10 ml water, give via NG tube, flush tube with 10 ml sterile water, clamp for 60 min

## ADVERSE EFFECTS
**CNS:** *Headache*
**GI:** Diarrhea, abdominal pain, vomiting, nausea, *constipation,* flatulence, acid regurgitation, anorexia, irritable colon, microscopic colitis, pseudomembranous colitis
**GU:** Hematuria, glycosuria, impotence, kidney calculus, breast enlargement

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid after granules leave stomach |
| **Distribution** | Protein binding 97% |
| **Metabolism** | Liver extensively |
| **Excretion** | Urine, feces; clearance decreased in geriatric, renal/hepatic disease |
| **Half-life** | Plasma 1.5 hr |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Individual products
Octreotide, misoprostol: decreased lansoprazole effect
Extended release amphetamine/dextroamphetamine: decreased release of extended-release product
Calcium carbonate, iron salts, itraconazole, ketoconazole, atazanavir, ampicillin: decreased absorption of each specific product
FluvoxaMINE, voriconazole: increased lansoprazole toxicity
Warfarin: increased bleeding risk
Sucralfate: delayed absorption of lansoprazole
Clopidogrel: decreased antiplatelet effect

### Drug/herb
- Avoid use with red yeast rice, St. John's wort

### Drug/food
- Food decreases rate of absorption; use before food

### Drug classifications
Loop/thiazide diuretics: increased hypomagnesemia
Antimuscarinics, $H_2$ blockers: decreased lansoprazole effect

## NURSING CONSIDERATIONS
### Assessment
- **Pseudomembranous colitis:** bowel sounds q8hr, abdomen for pain, swelling, anorexia, blood in stool, may occur even after completion of therapy
- Monitor liver enzymes (AST, ALT, alkaline phosphatase) during treatment
- Monitor INR and pro-time when taking warfarin
- Low magnesium may occur
- **Beers:** Avoid scheduling use for .8 wk unless for high-risk patients (oral corticosteroids/chronic NSAIDs use)

### Patient/family education
- Instruct patient to report severe diarrhea, cramping, blood in stools, fever product may have to be discontinued
- Inform diabetic patient that hypoglycemia may occur, to monitor blood glucose
- Encourage patient to avoid hazardous activities; dizziness may occur
- Tell patient to avoid alcohol, salicylates, ibuprofen; may cause GI irritation
- Teach patient that if using OTC for heartburn, it may take 1-4 days to see full benefit
- **Pregnancy:** Teach patient to notify provider if pregnancy is planned or suspected, if breastfeeding do not breastfeed

### Evaluation
**Positive therapeutic outcome**
- Absence of gastric pain, swelling, fullness

RARELY USED

## lapatinib (Rx)

(la-pa′tin-ib)

**Tykerb**

*Func. class.:* Antineoplastic—miscellaneous

*Chem. class.:* Biologic response modifier, signal transduction inhibitor (STIs)

**Therapeutic outcome:** Decrease in breast cancer progression

**USES:** Advanced/metastatic breast cancer patients with tumor that overexpresses HER2 protein and who have received previous chemotherapy

### CONTRAINDICATIONS

Pregnancy, hypersensitivity, breastfeeding

### DOSAGE AND ROUTES

**Advanced/metastatic breast cancer with HER2 overexpression who have received previous therapy**

**Adult:** PO 1250 mg (5 tabs)/day 1 hr before or after food on days 1-21 plus capecitabine 2000 mg/m$^2$/day in 2 divided doses on days 1-14 in a repeating 21-day cycle; continue until therapeutic response or toxicity occurs

**Metastatic breast cancer with HER2 overexpression for whom hormonal therapy is indicated**

**Adult:** PO 1500 mg (6 tabs) 1 hr before food with letrozole 2.5/day

**Hepatic dose**

**Adult (Child-Pugh C):** PO 750 mg/day (with capecitabine); 1000 mg/day (with letrozole)

## latanoprost ophthalmic

*See Appendix B*

⚠ HIGH ALERT

## ledipasvir/sofosbuvir

(le-dip′as-vir/soe-fos′bue-veer)

**Harvoni**

*Func. class.:* Antiviral antihepatitis agent

*Chem. class.:* N55A inhibitor

**ACTION:** A combination product with a HCV NS5A inhibitor (ledipasvir) and a nucleotide analog HCV NS5B polymerase inhibitor (sofosbuvir)

**Therapeutic outcome:** Hepatitis C RNA reduction

**USES:** Chronic hepatitis C virus (HCV) genotype 1 infection in patients with compensated liver disease

### CONTRAINDICATIONS: Hypersensitivity

**Precautions:** Decompensated hepatic disease, decompensated cirrhosis, severe renal impairment (eGFR <30 ml/min/1.73 m$^2$), end-stage renal failure requiring dialysis, pregnancy, breastfeeding

### DOSAGE AND ROUTES

**Adults with or without cirrhosis who are treatment-naive: PO** one tab (90 mg ledipasvir; 400 mg sofosbuvir) every day with or without food for 12 wk; 8 wk can be considered for those patients with a baseline HCV RNA <6 million IU/ml

**Adults without cirrhosis who are treatment-experienced: PO** one tab (90 mg ledipasvir; 400 mg sofosbuvir) every day with or without food for 12 wk

**Adults with cirrhosis who are treatment-experienced: PO** one tab (90 mg ledipasvir; 400 mg sofosbuvir) every day with or without food for 24 wk

**Oral dosage**

**Adult (treatment-naive) without cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 12 wk; however, an 8-wk treatment duration can be considered for those patients with a baseline hepatitis C virus RNA less than 6 million international units/ml. Recommendation includes patients coinfected with HIV

**Adults (treatment-naive) with compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 12 wk. Recommendation includes patients coinfected with HIV

**Adults (treatment-experienced) without cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 12 wk. Recommendation includes patients coinfected with HIV

**Adults (treatment-experienced) with compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 24 wk. Alternatively, treatment duration may be reduced to 12 wk if ledipasvir; sofosbuvir is administered in combination with ribavirin. Ribavirin must be administered with food in two divided doses, and the dose is based on weight as follows: less than 75 kg give 500 mg PO twice daily; 75 kg or more

give 600 mg PO twice daily. Recommendation includes patients coinfected with HIV

**Adults (treatment-naive and experienced) with decompensated (Child-Pugh B or C) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with ribavirin (600 mg PO once daily) for 12 wk. Ribavirin must be administered with food, and if tolerated, the dose may be increased as follows: if less than 75 kg give 500 mg PO twice daily; if 75 kg or more give 600 mg PO twice daily. Consider decreasing ribavirin dose for abnormal hemoglobin. Recommendation includes patients coinfected with HIV

**Adults (treatment-naive and experienced) who have undergone liver transplantation and are without cirrhosis or have compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with ribavirin for 12 wk. Ribavirin must be administered with food in two divided doses, and the dose is based on weight as follows: less than 75 kg give 500 mg PO twice daily; 75 kg or more give 600 mg PO twice daily. Recommendation includes patients coinfected with HIV

**Children and adolescent 12 to 17 yr (treatment-naive) without cirrhosis or with compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 12 wk. Recommendation includes patients coinfected with HIV

**Children and adolescent 12 to 17 yr (treatment-experienced) without cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 12 wk. Recommendation includes patients coinfected with HIV

**Children and adolescent 12 to 17 yr (treatment-experienced) with compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 24 wk. Recommendation includes patients coinfected with HIV

**Children younger than 12 years weighing at least 35 kg (treatment-naive) without cirrhosis or with compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 12 wk. Recommendation includes patients coinfected with HIV

**Children younger than 12 yr weighing at least 35 kg (treatment-experienced) without cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 12 wk. Recommendation includes patients coinfected with HIV

**Children younger than 12 yr weighing at least 35 kg (treatment-experienced) with compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 24 wk. Recommendation includes patients coinfected with HIV

### For the treatment of chronic hepatitis C virus (HCV) genotype 4 infection

#### Oral dosage

**Adult (treatment-naive and experienced) without cirrhosis or who have compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 12 wk. Recommendation includes patients coinfected with HIV

**Adult (treatment-naive and experienced) who have undergone liver transplantation and are without cirrhosis or have compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with ribavirin for 12 wk. Ribavirin must be administered with food in two divided doses, and the dose is based on weight as follows: less than 75 kg give 500 mg PO twice daily; 75 kg or more give 600 mg PO twice daily. Recommendation includes patients coinfected with HIV

**Children and adolescent 12 to 17 yr (treatment-naive and experienced) without cirrhosis or who have compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 12 wk. Recommendation includes patients coinfected with HIV

**Children younger than 12 yr weighing at least 35 kg (treatment-naive and experienced) without cirrhosis or who have compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 12 wk. Recommendation includes patients coinfected with HIV

### For the treatment of chronic hepatitis C virus (HCV) genotypes 5 or 6 infection

#### Oral dosage

**Adult (treatment-naive and experienced) without cirrhosis or who have compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with

or without food. The recommended duration of treatment is 12 wk. Recommendation includes patients coinfected with HIV

**Children and adolescent 12 to 17 yr (treatment-naive and experienced) without cirrhosis or who have compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 12 wk. Recommendation includes patients coinfected with HIV

**Children younger than 12 yr weighing at least 35 kg (treatment-naive and experienced) without cirrhosis or who have compensated (Child-Pugh A) cirrhosis:** 1 tablet (90 mg ledipasvir; 400 mg sofosbuvir) PO once daily with or without food. The recommended duration of treatment is 12 wk. Recommendation includes patients coinfected with HIV

**Available forms:** Tab 90/400 mg

### Implementation

- Use without regard to food

## ADVERSE EFFECTS

**CNS:** *Fatigue, headache,* insomnia
**GI:** Nausea, vomiting, diarrhea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Ledipasvir: >99.8% protein binding, Sofosbuvir: 61%-65% protein binding |
| **Metabolism** | Unknown |
| **Excretion** | Ledipasvir: biliary; Sofosbuvir: kidneys 80% recovered in the urine |
| **Half-life** | Terminal half-life 47 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Ledipasvir peak 4-5 hr, Sofosbuvir peak 0.8-1 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Digoxin: Increased digoxin level: Anticonvulsants, antimycobacterials (rifabutin, rifAMPin, rifapentine), p-glycoprotein inducers, avoid using together
Decrease: ledipasvir/sofosbuvir level
H2 receptor antagonists (famotidine): Decrease: Ledipasvir level, separate by ≤ 12 hr, max dose of H2 receptor antagonist should not exceed famotidine 40 mg bid equivalent
Avoid use with products that increase P-glycoprotein

### Drug/lab test

Increased: bilirubin, lipase, CK

## NURSING CONSIDERATIONS

### Assessment

- Hepatitis C: monitor hepatitis C RNA, serum bilirubin, creatinine
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

### Patient/family education

- Instruct patient to report effects to the prescriber
- Teach patient to take at the same time each day and use for full course even if feeling better, to take missed doses when remembered on the same day, do not take double doses
- Teach patient will not decrease transmission of infection of others
- Teach patient to notify all providers of product

### Evaluation

**Positive therapeutic outcome**

- Hepatitis C RNA reduction

## leflunomide (Rx)

(leh-floo'noh-mide)
**Arava**
*Func. class.:* Antirheumatic (DMARDs)
*Chem. class.:* Immune modulator, pyrimidine synthesis inhibitor

**ACTION:** Inhibits an enzyme involved in pyrimidine synthesis and has antiproliferative, antiinflammatory effect

**Therapeutic outcome:** Decreased pain, joint swelling, increased mobility

**USES:** Rheumatoid arthritis, to reduce disease process as well as symptoms

**Unlabeled uses:** Juvenile rheumatoid arthritis

## CONTRAINDICATIONS

Breastfeeding, hypersensitivity

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Children, renal disorders, vaccinations, infection, alcoholism, immunosuppression, jaundice, lactase deficiency, hepatic disease

## DOSAGE AND ROUTES

**Adult:** PO loading dose 100 mg/day × 3 days, maintenance 20 mg/day; may be decreased to 10 mg/day if not well tolerated

### Juvenile rheumatoid arthritis (unlabeled)

**Adolescent and child >40 kg:** PO 20 mg/day
**Adolescent and child 20-40 kg:** PO 15 mg/day
**Adolescent and child 10-19.9 kg:** PO 10 mg/day

**Available forms:** Tabs 10, 20, 100 mg

### Implementation

- Give with full glass of water to enhance absorption
- Give PO with food, milk, or antacids for GI upset, give same time each day; loading dose is recommended
- **Drug elimination:** to eliminate product give cholestyramine 8 g tid × 11 days, check levels

## ADVERSE EFFECTS

**CNS:** Dizziness, insomnia, depression, paresthesia, anxiety, migraine, neuralgia, headache
**CV:** Palpitations, hypertension, chest pain, angina pectoris, peripheral edema
**EENT:** Pharyngitis, oral candidiasis, stomatitis, dry mouth, blurred vision
**GI:** *Nausea, anorexia, vomiting, constipation, flatulence, diarrhea, increased liver function tests,* hepatotoxicity, weight loss
**HEMA:** Anemia, ecchymosis, hyperlipidemia
**INTEG:** Rash, pruritus, alopecia, acne, hematoma, herpes infections
**RESP:** Pharyngitis, rhinitis, bronchitis, cough, respiratory infection, pneumonia, sinusitis, interstitial lung disease
**SYST:** Opportunistic/fatal infections, Stevens-Johnson syndrome, toxic epidermal necrolysis, DRESS

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Cholestyramine: decreased effect of leflunomide, use for overdose
Methotrexate: increased hepatotoxicity
Rifampin: increased leflunomide levels

### Drug classifications

Hepatotoxic agents: increased side effects of leflunomide
Live virus vaccines: decreased antibody reaction
NSAIDs: increased NSAID effect

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Hepatic necrosis/failure: Hepatic studies:** If ALT elevations are >2× ULN, reduce dose to 10 mg/day, monitor monthly or more frequently

- Screen for latent TB before starting treatment; if TB is present, treat before using this product
- **Interstitial lung disease:** assess for worsening cough, dyspnea, fever; may need to be discontinued, and drug elimination procedure initiated (rare)
- Monitor liver function tests: if ALT elevations are >2 times baseline, reduce dosage to 10 mg/day
- Obtain CBC with differential qmo × 6 mo, then q6-8wk thereafter, pregnancy test, electrolytes
- **Assess arthritic symptoms:** ROM, mobility, swelling of joints, baseline, during treatment
- **Assess for infection:** fatal opportunistic infections can occur

**BLACK BOX WARNING: Pregnancy:** Determine that patient is not pregnant before treatment; not to be given to women of childbearing potential who are not using reliable contraception

- **Stevens-Johnson syndrome, toxic epidermal necrolysis:** Monitor for rash during treatment, if rash with fever, fatigue, joint aches, blisters are present discontinue immediately, initiate drug elimination procedure

### Patient/family education

- Teach patient that product must be continued for prescribed time to be effective, that up to a month may be required for improvement
- Instruct patient to take with food, milk, or antacids to avoid GI upset, take at same time of day
- Advise patient to use caution when driving; drowsiness, dizziness may occur

• Advise patient to take with a full glass of water to enhance absorption, may continue with correct prescribed treatment with other antiinflammatories

**BLACK BOX WARNING: Pregnancy:** Advise patient not to become pregnant while taking this product

• Inform patient that hair may be lost, review alternatives
• Advise patient to avoid live virus vaccinations during treatment

### Evaluation

**Positive therapeutic outcome**
• Increased joint mobility without pain
• Decreased joint swelling

## TREATMENT OF OVERDOSE:

Give cholestyramine 8 g tid × 11 days

**⚠ HIGH ALERT**

## letrozole (Rx)

(let'tro-zohl)
**Femara**
*Func. class.:* Antineoplastic, nonsteroidal aromatase inhibitor

**Do not confuse:** Femoral/Femhrt

**ACTION:** Binds to the heme group of aromatase; inhibits conversion of androgens to estrogens to reduce plasma estrogen levels

**Therapeutic outcome:** Decreased spread of malignancy

**USES:** Early, advanced, or metastatic breast cancer in postmenopausal women who are hormone receptor positive

## CONTRAINDICATIONS

Pregnancy, hypersensitivity, premenopausal females

**Precautions:** Hepatic disease, respiratory disease, osteoporosis

## DOSAGE AND ROUTES

**Adult:** PO 2.5 mg/day

**Available forms:** Tabs 2.5 mg

### Implementation

• May administer bisphosphonates to increase bone density
• Give with food or fluids for GI upset
• Give in equal intervals q6hr

## ADVERSE EFFECTS

**CNS:** Somnolence, dizziness, depression, anxiety, *headache, lethargy*
**CV:** Angina, MI, CVA, thromboembolic events, peripheral edema, hypertension
**GI:** *Nausea, vomiting, anorexia,* constipation, heartburn, diarrhea
**GU:** Endometrial cancer, vaginal bleeding, endometrial proliferation disorder
**INTEG:** *Rash, pruritus,* alopecia, sweating
**MISC:** Hot flashes, night sweats, second malignancies, anaphylaxis, angioedema
**MS:** Arthralgia, arthritis, bone fracture, myalgia, osteoporosis
**RESP:** Dyspnea, cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed, steady state 2-6 wk |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | Terminal 48 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 days |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Estrogens, oral contraceptives: decreased letrozole effect

## NURSING CONSIDERATIONS

### Assessment

• Monitor temperature q4hr; may indicate beginning of infection
• Monitor LFTs before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly

### Patient/family education

• Advise patient to avoid use of alcohol, which potentiates this product
• Tell patient that product may be taken without regard to meals
• Teach patient to report vaginal bleeding, diarrhea, chest/bone pain
• Advise patient to use adequate contraception in perimenopausal, recently menopausal women

### Evaluation

**Positive therapeutic outcome**
• Prevention of rapid division of malignant cells, postmenopausal cancer, prostate cancer

**RARELY USED**

## leucovorin (Rx)

(loo-koe-vor'in)
*Func. class.:* Vitamin/folic acid antagonist antidote
*Chem. class.:* Tetrahydrofolic acid derivative

**USES:** Megaloblastic or macrocytic anemia caused by folic acid deficiency, overdose of folic acid antagonist, methotrexate toxicity, toxicity caused by pyrimethamine/trimethoprim/trimetrexate, pneumocystosis, toxoplasmosis

## CONTRAINDICATIONS

Hypersensitivity to this product or folic acid, benzyl alcohol, anemias other than megaloblastic not associated with vit $B_{12}$ deficiency

## DOSAGE AND ROUTES

### Megaloblastic anemia caused by enzyme deficiency

**Adult and child:** PO/IM/**IV** up to 6 mg/day

### Megaloblastic anemia caused by deficiency of folate

**Adult and child:** IM 1 mg or less/day until adequate response

### Advanced colorectal cancer

**Adult: IV** 200 mg/m$^2$, then 5-fluorouracil 370 mg/m$^2$; or leucovorin 20 mg/m$^2$, then 5-fluorouracil 425 mg/m$^2$; give daily × 5 days q4-5wk

### Methotrexate toxicity—leucovorin rescue

**Adult and child:** PO/IM/**IV (normal elimination)** given 6 hr after dose of methotrexate 10 mg/m$^2$ until methotrexate is $<5 \times 10^{-8}$ m, CCr has increased 50% above prior level, or methotrexate level is $5 \times 10^{-8}$ m at 24 hr or at 48 hr level is $>9 \times 10^{-8}$ m; give leucovorin 100 mg/m$^2$ q3hr until level drops to $<10^{-8}$ m

### Pyrimethamine/trimethoprim toxicity

**Adult and child:** PO/IM 5-15 mg/day

**⚠ HIGH ALERT**

## leuprolide (Rx)

(loo-proe'lide)
**Eligard, Lupron, Lupron Depo, Lupron Depot-Ped**
*Func. class.:* Antineoplastic hormone
*Chem. class.:* Gonadotropin-releasing hormone

**Do not confuse:** Lupron/Lopurin/Nuprin

**ACTION:** Causes initial increase in circulating levels of LH, FSH; continuous administration results in decreased LH, FSH; in men testosterone is reduced to castration levels; in premenopausal women estrogen is reduced to menopausal levels

**Therapeutic outcome:** Prevention of rapidly growing malignant cells in prostate cancer, decreased pain in endometriosis, resolution of central precocious puberty (CPP)

**USES:** Metastatic prostate cancer (inj implant), management of endometriosis (depot), CPP, uterine leiomyomata (fibroids)

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity to GnRH or analogs, thromboembolic disorders, undiagnosed vaginal bleeding; Viadur implant or Eligard should not be used in women or children

**Precautions:** Edema, hepatic disease, CVA, MI, seizures, hypertension, diabetes mellitus, HF, depression, osteoporosis, spinal cord compression, urinary tract obstruction

## DOSAGE AND ROUTES

### Advanced prostate cancer

**Adult:** SUBCUT 1 mg/day; IM depot 7.5 mg/dose qmo; Viadur implant (72 mg) qyr; or IM depot 22.5 mg q3mo; or IM depot 30 mg q4mo; or IM depot 45 mg q6mo; SUBCUT (Eligard) 7.5 mg qmo; 22.5 mg q3mo, q6mo

### Endometriosis/fibroids

**Adult:** IM 3.75 mg qmo for 6 mo, 11.25 mg q3mo for 6 mo, or IM 30 mg q4mo

### Anemia related to uterine fibroids

**Adult:** IM 3.75 mg depot qmo × 3 mo or 11.25 mg depot as a single dose

### Central precocious puberty

**Child:** SUBCUT 50 mcg/kg/day; increase as needed by 10 mcg/kg/day
**Child >37.5 kg:** IM 15 mg q4wk
**Child 25-37.5 kg:** IM 11.25 mg q4wk
**Child ≤25 kg:** 7.5 mg q4wk

**Available forms:** Depot inj: 3.75, 7.5, 11.25, 15, 22.5, 30, 45 mg; Inj: 5 mg/ml (2.8 ml multidose vials)

### Implementation

- Never give IV
- Store in tight container at room temp
- Use depot only IM; never give SUBCUT
- Unused vials may be stored at room temperature

**Subcut route**

- No dilution needed; if patient is self-administering make sure patient uses syringes provided by manufacturer
- **Eligard subcut:** Bring to room temp, once mixed give within 30 min; prepare the 2 syringes for mixing, join the 2 syringes by pushing in and twisting until secure; mix the product by pushing the contents of both syringes back and forth between syringes until uniform, should be light tan to tan; hold syringes vertically with syringe B on the bottom, draw entire mixed product into syringe B (short, wide syringe) by depressing the syringe A plunger and slightly withdrawing syringe B plunger, uncouple syringe A while pushing down on syringe A plunger, small air bubbles will remain; hold syringe B upright, remove pink cap, attach needle cartridge to the end of syringe B, remove needle cover, give by subcut route

**IM route**

- Never give IV
- **Give monthly:** reconstitute single-use vial with 1 ml of diluent; if multiple vials are used, withdraw 0.5 ml and inject into each vial (1 ml), withdraw all and inject at 90-degree angle (3.75 mg)
- **Give 3 month:** reconstitute microspheres using 1.5 ml of diluent and inject in vial, shake, withdraw and inject
- **12-month:** inserted into upper arm; at the end of 12 months, implant must be removed
- Use syringe and product packaged together; give deep in large muscle mass; rotate sites

## ADVERSE EFFECTS

**CNS:** Memory impairment, depression, seizures
**CV:** MI, pulmonary emboli, dysrhythmias, peripheral edema
**GI:** Anorexia, diarrhea, GI bleeding, nausea, vomiting
**GU:** Edema, hot flashes, impotence, decreased libido, amenorrhea, vaginal dryness, gynecomastia, profuse vaginal bleeding
**INTEG:** Alopecia
**MS:** Bone pain
**Prostate cancer:** Increased bone pain for the first 4 wk of treatment, those with metastases in spinal column might have severe back pain
**RESP:** Dyspnea, pulmonary fibrosis, interstitial lung disease

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed (SUBCUT) |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 3-4 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Flutamide, megestrol: increased antineoplastic action

### Drug/herb

Do not confuse with black cohosh or chaste tree fruit, may interfere with treatment

## NURSING CONSIDERATIONS

### Assessment

- **Prostate cancer:** Assess for increased bone pain during first 4 wk of treatment, those with metastasis in the spinal column may exhibit severe back pain
- **Assess for symptoms of endometriosis/fibroids** including lower abdominal pain, excessive vaginal bleeding, bloating if product is given for the diagnosis of endometriosis
- **For central precocious puberty (CPP):** the diagnosis should have been confirmed by development of secondary sex characteristics in children <9 yr; also included to confirm the diagnosis of CPP is estradiol/testosterone, GnRH test, tomography of head, adrenal steroid, chorionic gonadotropin, wrist x-ray, height, weight; patients with CPP display the signs of testicular growth, facial, body hair (boys), breast development, menses (girls)
- Monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; prostate-specific antigen in prostate cancer; calcium, testosterone, bone mineral density, blood glucose, HbA1c
- Monitor pituitary gonadotropic and gonadal function during therapy and 4-8 wk after therapy is decreased; check LH, FSH, acid phosphate at beginning of treatment
- **Tumor flare:** monitor worsening of signs and symptoms (normal during beginning therapy): fatigue, increased pulse, pallor,

lethargy, edema in feet, joints, stomach pain, shaking
• Monitor renal status: I&O ratio, check for bladder distention daily during beginning therapy (renal obstruction)
• **Severe allergic reaction:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing

### Patient/family education
• Advise patient to notify prescriber if menstruation continues (menstruation should stop); to use a nonhormonal method of contraception during therapy
• **Pregnancy/breastfeeding:** Teach patient to notify prescriber if pregnancy is planned or suspected, avoid breastfeeding, to use a nonhormonal form of contraception (women of childbearing potential)
• Instruct patient to report any complaints, side effects to nurse or prescriber; hot flashes may occur; record weight, report gain of 2 lb/day
• Teach patient how to prepare, administer; to rotate sites for SUBCUT/IM inj; use only syringe provided by manufacturer; to store depot at room temperature, refrigerate unopened vials, to protect all from heat; to keep accurate records of dosing (prostate cancer)
• Instruct patient that tumor flare may occur: increase in size of tumor, increased bone pain; tell patient that bone pain disappears after 1 wk; may take analgesics for pain, usually in prostate cancer
• Advise the patient not to breastfeed while taking this product
• Inform patient that voiding problems may increase in beginning of therapy, but will decrease in several weeks
• Teach patient that ongoing treatment is needed to control precocious puberty

### Evaluation
**Positive therapeutic outcome**
• Decreased size, spread of malignancy
• Decreased pain in endometriosis, fibroids
• Decreased signs of CPP
• Increased follicle maturation

## levalbuterol (Rx)
(lev-al-bute′er-ole)
**Xopenex, Xopenex HFA**
*Func. class.:* Bronchodilator
*Chem. class.:* Adrenergic $\beta_2$-agonist

**ACTION:** Causes bronchodilatation by action on $\beta_2$ (pulmonary) receptors by increasing levels of cyclic adenosine monophosphate (AMP), which relaxes smooth muscle; produces bronchodilatation; CNS, cardiac stimulation, increased diuresis, and increased gastric acid secretion

**Therapeutic outcome:** Increased ability to breathe because of bronchodilatation

**USES:** Treatment or prevention of bronchospasm (reversible obstructive airway disease), asthma

## CONTRAINDICATIONS
Hypersensitivity to sympathomimetics, this product, or albuterol

**Precautions:** Pregnancy, breastfeeding, hyperthyroidism, diabetes mellitus, hypertension, prostatic hypertrophy, closed-angle glaucoma, seizures, renal disease, QT prolongation, tachydysrhythmias, severe cardiac disease, hypokalemia, children

## DOSAGE AND ROUTES
### Bronchospasm in reversible obstructive airway disease
**Adult and child ≥12 yr:** INH 0.63 mg tid, q6-8hr by nebulization; may increase to 1.25 mg q8hr
**Adult/adolescent/child >4 yr:** (HFA, metered dose) 90 mcg (2 INH) q4-6hr
**Child 6-11 yr:** INH 0.31 mg tid via nebulization, max 0.63 mg tid
### Asthma, relief (unlabeled)
**Child <4 yr:** nebulizer solution 0.31-1.25 in Nebsol 3 ml q4-6hr prn, or 0.075 mg/kg in Nebsol q20min × 3 doses, then 0.075-0.15 mg/kg up to 5 mg q1-4hr

**Available forms:** Inh pediatric 0.31 mg/3 ml; sol 0.63/3 ml, 1.25 mg/3 ml, 125 mg/0.5 ml, 45 mcg per actuation (HFA)

### Implementation
• Give by nebulization q6-8hr; wait at least 1 min between inhalation of aerosols
• Use this medication before other medications and allow 5 min between each to prevent overstimulation
• Keep unopened until ready for use, after opening, use within 2 wk, protect from light, heat
**Inhalation route**
• Shake well before use, use a spacer device, prime with 4 test sprays in new canister or when not used for >3 days
**Nebulizer route**
• Dilute conc sol with normal sterile saline (1.25 mg/0.5ml) before use

## ADVERSE EFFECTS
**CNS:** *Tremors, anxiety,* insomnia, headache, dizziness, stimulation, *restlessness,* weakness, irritability
**CV:** Palpitations, tachycardia, hypertension, angina, hypotension, dysrhythmias, QT prolongation

**EENT:** Dry nose, irritation of nose and throat
**GI:** Heartburn, nausea, vomiting, diarrhea, rhinitis
**INTEG:** Rash
**META:** Hypokalemia, hyperglycemia
**MS:** Muscle cramps
**RESP:** Cough, dyspnea
**SYST:** Anaphylaxis, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver extensively, tissues |
| **Excretion** | Unknown, breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics

| | INH SOL | INH AEROSOL |
|---|---|---|
| **Onset** | 5-15 min | 4.5-10.2 min |
| **Peak** | 1½ hr | 76-78 min |
| **Duration** | 5-6 hr | 6 hr |

## INTERACTIONS

### Individual drugs

Haloperidol, chloroquine, droperidol, pentamidine, arsenic trioxide, levomethadyl: increased QT prolongation, Increase: hypokalemia: loop/thiazide diuretics

### Drug classifications

Adrenergics: increased levalbuterol action
β-Adrenergic blockers: decreased levalbuterol action, severe bronchospasm may occur
Bronchodilators (aerosol): increased action of bronchodilator
Class IA/III antidysrhythmics, some phenothiazines, beta agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation
Loop/thiazide diuretics: increased hypokalemia
MAOIs: tricyclics, other adrenergics, increased levalbuterol action

### Drug/herb

Cola nut, guarana, tea (black/green), coffee, yerba maté: increased stimulation

## NURSING CONSIDERATIONS

### Assessment

- Assess cardiac status: palpitations, increased or decreased B/P, dysrhythmias
- **QT prolongation:** Monitor ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea
- **Assess respiratory function:** vital capacity, pulse oximetry, forced expiratory volume, ABGs, lung sounds, heart rate, rhythm (baseline, during therapy); character of sputum: color, consistency, amount
- Determine that patient has not received theophylline therapy before giving dose, to prevent additive effect; client's ability to self-medicate
- Monitor for evidence of allergic reactions; paradoxic bronchospasm, anaphylaxis, angioedema; withhold dose; notify prescriber, if these occur hold dose, notify prescriber at once, bronchospasm may occur with new canister or vial
- **Pregnancy/breastfeeding:** Avoid use in pregnancy, do not breastfeed, unknown reaction

### Patient/family education

- Tell patient not to use OTC medications before consulting prescriber; extra stimulation may occur; instruct patient to use this medication before other medications and allow at least 5 min between each to prevent overstimulation; to limit caffeine products such as chocolate, coffee, tea, and cola or herbs such as cola nut, guarana, yerba maté
- Teach patient that if paradoxical bronchospasm occurs to stop product immediately and notify prescriber
- Teach patient to use this product first, if using other inhalers, wait 5 min or more between products; rinse mouth with water after each dose to prevent dry mouth
- **Inhaler:** Teach patient to shake well before using and to breathe normally while using and mist goes into the reservoir, to spray × 4 before first use or if not used for 3 days, wash at least weekly
- **Diabetes:** Teach patient that diabetes may be exacerbated, use other products for diabetes in addition if needed

### Evaluation

**Positive therapeutic outcome**

- Absence of dyspnea and wheezing after 1 hr
- Improved airway exchange
- Improved ABGs

## TREATMENT OF OVERDOSE:

Administer a $\beta_1$-adrenergic blocker

## levETIRAcetam (Rx)

(lev-ee-tye'ra-see-tam)
**Keppra, Keppra XR, Spirtam**
*Func. class.:* Anticonvulsant

**Do not confuse:** levETIRAcetam/lamoTRIgine/levOCARNitine/levoFLOXacin

**ACTION:** Unknown; may inhibit nerve impulses by limiting influx of sodium ions across cell membrane in motor cortex

**Therapeutic outcome:** Absence of seizures

**USES:** Adjunctive therapy in partial-onset seizures, primary generalized tonic-clonic seizures, myoclonic seizures in juvenile patients

## CONTRAINDICATIONS

Hypersensitivity, breastfeeding

**Precautions:** Pregnancy, children, geriatric, cardiac/renal disease, psychosis

## DOSAGE AND ROUTES

### Adjunctive treatment of partial seizures

**Adult and adolescent ≥16 yr: IV** 500 mg bid, may titrate by 1000 mg/day q2wk; max 3000 mg/day in divided doses; ext rel 1000 mg/day, may increase q2wk, max 3000 mg/day

**Adolescent <16 yr/child/infant:** PO 10 mg/kg bid, increase the daily dose q2wk, by 20 mg/kg to 30 mg/kg bid; if unable to tolerate, may reduce dose

### Myoclonic seizures/tonic-clonic seizures/partial seizures

**Adult and adolescent >16 yr:** PO/**IV** 500 mg bid, may increase by 1000 mg/day q2wk; max 3000 mg/day

### Adjunctive treatment of partial-onset seizure in those with epilepsy (Spirtam)

**Adult/child ≥ 4 yr and > 40 kg:** PO 500 mg bid, may increase q2wk by 500 mg bid, max 1500 mg bid

### Renal dose

**Adult:** PO CCr 50-80 ml/min, 500-1000 mg q12hr, ext rel 1000-2000 q24hr, max 2000 mg/day; CCr 30-49 ml/min, 250-750 mg q12hr, ext rel 500-1500 mg q24hr, max 1500 mg/day; CCr <30 ml/min 250-500 mg q12hr, ext rel 500-1000 mg q24hr, max 1000 mg/day

**Available forms:** Tabs 250, 500, 750, 1000; oral sol 100 mg/ml; SOL for inj 100 mg, 5 ml, ext rel tab 500, 750 mg; 1000 mg/100 ml 0.75% NaCl, 1500 mg/100 ml 0.54% NaCl, 500 mg/100 ml 0.82% NaCl; oral disintegrating tab 250, 500, 750, 1000 mg

### Implementation

**PO route**

- Ext rel product should not be used in dialysis patients
- Give with food, milk to decrease GI symptoms (rare)
- **Child <20 kg:** give oral sol, use calibrated device
- Store at room temperature (PO); diluted preparation stable for 24 hr at room temperature in polyvinyl bags

**Oral disintegrating tab**

- Give only whole tabs
- Peel foil from blister, do not push through foil
- Place on tongue and follow with a sip of liquid, do not swallow
- Tab can be added to a tablespoon of liquid, swirl gently, consume

**Intermittent IV route**

- Single-use vials: dilute in 100 mg of 0.9% NaCl, $D_5W$, LR; give over 15 min, discard unused vial contents, do not use product with particulates or discoloration

**Child:** Max concentration of product to be used 15 mg/ml (diluted solution) infuse over 15 min

- Store vials at room temperature

## ADVERSE EFFECTS

**CNS:** Dizziness, somnolence, asthenia, psychosis, suicidal ideation, non-psychotic behavioral symptoms, headache, ataxia
**EENT:** Diplopia, conjunctivitis
**GI:** Nausea, vomiting, anorexia, diarrhea, constipation, hepatitis
**HEMA:** Infection, leukopenia
**INTEG:** Pruritus, rash
**MISC:** Abdominal pain, pharyngitis, infection
**SYST:** Stevens-Johnson syndrome, toxic epidermal necrolysis, dehydration (child <4 yr)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Widely distributed, not protein bound |
| **Metabolism** | Liver, small amount |
| **Excretion** | Kidneys, 66% unchanged |
| **Half-life** | 6-8 hr, longer in renal disease/geriatric |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

CarBAMazepine: increased carBAMazepine toxicity

Sevelamer: decreased levetiracetam absorption; separate by 1 hr before, 3 hr after sevelamer

### Drug classifications

TCAs, antihistamines, benzodiazepines, other CNS depressants: increased sedation

### Drug/lab test

Decreased: Hct/Hgb, WBC, RBC

## NURSING CONSIDERATIONS

### Assessment

- Monitor urine function tests (BUN, urine protein) periodically during treatments
- Assess seizure activity including type, location, duration, and character, intensity, precipitating factors; provide seizure precautions
- Assess blood studies: CBC, LFTs
- **Assess mental status:** mood, sensorium, affect, behavioral changes, suicidal thoughts/behaviors
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, if used in pregnancy patient should enroll in the Antiepileptic Drug Pregnancy Registry 888-233-2334, do not breastfeed
- **Beers:** Avoid in older adults unless safer alternatives are not available, may cause ataxia, impaired psychomotor function

### Patient/family education

- Teach patient to carry/wear emergency ID stating patient's name, products taken, condition, prescriber's name, phone number
- Caution patient to avoid driving, other activities that require alertness until stabilized on medication, until response is known, drowsiness occurs during first month
- Teach patient not to discontinue medication quickly after long-term use
- Instruct patient to report suicidal thoughts, behaviors immediately, mood changes, hostility, thoughts of death/dying
- Teach patient to use a nonhormonal type of contraception
- Teach patient to take exactly as prescribed, do not double or omit doses
- Advise not to breastfeed, excreted in breast milk

### Evaluation

**Positive therapeutic outcome**

- Decreased seizure activity

## levobetaxolol ophthalmic

*See Appendix B*

## levobunolol ophthalmic

*See Appendix B*

## levocabastine ophthalmic

*See Appendix B*

## levodopa-carbidopa (Rx)

(lee-voe-doe'pa kar-bi-doe'pa)

**Apo-Levocarb, Duodopa, Rytary, Sinemet, Sinemet CR**

*Func. class.:* Antiparkinsonism agent

*Chem. class.:* Catecholamine

**ACTION:** Decarboxylation of levodopa in periphery is inhibited by carbidopa; more levodopa is made available for transport to brain and conversion to dopamine in the brain

**Therapeutic outcome:** Absence of involuntary movements

**USES:** Parkinson's disease, parkinsonism resulting from carbon monoxide, chronic manganese intoxication, cerebral arteriosclerosis, motor fluctuations in those with advanced Parkinson's disease

**Unlabeled uses:** Restless legs syndrome

## CONTRAINDICATIONS

Hypersensitivity, malignant melanoma, history of malignant melanoma, or undiagnosed skin lesions resembling melanoma

**Precautions:** Pregnancy, breastfeeding, diabetes, renal/cardiac/hepatic/respiratory disease, MI with dysrhythmias, open-angle glaucoma, seizures, peptic ulcer, depression

## DOSAGE AND ROUTES

### For the treatment of idiopathic Parkinson's disease, postencephalitic parkinsonism, and symptomatic parkinsonism that may follow injury to the nervous system by carbon monoxide intoxication and/or manganese intoxication

**Adult: PO (immediate-release tablets):** Initial treatment: 1 carbidopa 25 mg/levodopa 100 mg tablet tid, may increase by 1 tablet qday or every other day max of 8 tablets/day. If carbidopa 10 mg/levodopa 100 mg is used, may start with 1 tablet three or four times a day. **MAINTENANCE TREATMENT:** Individualize and adjust dosing regimen according to response and tolerability. At least 70 mg to 100 mg of carbidopa per day should be used. When a greater proportion of carbidopa is required, 1 tablet of carbidopa 25 mg/levodopa 100 mg may be substituted for each

carbidopa 10 mg/levodopa 100 mg tablet. **PO (extended-release tablets – Sinemet CR): Initial Treatment:** carbidopa 50 mg/levodopa 200 mg tablet bid, most have been use extended-release tablets 400 mg to 1600 mg of levodopa/ day. The dosing intervals should be 4 to 8 hr apart during the waking day, adjust dose at 3-day intervals. **Patients From Levodopa To Carbidopa-Levodopa:** Initiate at 25% of the previous dose of levodopa alone; in those with mild to moderate disease, the usual initial dosage is carbidopa 50 mg/levodopa 200 mg extended-release tablet twice daily. **Converting Patients From Immediate-Release Carbidopa-Levodopa To Extended-Release Carbidopa-Levodopa:** Substitute extended-release tablets at a dosage that provides approximately 10% more levodopa per day than the immediate-release tablets. The dosing intervals should be 4 to 8 hr apart during the waking day. For those receiving 300-400 mg/day of levodopa as immediate-release carbidopa-levodopa, start Sinemet CR carbidopa 50 mg/levodopa 200 mg bid, for patients receiving 500 mg/day to 600 mg/day of levodopa as immediate-release carbidopa-levodopa, start Sinemet CR carbidopa 50 mg/levodopa 200 mg tid **PO (extended-release capsules; Rytary) Adults Initial Treatment:** Rytary 23.75 mg/95 mg PO three times a day for the first 3 days. On day 4, may increase the dose to 36.25 mg/145 mg three times a day.

### For the treatment of motor fluctuations in patients with advanced Parkinson's disease

**Adults: Enteral suspension dosage (nasojejunal tube for short-term administration or PEG-J for long-term administration)** Before initiating the enteral suspension on day 1, convert patients from all other forms of levodopa to oral immediate-release carbidopa/levodopa tablets (1:4 ratio). Patients should remain on a stable dose of their concomitant medications taken for the treatment of Parkinson's disease before initiation of the carbidopa/levodopa suspension via enteral pump. Health care providers should ensure patients take their oral Parkinson's disease medications the morning of the PEG-J procedure. The daily enteral suspension dose can be titrated as needed, based on response and tolerability, after day 1 and until a stable daily dose is maintained. The maximum recommended daily dose of carbidopa/levodopa enteral suspension is 2000 mg of the levodopa component (i.e., 1 cassette per day) administered over 16 hr. At the end of each daily 16-hr infusion, patients will disconnect the pump from the PEG-J and take their nighttime dose of oral immediate-release carbidopa-levodopa tablets. DAY 1 MORNING DOSING: Determine the total amount of levodopa in milligrams (mg) in the first dose of oral immediate-release carbidopa/levodopa that was taken by the patient on the previous day. Convert the oral levodopa dose from milligrams (mg) to milliliters (ml) by multiplying the oral dose by 0.8 and then dividing by 20 mg/ml. This calculation will provide the morning dose of carbidopa/levodopa suspension in milliliters. Add 3 ml to the morning dose to fill (prime) the intestinal tube to obtain the total morning dose. Program the pump to deliver the total morning dose, which is usually administered over 10 to 30 min. DAY 1 CONTINUOUS DOSING: Determine the amount of oral immediate-release levodopa that the patient received from oral immediate-release carbidopa-levodopa doses throughout the previous day (16 waking hr), in milligrams (mg). Do not include the doses of oral immediate-release carbidopa-levodopa taken at night when calculating the levodopa amount. Subtract the first oral levodopa dose in milligrams (mg) taken by the patient on the previous day from the total oral levodopa dose in milligrams (mg) taken over 16 waking hr. Divide the result by 20 mg/ml. This is the dose of carbidopa/levodopa suspension administered as a continuous dose (in ml) over 16 hr. The hourly infusion rate (ml per hour) is obtained by dividing the continuous dose by 16 hr. The hourly infusion rate will be programmed into the pump as the continuous rate. If persistent or numerous "off" periods occur during the 16-hr infusion, consider increasing the continuous dose or using the extra dose function. If dyskinesia or levodopa-related adverse reactions occur, consider decreasing the continuous dose or stopping the infusion until the adverse reactions subside. **Morning Dose Adjustments:** If there was an inadequate response within 1 hr of the morning dose on the prior day, adjust the morning dose (excluding the 3 ml to fill the tube) as follows: If the morning dose on the prior day was less than or equal to 6 ml, increase the morning dose by 1 ml. If the morning dose on the preceding day was greater than 6 ml, increase the morning dose by 2 ml. If the patient experienced dyskinesias or levodopa-related adverse reactions within 1 hr of the morning dose on the prior day, decrease the morning dose by 1 ml. **Continuous Dose Adjustments:** Consider increasing the continuous dose based on the number and volume of extra

doses of carbidopa/levodopa (i.e., total amount of levodopa component) that was needed for the previous day and the patient's clinical response. Consider decreasing the continuous dose if the patient experienced troublesome dyskinesia or other troublesome treatment-related adverse reactions on the preceding day as follows: For troublesome adverse reactions lasting 1 hr or more, decrease the continuous dose by 0.3 ml/hour. For troublesome adverse reactions lasting for two or more periods of 1 hr or more, decrease the continuous dose by 0.6 ml/hr. EXTRA DOSES: The enteral infusion pump has an extra dose function that can be used to manage acute "off" symptoms that are not controlled by the morning dose and the continuous dose administered over 16 hr. The extra dose function should be set at 1 ml (20 mg of levodopa) when starting the enteral suspension. If the amount of the extra dose needs to be adjusted, it is typically done in 0.2-ml increments. The extra dose frequency should be limited to one extra dose every 2 hr. Administration of frequent extra doses may cause or worsen dyskinesias. **Treatment Discontinuation:** Avoid sudden discontinuation or rapid dose reduction. If discontinuation is needed, the dose should be tapered or patients should be switched to oral immediate-release carbidopa/levodopa tablets. When using a PEG-J tube, the drug can be discontinued by withdrawing the tube and letting the stoma heal. The removal of the tube should only be performed by a qualified health care provider

### For the treatment of restless legs syndrome (RLS) (unlabeled)

**Adult: PO** A bedtime dose of immediate-release carbidopa/levodopa starting at 25 mg/100 mg. Levodopa dosages as high as 600 mg/day in divided doses have been used. Dosages may be increased rapidly based on individual response and are usually given before bedtime

**Available forms:** Tabs 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa; ext rel tab 25 mg/100 mg, 50 mg/200 mg carbidopa/levodopa (Sinemet CR); oral disintegrating tab (Parcopa) 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa; ext rel caps (Rytary) 23.75 mg/95 mg, 36.25 mg/145 mg, 48.75/195 mg, 61.25/245 mg; enteral suspension (Duopa) levodopa 20 mg/ml/4.63 mg/ml carbidopa

### Implementation

**PO route**

- Swallow **ext rel tabs** whole; do not break, crush, or chew
- **Oral disintegrating tab:** gently remove from bottle, place on tongue, swallow with saliva; after it dissolves, liquid is not necessary
- Give product until NPO before surgery; check with prescriber for continuing product
- Adjust dosage depending on patient response
- Give with meals or after meals to prevent GI symptoms; limit protein taken with product
- Give only after MAOIs have been discontinued for 2 wk; if previously on levodopa, discontinue for at least 8 hr before change to levodopa-carbidopa

**Enteral route**

- Fully thaw in refrigerator, remove one cassette from refrigerator, 20 min before to use, give through NG tube or a percutaneous endoscopic gastronomy tube connected to the CADD - Legacy 1400 pump, disconnect after use and flush with water, cassettes are single use only, label in order to be used based on date

## ADVERSE EFFECTS

**CNS:** *Involuntary choreiform movements, hand tremors, fatigue, headache, anxiety, twitching, numbness, weakness, confusion, agitation, insomnia, nightmares,* psychosis, hallucination, hypomania, severe depression, dizziness, impulsive behaviors, neuroleptic malignant syndrome, suicidal ideation
**CV:** *Orthostatic hypotension,* tachycardia, hypertension, palpitation, MI
**EENT:** Blurred vision, diplopia, dilated pupils
**GI:** *Nausea, vomiting, anorexia, abdominal distress, dry mouth, flatulence, dysphagia, bitter taste, diarrhea, constipation,* GI bleeding
**HEMA:** Hemolytic anemia, leukopenia, agranulocytosis, thrombocytopenia
**INTEG:** Rash, sweating, alopecia
**MISC:** Urinary retention, incontinence, weight change, dark urine, increased libido, hypersensitivity, dark sweat

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO); ER dose slowly absorbed |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, metabolites |
| **Half-life** | Levodopa (1 hr); carbidopa (1-2 hr) |

### Pharmacodynamics

| | PO | PO-ER | Enteral |
|---|---|---|---|
| **Onset** | Unknown | Unknown | |
| **Peak** | 1 hr | 2½ hr | 2.5 hr |
| **Duration** | 6-24 hr | Unknown | |

## INTERACTIONS

### Individual drugs

Metoclopramide: increased effects of levodopa
Papaverine, pyridoxine: decreased effects of levodopa

### Drug classifications

Antacids: increased effects of levodopa
Anticholinergics, antipsychotics, benzodiazepines, hydantoins: decreased effects of levodopa
Antihypertensives: Increased: Hypotension
MAOIs: hypertensive crisis

### Drug/food

Protein: decreased absorption of levodopa

### Drug/lab test

Increased: AST, ALT, bilirubin, LDH, alkaline phosphatase, BUN, serum glucose
Decreased: BUN, creatinine, uric acid
False increase: urine protein
False positive: urine ketones (dipstick), Coombs' test
False negative: urine glucose

## NURSING CONSIDERATIONS

### Assessment

- Parkinsonism: Assess for shuffling gait, muscle rigidity, involuntary movements, pill rolling, muscle spasms, drooling before and during treatment
- Assess B/P, respiration, orthostatic B/P
- Monitor I&O ratio; retention commonly causes decreased urinary output, distention, frequency, incontinence; palpate bladder if retention occurs
- Assess for muscle twitching, blepharospasm that may indicate toxicity
- Monitor renal, liver, hematopoietic studies; also for diabetes, acromegaly during long-term therapy
- Monitor for constipation, cramping, pain in abdomen, abdominal distention; increase fluids, bulk, exercise if this occurs
- Assess for tolerance over long-term therapy; dose may have to be increased or changed
- Assess for mental status: affect, mood, CNS depression, worsening of mental symptoms during early therapy
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, product is excreted in breast milk

### Patient/family education

- Teach patient to change positions slowly to prevent orthostatic hypotension, especially during beginning of treatment
- Teach patient to report side effects: twitching, eye spasms, grimacing, protrusion of tongue, personality changes that indicate overdose
- Instruct patient to use product exactly as prescribed; if product is discontinued abruptly, parkinsonian crisis may occur; do not double doses; take missed dose as soon as remembered up to 2 hr before next dose
- Teach patient that urine, sweat may darken and is harmless
- Advise patient to use physical activities to maintain mobility and lessen spasms
- Instruct patient that OTC medications should not be used unless approved by prescriber
- Advise patient that drowsiness, dizziness are common; to avoid hazardous activities until response is known
- Explain that sips of water, hard candy, or gum may lessen dry mouth
- Teach patient to take with meals to prevent GI symptoms; to limit protein intake, which impairs product's absorption
- Teach patient not to chew, crush extended-release product
- Teach patient to immediately report nausea, vomiting, abdominal pain, ongoing constipation if using enteral product
- Teach patient to use ODT immediately after removing from container, to dissolve on tongue, swallow with saliva
- Teach patient to take as prescribed, not to take double doses

### Evaluation

**Positive therapeutic outcome**

- Decrease in akathisia
- Improved mood
- Decreased involuntary movements

## levofloxacin (Rx)

(lev-o-floks'a-sin)
**Levaquin**
*Func. class.:* Antiinfective
*Chem. class.:* Fluoroquinolone antibacterial

**Do not confuse:** Levaquin/Larium, levoFLOXacin/levetiracetam

**ACTION:** Interferes with conversion of intermediate DNA fragments into high molecular weight DNA in bacteria; DNA gyrase inhibitor; inhibits topoisomerase IV

**Therapeutic outcome:** Bacteriocidal action against the following: *Streptococcus pneumoniae, Streptococcus pyogenes, Haemophilus influenzae, Haemophilus parainfluenzae, Moraxella catarrhalis, Klebsiella pneumoniae, Mycoplasma pneumoniae, Escherichia coli, Serratia marcescens, Chlamydia pneumoniae, Legionella pneumophila,*

*Enterococcus faecalis, Staphylococcus epidermidis, Staphylococcus pyogenes, Staphylococcus aureus, Bacillusanthracis*

**USES:** Acute sinusitis, acute chronic bronchitis, community-acquired pneumonia, uncomplicated skin infections, UTI, cellulitis, prostatitis, inhalational anthrax (postexposure), acute pyelonephritis, inhalation anthrax in children

## CONTRAINDICATIONS

Hypersensitivity to quinolones

**Precautions:** Pregnancy, breastfeeding, children; photosensitivity, acute MI, atrial fibrillation, colitis, dehydration, diabetes, QT prolongation, myasthenia gravis, renal disease, seizure disorder, syphilis

**BLACK BOX WARNING:** Tendon pain/rupture, tendinitis, myasthenia gravis, neurotoxicity

## DOSAGE AND ROUTES

### Acute bacterial exacerbation of chronic bronchitis

**Adult:** PO/**IV** 500 mg q24hr × 7 days

### Acute bacterial sinusitis

**Adult:** PO 500 mg q24hr × 10-14 days or 750 mg q24hr × 5 days

### Mild-moderate UTI/acute pyelonephritis

**Adult:** PO/**IV** 750 mg q24hr × 5 days or 250 mg q24hr × 10 days

### Chronic bacterial prostatitis

**Adult:** PO 500 mg q24hr × 28 days

### Postexposure inhalational anthrax

**Adult/adolescent/child >50 kg:** PO/**IV** 500 mg q24hr × 60 days

**Infant >6 mo and child <50 kg:** **IV** 8 mg/kg q12hr × 60 days, max 250 mg/dose

### Pneumonia, community acquired

**Adult:** PO/**IV** 500 mg q24hr × 7-14 days or 750 mg q24hr × 5 days

### Pneumonia, nosocomial

**Adult:** PO/**IV** 750 mg q24hr × 7-14 days

### SSSI, complicated

**Adult:** PO/**IV** 750 mg q24hr × 7-14 days

### SSSI, uncomplicated

**Adult:** PO 500 mg q24hr × 7-10 days

### UTI, complicated

**Adult:** PO/**IV** 750 mg q24hr × 5 days or 250 mg q24hr × 10 days

### UTI, uncomplicated

**Adult:** PO 250 mg q24hr × 3 days

### Plague *(Yersinia pestis)*

**Adult:** PO/**IV** 500 mg q24hr × 10-14 days (with pneumonia, 750 mg q24hr)

**Adolescent/child <50 kg:** PO/**IV** 8 mg/kg (max 250 mg/dose) q12hr × 10-14 days

### Renal disease

**Adult:** PO/IV CCr 20-49 ml/min: for 750-mg dose, give 750 mg q48hr; for 500-mg dose, give 500 mg once, then 250 mg q24hr; for 250-mg dose, no adjustment; CCr 10-19 ml/min: for 750-mg dose, give 750 mg once, then 500 mg q48hr; for 500-mg dose, give 500 mg once, then 250 mg q48hr; for 250-mg dose, give 250 mg q48hr, except when treating complicated UTI, then no dose adjustment

**Available forms:** Single-use vials (500, 750 mg), premixed flexible container; 250 mg/50 ml $D_5W$, 500 mg/100 ml $D_5W$, 750 mg/150 ml $D_5W$; tabs 250, 500, 750 mg; oral sol 25 mg/ml

### Implementation

- Obtain C&S before treatment and periodically to determine resistance to this product
- Give PO 2 hr before or 2 hr after antacids, iron, calcium, zinc, sucralfate; give fluids
- Check for irritation, extravasation, phlebitis daily

**Oral solution**

- Give 1 hr prior to or 2 hr after food

**Intermittent IV infusion route**

- Discard any unused sol in the single-dose vial
- Visually inspect for particulate matter/discoloration prior to use

**IV (single use vial)**

- **500 mg/20 ml vials:** To prepare a dose of 500 mg, withdraw 10 ml from a 20-ml vial and dilute with a compatible IV solution ($D_5W$, NS) to a total volume of 50 ml. To prepare a 500-mg dosage, withdraw all 20 ml from the vial and dilute with a compatible IV solution to a total volume of 100 ml
- **750 mg/30 ml vials:** To prepare a dose of 750 mg, withdraw 30 ml from a 30-ml vial and dilute with a compatible intravenous solution ($D_5W$, NS) to a total volume of 150 ml
- The concentration of the diluted solution should be 5 mg/ml prior to administration. Solutions contain no preservatives; any unused portions must be discarded
- **Storage:** The diluted solution may be stored for up to 72 hours when stored at or below 25° C (77° F) or for 14 days when stored under refrigeration at 5° C (41° F) in plastic containers. Solutions may be frozen for up to 6 months (−20° C or −4° F) in glass bottles or plastic containers. Thaw frozen solutions

at room temperature (25° C or 77° F) or in a refrigerator (8° C or 46° F). Do not force thaw by microwave or water bath immersion. Do not refreeze after initial thawing

**Premixed IV solution**

• No dilution is necessary

**Intermittent IV injection**

• Infuse doses of ≤500 mg IV over 60 minutes and doses of 750 mg IV over 90 minutes. Shorter infusions or bolus injections should be avoided because of the risk of hypotension

**Y-site compatibilities:** Alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, atenolol, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, caffeine citrate, calcium gluconate, CARBOplatin, carmustine, caspofungin, cefepime, cefoTEtan, ceftaroline, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin liposomal, dexamethasone, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, floxuridine, fluconazole, fludarabine, foscarnet, fosphenytoin, gallium, gemcitabine, gemtuzumab, gentamicin, granisetron, haloperidol, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, labetalol, lepirudin, leucovorin, levorphanol, lidocaine, linezolid, mannitol, mechlorethamine, meperidine, mesna, methylPREDNISolone, metoclopramide, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, morphine, mycophenolate mofetil, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, penicillin G sodium, pentamidine, phenylephrine, plicamycin, potassium acetate/chloride, promethazine, propranolol, quinupristin-dalfopristin, ranitidine, remifentanil, rocuronium, sargramostim, sodium bicarbonate, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

**Solution compatibilities:** 0.9% NaCl, $D_5W$, $D_5$/0.9% NaCl, $D_5LR$, $D_5$/0.45% NaCl, sodium lactate, plasma-lyte 56/$D_5W$

## ADVERSE EFFECTS

**CNS:** *Headache,* dizziness, *insomnia,* anxiety, seizures, *encephalopathy,* paresthesia, pseudotumor cerebri

**CV:** Chest pain, palpitations, vasodilatation, QT prolongation, hypotension (rapid infusion)

**EENT:** Dry mouth, visual impairment, tinnitus

**GI:** *Nausea,* flatulence, *vomiting,* diarrhea, abdominal pain, pseudomembranous colitis, hepatotoxicity, esophagitis, pancreatitis

**GU:** Vaginitis, crystalluria

**HEMA:** Eosinophilia, hemolytic anemia, lymphopenia

**INTEG:** Rash, pruritus, photosensitivity, epidermal necrolysis, injection site reaction, edema

**MISC:** Hypoglycemia, hypersensitivity, tendon rupture, rhabdomyolysis

**RESP:** Pneumonitis

**SYST:** Anaphylaxis, multisystem organ failure, Stevens-Johnson syndrome, angioedema, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Excretion** | Kidneys unchanged |
| **Half-life** | 6-8 hr |

### Pharmacodynamics

| | |

| **Onset** | Immediate |
| **Peak** | Infusion's end |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Calcium, iron, sucralfate, zinc: decreased absorption of levofloxacin, give 2 hr before or after products

Foscarnet: increased CNS stimulation, seizures

Haloperidol, chloroquine, droperidol, pentamidine, arsenic trioxide, levomethadyl: increased QT prolongation

Magnesium: decreased levofloxacin absorption; do not use in same **IV** line

Probenecid: increased levofloxacin levels

Theophylline: decreased theophylline clearance; toxicity may result

Warfarin: increased bleeding, monitor coagulation studies (INR/PT)

### Drug classifications

Antacids (magnesium, aluminum): decreased absorption of levofloxacin

**BLACK BOX WARNING:** Corticosteroids: increased tendon rupture, assess for tendon pain

Class IA/III antidysrhythmics, some phenothiazines, beta agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation, avoid using together

NSAIDs, cycloSPORINE: increased CNS stimulation, seizures

### Drug/lab test

Increased: PT, INR

Decreased: glucose, lymphocytes

### Drug/herb

Increase: Photosensitivity: St. John's wort

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction to quinolones
- Infection: **Assess patient for signs and symptoms of infection,** including characteristics of wounds, sputum, urine, stool, WBC $>10{,}000/mm^3$, fever; baseline, during treatment
- Obtain C&S before beginning product therapy to identify if correct treatment has been initiated
- **QT prolongation:** Monitor for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea
- **Pseudomembranous colitis:** Assess for diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC and low serum albumin; stop product and give usually either vancomycin or IV metroNIDAZOLE
- **Assess for allergic reactions and anaphylaxis:** rash, urticaria, pruritus, chills, fever, joint pain; may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available for anaphylactic reaction
- Determine urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also check for increased BUN, creatinine

**BLACK BOX WARNING: Myasthenia gravis:** Do not use this product, may lead to life-threatening weakness of the respiratory muscles

**BLACK BOX WARNING: Neurotoxicity:** May occur within hours to weeks after starting use, may be irreversible, avoid use in those who have experienced peripheral neuropathy, numbness, tingling, burning in extremities report immediately to prescriber

- Monitor blood tests: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
- **Assess for overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

**BLACK BOX WARNING: Tendon rupture:** Discontinue product at first sign of tendon pain or inflammation; usually the Achilles tendon is affected, can occur up to a few months after treatment and may require surgical repair; steroids may increase risk, elderly transplant patients

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate **blood dyscrasias (rare)**
- **Superinfection:** Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur, purulent discharge in stool
- Instruct patient to take all medication prescribed for the length of time ordered; product must be taken around the clock to maintain blood levels; do not give medication to others
- Advise patient to notify prescriber of diarrhea with blood or purulent discharge in stool
- Instruct patient to take 2 hr before antacids, iron, calcium, zinc products
- Tell patient to complete full course of therapy; to increase fluid intake to 2 L/day to prevent crystalluria
- Advise patient to avoid hazardous activities until response to product is known

• Instruct patient to rinse mouth frequently and use sugarless candy or gum for dry mouth
• Instruct patient to avoid taking other medications unless approved by prescriber
• Teach patient to monitor glucose (diabetes), notify provider of changes
• Advise patient to avoid sun exposure or use sunscreen to prevent phototoxicity

**BLACK BOX WARNING:** Teach patient to notify prescriber of tendon pain, inflammation, avoid corticosteroids with this product

### Evaluation

**Positive therapeutic outcome**
• Absence of signs/symptoms of infection (WBC $<10{,}000/mm^3$, temp WNL)
• Reported improvement in symptoms of infection

## levofloxacin ophthalmic

*See Appendix B*

## levomilnacipran

(lee′voe-mil-na′si-pran)
**Fetzima, milnacipran**
*Chem. class.:* Antidepressant
*Func. class.:* Serotonin norepinephrine reuptake inhibitor (SNRI)

**ACTION:** May potentiate serotonergic, andrenergic activity in the CNS; is a potent inhibitor of adrenal serotonin and norepinephrine reuptake

**Therapeutic outcome:** Decreased depression

**USES:** Major depressive disorder in adults

### CONTRAINDICATIONS

Alcohol intoxication, alcoholism, closed angle glaucoma, hepatic disease, hepatitis, jaundice, hypersensitivity

**Precautions:** Pregnancy, breastfeeding, geriatric patients, mania, hypertension, renal/cardiac disease, seizures, increased intraocular pressure, anorexia, bleeding, dehydration, diabetes, hypotension, hypovolemia, orthostatic hypotension, abrupt product withdrawal

**BLACK BOX WARNING:** Children, suicidal ideation

### DOSAGE AND ROUTES

**Major depressive disorder (levomilnacipran)**
**Adult: PO** 20 mg/day × 2 days, then 40 mg/day, may increase in increments of 40 mg at intervals of at least 2 days, max 120 mg/day; max 80 mg/day (strong CYP3A4 inhibitors therapy)

**Major depressive disorder (milnacipran)**
**Adult:** PO 12.5-25 mg bid, may titrate up to 100 mg bid, max 200 mg/day

**Renal dose**
**Adult:** PO CCr 30-59 ml/min, max 80 mg/day; 15-29 ml/min, max 40 mg/day; <15 ml/min, avoid use

**Fibromyalgia (levomilnacipran)**
**Adult/adolescent ≥ 17 yr:** PO 12.5 mg once on day 1, then 12.5 mg bid on days 2-3, then 25 mg bid on day 4-7 and 50 mg bid thereafter

**Fibromyalgia (Sarella) (milnacipran)**
**Adult:** PO 12.5 mg qday, increase by 12.5 mg bid on days 4 to 7, increase to 50 mg bid after day 7, may increase to 100 mg bid as needed

**Renal dose**
**Adult:** PO CCr 5-29 ml/min reduce maintenance dose by 50% (25-50 mg) bid

**Available forms:** Ext rel caps 20, 40, 80, 120 mg; tabs 12.5, 25, 50, 100 mg

### Implementation

• Swallow cap whole; do not break, crush, or chew; do not sprinkle on food or mix with liquid
• Give without regard to food
• Give at the same time of day

### ADVERSE EFFECTS

**CNS:** Dizziness, agitation, hallucinations, seizures, drowsiness, mania, migraine, paresthesias, suicidal ideation, syncope
**CV:** Hypertension, palpitations, dysrhythmia, sinus tachycardia
**EENT:** Teeth grinding, blurred vision
**GI:** Constipation, diarrhea, nausea, vomiting, anorexia, dry mouth, abdominal pain
**GU:** Urinary retention
**SYST:** Serotonin syndrome, Stevens-Johnson syndrome

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 22% protein binding |
| **Metabolism** | By CYP2D6 in the liver |
| **Excretion** | Unknown |
| **Half-life** | 12 hr |

#### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 6-8 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Linezolid, methylene blue IV: do not use concurrently

### Drug classifications

Anticoagulants, antiplatelets, NSAIDs, salicylates: increased bleeding risk

Antipsychotics, dopamine antagonists: Increased neuroleptic malignant syndrome, avoid using together

CYP34A inhibitors: increased levomilnacipran effect

MAOIs: Coadministration contraindicated within 14 days of MAOI

SSRIs, serotonin receptor agonists, SNRIs: increased serotonin syndrome

### Drug/herb

Alfalfa, feverfew, dong quai, fish oil: Increased bleeding risk

## NURSING CONSIDERATIONS

### Assessment

- **Serotonin syndrome:** assess for nausea/vomiting, dizziness, facial flush, shivering, sweating

**BLACK BOX WARNING: Depression:** assess mood, sensorium, affect, suicidal tendencies, increase in psychiatric symptoms, depression, panic; monitor children qwk face to face during first 4 wk or dosage change, then every other week for the next 4 wk, then at 12 wk

- **Beers:** Use with caution in older adults, may exacerbate or cause SIADs, monitor for hyponatremia
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, SSRIs should not be used in the third trimester, do not breastfeed
- Monitor B/P lying, standing; pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS q4hr in patients with CV disease
- Hepatic studies: monitor AST ALT, bilirubin
- Withdrawal symptoms: assess for headache, nausea, vomiting, muscle pain, weakness; not common unless product is discontinued abruptly

### Patient/family education

- Teach patient signs and symptoms of bleeding (GI bleeding, nosebleed, ecchymoses, bruising)
- Instruct patient to use caution when driving and in other activities requiring alertness because of drowsiness and blurred vision
- Instruct patient to avoid alcohol ingestion, MAOIs, other CNS depressants, to notify all providers of use of this product
- Instruct patient not to discontinue medication quickly after long-term use; may cause headache, malaise; taper

**BLACK BOX WARNING:** Teach patient that clinical worsening and suicidal risk may occur, to notify prescriber immediately if suicidal thoughts/behaviors, aggression, panic attacks occur

**BLACK BOX WARNING: Serotonin syndrome:** Teach patient to report immediately nausea, vomiting, dizziness, facial flush, shivering, sweating

- Teach patient to notify prescriber if pregnancy is planned or suspected, or if breastfeeding
- Teach patient improvement may occur in 4-8 wk or up to 12 wk (geriatric patients)
- Teach patient to swallow caps whole, do not break, crush, chew
- Advise patient that product may be used without food

### Evaluation

**Positive therapeutic outcome**

- Decreased depression

## levothyroxine (Rx)

(lee-voe-thye-rox'een)

**Eltroxin, Euthyrox, Levothroid, Levo-TB, Levoxyl, Synthroid, Tirosint, Unithroid**

*Func. class.:* Thyroid hormone

*Chem. class.:* Levoisomer of thyroxine

**Do not confuse:** Synthroid/Symmetrel, levothyroxine/lamatrigine/Lanoxin/liothyronine

**ACTION:** Controls protein synthesis; increases metabolic rate, cardiac output, renal blood flow, $O_2$ consumption, body temp, blood volume, growth, development at cellular level via action on thyroid hormone receptors

**Therapeutic outcome:** Correction of lack of thyroid hormone

**USES:** Hypothyroidism, myxedema coma, thyroid hormone replacement, thyrotoxicosis, congenital hypothyroidism, some types of thyroid cancer, pituitary TSH suppression

## CONTRAINDICATIONS

Adrenal insufficiency, recent MI, thyrotoxicosis, hypersensitivity to beef, alcohol intolerance (inj only)

**BLACK BOX WARNING:** Obesity treatment

**Precautions:** Pregnancy, breastfeeding, geriatric, angina pectoris, hypertension, ischemia, cardiac disease, diabetes

## DOSAGE AND ROUTES NTI

### Severe hypothyroidism

**Adult ≤50 yr:** PO 1.7 mcg/kg/day, 6-8 wk, average dose 100-200 mcg/day; IM/**IV** 50-100 mcg/day as a single dose or 50% of usual oral dosage

**Adult >50 yr without heart disease or <50 yr with heart disease:** PO 25-50 mcg/day, titrate q6-8wk

**Adult >50 yr with heart disease:** PO 12.5-25 mcg/day, titrate by 12.5-25 mcg q6-8wk

**Child:** PO (puberty complete) 1.7 mcg/kg/day

**Child >12 yr:** PO (incomplete puberty) 2-3 mcg/kg/day given as a single dose AM

**Child 6-12 yr:** PO 4-5 mcg/kg/day given as a single dose AM

**Child 1-5 yr:** PO 5-6 mcg/kg/day given as a single dose AM

**Child 6-12 mo:** PO 6-8 mcg/kg/day given as a single dose AM

**Child 3-6 mo:** PO 8-10 mcg/kg/day given as a single dose AM

### Myxedema coma

**Adult:** **IV** 300-500 mcg; may increase by 100-300 mcg after 24 hr; give oral medication as soon as possible

### Subclinical hypothyroidism

**Adult:** PO 1 mcg/kg/day may be sufficient

**Available forms:** Powder for inj 100, 200, 500 mcg/vial; tabs 25, 50, 88, 100, 112, 125, 137, 150, 175, 200, 300; cap (liquid filled) 13, 25, 50, 75, 88, 100, 112, 125, 137, 150 mcg

### Implementation

- Store in tight, light-resistant container; sol should be discarded if not used immediately
- Withdraw medication 4 wk before RAIU test

**PO route**

- Give in AM if possible as a single dose to decrease sleeplessness; give at same time each day to maintain product level
- Give crushed and mixed with water, nonsoy formula (decreased absorption), or breast milk for infants/children, give by spoon or dropper, may crush and sprinkle over food
- Give only for hormone imbalances; not to be used for obesity, male infertility, menstrual conditions, lethargy; give lowest dosage that relieves symptoms; lower dosage for geriatric and in cardiac disease
- Use 8 oz of water with Levoxyl to prevent trouble breathing
- Separate antacids, iron, calcium products by 4 hr

**Direct IV route**

- Give **IV** after reconstituting with 5 ml normal saline injection (0.9% NaCl), 500 mcg/5 ml, 200 mcg/2 ml; shake well; give through Y-tube or 3-way stopcock; give 100 mcg or less over 1 min; do not add to **IV** infusion; considered incompatible in syringe with all other products

## ADVERSE EFFECTS

**CNS:** *Anxiety, insomnia, tremors,* headache, thyroid storm, excitability

**CV:** *Tachycardia, palpitations, angina, dysrhythmias,* hypertension, cardiac arrest

**GI:** Nausea, diarrhea, increased or decreased appetite, cramps

**MISC:** Menstrual irregularities, weight loss, sweating, heat intolerance, fever, alopecia, decreased bone mineral density

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Erratic (PO); complete (**IV**) |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver; enterohepatic recirculation |
| **Excretion** | Feces via bile; breast milk (small amounts) |
| **Half-life** | 6-7 days |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | 24 hr | |
| **Peak** | 12-48 hr | 12-48 hr |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Aluminum, calcium, iron, magnesium, sucralfate, rifampin, rifabutin: decreased levothyroxine effects

Orlistat, ferrous sulfate: decreased absorption of levothyroxine

### Drug classifications

Antacids: decreased levothyroxine effects

Anticoagulants (oral): increased anticoagulant effect, monitor coagulation studies (INR, PT)

Antidiabetics, insulin: Increased or decreased glucose levels, adjust levels

Bile acid sequestrants: decreased levothyroxine absorption

EPINEPHrine products: increased cardiac insufficiency risk

Estrogens: decreased thyroid hormone effects

Selective serotonin reuptake inhibitors, antileptics (carBAMazepine, OXcarbazepine, PHENobarbital, primidone, phenytoin); antimicrobials (rifAMPin, efavirenz, nevirapine, rifabutin, rifapentine): decreased levothyroxine effects
Sympathomimetics: increased sympathomimetic effect
Tricyclic/tetracyclic antidepressants: Increased effects of both products

### Drug/food
Fiber, walnuts: decreased product absorption, avoid concurrent use or adjust dose

### Drug/herb
Horseradish, Soy: decreased thyroid hormone effect

### Drug/lab test
Increased: CPK, LDH, AST, blood glucose
Decreased: thyroid function tests

## NURSING CONSIDERATIONS
### Assessment
- Determine if the patient is taking anticoagulants, antidiabetic agents; document on chart
- Take B/P, pulse before each dose; monitor I&O ratio and weight every day in same clothing, using same scale, at same time of day
- Monitor height, weight, psychomotor development, and growth rate if given to a child
- Monitor $T_3$, $T_4$, which are decreased; radioimmunoassay of TSH, which is increased; radioactive iodine uptake (RAIU), which is increased if patient's dosage of medication is too low
- Monitor pro-time (may require decreased anticoagulant); check for bleeding, bruising
- Assess for increased nervousness, excitability, irritability, which may indicate a too-high dosage of medication, usually after 1-3 wk of treatment
- Assess cardiac status: angina, palpitations, chest pain, change in VS; the geriatric patient may have undetected cardiac problems and baseline ECG should be completed before treatment
- **Anticoagulants:** Should be tested and dose adjusted as needed
- **CAD:** Monitor for coronary insufficiency, also watch for cardiac changes in those receiving high, rapid doses
- **Bone density:** Patient bone density testing baseline and periodically, bone loss may occur with long-term therapy
- **Pregnancy/breastfeeding:** May be used in pregnancy, breastfeeding

### Patient/family education
- Teach patient that product is not a cure but controls symptoms and that treatment is long term
- Instruct patient to report excitability, irritability, anxiety, sweating, heat intolerance, chest pain, palpitations, which indicate overdose
- Advise patient not to switch brands unless approved by prescriber; bioavailability may differ; do not take with food; absorption will be decreased
- Teach patient that product may be discontinued after giving birth; thyroid panel will be evaluated after 1-2 mo
- Teach patient or parent that hyperthyroid child will show almost immediate behavior/personality change; that hair loss will occur in child but is temporary
- Caution patient that product is not to be taken to reduce weight
- Caution patient to avoid OTC preparations with iodine; read labels; other medications should not be used unless approved by prescriber, not to switch brands, protect from light, moisture
- Teach patient to avoid iodine-rich food: iodized salt, soybeans, tofu, turnips, high-iodine seafood, some bread, products
- **Pregnancy/breastfeeding**: Teach patient to continue using in pregnancy, breastfeeding

### Evaluation
**Positive therapeutic outcome**
- Absence of depression
- Weight loss, increased diuresis, pulse, appetite
- Absence of constipation, peripheral edema, cold intolerance, pale, cool dry skin, brittle nails, alopecia, coarse hair, menorrhagia, night blindness, paresthesias, syncope, stupor, coma, rosy cheeks
- Improved levels of $T_3$, $T_4$ by laboratory tests
- Child: age-appropriate weight, height, and psychomotor development

## TREATMENT OF OVERDOSE:
Withhold dose for up to 1 wk; acute overdose: gastric lavage or induced emesis, provide supportive treatment to control symptoms

**⚠ HIGH ALERT**

## lidocaine, parenteral (Rx)
(lye'doe-kane)
**LidoPen Auto-Injector, Xylocaine, Xylocard**
*Func. class.:* Antidysrhythmic (class IB)
*Chem. class.:* Aminoacyl amide

**ACTION:** Increases electrical stimulation threshold of ventricle and His-Purkinje system, which stabilizes cardiac membrane and decreases automaticity

**Therapeutic outcome:** Decreased ventricular dysrhythmia

## USES:
Ventricular tachycardia, ventricular dysrhythmias during cardiac surgery, MI, digoxin toxicity, cardiac catheterization

## CONTRAINDICATIONS
Hypersensitivity to amides, severe heart block, supraventricular dysrhythmias, Adams-Stokes syndrome, Wolff-Parkinson-White syndrome

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal/hepatic disease, HF, respiratory depression, malignant hyperthermia, myasthenia gravis, weight <50 kg

## DOSAGE AND ROUTES
### Ventricular arrythmias caused by MI, cardiac manipulation, glycosides
**Adult:** **IV** BOL 50-100 mg (1-1.5 mg/kg) 25-50 mg/min, repeat 5min, until arrythmias are controlled, max 300 mg in 1 hr; begin **IV** INF 1-4 mg/min (20-50 mcg/kg/min)
**Child:** IV/intraosseous bolus: 1 mg/kg, start infusion at 30 mcg/kg/min

**Available forms:** **IV inf** 0.2% (2 mg/ml), 0.4% (4 mg/ml), 0.8% (8 mg/ml); **IV** admixture 4% (40 mg/ml), 10% (100 mg/ml), 20% (200 mg/ml); **IV direct** 1% (10 mg/ml), 2% (20 mg/ml); inj (to IV admixture) 20% (200 mg/ml)

### Implementation
**IM route**
- Administer in deltoid, aspirate to prevent **IV** administration
- Check site daily for extravasation, do not use in shock

**Direct IV route**
- Give undiluted (1%, 2% only); give 6 mg or less over 1 min; if using an **IV** line, use port near insertion site, flush with 0.9% NaCl (50 ml)
- Store at room temperature; sol should be clear

**Continuous IV infusion route**
- Give after adding 1 g/250-1000 ml of $D_5W$; give 1-4 mg/min; use infusion pump for correct dosage; pediatric inf is 120 mg of lidocaine/100 ml of $D_5W$; 1-2.5 ml/kg/hr = 20-50 mcg/kg/min; use only 1%, 2% sol
- Use cardiac monitor
- Additive syringes/single-use vials are for infusing and must be diluted

**Solution compatibilities:** $D_5W$, $D_5$/0.9% NaCl, $D_5$/0.45% NaCl, $D_5$/LR, LR, 0.9% NaCl, 0.45% NaCl

**Y-site compatibilities:** Acetaminophen, alemtuzumab, alfentanil, alteplase, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid/liposome, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, ceftaroline, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clarithromycin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, linezolid, LORazepam, magnesium sulfate, meperidine, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, morphine, nafcillin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, ranitidine, remifentanil, sodium bicarbonate, tacrolimus, theophylline, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, vitamin B complex with C, voriconazole, warfarin

**Y-site incompatibilities:** Acyclovir, amphotericin B cholesteryl sulfate complex/colloidal, azaTHIOprine, caspofungin, diazepam, ganciclovir, lansoprazole, pantoprazole, phenytoin, thiopental, trimethoprim/sulfamethoxazole

## ADVERSE EFFECTS
**CNS:** *Headache, dizziness,* involuntary movement, confusion, tremor, *drowsiness,* euphoria, seizures, shivering

**CV:** *Hypotension, bradycardia,* heart block, cardiovascular collapse, arrest
**EENT:** Tinnitus, blurred vision
**GI:** Nausea, vomiting, anorexia
**HEMA:** Methemoglobinemia
**INTEG:** Rash, urticaria, edema, swelling, petechiae, pruritus
**MISC:** Febrile response, phlebitis at inj site
**RESP:** Dyspnea, respiratory depression

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability (**IV**) |
| **Distribution** | Erythrocytes, cardiovascular endothelium |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | Biphasic 8 min, 1-2 hr |

### Pharmacodynamics

| | IV | IM |
|---|---|---|
| **Onset** | 2 min | 5-15 min |
| **Peak** | Unknown | ½ hr |
| **Duration** | 20 min | 1½ hr |

## INTERACTIONS

### Individual drugs

Amiodarone, phenytoin, procainamide, propranolol, quiNIDine: increase cardiac depression, toxicity
Cimetidine, metoprolol, phenytoin: increased lidocaine effects
CycloSPORINE: decreased effect of cycloSPORINE

### Drug classifications

Antihypertensives, MAOIs: increased hypotensive effects
β-blockers, protease inhibitors: increased lidocaine effects, toxicity
Barbiturates: decreased lidocaine effects
Ergots: Increased hypotension, avoid concurrent use
Neuromuscular blockers: increased neuromuscular blockade, monitor for effects

## NURSING CONSIDERATIONS

### Assessment

- Assess for oxygenation or perfusion deficit: decreased B/P, chest pain, dizziness, loss of consciousness
- Assess respiratory status: auscultate lung fields for bibasilar crackles in patients with advanced HF
- Assess for urinary retention: check for pain, abdominal absorption, palpate bladder; check males with benign prostatic hypertrophy; anticholinergic reaction may cause retention
- Monitor I&O ratio, electrolytes (potassium, sodium, chloride); watch for decreasing urinary output, possible retention
- Monitor liver function tests: AST, ALT, bilirubin, alk phos
- Monitor ECG continuously to determine product effectiveness, measure PR, QRS, QT intervals, check for PVCs, other dysrhythmias; monitor B/P continuously for hypo/hypertension; check for rebound hypertension after 1-2 hr, prolonged PR/QT intervals, QRS complex; if QT or QRS increases by 50% or more, withhold next dose, notify prescriber
- Monitor for CNS symptoms: confusion, numbness, depression, involuntary movements; if these occur, product should be discontinued
- Monitor drug levels (therapeutic level 1.5-5 mcg/ml), notify prescriber of abnormal results
- **Malignant hyperthermia:** Monitor for tachypnea, tachycardia, changes in B/P, increased temperature
- **Toxicity:** Monitor for seizures, confusion, tremors, if these occur discontinue immediately, notify prescriber, keep emergency equipment nearby
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding, excreted in breast milk

### Patient/family education

- Teach patient or family reason for use of medication and expected results
- Instruct patient in at-home use of Lidopen Auto-Injector; patient should call prescriber before use if heart attack is imminent

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P, dysrhythmias
- Decreased heart rate
- Normal sinus rhythm

## TREATMENT OF OVERDOSE:

Oxygen, artificial ventilation, ECG, administer DOPamine for circulatory depression, diazepam or thiopental for seizures; decreased product or discontinuation may be required

**lidocaine topical**
*See Appendix B*

**⚠ HIGH ALERT**

# linagliptin

(lin-a-glip'tin)

**Tradjenta, Trajenta** 🍁

*Func. class.:* Antidiabetic

*Chem. class.:* Dipeptidyl peptidase-4 inhibitor

**ACTION:** Slows the inactivation of incretin hormones. Concentrations of the active, intact hormones are increased by linagliptin, thereby increasing and prolonging the action of these hormones. Incretin hormones are released by the intestine throughout the day, and levels are increased in response to a meal.

**Therapeutic outcome:** Decreasing blood glucose level, A1C; decreasing polydipsia, polyphagia

**USES:** Type 2 diabetes mellitus

## CONTRAINDICATIONS

Hypersensitivity to linagliptin, type 1 diabetes mellitus, diabetic ketoacidosis (DKA)

**Precautions:** Pregnancy, breast-feeding, adolescents or children <18 years old, debilitated physical condition, malnutrition, uncontrolled adrenal insufficiency, pituitary insufficiency, hypothyroidism, diarrhea, gastroparesis, GI obstruction, ileus, female hormonal changes, high fever, severe psychological stress, uncontrolled hypercortisolism, hyperthyroidism

## DOSAGE AND ROUTES

**Adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes**

**Adult: PO** 5 mg/day; when used with a sulfonylurea, a lower dose of the sulfonylurea or insulin may be necessary to minimize the risk of hypoglycemia

**Available forms:** Tab 5 mg

### Implementation

- Given once daily; may give without regard to food
- May require an increased dose in stress, fever, surgery, trauma
- Store at room temperature

## ADVERSE EFFECTS

**CNS:** Headache
**EENT:** Nasopharyngitis
**ENDO:** Hyperuricemia, hypoglycemia
**GI:** Body weight loss, pancreatitis
**INTEG:** Serious angioedema, exfoliative dermatitis, hypersensitivity reactions, urticaria
**MISC:** Arthralgia, back pain
**RESP:** Bronchial hyperreactivity (with bronchospasm), cough, nasopharyngitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly, bioavailability 30% |
| **Distribution** | Extensive, tissues; protein binding concentration dependent |
| **Metabolism** | Weak CYP3A4 inhibitor |
| **Excretion** | 90% unchanged, 80% enterohepatic, urine 5% |
| **Half-life** | Terminal >100 hr, effective 12 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol, cisapride, lithium, metoclopramide, tegaserod: increased need for dosing change
Bumetanide, dextrothyroxine, ethacrynic acid, ethotoin, fosphenytoin, furosemide, glucagon, niacin (nicotinic acid), phenothiazine, phenytoin, torsemide, triamterene: decreased hypoglycemic effect
CloNIDine, dexfenfluramine, disopyramide, fenfluramine, FLUoxetine, guanethidine, octreotide: increased hypoglycemia
Reserpine, β-blockers: increased masking the signs and symptoms of hypoglycemia

### Drug classifications

Beta blockers, ACE inhibitors, angiotensin II receptor antagonists, fibric acid derivatives, monoamine oxidase inhibitors (MAOIs), salicylates, sulfonylureas: increased or prolonged hypoglycemia
Atypical antipsychotics (ARIPiprazole, cloZAPine, OLANZapine, QUEtiapine, risperiDONE, and ziprasidone), carbonic anhydrase inhibitors, estrogens, glucocorticoids, oral contraceptives, progestins, thiazide diuretics, thyroid hormones: decreased hypoglycemic effect
Androgens, quinolones: increased need for dosing change
CYP3A4 inducers (topiramate, rifabutin, pioglitazone, OXcarbazepine, carBAMazepine, nevirapine, modafinil, metyrapone, etravirine, efavirenz, bosentan, barbiturates, aprepitant, fosaprepitant): decreased effect of linagliptin

### Drug/lab test

Increased: uric acid
Decrease: HbA1C level, fasting blood glucose

## NURSING CONSIDERATIONS

### Assessment

- Monitor blood glucose, A1C, during treatment to determine diabetes control; monitor for hypoglycemia: confusion, sweating, tachycardia, anxiety; hyperglycemia, polydipsia, polyuria, polyphagia
- Monitor CBC baseline and periodically during treatment, report decreased blood counts
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding, excretion unknown

### Patient/family education

- Teach patient the symptoms of hypo/hyperglycemia and what to do about each; to have glucagon emergency kit available, carry sugar packets
- Advise patient that product must be continued on a daily basis, explain consequences of discontinuing product abruptly; to take only as directed
- Direct patient to avoid OTC products unless approved by prescriber
- Teach patient that diabetes is a life-long illness, product will not cure diabetes
- Advise patient to carry emergency ID with prescriber, condition and medications taken
- Report immediately, skin disorders, swelling, difficulty breathing, or severe abdominal pain
- **Pancreatitis (rare):** Teach patient to report immediately severe abdominal pain, vomiting may be fatal, discontinue product immediately, use supportive therapy, monitor amylase, lipase electrolytes
- **Arthralgia:** May be severe, but temporary
- **Pregnancy:** Teach patient to notify provider if pregnancy is planned or suspected, or if breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Improving blood glucose level, A1C; decreasing polydipsia, polyphagia, polyuria, clear sensorium, absence of dizziness

## lindane (OTC)

(lin-dane)

**Hexit, GBH, Kwedella**

*Func. class.:* Scabicide/pediculicide

*Chem. class.:* Chlorinated hydrocarbon (synthetic)

**ACTION:** Stimulates nervous system of arthropods, resulting in seizures, death of organism

**Therapeutic outcome:** Resolution of infestation

**USES:** Scabies, lice (head/pubic/body), nits in those intolerant to or who do not respond to other agents

## CONTRAINDICATIONS

Hypersensitivity; patients with known seizure disorders; Norwegian (crusted) scabies

**BLACK BOX WARNING:** Premature neonate; inflammation of skin, abrasions, or breaks in skin; seizure disorder

**Precautions:** Pregnancy, breastfeeding, infants, children <10 yr; avoid contact with eyes

## DOSAGE AND ROUTES

### Lice

**Adult and child:** Shampoo using 30 ml, work into lather, rub for 5 min, rinse, dry with towel; use fine-toothed comb to remove nits; most require 1 oz, max 2 oz

### Scabies

**Adult and child:** TOP cream/lotion wash area with soap and water, remove visible crusts; apply to skin surfaces; remove with soap, water 8-12 hr after application; may reapply in 1 wk if needed; TOP apply 1% cream/lotion to skin from neck to bottom of feet, toes; repeat in 1 wk if necessary; most require 1 oz, max 2 oz

**Available forms:** Lotion, shampoo, cream (1%)

### Implementation

- Apply to body areas, scalp only; do not apply to face, lips, mouth, eyes, any mucous membrane, anus, or meatus
- Give topical corticosteroids as ordered to decrease contact dermatitis; provide antihistamines
- Apply menthol or phenol lotions to control itching
- Give topical antibiotics for infection
- Provide isolation until areas on skin, scalp have cleared and treatment is completed
- Remove nits by using a fine-toothed comb rinsed in vinegar after treatment; use gloves
- Caregivers applying these products to another person should wear gloves less permeable to lindane, thoroughly clean hands after application, avoid natural latex gloves

**Cream/ointment/lotion**

- Use for scabies only; skin should be clean without other products on it, wait 1 hr after bathing or showering before application, shake well, apply under fingernails after trimming, a toothbrush can be used to apply; after application wrap toothbrush in paper and discard, use only a single application, apply as a thin layer over all

skin from neck down, close bottle with leftover and discard
• Do not cover, wash off after 8-12 hr using warm (not hot) water, do not leave on >12 hr
**Shampoo**
• For lice only, do not use other hair products before use, shake well, hair should be completely dry, use only enough shampoo to lightly wet the hair and scalp, work into hair, do not use water, allow to remain only 4 min, rinse and lather away, towel briskly

## ADVERSE EFFECTS
**CNS:** Seizures, stimulation, dizziness
**INTEG:** *Pruritus, rash, irritation, contact dermatitis*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 20% |
| **Distribution** | Fat |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 18 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 3 hr |
| **Peak** | Rapid |
| **Duration** | 3 hr |

## INTERACTIONS
Oil-based hair dressing: increased absorption; wash, rinse, and dry hair before using lindane

## NURSING CONSIDERATIONS
### Assessment
**BLACK BOX WARNING:** Skin with abrasions, breaks, inflammation; do not use on these areas

• **Infestation:** Assess head, hair for lice and nits before, after treatment; if scabies are present, check all skin surfaces
• Identify source of infection: school, family members, sexual contacts
• **Pregnancy/breastfeeding:** Avoid in pregnancy, breastfeeding

### Patient/family education
• Advise patient to wash all inhabitants' clothing, using insecticide; preventive treatment may be required for all persons living in same house, using lotion or shampoo to decrease spread of infection; use rubber gloves when applying product
• Instruct patient that itching may continue for 4-6 wk; that product must be reapplied if accidentally washed off, or treatment will be ineffective; remove after specified time to prevent toxicity
• Advise patient not to apply to face; if contact with eyes occurs, flush with water
• Advise patient that sexual contacts should be treated simultaneously
• **Inform the patient of CNS toxicity:** dizziness, cramps, anxiety, nausea, vomiting, seizures

### Evaluation
**Positive therapeutic outcome**
• Decreased crusts, nits, brownish trails on skin, itching papules in skinfolds
• Decreased itching after several wk

## TREATMENT OF INGESTION:
Gastric lavage, saline laxatives, **IV** diazepam (Valium) for seizures (if taken orally)

## linezolid (Rx)
(lih-nee'zoh-lid)
**Zyvox**
*Func. class.:* Broad-spectrum antiinfective
*Chem. class.:* Oxazolidinone

L

**Do not confuse:** Zyvox/Vioxx/Zovirax

## ACTION:
Inhibits protein synthesis by interfering with translation; binds to bacterial 23S ribosomal RNA of the 50S subunit, preventing formation of the bacterial translation process in primarily gram-positive organisms

**Therapeutic outcome:** Negative blood cultures, absence of signs/symptoms of infection

## USES:
Vancomycin-resistant *Enterococcus faecium* infections, nosocomial pneumonia caused by *Staphylococcus aureus* or *Streptococcus pneumoniae,* uncomplicated or complicated skin and skin structure infections, community-acquired pneumonia, *Pasteurella multocida,* viridans Streptococcus, *E. faecium* infections *S. aureus, S. pyogenes;* can be used for MSSA/MSRA/MDRSP/ strains

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, thrombocytopenia, bone marrow suppression, hypertension, hyperthyroidism, pheochromocytoma, seizure disorder, ulcerative colitis, MI, PKU, renal/GI disease

## DOSAGE AND ROUTES
**Vancomycin-resistant *E. faecium* infections, including concurrent bacteremia**
**Adult/adolescent/child ≥12 yr: IV**/PO 600 mg q12hr × 14-28 days; max 1200 mg/day

**Child <12 yr/infant/term neonate:** **IV**/PO 10 mg/kg q8hr × 14-28 days

### Hospital-acquired pneumonia/ complicated skin infections/ community-acquired pneumonia/ concurrent bacterial infection

**Adult /child ≥ 12 yr:** **IV**/PO 600 mg q12hr × 10-14 days; max 1200 mg/day
**Child birth-11 yr:** PO 10 mg/kg q8hr × 10-14 days

### Uncomplicated skin infections caused by *S. aureus* (MSSA only) or *S. pyogenes*

**Adult:** **IV**/PO 400 mg q12hr × 10-14 days; max 1200 mg/day
**Adolescent:** PO 600 mg q12hr × 10-14 days, max 1200 mg/day
**Child 5-11 yr:** PO 10 mg/kg q12hr × 10-14 days
**Neonate ≥ 7 days old/infant/child <5 yr old:** PO 10 mg/kg q8hr × 10-14 days
**Infant, preterm <7 days old:** PO 10 mg/kg q12hr × 10-14 days

**Available forms:** Tabs 600 mg; oral susp 100 mg/5 ml; inj 2 mg/ml

### Implementation

**PO route**

- Store reconstituted oral susp at room temperature, use within 3 wk
- Give over 30-120 min; do not use **IV** inf bag in series connections, do not use with additives in sol, do not use with another product, administer separately, flush line before and after use

**Intermittent IV infusion route**

- Do not use if particulate is present; yellow color is normal
- Premixed solutions are ready to use (2 mg/ml)
- Store at room temperature in original packaging

**Y-site compatibilities:** Acyclovir, alfentanil, amikacin, aminophylline, ampicillin, aztreonam, bretylium, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, ceFAZolin, cefoperazone, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, HYDROmorphone, ifosfamide, labetalol, leucovorin, levofloxacin, lidocaine, LORazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, midazolam, minocycline, mitoXANtrone, morphine, nalbuphine, naloxone, nitroglycerin, ofloxacin, ondansetron, PACLitaxel, PENTobarbital, piperacillin, potassium chloride, prochlorperazine, promethazine, propranolol, ranitidine, remifentanil, theophylline, ticarcillin, tobramycin, vancomycin, vecuronium, verapamil, vinCRIStine, zidovudine

**Solution compatibilities:** $D_5W$, 0.9% NaCl, LR

## ADVERSE EFFECTS

**CNS:** *Headache,* dizziness, insomnia
**GI:** *Nausea, diarrhea,* increased ALT, AST, *vomiting,* taste change, tongue color change, pseudomembranous colitis
**HEMA:** Myelosuppression
**MISC:** Vaginal moniliasis, fungal infection, oral moniliasis, lactic acidosis, anaphylaxis, angioedema, Stevens-Johnson syndrome, serotonin syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid, excessive |
| **Distribution** | Protein binding 31% |
| **Metabolism** | Oxidation of the morpholine ring |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Amoxapine, cyclobenzaprine, maprotiline, methyldopa, mirtazapine, traZODone: increased hypertensive crisis, seizures, coma

### Drug classifications

Adrenergic blockers (dopamine, EPINEPHrine, pseudoePHEDrine): increased effects of adrenergics, monitor B/P
Antidepressants (tricyclics): increased hypertensive crisis, seizures, coma
MAOIs or those that possess MAOI-like action (furazolidone, isoniazid, procarbazine): do not use together; hypertensive crisis may occur
SSRIs, SNRIs: increased serotonin syndrome, notify prescriber immediately
Serotoninergic agents: increased effect

### Drug/herb

Green tea, valerian, ginseng, yohimbe, kava: avoid use

### Drug/lab test
Increase: LFTs, alkaline phosphatase, amylase, lipase, BUN
Decrease: WBC, platelets, blood glucose

### Drug/food
Tyramine foods: avoid; increased pressor response

## NURSING CONSIDERATIONS
### Assessment
- Assess CNS symptoms: headache, dizziness
- Monitor liver function tests: AST, ALT
- Monitor CBC weekly, assess for myelosuppression (anemia, leukopenia, pancytopenia, thrombocytopenia)
- **Pseudomembranous colitis:** Assess for diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC, and low serum albumin; stop product and usually give either vancomycin or IV metroNIDAZOLE
- **Serotonin syndrome:** at least 2 wk should elapse between continuing linezolid and start of serotonergic agents; assess for increased heart rate, shivering, sweating, dilated pupils, tremor, high B/P, hyperthermia, headache, confusion; if these occur stop linezolid; administer a serotonin antagonist if needed
- **Lactic acidosis:** repeated nausea/vomiting, unexplained acidosis, low bicarbonate level: notify prescriber immediately
- **Anaphylaxis/angioedema/Stevens-Johnson syndrome:** rash, pruritus, difficulty breathing, fever: have emergency equipment nearby
- **Diabetes mellitus:** Monitor those receiving insulin or oral antidiabetics for increased hypoglycemia
- **Pregnancy/breastfeeding:** Avoid in pregnancy, breastfeeding

### Patient/family education
- Advise patient if dizziness occurs, to ambulate and perform activities with assistance
- Advise patient to complete full course of product therapy
- Advise patient to contact prescriber if adverse reaction occurs
- Advise patient to avoid large amounts of tyramine-containing foods (give list)
- **Serotonin syndrome:** Notify provider immediately of fever, sweating, diarrhea, confusion
- Teach patient that tab and suspension may be taken with or without food

### Evaluation
**Positive therapeutic outcome**
- Decreased symptoms of infection, blood cultures negative

**⚠ HIGH ALERT**

## liraglutide (Rx)
(lir'a-gloo'tide)
**Saxenda, Victoza**
*Func. class.:* Antidiabetic agent
*Chem. class.:* Incretin mimetics

**ACTION:** Improved glycemic control and potential weight loss via activation of the glucagon-like peptide-1 (GLP-1) receptor

**Therapeutic outcome:** Stable and improved serum glucose, HbA1C, weight loss

**USES:** Type 2 diabetes mellitus in combination with diet and exercise, obesity

## CONTRAINDICATIONS
Hypersensitivity, pancreatitis, pregnancy

**Precautions:** Alcoholism, breastfeeding, children, cholelithiasis, ketoacidosis, diarrhea, elderly, fever, gastroparesis, hepatic disease, hypoglycemia, infection, renal disease, surgery, thyroid disease, trauma, vomiting, medullary thyroid carcinoma (MTC), multiple endocrine neoplasia syndrome type 2 (MEN 2), thyroid cancer

**BLACK BOX WARNING:** Thyroid C-cell tumors

## DOSAGE AND ROUTES
**Adult:** SUBCUT 0.6 mg/day × 1 wk, then increase to 1.2 mg/day, max 1.8 mg/day

**Available forms:** Solution for injection 0.6, 1.2, 1.8, 2, 4, 3 mg prefilled pen

### Implementation
**SUBCUT route**
- Use safe handling procedures
- Give by SUBCUT only, inspect for particulate matter or discoloration, do not use if unusually viscous, cloudy, discolored, or if particles are present; give daily at any time without regard to meals; pen needles must be purchased separately, use Novo Nordisk needles, prime before first use, see manual for directions; give in thigh, abdomen, or upper arm; lightly pinch fold of skin, insert needle at 90-degree angle or 45-degree angle if thin, release skin, aspiration is not needed, give over 6 seconds, rotate injection sites

• Storage: do not store pen with needle attached; avoid direct heat and sunlight, discard 30 days after first use, after first use may be stored at room temperature or refrigerated, do not freeze; if >3 days have elapsed since last dose, reinitiate at 0.6 mg, titrate
• If dose is missed, resume once daily dosing at next scheduled dose

## ADVERSE EFFECTS

**CNS:** Dizziness, headache
**CV:** Hypertension
**ENDO:** Hypoglycemia
**EENT:** Sinusitis
**GI:** Abdominal pain, anorexia, constipation, diarrhea, dyspepsia, nausea, vomiting, pancreatitis
**INTEG:** Angioedema, erythema, injection site reaction, urticaria
**MS:** Back pain
**SYST:** Antibody formation, infection, influenza, secondary thyroid malignancy, anaphylaxis, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Protein binding (98%) |
| **Distribution** | Binds to albumin, then released into circulation |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 12-13 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Peak 8-12 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Atorvastatin, acetaminophen, griseofulvin: increased or decreased effects of each specific drug
Baclofen, cycloSPORINE, tacrolimus, dextrothyroxine, diazoxide, phenytoin, fosphenytoin, ethotoin, isoniazid, niacin, nicotine: increased hyperglycemic reactions
Bortezomib, cloNIDine, alcohol, lithium, pentamidine: increased or decreased hypoglycemic reactions
Dexfenfluramine, fenfluramine, disopyramide, FLUoxetine, mecasermin, octreotide, pegvisomant, salicylates: increased hypoglycemic reactions
Digoxin: decreased digoxin levels

### Drug classifications

Angiotensin II receptor antagonists, ACE inhibitors, other antidiabetics, β-blockers, fibric acid derivatives, MAOIs, salicylates: increased hypoglycemic reactions
Protease inhibitors, phenothiazines, atypical antipsychotics, corticosteroids, carbonic anhydrase inhibitors, estrogens, progestins, oral contraceptives, growth hormones, sympathomimetics: increased hyperglycemic reactions
Androgens, quinolones: decreased liraglutide effect

### Drug/lab test

Increase: Calcitonin, lipase
Decrease: Glucose

## NURSING CONSIDERATIONS

### Assessment

• Watch for hypoglycemic reactions that can occur soon after meals: hunger, sweating, weakness, dizziness, tremors, restlessness, tachycardia
• Assess for hypersensitivity to this product
• Monitor serum glucose, A1C, CBC during treatment
• **Assess for stress:** diabetic patients exposed to stress, surgery, fever, infections may require insulin administration temporarily
• **Assess for serious skin reactions:** angioedema; also pancreatitis, secondary thyroid malignancy
• **Pregnancy:** Identify if pregnancy is planned or suspected or if breastfeeding
• **Pancreatitis:** Monitor for nausea, vomiting, severe abdominal pain, product should be discontinued, give supportive care, monitor amylase, lipase, electrolytes

**BLACK BOX WARNING:** Thyroid C-cell tumors: monitor during treatment; if calcitonin is elevated or if nodules can be felt, a referral is needed, do not use in those with a family history of MTC and those with multiple endocrine neoplasia syndrome type 2

### Patient/family education

• Teach patient the symptoms of hypo/hyperglycemia and what to do about each, to have glucagon emergency kit available, carry a carbohydrate source at all times
• Teach patient about side effects associated with therapy such as nausea and vomiting; upward dose titration can be delayed or ignored depending on tolerance
• Teach patient that diabetes is a lifelong illness, product does not cure disease and must be continued on a daily basis
• Instruct patient to carry emergency ID with prescriber's phone number and medications taken
• Advise patient to continue with other recommendations: diet, exercise, hygiene

- Teach patient to test blood glucose using a blood glucose meter
- Advise patient to avoid other medications, herbs, supplements unless approved by prescriber
- Advise patient to report serious skin effects, abdominal pain with nausea/vomiting
- Provide patient with written instructions if self-administration is ordered, to discard pen after 30 days
- **Hypersensitivity:** Teach patient to report any allergic symptoms
- Teach patient not to share product with other, infections may occur
- Teach patient that secondary malignancy is possible, that routing monitoring may be needed, to report trouble breathing, continuous hoarseness, lump in neck to report immediately
- Discuss possibilities of secondary malignancy, routine monitoring may be needed
- **Pregnancy/breastfeeding:** Teach patient that product is not to be used in pregnancy or breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Stable and improved serum glucose, A1C, weight loss

## lisinopril (Rx)

(lyse-in′oh-pril)

**Zestril**

*Func. class.:* Antihypertensive, angiotensin converting enzyme (ACE) I inhibitor

*Chem. class.:* Enalaprilat lysine analog

**Do not confuse:** lisinopril/Risperdal/Lipitor, Zestril/Zetia/Zipexa

**ACTION:** Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE; prevents conversion of angiotensin I to angiotensin II

**Therapeutic outcome:** Decreased B/P in hypertension, decreased preload, afterload in HF

**USES:** Mild to moderate hypertension, adjunctive therapy of systolic HF, acute MI

**Unlabeled uses:** Diabetic nephropathy/retinopathy, proteinuria, post MI

## CONTRAINDICATIONS

Hypersensitivity, angioedema

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Pregnancy (1st trimester), breastfeeding, renal disease, hyperkalemia, renal artery stenosis, HF, aortic stenosis

## DOSAGE AND ROUTES

### Hypertension

**Adult:** PO initially 10 mg, 10-40 mg/day; may increase to 80 mg/day if required

**Child ≥6 yr:** PO 0.7 mg/kg/day, up to 5 mg/day; titrate q1-2wk up to 0.6 mg/kg/day or 40 mg/day

**Geriatric:** PO 2.5-5 mg/day, increase q7day

### Renal dose

**Adult:** PO CCr <30 ml/min reduce dose by 50%, initially 5 mg/day, max 40 mg/day; CCr <10 ml/min 2.5 mg/day, max 40 mg/day

### Adjunctive treatment in combination with diuretics and cardiac glycosides for heart failure

**Adult:** PO 5 mg/day, increase if needed to max 20 mg/day or 40 mg/day (Zestril): in hyponatremia <130 mEq/L or creatinine >3 mg/dl or CCr <30 ml/min use 2.5 mg/day initially

### Acute myocardial infarction

**Adults who are hemodynamically stable:** PO give 5 mg within 24 hr of onset of symptoms, then 5 mg after 24 hr, 10 mg after 48 hr, then 10 mg/day

**Available forms:** Tabs 2.5, 5, 10, 20, 30 40 mg

### Implementation

- Store in airtight container at 86° F (30° C) or less
- Severe hypotension may occur after 1st dose of this medication; may be prevented by reducing or discontinuing diuretic therapy 3 days before beginning lisinopril therapy
- Without regard to food

## ADVERSE EFFECTS

**CNS:** *Vertigo,* depression, stroke, insomnia, paresthesias, *headache,* fatigue, asthenia, *dizziness*

**CV:** Chest pain, *hypotension,* sinus tachycardia

**EENT:** Blurred vision, nasal congestion

**GI:** Nausea, vomiting, anorexia, constipation, flatulence, GI irritation, diarrhea, hepatic failure, hepatic necrosis, pancreatitis

**GU:** Proteinuria, renal insufficiency, sexual dysfunction, impotence

**HEMA:** Neutropenia, agranulocytosis

**INTEG:** Rash, pruritus

**MISC:** Muscle cramps, *hyperkalemia*

**RESP:** Dry cough, dyspnea

**SYST:** Angioedema, anaphylaxis, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Variable |
| **Distribution** | Unknown |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys, unchanged |
| **Half-life** | 12 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1 hr |
| **Peak** | 6-8 hr |
| **Duration** | 24 hr |

## INTERACTIONS

### Individual drugs

Alcohol (large amounts), probenecid: increased hypotension
Allopurinol: increased hypersensitivity
Aspirin: decreased lisinopril effect
CycloSPORINE: increased hyperkalemia
Indomethacin: decreased antihypertensive effect
Lithium: increased levels of lithium, toxicity

### Drug classifications

Antihypertensives, diuretics, nitrates, phenothiazines: increased hypotension
Diuretics, potassium-sparing, potassium salt substitutes, potassium supplements: increased hyperkalemia
NSAIDs: decreased lisinopril effect, adjust dose as needed

### Drug/food

High-potassium diet (bananas, orange juice, avocados, broccoli, nuts, spinach) should be avoided; hyperkalemia may occur, monitor potassium

### Drug/lab test

Interference: glucose/insulin tolerance tests, LFTs, BUN, creatinine

## NURSING CONSIDERATIONS

### Assessment

- **Assess blood studies:** platelets, WBC with differential: baseline, q3mo; if neutrophils are $<1000/mm^3$, discontinue treatment
- **Hypertension:** monitor B/P, check for orthostatic hypotension, syncope; if changes occur, dosage change may be required

**BLACK BOX WARNING:** Determine pregnancy before starting, if breastfeeding

- Establish baselines in renal/liver function tests before therapy begins
- **Acute MI:** Can be used in combination with salicylates, beta blockers, thrombolytics
- Monitor renal/liver function tests: protein, BUN, creatinine; watch for increased levels that may indicate nephrotic syndrome and renal failure; monitor renal symptoms: polyuria, oliguria, frequency, dysuria
- Check potassium levels throughout treatment, although hyperkalemia rarely occurs
- **HF:** check for edema in feet, legs daily, weight daily, dyspnea, wet crackles
- Assess for anaphylaxis, toxic epidermal necrolysis, angioedema, allergic reactions: rash, fever, pruritus, urticaria; facial swelling, dyspnea, tongue swelling (rare), have emergency equipment nearby, may be more common in Black patients; product should be discontinued if antihistamines fail to help

**BLACK BOX WARNING:** Pregnancy/breastfeeding: Do not use in pregnancy, breastfeeding

### Patient/family education

- Caution patient not to discontinue product abruptly; advise patient to inform all health care providers about taking this product
- Teach patient not to use OTC products (cough, cold, allergy) unless directed by prescriber; serious side effects can occur
- Teach patient the importance of complying with dosage schedule, even if feeling better; to continue with medical regimen to decrease B/P: exercise, cessation of smoking, decreasing stress, diet modifications
- Teach patient to notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, coughing, shortness of breath
- Caution patient to report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P
- Emphasize the need to rise slowly to sitting or standing position to minimize orthostatic hypotension; not to exercise in hot weather or increased hypotension can occur
- Caution patient that product may cause dizziness, fainting, light-headedness; may occur during 1st few days of therapy; to avoid activities that may be hazardous
- Teach patient how to take B/P, and normal readings for age-group; advise patient to take B/P regularly
- Instruct patient to avoid increasing potassium in the diet

**BLACK BOX WARNING:** Advise patient to report if pregnancy is planned or suspected, do not breastfeed, not to use in pregnancy

### Evaluation
**Positive therapeutic outcome**
- Decreased B/P in hypertension
- Decreased HF symptoms

## TREATMENT OF OVERDOSE:
0.9% NaCl **IV** inf, hemodialysis

## lithium (Rx)
(li'thee-um)
**Carbolith, Lithane, Lithobid**
*Func. class.:* Antimanic, antipsychotic
*Chem. class.:* Alkali metal ion salt

**Do not confuse:** lithium/lanthanum

**ACTION:** May alter sodium, potassium ion transport across cell membrane in nerve, muscle cells; may balance biogenic amines of norepinephrine, serotonin in CNS areas involved in emotional responses

**Therapeutic outcome:** Stable mood

**USES:** Bipolar disorder (manic phase), prevention of bipolar manic-depressive psychosis

## CONTRAINDICATIONS
Pregnancy, breastfeeding, children <12 yr, hepatic disease, brain trauma, organic brain syndrome, schizophrenia, severe cardiac/renal disease, severe dehydration

**Precautions:** Geriatric, thyroid disease, seizure disorders, diabetes mellitus, systemic infection, urinary retention, QT prolongation

**BLACK BOX WARNING:** Lithium level >1.5 mmol/L

## DOSAGE AND ROUTES NTI
### Bipolar disorder (mania)
**Adult:** PO 600 mg tid; maintenance 300 mg tid or qid; EXT REL 900 mg q12hr; dosage should be individualized to maintain blood levels at 0.5-1.5 mEq/L or 0.6-1.2 mEq/L (maintenance)
**Geriatric:** PO 300 mg bid, increase q7day by 300 mg to desired dose
**Child:** PO 15-20 mg/kg/day in 3-4 divided doses; increase as needed; do not exceed adult doses; maintain blood levels at 0.4-0.5 mEq/L

### Renal dose
**Adult:** PO CCr 10-50 ml/min 50%-75% of dose; CCr <10 ml/min 25%-50% of dose

**Available forms:** Caps 150, 300, 600 mg; tabs 300 mg; ext rel tabs 300, 450 mg; syr 300 mg/5 ml (8 mEq/5 ml)

### Implementation
- Do not break, crush, or chew caps and slow rel caps
- Administer reduced dosage to geriatric; give with meals to avoid GI upset
- Provide adequate fluids (2-3 L/day) to prevent dehydration during initial treatment, 1-2 L/day during maintenance
- Give list of products that interact with lithium

## ADVERSE EFFECTS
**CNS:** *Headache, drowsiness, dizziness, tremors,* twitching, ataxia, seizures, slurred speech, restlessness, *confusion,* stupor, memory loss, clonic movements, *fatigue*
**CV:** *Hypotension,* ECG changes, dysrhythmias, circulatory collapse, edema, Brugada syndrome, QT prolongation
**EENT:** Tinnitus, blurred vision
**ENDO:** Hypothyroidism, goiter, hyperglycemia, hyperthyroidism, hyponatremia
**GI:** *Dry mouth, anorexia, nausea, vomiting, diarrhea,* incontinence, abdominal pain, metallic taste
**GU:** Polyuria, glycosuria, proteinuria, albuminuria, urinary incontinence, polydipsia
**HEMA:** Leukocytosis
**INTEG:** Drying of hair, alopecia, rash, pruritus, hyperkeratosis, *acneiform rash, folliculitis*
**MS:** *Muscle weakness*

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Completely absorbed |
| **Distribution** | Reabsorbed by renal tubules (80%); crosses blood-brain barrier; crosses placenta |
| **Metabolism** | Unknown |
| **Excretion** | Urine, unchanged |
| **Half-life** | 18-36 hr depending on age |

### Pharmacodynamics
| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | ½-3 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
AcetaZOLAMIDE, aminophylline, mannitol, sodium bicarbonate: increased renal clearance
Calcium iodide, iodinated glycerol, potassium iodide: increased hypothyroid effect
CarBAMazepine, FLUoxetine, methyldopa, probenecid: increased lithium effect/toxicity
Haloperidol: increased neurotoxicity
Indomethacin, losartan: increased toxicity
Thioridazine: brain damage
Urea: decreased lithium effect

### Drug classifications

ACE inhibitors: Increase: Lithium level
Antiarrhythmics, other products that prolong the QT interval: Increase GT interval
Antithyroid agents: increased hypothyroid effects
β-Blockers used for lithium tremor: increase masking of lithium toxicity
Neuromuscular blocking agents: increased effect of neuromuscular blocking effects
NSAIDs, thiazides: increased lithium toxicity
Phenothiazines: increased effect of phenothiazines
Calcium channel blockers Theophyllines, urinary alkalinizers: decreased effect of lithium

### Drug/herb

Guarana, tea (black/green): decreased lithium effect
• Avoid use with kava, St. John's wort, valerian

### Drug/food

Caffeine: Decrease lithium level, adjust dose
Significant changes in sodium intake will alter lithium excretion

### Drug/lab test

Increased: potassium excretion, urine glucose, blood glucose, protein, BUN
Decreased: VMA, $T_3$, $T_4$, PBI, $^{131}I$

## NURSING CONSIDERATIONS

### Assessment

• **Bipolar disorder:** manic symptoms, mood, behavior before and during treatment

**BLACK BOX WARNING:** Assess for lithium toxicity: Vomiting, diarrhea, poor coordination, fine motor tremors, weakness, lassitude; major toxicity: coarse tremors, severe thirst, tinnitus, dilute urine. Monitor serum lithium levels weekly initially, then q2mo (therapeutic level: 0.5-1.5 mEq/L); toxic level >1.5 mcg/L; twitching; toxicity and therapeutic levels are very close; toxicity may occur rapidly; blood levels are measured before the AM dose, there is a narrow therapeutic index (NTI)

• Assess weight daily; check for edema in legs, ankles, wrists; report if present; check skin turgor at least daily
• Monitor sodium intake; decreased sodium intake with decreased fluid intake may lead to lithium retention; increased sodium and fluids may decrease lithium retention
• Monitor urine for albuminuria, glycosuria, uric acid during beginning treatment, q2mo thereafter, specific gravity any level <1.005 may indicate diabetes insipidus and should be reported to the provider
• Assess neurologic status: LOC, gait, motor reflexes, hand tremors
• ECG in those >50 yr with CV disease; cardiology consult is recommended in those with risk factors, QT prolongation may occur

### Patient/family education

• **Provide patient with written information on symptoms of minor toxicity:** vomiting, diarrhea, poor coordination, fine motor tremors, weakness, lassitude; major toxicity: coarse tremors, severe thirst, tinnitus, dilute urine, seek medical care immediately
• Advise patient to monitor urine specific gravity; emphasize need for follow-up care to determine lithium effects
• Advise patient that contraception is necessary, since lithium may harm fetus
• Caution patient not to operate machinery until lithium levels are stable and response determined; that beneficial effects may take 1-3 wk
• Provide to the patient a list of products that interact with lithium and discuss need for adequate, stable intake of salt and fluid
• Advise patient to have lithium levels monitored to ensure effectiveness
• Teach patient to use an emergency ID with diagnosis, product used

### Evaluation

**Positive therapeutic outcome**

• Decrease in excitement, poor judgment, insomnia (manic phase)
• Decreased mood swings and lability

## TREATMENT OF OVERDOSE:

Induce emesis or lavage, maintain airway, respiratory function; dialysis for severe intoxication

**⚠ HIGH ALERT**

# lixisenatide

(lixi-sena-tide)

**Adlyxin**

*Func. class.:* Antidiabetic
*Chem. class.:* Incretin mimetic

**ACTION:** An incretin mimetic; a glucagon-like peptide-1 (GLP-1) receptor agonist; binds and activates the GLP-1 receptor. GLP-1 is an important, gut-derived, glucose homeostasis regulator that is released after the oral ingestion of carbohydrates or fats. In patients with type 2 diabetes, GLP-1 concentrations are decreased in response to an oral glucose load. GLP-1 enhances insulin secretion; increases glucose-dependent insulin synthesis and secretion of insulin

from pancreatic beta cells in the presence of elevated glucose

**Therapeutic outcome:** Decreasing polydipsia, polyuria, polyphagia, clear sensorium, improving A1c, weight

**USES:** Treatment of type 2 diabetes mellitus in combination with diet and exercise

## CONTRAINDICATIONS

Angioedema

**Precautions:** Alcoholism, breastfeeding, children, cholelithiasis, diabetic ketoacidosis, gastroparesis, hypoglycemia, pancreatitis, pregnancy, renal failure, renal impairment, risk of serious hypersensitivity reactions or anaphylaxis, type 1 diabetes mellitus

## DOSAGE AND ROUTES

**Adult: SUBCUT** Initially, 10 mcg qday within 1 hr before the morning meal. If a dose is missed, give within 1 hr before the next meal. Continue 10 mcg qday <?> 14 days; on day 15, increase the dose to the maintenance dose of 20 mcg qday, max 20 mcg/day

### Renal dose

**Adult:** eGFR 30-89 ml/min/1.73 $m^2$ : No dosage adjustment needed; eGFR 15-29 ml/min/1.73 $m^2$ : Monitor closely for adverse reactions, especially hypoglycemia, nausea, and vomiting, and for changes in renal function. Dehydration and acute renal failure and worsening of chronic renal failure may occur in these patients; eGFR less than 15 ml/min/1.73 $m^2$ : Do not use

**Available forms:** Solution for injection 10 mcg, 20 mcg prefilled pen starter pack, maintenance pack

### Implementation

- May be used as monotherapy or with other antidiabetic medications. Dose adjustment of metformin or a thiazolidinedione is not usually required. A reduction in the dose of a sulfonylurea may be needed to reduce the risk of hypoglycemia
- Give subcut injection only. Do not give IV/IM
- Visually inspect for particulate matter and discoloration before use; do not use if unusually viscous, cloudy, discolored, or if particles are present
- Available as a prefilled pen. Each pen must be activated before the first use
- Administer qday within 1 hr before the first meal of the day, preferably the same meal each day. If a dose is missed, give within 1 hr before the next meal
- Inject subcut into the thigh, abdomen, or upper arm
- Double-check dosage before use
- Rotate sites with each injection to prevent lipodystrophy
- Storage: The pen should be protected from light and kept in its original packaging, discard pen 14 days after its first use

## ADVERSE EFFECTS

**CNS:** Dizziness, headache
**GI:** Nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, pancreatitis (rare)
**MISC:** Antibody formation, hypoglycemia, injection-site reactions, hypotension, anaphylactoid reaction, bronchospasm, renal failure, laryngeal edema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Eliminated through glomerular filtration and proteolytic degradation; elimination prolonged in renal disease with mild (CCr 60-89 ml/min), moderate (CCr 30-59 ml/min), and severe renal impairment (CCr 15-29 ml/min) was increased by approximately 34%, 69%, and 124%, respectively; use with caution in renal disease |
| **Half-life** | Terminal 1-3 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-3.5 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Androgens, carbonic anhydrase inhibitors, quinolones, salicylates: increased hypoglycemia or hyperglycemia

Antidiabetics: estrogens, MAOIs, NSAIDs, oral contraceptives, progestins, thiazide diuretics: decreased effect of each

Atypical antipsychotics, baclofen, corticosteroids, cyclosporine, niacin, phenothiazines, protease inhibitors, thyroid hormones, tacrolimus: increased hyperglycemia

Sulfonylureas: Increased: effect of ACE inhibitors, angiotensin II receptor antagonists, beta blockers, fibric acid derivatives: increased hypoglycemia

## NURSING CONSIDERATIONS

### Assessment

- Fasting blood glucose, A1c level during treatment to determine diabetic control
- **Pancreatitis:** Severe abdominal pain with or without nausea and vomiting, product should be discontinued immediately
- **Renal disease:** Monitor BUN, creatinine in mild renal disease, do not use in severe renal disease
- **Hypo-hyperglycemia:** reaction can occur soon after meals, for severe hypoglycemia give IV D50W, IV dextrose solution
- **Pregnancy:** If pregnant or planning to become pregnant, take oral contraceptive 1 hr before this product

### Patient/family education

- Not to share among patients. Even if the disposable needle is changed, sharing may result in transmission of hepatitis viruses, HIV, or other bloodborne pathogens. Do not share pens among multiple patients in an inpatient setting; use multidose vials, if available, or reserve the use of any pen to 1 patient only
- For patients and caregivers, give instruction on the preparation and use of the pen, include a practice injection
- About the signs and symptoms of hypohyperglycemia and what to do about each; to have emergency glucagon kit available at all times, to carry glucose source (sugar, candy)
- That product must be taken on a continuing basis, not to discontinue without prescriber's approval
- That diabetes is a lifelong condition, product will not cure condition, to carry emergency ID with condition, products taken, prescriber's phone number and name
- To continue weight control, dietary restrictions, exercise, hygiene
- That regular lab testing and A1c will be necessary
- **Pregnancy:** To notify prescriber if pregnant or planning to become pregnant, if taking oral contraceptives, take at least 1 hr before this product
- **Pancreatitis:** If severe abdominal pain occurs with or without nausea, vomiting, seek medical care immediately

### Evaluation

**Therapeutic response:** Decreasing polydipsia, polyuria, polyphagia, clear sensorium, improving A1c, weight

## Iodoxamide ophthalmic

*See Appendix B*

## Ioperamide (OTC, Rx)

(loe-per'a-mide)
**Diamode, Imodium, Imodium A-D,**
*Func. class.:* Antidiarrheal
*Chem. class.:* Piperidine derivative

**Do not confuse:** Imodium/Indocin, Loperamide/furosemide

**ACTION:** Direct action on intestinal muscles to decrease GI peristalsis; reduces volume, increases bulk; electrolytes are not lost

**Therapeutic outcome:** Absence of diarrhea

**USES:** Diarrhea (cause undetermined), chronic diarrhea, to decrease amount of ileostomy discharge, traveler's diarrhea

## CONTRAINDICATIONS

Hypersensitivity, pseudomembranous colitis, constipation, dysentery, GI bleeding/obstruction/perforation, ileus, vomiting

**Precautions:** Pregnancy, breastfeeding, children <2 yr, hepatic disease, gastroenteritis, toxic megacolon, geriatric patients, dehydration, bacterial disease, AIDS, severe ulcerative colitis

## DOSAGE AND ROUTES

**Adult:** PO 4 mg, then 2 mg after each loose stool, max 16 mg/24 hr
**Child 9-11 yr:** PO 2 mg, then 1 mg after each loose stool, max 6 mg/24 hr
**Child 6-8 yr:** PO 2 mg, then 0.1 mg/kg after each loose stool, max 4 mg/day
**Child 2-5 yr:** PO 1 mg, then 0.1 mg/kg after each loose stool, max 4 mg/24 hr

### Traveler's diarrhea (unlabeled)

**Adult:** PO 4 mg, then 2 mg after each diarrhea stool, max 16 mg/day

**Available forms:** Caps 2 mg; liquid 1 mg/5 ml; tabs 2 mg; chew tabs 2 mg

### Implementation

- Do not break, crush, or chew caps
- Store in airtight containers
- Do not mix oral sol with other sol

## ADVERSE EFFECTS

**CNS:** Dizziness, drowsiness, fatigue
**GI:** *Nausea, dry mouth, vomiting, constipation,* abdominal pain, anorexia, toxic megacolon, bacterial enterocolitis, flatulence
**INTEG:** Rash
**MISC:** Hyperglycemia
**SYST:** Anaphylaxis, angioedema, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poor |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Feces, unchanged; small amount in urine |
| **Half-life** | 9-14 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½-1 hr |
| **Peak** | Unknown |
| **Duration** | 24 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression

### Drug classifications

Antihistamines, analgesics (opioids), sedative/hypnotics: increased CNS depression

### Drug/herb

Chamomile, hops, kava, skullcap, valerian: increased CNS depression

Nutmeg: increased antidiarrheal effect

## NURSING CONSIDERATIONS

### Assessment

- Monitor electrolytes (potassium, sodium, chloride) if patient is on long-term therapy; check fluid status, skin turgor
- **Stools:** Assess bowel pattern before, during treatment; check for rebound constipation after termination of medication; check bowel sounds
- Check response after 48 hr; if no response, product should be discontinued and other treatment initiated
- Assess for abdominal distention, toxic megacolon, which may occur in ulcerative colitis
- Assess for dehydration, CNS symptoms in children or those with hepatic disease
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, breastfeeding is not recommended

### Patient/family education

- Caution patient to avoid alcohol and OTC products unless directed by prescriber; may cause increased CNS depression
- Advise patient not to exceed recommended dosage; product may be habit forming; ileostomy patient may take this product for extended time
- Advise patient that product may cause drowsiness and to avoid hazardous activities until response to product is determined
- Teach patient that dry mouth can be decreased by frequent sips of water, hard candy, sugarless gum

### Evaluation

**Positive therapeutic outcome**

- Decreased diarrhea

## loratadine (Rx, OTC)

(lor-a'ti-deen)

**Alavert, Claritin, Children's Claritin RediTabs, Dimetapp, Triaminic Allerchews**

*Func. class.:* Antihistamine (2nd generation)

*Chem. class.:* Selective histamine ($H_1$) receptor antagonist

**Do not confuse:** loratadine/lovastatin/LORazepam/losartan

**ACTION:** Binds to peripheral histamine receptors, which provides antihistamine action without sedation

**Therapeutic outcome:** Decreased nasal stuffiness, itching, swollen eyes

**USES:** Seasonal rhinitis, chronic idiopathic urticaria for those ≥2 yr

## CONTRAINDICATIONS

Hypersensitivity, acute asthma attacks, lower respiratory tract disease

**Precautions:** Pregnancy, increased intraocular pressure, bronchial asthma, breastfeeding, hepatic/renal disease

## DOSAGE AND ROUTES

**Adult and child ≥6 yr:** PO 10 mg/day
**Child 2-5 yr:** PO 5 mg/day

### Renal dose

**Adult:** PO CCr <30 ml/min 10 mg every other day
**Child 2-5 yr:** PO GFR <50 ml/min 5 mg every other day

### Hepatic dose

**Adult:** PO 10 mg every other day

**Available forms:** Tabs 10 mg; rapid-disintegrating tabs 10 mg; orally disintegrating tabs 10 mg; syr 1 mg/ml; susp 5 mg/ml; ext rel tabs 10 mg

### Implementation

- Give on an empty stomach, 1 hr before or 2 hr after meals to facilitate absorption
- **Rapid-disintegrating tabs:** Place rapidly disintegrating tabs on tongue, then swallow after disintegrated with or without water

- Use within 6 mo of opening pouch; immediately after opening blister pack
- Store in airtight, light-resistant container
- **Ext rel tab:** Do not break, crush, or chew

## ADVERSE EFFECTS

**CNS:** Sedation (more common with increased dosages), headache, fatigue, restlessness
**EENT:** Dry mouth

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively, to active metabolite desloratadine |
| **Excretion** | Kidneys |
| **Half-life** | 17-28 hr |

### Pharmacodynamics

| | |
|---|---|
| **Peak** | 1.3-2.5 hr |
| **Duration** | >24 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Cimetidine, ketoconazole: increased loratadine level

### Drug classifications

Antidepressants, antihistamines (other), sedative-hypnotics: increased CNS depression
Macrolides (clarithromycin, erythromycin): increased loratadine level

### Drug/lab test

False negative: skin allergy tests (discontinue antihistamine 3 days before testing)

## NURSING CONSIDERATIONS

### Assessment

- **Assess allergy:** hives, rash, rhinitis
- Assess respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding
- **Beers:** Avoid in older men, may decrease urinary flow and cause urinary retention

### Patient/family education

- Teach all aspects of product uses; to notify prescriber if confusion, sedation, hypotension occur; to avoid driving and other hazardous activity if drowsiness occurs; to avoid alcohol and other CNS depressants that may potentiate effect
- Teach patient to take 1 hr before or 2 hr after meals to facilitate absorption
- Advise patient to use sunscreen or stay out of the sun to prevent burns
- Caution patient not to exceed recommended dosage; dysrhythmias may occur
- Teach patient that hard candy, gum, frequent rinsing of mouth may be used for dryness

### Evaluation

**Positive therapeutic outcome**

- Absence of runny or congested nose, other allergy symptoms

**⚠ HIGH ALERT**

## LORazepam (Rx)

(lor-az′e-pam)
**Ativan**
*Func. class.:* Sedative-hypnotic, antianxiety agent
*Chem. class.:* Benzodiazepine, short acting
**Controlled substance schedule IV**

**Do not confuse:** LORazepam/ALPRAZolam/clonazePAM

**ACTION:** Potentiates the actions of GABA, an inhibitory neurotransmitter, especially in the limbic system and reticular formation, which depresses the CNS

**Therapeutic outcome:** Decreased anxiety, relaxation

**USES:** Anxiety, irritability in psychiatric or organic disorders, preoperatively; adjunct in endoscopic procedures, status epilepticus

**Unlabeled uses:** Antiemetic before chemotherapy, rectal use, insomnia

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity to benzodiazepines/benzyl alcohol, closed-angle glaucoma, psychosis, history of drug abuse, COPD, sleep apnea

**Precautions:** Geriatric, debilitated patients, children <12 yr, renal/hepatic disease, addiction, suicidal ideation, abrupt discontinuation

**BLACK BOX WARNING:** Coadministration with other CNS depressants

## DOSAGE AND ROUTES

### Anxiety

**Adult/adolescent:** PO 2-3 mg/day in divided doses, max 10 mg/day
**Geriatric:** PO 1-2 mg/day in divided doses, or 0.5-1 mg at bedtime

### Insomnia (unlabeled)

**Adult:** PO 2-4 mg at bedtime; only minimally effective after 2 wk continuous therapy
**Geriatric:** PO 0.5-1 mg initially

### Preoperatively for sedation

**Adult:** IM 50 mcg/kg 2 hr before surgery; **IV** 44 mcg/kg 15-20 min before surgery, max 2 mg 15-20 min before surgery
**Child ≥12 yr:** **IV** 0.05 mg/kg

### Status epilepticus

**Neonate:** **IV** 0.05 mg/kg
**Child:** **IV** 0.1 mg/kg up to 4 mg/dose; RECT (unlabeled) 0.05-0.1 mg × 2; wait 7 min before giving 2nd dose

### Sedation in mechanically ventilated patients (unlabeled)

**Adult/adolescent (intermittent):** **IV** 0.044 mg/kg q2-4hr, prn, max 4 mg

### Single-dose IV (infusion)

**Adult/adolescent:** 0.5-8 mg/hr titrate, use loading dose of 2-4 mg

**Available forms:** Tabs 0.5, 1, 2 mg; inj 2, 4 mg/ml; oral sol 2 mg/ml

### Implementation

**PO route**

- Give largest dose before bedtime if giving in divided dose
- **Concentrate:** use calibrated dropper; add to food/drink, consume immediately
- Give with food or milk for GI symptoms; crush tab if patient is unable to swallow medication whole; provide sugarless gum, hard candy, frequent sips of water for dry mouth

**SUBCUT route**

- Use by SUBCUT route for rapid response (investigational use)

**IM route**

- Give deep in muscle mass; if using for preoperative sedation, give 2 hr or more before surgical procedure
- Use this route when IV route is not feasible

**Direct IV route**

- Prepare immediately before use; short stability time
- Dilute with sterile water for inj, 0.9% NaCl, or $D_5W$ just before using; give by Y-site or 3-way stopcock at 2 mg/min
- Do not use sol that is discolored or contains a precipitate
- Do not use in neonates (benzyl alcohol)

**Y-site compatibilities:** Acetaminophen, acyclovir, albumin, allopurinol, amifostine, amikacin, amoxicillin, amoxicillin/clavulanate, amphotericin B cholesteryl, amsacrine, atenolol, atracurium, bivalirudin, bleomycin, bumetanide, butorphanol, calcium chloride/gluconate, CARBOplatin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, cloNIDine, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, diltiazem, DOBUTamine, DOCEtaxel, DOPamine, doripenem, DOXOrubicin, DOXOrubicin liposomal, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, erythromycin, esmolol, etomidate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fosphenytoin, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, inamrinone, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, magnesium sulfate, mannitol, mechlorethamine, melphalan, meropenem, metaraminol, methadone, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mitoXANtrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, PENTobarbital, PHENobarbital, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, propofol, ranitidine, remifentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, TPN, trastuzumab, trimethobenzamide, trimethoprim-sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zidovudine

**Y-site incompatibilities:** IDArubicin, ondansetron, sargramostim

## ADVERSE EFFECTS

**CNS:** *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, stimulation, fatigue, depression, insomnia, hallucinations, weakness, unsteadiness
**CV:** *Orthostatic hypotension,* ECG changes, tachycardia, hypotension, apnea, cardiac arrest (IV, rapid)
**EENT:** *Blurred vision,* tinnitus, mydriasis
**GI:** Constipation, dry mouth, nausea, vomiting, anorexia, diarrhea
**INTEG:** Rash, dermatitis, itching
**MISC:** Acidosis

## Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO); completely absorbed (IM) |
| **Distribution** | Widely distributed; crosses placenta, blood-brain barrier |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 42 hr (neonates), 10.5 hr (older child), 12 hr (adult), 91% protein bound |

## Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | 1 hr | 15-30 min | |
| **Peak** | 1-2 hr | 1-1½ hr | 1-1.5 hr |
| **Duration** | 12-24 hr | 6-8 hr | 6-8 hr |

# INTERACTIONS

### Individual drugs

**BLACK BOX WARNING:** Alcohol: increased CNS depression

Disulfiram: increased LORazepam effects
Hormonal contraceptives, valproic acid: decreased LORazepam effects

### Drug classifications

**BLACK BOX WARNING:** CNS depressants, opioids: increased LORazepam effects

### Drug/herb

Chamomile, hops, kava, lavender, valerian: increased CNS depression

### Drug/lab test

Increased: AST, ALT

# NURSING CONSIDERATIONS

### Assessment

- Assess degree of anxiety; what precipitates anxiety and whether product controls symptoms; other signs of anxiety: dilated pupils, inability to sleep, restlessness, inability to focus
- Assess for alcohol withdrawal symptoms, including hallucinations (visual, auditory), delirium, irritability, agitation, fine to coarse tremors
- **Beers:** Avoid in older adults, may increase cognitive impairment, delirium

**BLACK BOX WARNING:** Coadministration with other CNS depressants (especially opioids) should be avoided, if used together, use lower dose

- Monitor B/P (with patient lying/standing), pulse; check respiratory rate; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; respirations q5-15min if given **IV**
- Monitor CBC during long-term therapy; blood dyscrasias have occurred (rare)
- Monitor for seizure control; type, duration, and intensity of seizures; what precipitates seizures
- Monitor hepatic studies: AST, ALT, bilirubin, creatinine, LDH, alkaline phosphatase
- Assess mental status: mood, sensorium, affect, sleeping pattern, drowsiness, dizziness, suicidal tendencies, and ability of product to control these symptoms; check for tolerance, withdrawal symptoms: headache, nausea, vomiting, muscle pain, weakness after long-term use

### Patient/family education

- Teach patient to notify prescriber if pregnancy is planned or suspected; do not breastfeed, use contraception
- Advise patient that product may be taken with food; that product is not to be used for everyday stress or used longer than 4 mo unless directed by a prescriber; to take no more than prescribed amount; may be habit forming

**BLACK BOX WARNING:** Caution patient to avoid OTC preparations unless approved by prescriber; to avoid alcohol, other psychotropic medications unless prescribed by physician, notify prescriber immediately trouble breathing, dizziness, coma, no response; not to discontinue medication abruptly after long-term use

- Inform patient to avoid driving and activities that require alertness; drowsiness may occur; to rise slowly or fainting may occur, especially in geriatric
- Inform patient that drowsiness may worsen at beginning of treatment
- Teach patient/family to report suicidal ideation

### Evaluation

**Positive therapeutic outcome**

- Decreased anxiety, restlessness, insomnia

# TREATMENT OF OVERDOSE:

Lavage, VS, supportive care

## lorcaserin

(lor-ca-ser′in)

**Belviq**

*Func. class.:* Appetite suppressant

*Chem. class.:* Serotonin 2C ($5\text{-HT}_{2C}$) receptor agonist

**Controlled substance IV**

**ACTION:** Decreases food consumption and decreases hunger by selectively activating $5\text{-HT}_{2C}$ receptors

**Therapeutic outcome:** Decrease in weight

**USES:** Obesity management

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, severe renal impairment

**Precautions:** Children, other organic causes of obesity, anemia, AV block, bradycardia, bundle branch block, depression, dialysis, liver/kidney disease, multiple myeloma, neutropenia, suicidal ideation, Peyronie's disease, pulmonary hypertension, sick sinus syndrome

## DOSAGE AND ROUTES

### Renal dose

**Adult:** PO 10 mg bid; do not exceed recommended dosage; discontinue after 12 wk if weight loss has not been achieved

**Available forms:** Tabs, film-coated 10 mg

### Implementation

- Identify obesity if patient is on weight reduction program that includes dietary changes, exercise
- May give without regard to food

## ADVERSE EFFECTS

**CNS:** Insomnia, depression, serotonin syndrome, anxiety, suicidal ideation, dizziness, headache, fatigue
**CV:** Bradycardia, hypertension
**GI:** Diarrhea, constipation, nausea
**HEMA:** Neutropenia, leukopenia, lymphopenia
**INTEG:** Rash
**MS:** Back pain

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 70% protein binding |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 11 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Linezolid, buPROPion, lithium, sibutramine, traMADol: increased life-threatening serotonin syndrome
Insulin: increased risk of hypoglycemia with this product

### Drug classifications

SSRIs, SNRIs, serotonin receptor agonists, MAOIs, tricyclic antidepressants: increased life-threatening serotonin syndrome
Sulfonylureas: increased risk of hypoglycemia with this product

### Drug/lab test

Increase: Prolactin
Decrease: Glucose, Hct, WBC, RBC

### Drug/herb

St. John's wort: increased serotonin syndrome

## NURSING CONSIDERATIONS

### Assessment

- Monitor weight weekly; oral hypoglycemic dosage might need to be reduced in diabetic patients
- Monitor blood glucose, CBC with differential, Hct/Hgb, serum prolactin
- **Pregnancy, breastfeeding:** do not use in pregnancy, baseline and periodically
- **Suicidal ideation:** use caution in psychiatric disorders with emotional lability; assess for depression, suicidal thoughts/behaviors, hostility, irritability
- **Serotonin syndrome:** Assess for nausea, vomiting, diarrhea, confusion, tachycardia, hyperthermia, if these occur stop product, notify prescriber

### Patient/family education

- Advise patient to avoid hazardous activities until stabilized on medication
- Inform patient to discuss unpleasant side effects
- Teach patient to notify prescriber if pregnancy is planned or suspected, do not use in pregnancy, breastfeeding
- Teach patient to use in conjunction with diet, exercise

### Evaluation
**Positive therapeutic outcome**
- Decrease in weight

## losartan (Rx)
(low-sar′tan)
**Cozaar**
*Func. class.:* Antihypertensive
*Chem. class.:* Angiotensin II receptor (type $AT_1$)

**Do not confuse:** losartan/valsartan, Cozaar/Zocor

**ACTION:** Blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the $AT_1$ receptor found in tissues

**Therapeutic outcome:** Decreased B/P

**USES:** Hypertension, alone or in combination; nephropathy in type 2 diabetes, proteinuria, stroke prophylaxis in hypertensive patients with left ventricular hypertrophy

## CONTRAINDICATIONS
Hypersensitivity

**BLACK BOX WARNING:** Pregnancy (2nd/3rd trimesters) pregnancy (1st trimester), breastfeeding, children, geriatric, hypersensitivity to ACE inhibitors, hepatic disease, angioedema, renal artery stenosis, African descent, hyperkalemia, hypotension

## DOSAGE AND ROUTES
### Hypertension
**Adult:** PO 50 mg/day alone or 25 mg/day when used in combination with diuretic; maintenance 25-100 mg/day
**Child ≥6 yr:** PO 0.7 mg/kg/day, max 50 mg/day

### Hepatic dose
**Adult:** PO 25 mg/day as starting dose/volume depletion

### Hypertension with left ventricular hypertrophy (benefit does not apply to those of African descent)
**Adult:** PO 50 mg/day, add hydrochlorothiazide 12.5 mg/day and/or increase losartan to 100 mg/day, then increase hydrochlorothiazide to 25 mg/day

### Nephropathy in type 2 diabetes patients
**Adult:** PO 50 mg/day, may increase to 100 mg/day

**Available forms:** Tabs 25, 50, 100 mg

### Implementation
- Administer without regard to meals
- If product is compounded into a suspension, store in refrigerator and shake well before use
- May use alone or in combination

## ADVERSE EFFECTS
**CNS:** *Dizziness, insomnia,* anxiety, confusion, abnormal dreams, migraine, tremor, vertigo, headache, malaise, depression, fatigue
**CV:** Angina pectoris, 2nd-degree AV block, CVA, *hypotension,* MI, dysrhythmias
**EENT:** Blurred vision, burning eyes, conjunctivitis
**GI:** *Diarrhea, dyspepsia,* anorexia, constipation, dry mouth, flatulence, gastritis, vomiting
**GU:** Impotence, nocturia, urinary frequency, urinary tract infection, renal failure
**HEMA:** Anemia, thrombocytopenia
**INTEG:** Alopecia, dermatitis, dry skin, flushing, photosensitivity, rash, pruritus, sweating angioedema
**META:** Gout, hyperkalemia, hypoglycemia
**MS:** Cramps, myalgia, pain, stiffness
**RESP:** *Cough, upper respiratory infection,* congestion, dyspnea, bronchitis
**MISC:** Diabetic vascular disease

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Bound to plasma proteins |
| **Metabolism** | Extensive |
| **Excretion** | Feces, urine |
| **Half-life** | Biphasic, 2 hr, 6-9 hr |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Individual drugs
Fluconazole: increased antihypertensive effect
Lithium: increased toxicity
PHENobarbital, rifamycin: decreased antihypertensive effect

### Drug classifications
ACE inhibitors, diuretics (potassium-sparing), potassium supplements: increased hyperkalemia
NSAIDs, salicylates: decreased antihypertensive effect

### Drug/lab test
Increase: AST/ALT

### Drug/herb
Ma huang: Decrease antihypertensive effects

## NURSING CONSIDERATIONS

### Assessment

- Assess B/P with position changes, pulse q4hr; note rate, rhythm, quality, Black patients should use combination therapy for better control of B/P
- Monitor electrolytes: potassium, sodium, chloride
- Obtain baselines for renal, electrolyte, liver function tests before therapy begins
- **HF:** assess for jugular vein distention, weight daily, edema in feet, legs daily
- **Angioedema:** facial swelling, dyspnea, wheezing, may occur rapidly, tongue swelling (rare)
- **Blood dyscrasias:** thrombocytopenia, anemia (rare)

**BLACK BOX WARNING:** Pregnancy before starting treatment; not to use in pregnancy, breastfeeding

### Patient/family education

- Teach patient to avoid sunlight or wear sunscreen if in sunlight; photosensitivity may occur
- Advise patient to comply with dosage schedule, even if feeling better
- Teach patient to notify prescriber of mouth sores, fever, swelling of hands or feet, irregular heartbeat, chest pain
- Advise patient that excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in blood pressure, consult prescriber if these occur
- Inform patient that product may cause dizziness, fainting; light-headedness may occur, to avoid hazardous activities until reaction is known
- Caution patient to rise slowly to sitting or standing position to minimize orthostatic hypotension

**BLACK BOX WARNING:** Advise patient to use contraception while taking this product, pregnancy not to breastfeed

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P

## loteprednol ophthalmic

*See Appendix B*

## lovastatin (Rx)

(loe′va-sta-tin)

**Altoprev, Mevacor (mevinolin)**

*Func. class.:* Antilipemic

*Chem. class.:* HMG-CoA reductase inhibitor

**Do not confuse:** lovastatin/Lotensin

**ACTION:** By inhibiting HMG-CoA reductase, which reduces cholesterol synthesis

**Therapeutic outcome:** Decreased cholesterol levels and LDL, increased HDL

**USES:** As an adjunct in primary hypercholesterolemia (types IIa, IIb), atherosclerosis, heterozygous familial hypercholesterolemia (adolescents)

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, active liver disease

**Precautions:** Past liver disease, alcoholism, severe acute infections, trauma, hypotension, uncontrolled seizure disorders, severe metabolic disorders, electrolyte imbalances, visual condition, children

## DOSAGE AND ROUTES

### To prevent/treat CAD, hyperlipidemia

**Adult:** PO 20 mg/day with evening meal; may increase to 20-40 mg/day in single or divided doses at 4-wk intervals; max 40 mg/day; ext rel 20-60 mg/day at bedtime; max 40 mg/day

### Heterozygous familial hypercholesterolemia

**Adolescent 10-17 yr:** PO 10-40 mg with evening meal

### Primary prevention of CV disease

**Adult 45-75 yr with type 1 or 2 diabetes:** PO 40 mg immediate-release

### Secondary prevention of CV disease

**Adult >75 yr (not a candidate for high-intensity use):** 40 mg immediate-release qday

### Renal dose

**Adult:** PO CCr <30 mg/min max 20 mg/day unless titrated

**Available forms:** Tabs 10, 20, 40 mg; ext rel tab 10, 20, 40, 60 mg

### Implementation

- Give with evening meal; if dosage is increased, take with breakfast and evening meal (immediate release); use at bedtime
- Altroprev is not equivalent to Mevacor

• Store in cool environment in airtight, light-resistant container
• Do not crush or chew ext rel tab

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, tremor, insomnia, paresthesia
**EENT:** Blurred vision, lens opacities
**GI:** Nausea, constipation, diarrhea, dyspepsia, *flatus,* abdominal pain, heartburn, liver dysfunction, vomiting, acid regurgitation, dry mouth, dysgeusia
**HEMA:** Thrombocytopenia, hemolytic anemia, leukopenia
**INTEG:** Rash, pruritus, photosensitivity
**MS:** Muscle cramps, myalgia, myositis, rhabdomyolysis; leg, shoulder, or localized pain

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poorly absorbed, erratic |
| **Distribution** | Crosses placenta, blood-brain barrier |
| **Metabolism** | Liver, extensively |
| **Excretion** | Feces (83%); kidneys, urine (10%) |
| **Half-life** | 3-4 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Bosentan, exenatide: decreased action of lovastatin
Clarithromycin, clofibrate, cycloSPORINE, danazol, diltiazem, erythromycin, gemfibrozil, niacin, quinupristin-dalfopristin, telithromycin, verapamil: increased myalgia, myositis, rhabdomyolysis; avoid concurrent use
Diltiazem: increased lovastatin effects
Warfarin: increased bleeding

### Drug classifications

Azole antifungals, protease inhibitors: increased myositis, myalgia, rhabdomyolysis
Bile acid sequestrants: decreased lovastatin effects

### Drug/herb

Pectin, St. John's wort: decreased effect
Red yeast rice: increased adverse reactions

### Drug/food

Increased levels of lovastatin with food, must be taken with food
Grapefruit juice: increased toxicity
Oat bran: decreased absorption

### Drug/lab test

Increased: CPK, liver function tests
Interference: T3, T4, T7, TSH

## NURSING CONSIDERATIONS

### Assessment

• Assess nutrition: fat, protein, carbohydrates; nutritional analysis should be completed by dietitian before treatment
• Monitor bowel pattern daily; diarrhea may be a problem
• Monitor triglycerides, fasting cholesterol LDL, HDL at baseline, throughout treatment; watch LDL and VLDL closely; if increased, product should be discontinued
• Assess for muscle pain, tenderness, obtain CPK; if these occur, product may need to be discontinued
• **Rhabdomyolysis:** muscle pain, increased CPK, weakness, swelling of affected muscles; if these occur and if confirmed by CPK, product should be discontinued

### Patient/family education

• Inform patient that compliance is needed for positive results to occur; not to double doses
• Inform patient that blood work and ophthalmic exam will be necessary during treatment
• Teach patient that risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
• Advise patient to report if pregnancy is suspected, pregnancy X, do not breastfeed, do not use in pregnancy
• Advise patient to notify prescriber if the GI symptoms of diarrhea, abdominal or epigastric pain, nausea, vomiting occur; or if chills, fever, sore throat, blurred vision, dizziness, headache, muscle pain, weakness occur
• Advise patient to stay out of the sun or use sunscreen to prevent burns
• Instruct patient that product should be taken with food, not to crush, chew ext rel product, to take immediate-release product in the AM and extended-release product at bedtime
• Teach patient not to use with grapefruit juice, large amounts of alcohol
• Teach patient to protect from light, moisture

### Evaluation

#### Positive therapeutic outcome

• Decreased cholesterol, serum triglyceride levels
• Improved level of HDL

## lurasidone (Rx)

(loo-ras'i-done)

**Latuda**

*Func. class.:* Atypical antipsychotic

*Chem. class.:* Dopamine-serotonin receptor antagonist

**Do not confuse:** Latuda/Lantus

**ACTION:** May modulate central dopaminergic and serotoninergic activity, high affinity for dopamine-$D_2$ receptors, serotonin 5-$HT_{2A}$ receptors, and partial agonist at serotonin 5-$HT_{1A}$ receptor

**Therapeutic outcome:** Decreasing hallucinations, delusions, agitation, social withdrawal

**USES:** Schizophrenia, depression associated with bipolar disorder I

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Abrupt discontinuation, ambient temperature increase, breast cancer, breastfeeding, cardiac disease, children, dehydration, diabetes, ketoacidosis, driving/operating machinery, dysphagia, geriatrics, heart failure, hematological/hepatic/renal disease, hypotension, hypovolemia, MI, infertility, obesity, Parkinson's disease, pregnancy, seizures, strenuous exercise, stroke, substance abuse, suicidal ideation, syncope, tardive dyskinesia

**BLACK BOX WARNING:** Dementia: antipsychotics, such as lurasidone, are not approved for the treatment of dementia-related psychosis in geriatric patients and may increase the risk of death in this population, children, suicidal ideation

## DOSAGE AND ROUTES

### Schizophrenia

**Adult:** PO 40 mg/day, range 40-160 mg/day, those receiving CYP3A4 inhibitors max 80 mg/day, do not use with strong CYP3A4 inducers/inhibitors

### Bipolar disorder I

**Adult:** PO 20 mg qday, max 120 mg/day

### Hepatic/renal dose

**Adult:** PO CCr <50 ml/min, hepatic disease CTPA start dose 20 mg/day, max 80 mg/day; hepatic disease CTP B start dose 20 mg/day, max 40 mg/day

**Available forms:** 20, 40, 80, 120 mg tabs

### Implementation

- Give with a meal of at least 350 calories
- Store at room temperature, protect from moisture

## ADVERSE EFFECTS

**CNS:** Agitation, akathisia, anxiety, dizziness, drowsiness, fatigue, hyperthermia, insomnia, dystonic reactions; neuroleptic malignant syndrome (rare), pseudoparkinsonism, restlessness, seizures, suicidal ideation, syncope, tardive dyskinesia, vertigo

**CV:** Angina, AV block, bradycardia, hypertension, orthostatic hypotension, sinus tachycardia, stroke

**EENT:** Blurred vision

**ENDO:** Diabetes mellitus, ketoacidosis, hyperglycemia, hyperprolactinemia

**GI:** Abdominal pain, diarrhea, dyspepsia, nausea, vomiting, gastritis, weight gain/loss

**GU:** Amenorrhea, breast enlargement, dysmenorrhea, impotence, dysuria, renal failure

**HEMA:** Agranulocytosis, anemia, leucopenia, neutropenia

**INTEG:** Pruritus, rash

**MS:** Back pain, dysarthria; rhabdomyolysis (rare)

**SYST:** Angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 9%-19% |
| **Distribution** | 99% protein binding |
| **Metabolism** | Unknown |
| **Excretion** | 80% feces, 9% urine |
| **Half-life** | 18 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-3 hr |
| **Duration** | Steady state 7 days |

## INTERACTIONS

### Individual drugs

Metoclopramide: do not use concurrently

### Drug classifications

Other CNS depressants, alcohol: increased sedation

Strong CYP3A4 inhibitors: increased lurasidone effect, do not use concurrently

SSRIs, SNRIs: increased serotonin syndrome, neuroleptic malignant syndrome

### Drug/herb

St. John's wort: Decrease: Product effect, do not use together

### Drug/food

Not to use with grapefruit juice

## NURSING CONSIDERATIONS

### Assessment

- **Assess for schizophrenia:** hallucinations, delusions, agitation, social withdrawal; monitor orientation, behavior, mood prior to and periodically during therapy
- **Assess for neuroleptic malignant syndrome (rare):** fever, dyspnea, tachycardia, seizures, sweating, hypertension, hypotension, muscle stiffness, pallor, report immediately
- **Monitor for blood dyscrasias:** CBC periodically, blood dyscrasias may occur
- **Monitor for serious cardiac symptoms:** AV block, stroke, bradycardia may occur
- Assess AIMS assessment, thyroid function tests, LFTs, lipid panel, electrolytes
- **Assess for EPS:** restlessness, difficulty speaking, loss of balance, pill rolling, masklike face, shuffling gait, rigidity, tremors, muscle spasms; monitor prior to and periodically during therapy; report tardive dyskinesia immediately

**BLACK BOX WARNING: Dementia:** This product is not approved for the elderly with dementia-related psychosis

- Monitor for weight gain, hyperglycemia, metabolic changes in diabetes
- **Coadministration with other CNS depressants (opioids). If given together, assess for excessive sedation, slow breathing, avoid concurrent use**

**BLACK BOX WARNING:** Suicidal ideation/children: Avoid use in children, may be risk of suicide in young adults (<24 yr) and children; assess for worsening depression, suicidal thoughts/behaviors, product should be dispensed in small quantities

- **Beers:** Avoid in older adults except for schizophrenia, bipolar disorder, short-term use as an antiemetic for chemotherapy, increased risk of stroke, cognitive decline

### Patient/family education

- Explain reason for treatment and expected results
- **Teach patient to report EPS, blood dyscrasias:** sore throat, fever, unusual bleeding/bruising
- Teach patient that lab work will be needed regularly
- Advise patient to avoid hazardous activities until response is known
- Teach patient to avoid OTC products unless approved by prescriber, serious reaction may occur, not to use grapefruit juice, alcohol
- Teach patient to report fast heartbeat, extra beats, trouble breathing, sweating, stiffness

**BLACK BOX WARNING:** Suicidal ideation/children: Teach patient/family to be aware and report immediately worsening depression, suicidal thoughts/behaviors, hostility, irritability

### Evaluation

**Positive therapeutic outcome**

- Decreasing hallucinations, delusions, agitation, social withdrawal

## luliconazole topical

*See Appendix B*

labetalol (Rx)
lamiVUDine (3TC) (Rx)
lapatinib (Rx)
leflunomide (Rx)
leuprolide (Rx)
levobetaxolol ophthalmic
levodopa-carbidopa (Rx)
levomilnacipran
lidocaine topical
linezolid (Rx)
lithium (Rx)
loperamide (OTC, Rx)
lorcaserin
lovastatin (Rx)
lacosamide (Rx)
lamoTRIgine (Rx)
latanoprost ophthalmic
letrozole (Rx)
levalbuterol (Rx)
levobunolol ophthalmic
levofloxacin (Rx)
levothyroxine (Rx)
linagliptin
liraglutide (Rx)
lixisenatide
loratadine (Rx, OTC)
losartan (Rx)
lurasidone (Rx)
lactulose (Rx)
lansoprazole (Rx, OTC)
ledipasvir/sofosbuvir
leucovorin (Rx)
levETIRAcetam (Rx)
levocabastine ophthalmic
levofloxacin ophthalmic
lidocaine, parenteral (Rx)
lindane (OTC)
lisinopril (Rx)
lodoxamide ophthalmic
LORazepam (Rx)
loteprednol ophthalmic
luliconazole topical

## mafenide topical

*See Appendix B*

## magaldrate (OTC)

(mag′al-drate)

**Isopan, Losapan, Riopan, Riopan Extra Strength**

*Func. class.:* Antacid

*Chem. class.:* Aluminum/magnesium hydroxide

**ACTION:** Neutralizes gastric acidity; product is dissolved in gastric contents; this product is a combination of aluminum and magnesium

**Therapeutic outcome:** Decreased pain of ulcers

**USES:** Antacid, hiatal hernia, indigestion/heartburn, hyperacidity

**Unlabeled uses:** Duodenal and gastric ulcers, peptic ulcer disease (adjunct), reflex esophagitis

### CONTRAINDICATIONS

Hypersensitivity to this product or benzyl alcohol

**Precautions:** Pregnancy, geriatric, fluid restriction, decreased GI motility, GI obstruction, dehydration, renal disease, sodium-restricted diets, bone disease, hypertension, appendicitis, diverticulitis, ulcerative colitis, neonates/infants, hypermagnesemia, hypophosphatemia

### DOSAGE AND ROUTES

**Adult/child/geriatric:** SUSP 5-10 ml (480-1080 mg) with water between meals, at bedtime

**Available forms:** SUSP 540 mg/5 ml

#### Implementation

- Take antacids 2 hr before or 2 hr after taking enteric-coated products
- Give laxatives or stool softeners if constipation occurs
- Give SUSP after shaking; give between meals and at bedtime
- Give when stomach is empty after meals and at bedtime

### ADVERSE EFFECTS

**GI:** Constipation, diarrhea, anorexia

**META:** Hypermagnesemia, hypophosphatemia

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Not absorbed |
| **Distribution** | Not distributed |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

#### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | ½ hr |
| **Duration** | 1 hr |

### INTERACTIONS

#### Individual drugs

ChlordiazePOXIDE, cimetidine, isoniazid, ketoconazole, phenytoin, tetracycline: decreased absorption of each specific product

Flecainide, quiNIDine: increased action when taken in large amounts

#### Drug classifications

Amphetamines: increased action when taken in large amounts

Anticholinergics, corticosteroids, fluoroquinolones, iron salts, phenothiazines, salicylates: decreased absorption of each specific product

Salicylates: decreased action when taken in large amounts

### NURSING CONSIDERATIONS

#### Assessment

- **Antacid:** location of pain, intensity, characteristics, what aggravates, ameliorates pain; heartburn/indigestion; hematemesis
- Monitor serum magnesium, calcium, phosphate, potassium if using long term or with impaired renal function
- Assess for constipation: increase bulk in diet if needed or obtain order for stool softener

#### Patient/family education

- Advise patient to separate ingestion of enteric-coated products and antacid by 2 hr
- Advise patient to use product 2 wk or less; product should not be used for long periods
- Teach patient to notify prescriber immediately if coffee-ground emesis, emesis with frank blood, or black tarry stools occur

#### Evaluation

**Positive therapeutic outcome**

- Absence of abdominal pain
- Decreased acidity

## magnesium salts

(mag-neez′ee-um)

**magnesium chloride (Rx)**

**Mag-64**

**magnesium citrate (OTC)**

**magnesium gluconate (OTC)**

**Magtrate**

## magnesium hydroxide (OTC)

**Dulcolax, Phillips Milk of Magnesia, MOM**

## magnesium oxide (OTC)

**Mag-Ox 400, Uro-Mag**

**⚠ HIGH ALERT**

## magnesium sulfate (OTC, Rx)

**(IV)— HIGH ALERT**

*Func. class.:* Electrolyte; anticonvulsant, laxative, saline; antacid

**ACTION:** Increases osmotic pressure, draws fluid into colon, neutralizes HCl

**Therapeutic outcome:** Magnesium levels WNL, absence of constipation

**USES:** Constipation, dyspepsia, bowel preparation before surgery or exam, electrolyte, anticonvulsant, in preeclampsia, eclampsia (magnesium sulfate); cardiac glycoside-induced arrhythmias, nutritional supplement

## CONTRAINDICATIONS

Hypersensitivity, abdominal pain, nausea/vomiting, obstruction, acute surgical abdomen, rectal bleeding, heart block, myocardial damage

**Precautions:** Pregnancy (magnesium sulfate), renal disease/cardiac disease

## DOSAGE AND ROUTES

### Laxative

**Adult:** PO 15-60 ml at bedtime (Milk of Magnesia)

**Adult and child >12 yr:** PO 15 g in 8 oz of $H_2O$ (magnesium sulfate); PO 5-30 ml (Concentrated Milk of Magnesia); PO 5-10 oz at bedtime (magnesium citrate)

**Child 2-6 yr:** 5-15 ml/day (Milk of Magnesia)

### Prevention of magnesium deficiency

**Adult and child ≥10 yr:** PO (male): 350-400 mg/day; (female): 280-300 mg/day; (breastfeeding): 335-350 mg/day; (pregnancy): 320 mg/day

**Child 8-10 yr:** PO 170 mg/day

**Child 4-7 yr:** PO 120 mg/day

### Magnesium sulfate deficiency

**Adult:** PO 200-400 mg in divided doses tid-qid; IM 1 g q6hr × 4 doses; **IV** 5 g (severe)

**Child 6-12 yr:** 3-6 mg/kg/day in divided doses tid-qid

### Preeclampsia/eclampsia magnesium sulfate

**Adult:** IM/**IV** INF 4-5 g; with 5 g IM in each gluteus, then 5 g q4hr or 4 g **IV** INF, then 1-3 g/hr cont INF, max 40 g/day or 20 g/48 hr in severe renal disease

**Available forms: Chloride:** sus rel tabs 535 mg (64 mg Mg); enteric tabs 833 mg (100 mg Mg); **hydroxide:** liquid 400 mg/5 ml (164 mg Mg/5 ml); conc liquid 800 mg/5 ml (328 mg Mg/5 ml); chew tabs 300, 600 mg; **Gluconate:** tabs 500 mg; liquid 54 mg/5 ml; **oxide:** tabs 400 mg (241.3 mg Mg); caps 140 mg (84.5 mg Mg); **sulfate:** 500 mg/ml; premixed infusion 1g/100 ml, 2 g/100 ml, 4 g/50 ml, 4 g/100 ml, 20 g/500 ml, 40 g/1000 ml; **citrate:** oral sol 240, 296, 300 ml bottles (77 mEq/100 ml)

### Implementation

**PO route**

- Administer with 8 oz of water
- Refrigerate magnesium citrate before administration
- Shake susp before using
- Administer to patient crushed or whole; chewable tablets may be chewed
- Administer with food or milk to decrease gastric symptoms; give 30 min before or 2 hr after antacids
- Tablets should be chewed thoroughly before swallowing, give 4 oz of water afterward
- **Laxative:** give on empty stomach

**IM route (magnesium sulfate)**

- Give deeply in gluteal site

**IV route (magnesium sulfate)**

- Only when calcium gluconate available for magnesium toxicity

**Direct IV route**

- Dilute 50% solution to 20% or less give at ≤150 mg/min

**Continuous IV INF route**

- May dilute to 20% sol, infuse over 3 hr
- IV at less than 125 mg/kg/hr; circulatory collapse may occur; use inf pump

**Y-site compatibilities:** Acyclovir, aldesleukin, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, argatroban, arsenic trioxide, ascorbic acid injection, asparaginase, atenolol, atosiban, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, cangrelor, CARBOplatin, carmustine, caspofungin, cefotaxime, cefoTEtan, cefOXitin, ceftAZidime, ceftizoxime, cephapirin, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cloNIDine, codeine, cyanocobalamin, cyclophosphamide, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin liposome, DAUNOrubicin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhyDRINATE, diphenhydrAMINE,

DOBUTamine, DOCEtaxel, dolasetron, DOPAmine, doripenem, doxacurium chloride, DOXOrubicin liposomal, doxycycline, enalaprilat, EPHEDrine, EPINEPHrine, epoetin alfa, eptifibatide, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid (as sodium salt), foscarnet, gallium, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, insulin, regular, irinotecan, isoproterenol, kanamycin, ketamine, ketorolac, labetalol, lactated ringer's injection, lepirudin, leucovorin, lidocaine, linezolid, LORazepam, mannitol, mechlorethamine, mesna, metaraminol, methotrexate, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, morphine, moxifloxacin, multiple vitamins injection, mycophenolate mofetil, nafcillin, nalbuphine, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, piperacillin, piperacillin tazobactam, polymyxin B, potassium acetate/chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, ringer's injection, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, TNA (3-in-1), tobramycin, tolazoline, topotecan, TPN (2-in-1), trastuzumab, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Muscle weakness, flushing, sweating, confusion, sedation, depressed reflexes, flaccid paralysis, hypothermia

**CV:** Hypotension, heart block, circulatory collapse, vasodilatation

**GI:** *Nausea, vomiting, anorexia, cramps,* diarrhea

**HEMA:** Prolonged bleeding time

**META:** Electrolyte, fluid imbalances

**RESP:** Respiratory depression/paralysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |
| | effective anticonvulsant levels 2.5-7.5 mEq/L |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | 3-6 hr | 1 hr | Unknown |
| **Peak** | Unknown | Unknown | Unknown |
| **Duration** | Unknown | 4 hr | ½ hr |

## INTERACTIONS

### Individual products

Digoxin: decreased effect of digoxin
Nitrofurantoin: decreased absorption

### Drug classifications

Antihypertensives: increased hypotension, calcium channel blockers
Antiinfectives (fluoroquinolones), tetracyclines: decreased absorption
Neuromuscular blockers: increased effect

## NURSING CONSIDERATIONS

### Assessment

- Assess I&O ratio; check for decrease in urinary output
- **Laxative:** assess cause of constipation; lack of fluids, bulk, exercise
- Assess cramping, rectal bleeding, nausea, vomiting; product should be discontinued
- **Assess magnesium toxicity:** thirst, confusion, decrease in reflexes
- Assess visual changes: blurring, halos, corneal and retinal damage
- Assess edema in feet, ankles, legs
- Assess prior product history; there are many product interactions
- **Eclampsia:** seizure precautions, BP, ECG (magnesium sulfate)
- **Pregnancy/breastfeeding:** Do not use in pregnancy, unless clearly needed, cautious use in breastfeeding, excreted in breast milk

### Patient/family education

#### PO route

- Teach not to use laxatives for long-term therapy; bowel tone will be lost
- Teach that chilling helps the taste of magnesium citrate
- Teach to shake suspension well

- Teach to not use at bedtime as a laxative; may interfere with sleep; MOM is usually given at bedtime
- Teach to give citrus fruit after administering to counteract unpleasant taste
- Teach reason for product, expected result

### Evaluation

**Positive therapeutic outcome**
- Decreased constipation; absence of seizures (eclampsia), normal serum calcium levels

## mannitol (Rx)

(man′i-tole)
**Aridol Bronchial Challenge test kit, Osmitrol, Resectisol**
*Func. class.:* Diuretic-osmotic
*Chem. class.:* Hexahydric alcohol

**ACTION:** Increases osmolarity of glomerular filtrate, which raises osmotic pressure of fluid in renal tubules; there is a decrease in reabsorption of water, electrolytes; increases in urinary output, sodium, chloride, potassium, calcium, phosphorus, uric acid, urea, magnesium

**USES:** Edema; promote systemic diuresis in cerebral edema, decrease intraocular pressure, improve renal function in acute renal failure, chemical poisoning, urinary bladder irrigation, kidney transplant

**Unlabeled uses:** traumatic brain injury

## CONTRAINDICATIONS

Active intracranial bleeding, hypersensitivity, anuria, severe pulmonary congestion, edema, severe dehydration, progressive heart disease, renal failure, acute MI, aneurysm, stroke

**Precautions:** Pregnancy, breastfeeding, geriatric, dehydration, severe renal disease, HF, electrolyte imbalances

**BLACK BOX WARNING:** Acute bronchospasm, asthma

## DOSAGE AND ROUTES

### Oliguria, prevention in acute renal failure

**Adult: IV** after initial test dose and if urine output is 30-50 mg/hr × 2 hr, give 20-100 g of a 15% or 20% SOL in a 24-hr period

### Oliguria, treatment

**Adult: IV** after initial test dose, give balance of 50 g of a 20% SOL over 1 hr, then 5% via CONT IV INF to maintain output at 50 ml/hr
**Child (unlabeled): IV** 0.5-2 g/kg as a 15%-20% SOL, run over 30-60 min; maintenance 0.25-0.5 g/kg q4-6hr

### Edema

**Adult: IV** after dose, use product 10%-20% at a rate of 25-75 ml/hr, give loop diuretics prior to mannitol
**Child: IV** (unlabeled) 0.5-2 g/kg of 15%-20% mannitol over 2-6 hr

### Intraocular pressure

**Adult: IV** 1.5-2 g/kg of a 15%-20% SOL over 30-60 min

### ICP

**Adult: IV** 1-2 g/kg, then 0.25-1 g/kg q4hr

### Diuresis in product intoxication

**Adult and child >12 yr:** 5%-25% SOL continuously up to 200 g **IV**, while maintaining 100-500 ml urine output/hr

### Kidney transplant

**Adult:** Donor **IV** 12.5 g prior to nephrectomy, with adequate hydration, may repeat
**Recipient:** 50 g prior to revascularization

### Traumatic brain injury (unlabeled)

**Adult: IV** 1.4 g/kg prior to neurosurgery with fluid replacement

**Available forms:** Inj 5%, 10%, 15%, 20%, 25%; GU irrigation 5%; Inhalation cap challenge kit

### Implementation

**Irrigation**
- Use 100 ml of 25%/900 ml of sterile water for inj (2.5% sol)
- Administer potassium replacement if potassium level is <3 mg/ml

**Intermittent/continuous IV route**
- Change IV set q24hr
- May warm solution to dissolve crystals
- Precipitate may occur with PVC
- Use an in-line filter for 15%, 20%, 25%; give with inf pump; check **IV** patency at inf site before, during administration; do not use sol that is yellow or has a precipitate or crystals, use in-line filter, do not give as direct injection; to redissolve, run bottle under hot water and shake vigorously; cool to body temp before giving
- Run at 30-50 ml/hr in oliguria; run over 30-60 min in increased ICP; run over 30 min for intraocular pressure; 60-90 min after surgery
- Monitor for infiltration, potency during use
- Give 20 mEq NaCl/L of product solution if blood is given concurrently
- **Test dose** with severe oliguria, 0.2 g/kg over 3-5 mins; if continued oliguria give 2nd test dose; if no response, reassess patient

**Y-site compatibilities:** Acetaminophen, acyclovir, alemtuzumab, amifostine, amikacin, ampicillin, atropine, asparaginase, aztreonam, bivalirudin, bumetanide, calcium gluconate,

caspofungin, ceFAZolin, cefotaxime, cefOXitin, cefTAZidime, ceftizoxime, chloramphenicol, cimetidine, cisatracurium, clindamycin, DAPTOmycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOPamine, DOXOrubicin liposome, doxycycline, enalaprilat, EPINEPHrine, ertapenem, esmolol, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, gentamicin, granisetron, heparin, HYDROmorphone, hydrOXYzine, IDArubicin, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, meperidine, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, morphine, nafcillin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pantoprazole, penicillin G potassium, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, ranitidine, remifentanil, sargramostim, sodium bicarbonate, tacrolimus, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, verapamil, vinCRIStine, vitamin B complex with C, voriconazole, zoledronic acid

**Y-site incompatibilities:** Aminophylline, amphotericin B cholesteryl sulfate complex, calcium chloride, cefepime, cefTRIAXone, cefuroxime, ciprofloxacin, dexamethasone sodium phosphate, diazepam, drotrecogin, haloperidol, lansoprazole, methylPREDNISolone sodium succinate, phenytoin, phytonadione

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache,* seizures, rebound increased ICP, confusion
**CV:** Edema, hypotension, hypertension, tachycardia, HF, thrombophlebitis, angina-like chest pains, fever, chills, circulatory overload, PVCs
**EENT:** Loss of hearing, blurred vision, nasal congestion, decreased intraocular pressure
**ELECT:** Fluid, electrolyte imbalances, acidosis, electrolyte loss, dehydration, hyper/hypokalemia
**GI:** *Nausea, vomiting,* dry mouth, diarrhea
**GU:** Marked diuresis, urinary retention, thirst
**RESP:** Pulmonary congestion, *cough,* dyspnea
**INTEG:** Injection site reaction

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Extracellular spaces |
| **Metabolism** | Minimal |
| **Excretion** | Renal |
| **Half-life** | 100 min |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½-1 hr |
| **Peak** | 1 hr |
| **Duration** | 6-8 hr |

## INTERACTIONS

### Individual drugs

Lithium: increased elimination of mannitol, monitor lithium level
Imipramine: increased excretion of imipramine
Arsenic trioxide, levomethadyl: increased hypokalemia

### Drug classifications

Aminoglycosides, other nephrotic products, avoid concurrent use
Salicylates, barbiturates, bromides: increased excretion of each specific product
Opioids: decreased mannitol effet, increased reactions

### Drug/food

Potassium foods: increased hyperkalemia

### Drug/lab test

Interference: inorganic phosphorus, ethylene glycol
Decrease: ANC
Increase or decrease: sodium, potassium, magnesium

## NURSING CONSIDERATIONS

### Assessment

- Assess neurologic status: LOC, ICP reading, pupil size and reaction when product is given for increased ICP
- Assess for vision changes or eye discomfort or pain before, during treatment (increases intraocular pressure); neurologic checks, ICP during treatment (increased ICP)

**BLACK BOX WARNING: Bronchospasm/asthma:** Test for bronchial hyperresponsiveness should not be performed in any person with asthma or baseline pulmonary function test FEV1<1-1.5L or <70% of predicted values

- Assess patient for tinnitus, hearing loss, ear pain; periodic testing of hearing is needed when high doses of this product are given by **IV** route
- Assess fluid volume status: check I&O ratios and record hourly urine values, breath sounds, weight, distended red veins, crackles in lungs, color, quality, and specific gravity of urine, skin turgor, adequacy of pulses, moist mucous membranes (provide adequate fluids), bilateral lung sounds, peripheral pitting edema

M

• Assess for dehydration; symptoms of decreasing output, thirst, hypotension, dry mouth and mucous membranes should be reported, provide frequent mouth care
• Monitor electrolytes: potassium, sodium, calcium, magnesium; also include BUN, PAP, qday; regularly monitor serum and urine levels of sodium and potassium
• Assess B/P before, during therapy with patient lying, standing, and sitting as appropriate; orthostatic hypotension can occur rapidly
• Monitor for rebound ICP: headache, confusion
• **Beers:** Use with caution in older adults, may cause or exacerbate SIADH
• **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding, excretion unknown

### Patient/family education
• Teach patient reason for and method of treatment, pain at injection site, hearing loss, blurred vision

### Evaluation
**Positive therapeutic outcome**
• Decreased intraocular pressure
• Prevention of hypokalemia (diuretic use)
• Decreased edema
• Decreased ICP
• Increased diuresis of >30 ml/hr
• Increased excretion of toxic substances

## TREATMENT OF OVERDOSE:
Discontinue infusion; correct fluid, electrolyte imbalances; hemodialysis; monitor hydration, CV, renal function

## meclizine (OTC, Rx)
(mek'li-zeen)
**Antivert, Bonine, Dramamine Less Drowsy Formula**
*Func. class.:* Antiemetic, antihistamine, anticholinergic
*Chem. class.:* $H_1$-receptor antagonist, piperazine derivative

**Do not confuse:** Antivert/Axert

**ACTION:** Suppresses vestibular end-organ receptors and inhibits activation of cholinergic pathways

**Therapeutic outcome:** Decreased nausea in motion sickness; decreased vertigo

**USES:** Vertigo, motion sickness

## CONTRAINDICATIONS
Hypersensitivity to cyclizines, shock

**Precautions:** Pregnancy, breastfeeding, children, geriatric, closed-angle glaucoma, glaucoma, prostatic hypertrophy, urinary retention, GI obstruction, contact lenses

## DOSAGE AND ROUTES
### Vertigo
**Adult/adolescent:** PO 25-100 mg/day in divided doses

### Motion sickness
**Adult/adolescent:** PO 25-50 mg 1 hr before traveling; repeat dose q24hr prn

**Available forms:** Tabs 12.5, 25, 50 mg

### Implementation
• May give without regard to food
• **Chew tab:** Give without regard to water or may be swallowed whole with water
• Give lowest possible dose in geriatric, anticholinergic effects

## ADVERSE EFFECTS
**CNS:** *Drowsiness,* fatigue
**CV:** Hypotension
**EENT:** blurred vision
**GI:** Dry mouth

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 6 hr |

### Pharmacodynamics
| | |
|---|---|
| **Onset** | 1 hr |
| **Peak** | Unknown |
| **Duration** | 8-24 hr |

## INTERACTIONS
### Individual drugs
Alcohol: increased effects
Atropine: increased anticholinergic effects

### Drug classifications
Antihistamines, antidepressants, phenothiazines: increased anticholinergic effect
CNS depressants, opioids: increased CNS depression

### Drug/herb
Hops, valerian, kava: increased sedative effect

### Drug/lab test
False negative: allergy skin testing (allergen extracts)

## NURSING CONSIDERATIONS
### Assessment
• **Vertigo/motion sickness:** nausea, vomiting after 1 hr, assess vertigo periodically

- Monitor VS, B/P
- **Assess for signs of toxicity of other products or masking of symptoms of disease:** brain tumor, intestinal obstruction
- Observe for drowsiness, dizziness, LOC
- **Pregnancy/breastfeeding:** Only use if needed, occasional doses should not pose a risk in breastfeeding

### Patient/family education

- Teach patient that a false-negative result may occur with skin testing for allergies; these procedures should not be scheduled for 4 days after discontinuing use
- Advise patient to use sugarless gum, frequent sips of water for dry mouth
- Teach patient to avoid hazardous activities, activities requiring alertness; dizziness may occur; instruct patient to request assistance with ambulation
- Teach patient to avoid alcohol, other depressants, breastfeeding, report severe side effects
- **Motion sickness prophylaxis: Teach patient to take ≥ 1 hr before event that may cause motion sickness**

### Evaluation

**Positive therapeutic outcome**

- Absence of dizziness, vomiting

**⚠ HIGH ALERT**

## medroxyPROGESTERone (Rx)

(me-drox-ee-proe-jess'te-rone)

**Depo-Provera, Depo-subQ Provera, Gen-Medroxy 🍁, Provera**

*Func. class.:* Hormone: progestogen, contraceptive, antineoplastic

*Chem. class.:* Progesterone derivative

**Do not confuse:** medroxyPROGESTERone/methylPREDNISolone, Provera/Premarin/Covera

**ACTION:** Inhibits secretion of pituitary gonadotropins, which prevents follicular maturation and ovulation; antineoplastic action against endometrial cancer

**Therapeutic outcome:** Decreased abnormal uterine bleeding, absence of amenorrhea

**USES:** Uterine bleeding (abnormal), secondary amenorrhea, contraceptive, prevention of endometrial changes associated with estrogen replacement therapy (ERT), inoperable, recurrent, metastatic endometrial/renal cancer

## CONTRAINDICATIONS

Pregnancy, hypersensitivity, reproductive cancer, genital bleeding (abnormal, undiagnosed), missed abortion, stroke, cerebrovascular disease, cervical cancer, hepatic disease, uterine/vaginal cancer

**BLACK BOX WARNING:** Breast cancer, MI, stroke, thromboembolic disease, thrombophlebitis

**Precautions:** Breastfeeding, hypertension, asthma, blood dyscrasias, gallbladder disease, HF, diabetes mellitus, bone disease, depression, migraine headache, seizure disorders, renal/hepatic disease, family history of cancer of breast or reproductive tract, bone mineral density loss, ocular disorders, AIDS/HIV, alcoholism, children, hyperlipidemia, cardiac disease

**BLACK BOX WARNING:** Use of this product has been shown to increase dementia in women ≥65 yr old; use may increase osteoporosis in long-term treatment, those at greater risk also smoke, adequate calcium and vitamin D should be taken

M

## DOSAGE AND ROUTES

### Secondary amenorrhea

**Adult:** PO 5-10 mg/day × 5-10 days, start during any time of the menstrual cycle

### Uterine bleeding

**Adult:** PO 5-10 mg/day × 5-10 days starting on 16th or 21st day of menstrual cycle

### With ERT

**Adult:** PO 5-10 mg qd × 10-14 or more days/mo (sequential estrogen); 2.5-5 mg qd (continuous estrogen)

### Contraceptive

**Adult (women):** IM 150 mg q12wk (Depo-Provera); SUBCUT (depot SUBCUT 104 inj) 104 mg q3mo, give first dose during first 5 days of the menstrual period, only within the first 5 days postpartum (no breastfeeding), only sixth postpartum week (breastfeeding)

### Endometrial/renal cancer inoperable recurrent metastatic

**Adult:** IM 400 mg-1 g (using 400 mg/ml depot inj susp) qwk

### Endometriosis pain

**Adult:** SUBCUT 104 mg q12-14 wk, begin on day 5 of normal menses, avoid use >2 yr

**Available forms:** Tabs 2.5, 5, 10 mg; inj susp 50, 150, 400 mg/ml; 104 mg/0.65 ml

### Implementation

**PO route**

• Give without regard to food

**IM route**

• Visually inspect particulate matter and discoloration prior to use

• Give titrated dose; use lowest effective dose; give oil sol deep in large muscle mass (IM); rotate sites; use after warming to dissolve crystals

**Depo-Provera Contraceptive injection suspension:**

• IM only, NEVER IV, use only 150 mg/ml vial

• Instruct patient on risks and warnings associated with hormonal contraceptives (see Patient Information)

• The possibility of pregnancy should be excluded prior to giving the first dose of medroxyprogesterone or whenever more than 14 weeks have passed since the last dose

• Do not dilute

• Shake vigorously immediately before administration

• Inject deeply into the gluteal or deltoid muscle. Aspirate prior to injection to avoid injection into a blood vessel

**Depo-Provera Sterile Aqueous Suspension, preserved:**

• IM only, NEVER IV

• Instruct patient on risks and warnings associated with progestin use (see Patient Information)

• Shake vigorously immediately before use

• When multidose vials are used, take special care to prevent contamination

• Inject deeply into the gluteal or deltoid muscle. Aspirate prior to injection

**SUBCUT route**

**Depo-subQ Provera 104 Contraceptive Injection Suspension ONLY:**

• For SUBCUT use only; NEVER give IM or IV

• Instruct patient on risks and warnings associated with hormonal contraceptives (see Patient Information)

• Shake vigorously for at least 1 min before use

• Inject the entire contents of the prefilled syringe subcut into the anterior thigh or abdomen, avoiding bony areas and the umbilicus. Gently grasp and squeeze a large area of skin in the chosen injection area, ensuring that the skin is pulled away from the body. Insert the needle at a 45-degree angle. Inject until the syringe is empty; this usually requires 5-7 seconds. Following use, press lightly on the injection site with a clean cotton pad for a few seconds; do not rub the area

## ADVERSE EFFECTS

**CNS:** Dizziness, *headache*, migraine, depression, fatigue, nervousness

**CV:** Thrombophlebitis, edema, thromboembolism, stroke, pulmonary embolism, MI

**EENT:** Diplopia

**GI:** *Nausea, increased weight,* cholestatic jaundice, *abdominal pain*

**GU:** *Amenorrhea*, cervical erosion, breakthrough bleeding, dysmenorrhea, vaginal candidiasis, breast changes, vaginitis, increased/decreased libido

**INTEG:** Acne, hirsutism, alopecia, injection site reaction

**META:** Hyperglycemia

**MS:** Decreased bone density

**SYST:** Angioedema, anaphylaxis, breast cancer

### Pharmacokinetics

Unknown

### Pharmacodynamics

| | PO | IM |
|---|---|---|
| **Onset** | Unknown | Unknown |
| **Peak** | Unknown | Unknown |
| **Duration** | 2-4 hr | Unknown |

## INTERACTIONS

### Individual drugs

Aminoglutethimide, carBAMazepine, phenytoin, PHENobarbital, rifampin: decreased contraceptive effect

### Drug categories

Anticoagulants, corticosteroids: decreased bone mineral density

Strong CYP3A4 inhibitors (clarithromycin, ketoconazole, itraconazole, ritonavir, indinavir, voriconazole:

Increased: medroxyprogesterone

### Drug/lab test

Increased: LFTs, HDL, triglycerides, coagulation tests

Decreased: GTT

### Drug/herb

St. John's wort: Increased menstrual bleeding

## NURSING CONSIDERATIONS

### Assessment

• Assess for symptoms indicating severe allergic reaction, angioedema; have EPINEPHrine and resuscitative equipment available

• Monitor B/P at beginning of treatment and periodically; check weight daily; notify prescriber of weekly weight gain >5 lb; bone mineral density

• Assess liver function tests: ALT, AST, bilirubin, periodically during long-term therapy

**BLACK BOX WARNING:** Use of product shown to increase dementia in women ≥ 65 yr old; use may increase osteoporosis in long-term treatment; those who smoke also at greater risk; adequate calcium and vitamin D should be taken

**BLACK BOX WARNING:** This product should not be given to those with breast cancer, MI, stroke, thromboembolic disorders

- **Bone mineral density loss:** in those taking anticoagulants, corticosteroids with Depo-Provera or Depo-subQ Provera
- **Menstrual history:** Duration of menses, bleeding, spotting, age of menstruation, regularity; start on any day in those with amenorrhea, or day 16 or 21 in dysfunctional bleeding
- Assess mental status: affect, mood, behavioral changes, depression
- **Ectopic pregnancy:** Assess for severe abdominal pain, if patient becomes pregnant, may indicate ectopic pregnancy, which is a medical emergency

### Patient/family education

- Advise patients to avoid sunlight or use sunscreen; photosensitivity and melasma (brown patches on the face) can occur
- Teach patient about cushingoid symptoms: weight gain, moon face, buffalo hump, acne
- Teach women patients to report breast lumps, vaginal bleeding, edema, jaundice, dark urine, clay-colored stools, dyspnea, headache, blurred vision, abdominal pain, sudden changes in speech/coordination, numbness or stiffness in legs, chest pain; teach men to report impotence or gynecomastia
- Teach patient to report suspected pregnancy immediately; fertility returns in 6-12 mo after discontinuing, do not use in pregnancy, breastfeeding

**BLACK BOX WARNING:** Long-term use decreases bone density; exercise, calcium, vitamin D supplements can help lessen osteoporosis

- Advise patient that product doesn't protect against sexually transmitted disease, including HIV
- Advise patient that injection (SUBCUT) must be given every 3 mo for contraception, if dose is missed, pregnancy can occur
- Teach patient how to perform a breast self-exam, that if lumps are detected notify provider immediately
- Teach patient to take with food if nausea occurs
- Teach patient to have complete physical exam with reproductive exam, including mammogram, yearly
- Review package insert with patient, patient must understand all possible reactions

### Evaluation

**Positive therapeutic outcome**

- Decreased abnormal uterine bleeding
- Absence of amenorrhea
- Prevention of pregnancy
- Arrested spread of malignant cells

**⚠ HIGH ALERT**

## megestrol (Rx)

(me-jess'trole)

**Megace, Megace ES, Megase OS** 🍁

*Func. class.:* Antineoplastic hormone

*Chem. class.:* Progestin

**Do not confuse:** Megace/Reglan

**ACTION:** Affects endometrium by antiluteinizing effect; this is thought to bring about cell death, stimulates appetite by unknown action

**Therapeutic outcome:** Prevention of rapidly growing malignant cells; weight gain, increased appetite in AIDS

**USES:** Breast, endometrial cancer; increased weight, decreased cachexia and anorexia associated with AIDS

**Unlabeled uses:** Hot flashes, prostate cancer

### CONTRAINDICATIONS

Pregnancy, hypersensitivity

**Precautions:** Diabetes, thrombosis, adrenal insufficiency

### DOSAGE AND ROUTES

**Endometrial/ovarian carcinoma (palliative)**

**Adult:** PO 40-320 mg/day in divided doses

**Breast carcinoma**

**Adult:** PO 40 mg qid or 160 mg/day

**AIDS (cachexia)**

**Adult:** PO 800 mg/day (oral SUSP) or 625 mg/day (ES)

**Hot flashes (unlabeled)**

**Adult:** PO 20 mg bid

**Available forms:** Tabs 20, 40 mg; oral susp 40, 125 mg/ml

### Implementation
- Administer with meals for GI symptoms
- Oral susp is usually used for AIDS patients; shake well
- Give tablets for carcinoma
- Give without regard to food

## ADVERSE EFFECTS
**CNS:** Mood swings, insomnia, fever, lethargy, depression
**CV:** Thrombophlebitis, thromboembolism, hypertension
**ENDO:** Adrenal insufficiency
**GI:** Nausea, vomiting, *diarrhea*, abdominal cramps, *weight gain*, flatus, indigestion
**GU:** Gynecomastia, fluid retention, hypercalcemia, vaginal bleeding, discharge, *impotence*, decreased libido, menstruation disorders
**INTEG:** Alopecia, *rash*, pruritus, purpura, itching, sweating
**META:** Hyperglycemia
**MISC:** Tumor flare, leukopenia
**RESP:** Dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed; food increases oral sol |
| **Distribution** | Unknown |
| **Metabolism** | Liver, completely |
| **Excretion** | Feces, urine |
| **Half-life** | 13-105 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Several wk to mo |
| **Peak** | Unknown |

## INTERACTIONS
### Individual drugs
Dofetilide: Serious arrhythmias, avoid using concurrently
Indinavir: Decrease effect of indinavir, may need to increase dose

### Drug/lab test
Increased: glucose

## NURSING CONSIDERATIONS
### Assessment
- PSA levels in men (prostate cancer); blood glucose, liver function studies, serum calcium, weight
- Monitor effects of alopecia on body image; discuss feelings about body changes
- Monitor for frequency of stools, characteristics, cramping, acidosis, signs of dehydration (poor skin turgor, decreased urine output, dry skin, restlessness, weakness, rapid respirations)
- In AIDS patients monitor calorie counts, weight, appetite
- **Assess for thrombophlebitis:** Homan's sign, pain, redness, swelling in calf, thigh; notify prescriber immediately if these occur
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding
- **Beers:** Avoid in older adults for an appetite stimulant, minimal effect on weight, increased risk of thrombotic events

### Patient/family education
- Teach patient to report any complaints or side effects to prescriber
- Advise patient that contraceptive measures must be used during and 4 mo after treatment; product is teratogenic:
- Explore with patient the need for wig or a hairpiece for hair loss
- Caution patient to report vaginal bleeding to prescriber
- Review with patient the need to comply with dosage schedule, not to miss or double doses; missed doses may be taken up to 1 hr before next dose
- Teach patient how to recognize signs of fluid retention, thromboembolism and report immediately
- Teach that gynecomastia and alopecia can occur; reversible after discontinuing treatment
- Advise to monitor blood glucose if diabetic

### Evaluation
**Positive therapeutic outcome**
- Decreased spread of malignant cells
- Weight gain, increased appetite in AIDS patients
- Resolved dysfunctional uterine bleeding

**⚠ HIGH ALERT**

## melphalan (Rx)
(mel'fa-lan)
**Alkeran, Evomela**
*Func. class.:* Antineoplastic, alkylating agent
*Chem. class.:* Nitrogen mustard

**Do not confuse:** melphalan/myleran, Alkeran/Alferon/LeuKeran

**ACTION:** Responsible for cross-linking DNA strands leading to cell death; activity is not cell cycle phase specific

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Multiple myeloma, advanced ovarian cancer

**Unlabeled uses:** Amyloidosis

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity to this product

**Precautions:** Children, radiation therapy, infection, renal disease

**BLACK BOX WARNING:** Bone marrow depression, secondary malignancy, radiation therapy: requires an experienced clinician, bleeding, infection, risk of serious hypersensitivity reactions

## DOSAGE AND ROUTES

### Multiple myeloma (palliative)

**Adult:** PO 6 mg qd × 2-3 wk, or 10 mg qd × 7-10 days, stop for ≤ 4 wk or until WBC/platelets begin to rise, maintenance 2 mg qday then 2 mg/day when WBC >4000 cells/$mm^3$ and platelets >100,000 cells/$mm^3$, adjust daily between 1 and 3 mg/day based on response or 0.15 mg/kg/day × 7 days, then a rest period of ≥ 14 days, maintenance ≤ 0.05 mg/kg/day or 0.25 mg/kg/day × 4 days repeat q4-6 wk

**Adult: IV** INF 16 mg/$m^2$; reduce in renal insufficiency; give over 15-20 min; give at 2-wk intervals × 4 doses, then at 4-wk intervals

### Ovarian carcinoma (palliative)

**Adult:** PO 0.2 mg/kg/day × 5 days repeat q4-5wk depending on blood counts

**Available forms:** Tabs 2 mg; powder for inj 50 mg

### Multiple myeloma conditioning treatment before stem cell transplantation (Evomela only)

**Adult:** IV infusion 100 mg/$m^2$/day over 30 min for 2 days before stem cell transplantation (day 3, day 2; day 0 (transplant); >130% of ideal body weight or renal disease BUN >30 mg/d reduce dose by 50%

### Implementation

- Give fluids **IV** or PO before chemotherapy to hydrate patient
- Give antacid before oral agent; give product after evening meal, before bedtime; provide antiemetic 30-60 min before giving product and prn to prevent vomiting; give antibiotics for prophylaxis of infection
- Give in AM so product can be eliminated before bedtime
- Use a liquid diet: carbonated beverages; gelatin may be added if patient is not nauseated or vomiting

**PO route**

- Give 1 hr before or 2 hr after meals to prevent nausea/vomiting
- Protect from light, store refrigerated

**Intermittent IV INF route**

- Use gloves during administration; if skin exposure occurs, wash immediately with soap and water, use cytotoxic handling procedures

**Evomela**

**Reconstitution:**

- Add 8.6 ml of 0.9% sodium chloride injection to the vial for a final vial concentration of 5 mg/ml
- Negative pressure should be present in the vial; discard any vial that does not have a vacuum present during reconstitution
- **Storage after reconstitution:** Store at room temperature for up to 1 hr or refrigerated up to 24 hr

**IV infusion:**

- Dilute the appropriate dose with 0.9% sodium chloride to a final concentration not to exceed 0.45 mg/ml
- The diluted solution may be stored at room temperature for up to 4 hr (in addition to 1 hr after reconstitution)
- Administer IV over 30 min when used as conditioning treatment before an autologous stem cell transplant or IV over 15 to 20 min when used as palliative treatment in multiple myeloma patients
- Infuse into an injection port or by injecting slowly into a fast-running IV infusion via a central venous line to avoid extravasation

**Alkeran and generic melphalan**

**Reconstitution:**

- Using a 20-gauge or larger needle, rapidly inject 10 ml of the supplied diluent into a 50-mg vial for a final vial concentration of 5 mg/ml
- Immediately shake the vial well until the solution becomes clear and all material is dissolved
- Dilute the reconstituted vial immediately; the solution is unstable
- Do NOT refrigerate the reconstituted vial; a precipitate forms if the solution is stored at 5° C

**IV infusion:**

- Dilute the appropriate dose in 0.9% sodium chloride to a final concentration not to exceed 0.45 mg/ml
- Administer IV over 15 to 20 min; do NOT give over less than 15 min, and complete the infusion within 60 min from vial reconstitution
- The diluted solution is unstable; about 1% of the labeled dose hydrolyzes every 10 min after dilution with sodium chloride
- Infuse through a central line to avoid extravasation

**Y-site compatibilities:** Acyclovir, amikacin, aminophylline, ampicillin, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol,

calcium gluconate, CARBOplatin, carmustine, cefAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cimetidine, CISplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, DACTINomycin, DAUNOrubicin, dexamethasone, diphenhydrAMINE, DOXOrubicin, doxycycline, droperidol, enalaprilat, etoposide, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, gallium, ganciclovir, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium phosphate, hydromorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, LORazepam, mannitol, mechlorethamine, meperidine, mesna, methylPREDNISolone, metoclopramide, methotrexate, metroNIDAZOLE, miconazole, minocycline, mitoMYcin, mitoXANtrone, morphine, nalbuphine, netilmicin, ondansetron, pentostatin, piperacillin, plicamycin, potassium chloride, prochlorperazine, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinBLAStine, vinCRIStine, vinorelbine, zidovudine

## ADVERSE EFFECTS

**GI:** *Nausea, vomiting, stomatitis*, *diarrhea*, hepatotoxicity, abdominal pain, anorexia, constipation, dyspepsia
**GU:** *Amenorrhea*, hyperuricemia, gonadal suppression
**HEMA:** Thrombocytopenia, neutropenia, leukopenia, anemia
**INTEG:** Pruritus, necrosis, extravasation
**RESP:** Dyspnea, *pneumonitis,* bronchospasm
**SYST:** Anaphylaxis, allergic reaction, secondary malignancies, edema
**CNS:** Fatigue, fever
**META:** *Hypokalemia*, *hypophosphatemia*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Variable; incompletely absorbed |
| **Distribution** | Rapidly distributed, protein binding ≤ 30%-90% |
| **Metabolism** | Bloodstream |
| **Excretion** | Kidneys, unchanged (10%) |
| **Half-life** | 2 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Sargramostim, GM-CSF, filgrastim, G-CSF: avoid administration 24 hr before or 24 hr after this product
Carmustine: increased pulmonary toxicity
CycloSPORINE: increased renal failure risk, monitor renal studies
Nalidixic acid: increased enterocolitis risk
Radiation: increased toxicity

### Drug classifications

Anticoagulants, NSAIDs, salicylates, thrombolytics, platelet inhibitors: increased bleeding risk, avoid concurrent use
Antineoplastics: increased toxicity
Live virus vaccines: increased adverse reactions; decreased antibody reaction, bring up to date before use

### Drug/lab test

Decrease: Hgb, RBC, WBC, platelets
False-positive: direct Coombs test

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Bone marrow suppression:** Monitor full nadir 2-3 wk; CBC, differential, platelet count weekly; notify prescriber; withhold product if WBC is <3000/mm$^3$ or platelet count is <100,000/mm$^3$; notify prescriber; recovery usually occurs in 6 wk, IV product causes more myelosuppression

**BLACK BOX WARNING:** Requires an experienced clinician; product should be used only by clinician knowledgeable in use of chemotherapy

**BLACK BOX WARNING: Infection:** monitor for cold, fever, chills, sore throat

- **Assess for bleeding:** hematuria, guaiac, bruising or petechiae, from mucosa or orifices q8hr; no rectal temp

**BLACK BOX WARNING:** Assess for symptoms indicating severe allergic reaction: rash, pruritus, urticaria, purpuric skin lesions, itching, flushing; assess allergy to chlorambucil; cross-sensitivity may occur

- **Pregnancy/breastfeeding:** Do not use in pregnancy/breastfeeding
- **Secondary malignancy:** May cause acute leukemia, myeloproliferative syndrome, may occur due to chromosomal change, risk in long-term use

### Patient/family education

- Teach patient to avoid use of products containing aspirin or ibuprofen, nausea/vomiting, dehydration, decreased urine output; to report symptoms of bleeding (hematuria, tarry stools)
- Instruct patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath)

• Instruct patient to report any changes in breathing or coughing even several mo after treatment; to avoid crowds and persons with respiratory tract or other infections
• Tell patient hair loss is common; discuss the use of wigs or hairpieces
• Caution patient not to have any vaccinations without the advice of the prescriber, serious reactions can occur
• Advise patient to report suspected pregnancy, that contraception is needed during treatment and for several mo after the completion of therapy
• Teach patient to rinse mouth tid-qid with water, club soda; brush teeth bid-qid with soft brush or cotton-tipped applicators for stomatitis, use unwaxed dental floss

### Evaluation

**Positive therapeutic outcome**
• Decreased size of tumor
• Decreased spread of malignancy
• **Hepatotoxicity:** Teach patient to report immediately yellowing of skin, eyes, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea

## memantine (Rx)

(me-man'teen)
**Ebixa, Namenda, Namenda XR**
*Func. class.:* Anti–Alzheimer's disease agent
*Chem. class.:* N-methyl-D-aspartate receptor antagonist

**ACTION:** Antagonist action of CNS NMDA receptors that may contribute to the symptoms of Alzheimer's disease

**Therapeutic outcome:** Improved mood, orientation, decreasing confusion

**USES:** Moderate to severe dementia in Alzheimer's disease

**Unlabeled uses:** Vascular dementia

## CONTRAINDICATIONS

Hypersensitivity, children

**Precautions:** Pregnancy, breastfeeding, renal disease, seizures, severe hepatic disease, GU conditions that raise urine pH, renal failure

## DOSAGE AND ROUTES

### Moderate-severe Alzheimer's disease

**Adult:** PO 5 mg/day, may increase dose in 5-mg increments ≥1-wk intervals over a 3-wk period; recommended target dose as 10 mg bid at week 4; ext rel 7 mg/day, increased by 7 mg ≥1 wk up to target dose of 28 mg/day

### Renal dose

**Adult:** PO CCR 5-29 ml/min, a target of 5 mg bid immediate release or 14 mg/day extended release

**Available forms:** Tabs 5, 10 mg; tab titration pak 5, 10 mg; oral sol 2 mg/ml, 10 mg/5 ml; cap ext rel 7, 14, 21, 28 mg

### Implementation

• Can be taken without regard to meals
• Give twice a day if dose >5 mg
• Dosage is adjusted to response no more than q1wk
• Provide assistance with ambulation during beginning therapy; dizziness may occur
• **Extended Release Caps:** Do not crush, chew, divide; swallow whole or open and sprinkle on applesauce
• When switching from immediate release product begin the ext rel the day after the last dose of immediate release product. Those on 10 mg bid should be switched to ext rel 28 mg q day

## ADVERSE EFFECTS

**CNS:** *Dizziness, confusion,* somnolence, headache, hallucinations, stroke
**CV:** Hypertension, heart failure, HF
**GI:** Vomiting, constipation
**INTEG:** Rash
**MISC:** Back pain, fatigue, pain, influenzalike symptoms
**RESP:** Coughing, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed PO |
| **Distribution** | 44% protein binding |
| **Metabolism** | Very little |
| **Excretion** | 57%-82% excreted unchanged in urine |
| **Half-life** | Half-life 60-80 hr |

### Pharmacodynamics

| | |
|---|---|
| **Peak** | 3-7 hr (tab)<br>9-12 hr (caps) |

## INTERACTIONS

### Individual drugs

Cimetidine, hydrochlorothiazide, nicotine, quiNIDine, ranitidine, triamterene: increased/decreased levels of both products, monitor for adverse reactions
Ergot, levodopa: increased effect of each, monitor for adverse reactions

### Drug classifications

Drugs that make the urine alkaline (sodium bicarbonate, carbonic anhydrase inhibitors): decreased clearance

Use cautiously with amantadine, dextromethorphan, ketamine: reaction unknown

### Drug/lab test
Increase: alkaline phosphatase
**Decrease:** HCT

## NURSING CONSIDERATIONS
### Assessment
- Alzheimer's dementia: affect, mood, behavioral changes; hallucinations, confusion, attention, orientation, memory; monitor serum creatinine
- **Renal disease:** Monitor BUN, creatinine, CCr<30 ml/min, dosage adjustment may be needed
- **Pregnancy/breastfeeding:** Avoid use in pregnancy, breastfeeding

### Patient/family education
- Advise to report side effects: restlessness, psychosis, visual hallucinations, stupor, loss of consciousness; indicate overdose
- Advise patient to avoid alcohol, nicotine
- Advise to use product exactly as prescribed; product is not a cure
- Teach patient to avoid OTC, herbal products unless approved by prescriber
- Teach patient that product doesn't cure Alzheimer's disease, but controls symptoms
- **Adverse reactions:** Patient may not be able to verbalize reactions

### Evaluation
**Positive therapeutic outcome**
- Decrease in confusion, improved mood or ability to maintain function, even with no improvement in symptoms

**⚠ HIGH ALERT**

## meperidine (Rx)
(me-per'i-deen)
**Demerol, Meperitab**
*Func. class.:* Opioid analgesic
*Chem. class.:* Phenylpiperidine derivative
**Controlled substance schedule II**

**Do not confuse:** meperidine/HYDROmorphone/meprobamate/morphine, Demerol/Dilaudid

**ACTION:** Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors

**Therapeutic outcome:** Relief of pain

**USES:** Moderate to severe pain, preoperatively, postoperatively, general anesthesia maintenance, sedation induction

## CONTRAINDICATIONS
Hypersensitivity, severe respiratory insufficiency, GI obstruction, ileus

**Precautions:** Pregnancy, breastfeeding, children, geriatric, addictive personality, increased ICP, respiratory depression, renal/hepatic disease, seizure disorder, abrupt discontinuation, chronic pain, cardiac disease, adrenal insufficiency, alcoholism, angina, anticoagulant therapy, asthma, atrial flutter, biliary tract disease, bladder obstruction, cardiac dysrhythmias, COPD, CNS depression, coagulopathy, constipation, cor pulmonale, dehydration, diarrhea, driving epidural use, geriatrics, GI obstruction, head trauma, heart failure, hypotension, hypothyroidism, ileus, IBS, IM/intrathecal/IV use, labor, myxedema/thrombocytopenia, MAOI therapy

**BLACK BOX WARNING:** Coadministration with other CNS depressants, respiratory depression

## DOSAGE AND ROUTES
### Moderate to severe pain
**Adult:** PO/SUBCUT/IM 50-150 mg q3-4hr prn
**Child:** PO/SUBCUT/IM 1-1.8 mg/kg q3-4hr prn, max single dose 150 mg

### Preoperative analgesia
**Adult:** IM/SUBCUT 50-100 mg 30-90 min before surgery
**Child:** IM/SUBCUT 1-2 mg/kg 30-90 min before surgery, max 100 mg

### Coadministration with other CNS depressants
**Adult:** PO/IM/SUBCUT/IV Reduce dose by 25%-50%

### Renal dose
**Adult:** PO/SUBCUT/IM/IV, CCr 10-50 ml/min give 75% of dose; CCr <10 ml/min give 25%-50% of dose

### Labor analgesia
**Adult:** SUBCUT/IM 50-100 mg given when contractions are regularly spaced, repeat q1-3hr prn

**Available forms:** Inj 10, 25, 50, 75, 100 mg/ml; tabs 50, 100 mg; syr 50 mg/5 ml

### Implementation
- Doses that are given regularly before pain returns are more effective
- Give with antiemetic if nausea, vomiting occur
- Administer when pain is beginning to return; determine dosage interval by patient response; continuous dosing of medication is more effective given prn
- Medication should be slowly withdrawn after long-term use to prevent withdrawal symptoms

• Store in light-resistant container at room temperature

**PO route**

• May be given with food or milk to lessen GI upset
• Syr should be mixed with 4 oz of water
• Do not use in severe respiratory insufficiency (PO)
• **Oral liquid:** dilute in 4 oz water

**IM/SUBCUT route**

• Do not give if cloudy or a precipitate has formed
• Patient should remain recumbent for 1 hr after administration
• Inject IM into a large muscle mass; IM is preferred route for multiple injections

**Direct IV route**

• Give after diluting to 10 mg/ml or less with sterile water, 0.9% NaCl for inj; give slowly at ≤25 mg/min, over at least 5 min; rapid administration may cause respiratory depression, hypotension, circulatory collapse
• Have emergency equipment and opiate antagonist on hand

**Intermittent IV infusion route**

• Give after diluting to 1 mg/ml with $D_5W$, $D_{10}W$, dextrose/saline combinations, dextrose/Ringer's, inj combinations, 0.45% NaCl, 0.9% NaCl, Ringer's, LR; give by inf pump; titrate according to response

**Y-site compatibilities:** Abelcet, acetaminophen, amifostine, amikacin, anidulafungin, atenolol, aztreonam, bumetanide, cefamandole, cefAZolin, cefmetazole, cefotaxime, cefOXitin, cefoperazone, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cladribine, clindamycin, diltiazem, diphenhydrAMINE, DOBUTamine, DOPamine, doxycycline, droperidol, erythromycin lactobionate, famotidine, filgrastim, fluconazole, fludarabine, gallium, gentamicin, granisetron, hydrocortisone, IDArubicin, regular insulin, imipenem/cilastatin, kanamycin, labetalol, lidocaine, melphalan, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, minocycline ondansetron, oxytocin, PACLitaxel, penicillin G potassium, piperacillin, potassium chloride, propofol, propranolol, ranitidine, sargramostim, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, verapamil, vinorelbine

**Continuous intrathecal infusion route**

• Use controlled-infusion device, an implantable controlled-microinfusion device is used for highly concentrated infusion, monitor for several days after implantation
• Infusion reservoir should only be filled by those fully qualified
• To prevent pain, depletion of reservoir should be avoided

## ADVERSE EFFECTS

**CNS:** Drowsiness, dizziness, confusion, headache, sedation, euphoria, increased ICP, seizures, serotonin syndrome
**CV:** Palpitations, bradycardia, hypotension, change in B/P, tachycardia (IV)
**EENT:** Tinnitus, blurred vision, miosis, diplopia, depressed corneal reflex
**GI:** Nausea, vomiting, anorexia, constipation, cramps, biliary spasm, paralytic ileus
**GU:** Urinary retention, dysuria
**INTEG:** Rash, urticaria, bruising, flushing, diaphoresis, pruritus
**RESP:** Respiratory depression
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM, SUBCUT); 50% (PO) |
| **Distribution** | Widely distributed; crosses placenta; protein binding 65%-75%; toxic by-product accumulation can result from regular use or in renal disease |
| **Metabolism** | Liver, extensively to active/inactive metabolites |
| **Excretion** | Kidneys; breast milk |
| **Half-life** | 3-4 hr |

### Pharmacodynamics

| | PO | IM/SUBCUT | IV |
|---|---|---|---|
| **Onset** | 15 min | 10 min | immediate, peak 5-7 min |
| **Peak** | | ½-1 hr | 5-7 min |
| **Duration** | 2-4 hr | 2-4 hr | 2 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased respiratory depression, hypotension, sedation
Phenytoin: decreased meperidine effect
Procarbazine: fatal reaction, do not use together within 14 days

### Drug classifications

CNS depressants, opioids, sedative/hypnotics, antipsychotics, skeletal muscle relaxants: increased effects
SSRIs, SNRIs, serotonin-receptor agonists: increased serotonin syndrome, increased neuroleptic malignant syndrome

MAOIs: do not use for 2 wk before taking meperidine; may cause fatal reaction
Protease inhibitor antiretrovirals: increased adverse reactions

### Drug/herb

Kava, hawthorn, lavender, valerian: Increased sedation
St. John's wort: increased CNS depression

### Drug/lab test

Increased: amylase, lipase

## NURSING CONSIDERATIONS

### Assessment

- **Assess pain:** location, duration, intensity before and 1 hr (IM, SUBCUT, PO), 5-10 min (**IV**) after administration
- **Sex hormone change:** Assess for libido, changes in menstrual cycle, erectile dysfunction, infertility, if suspected, obtain androgen levels
- **Adrenal insufficiency:** Assess for anorexia, nausea, vomiting, decreased B/P, weakness; if suspected, obtain cortisol, sodium, potassium levels; if present do not abruptly withdraw, taper
- **Abrupt discontinuation:** Withdraw slowly, if stopped abruptly, assess for withdrawal
- Monitor BUN, serum creatinine
- **Opioids/benzodiazepine:** Use only if alternative products cannot be used, excessive sedation and death may occur
- Monitor B/P, pulse, respirations baseline and during use
- Assess renal function before initiating therapy; poor renal function can lead to accumulation of toxic metabolite and seizures
- **Serotonin syndrome:** When given with SSRI, SNRIs, and serotonin receptor agonists; monitor for hyperthermia, hypertension, rigidity, delirium, coma, symptoms may occur rapidly after a long period
- **Monitor VS after parenteral route; note muscle rigidity, product history, liver, kidney function tests, respiratory dysfunction:** respiratory depression, character, rate, rhythm; notify prescriber if respirations are <12/min, dose may need to be reduced by 25% or more
- Monitor CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction; these are due to metabolite produced; CNS stimulation occurs with chronic or high doses, risk of toxicity increases with >600 mg/days
- Monitor allergic reactions: rash, urticaria
- **Bowel function:** Assess for constipation; increase fluids, bulk in diet; give stimulant laxatives if needed
- Pregnancy: Do not use in pregnancy until use in labor, do not breastfeed
- **Beers:** Avoid in older adults especially in those with chronic disease, may cause neurotoxicity, monitor for delirium frequently
- **Children:** Monitor for restlessness, changes in respirations may occur more frequently than in adult
- **Serotonin syndrome:** Report symptoms immediately
- Teach patient not to be used long term

### Patient/family education

- Advise patients to avoid CNS depressants (alcohol, sedative/hypnotics) for at least 24 hr after taking this product
- Discuss with patient that dizziness, drowsiness, and confusion are common; to avoid getting up without assistance
- Discuss in detail with patient all aspects of the product, including its purpose and what to expect
- Caution patient to make position changes carefully to lessen orthostatic hypotension

### Evaluation

**Positive therapeutic outcome**

- Decreased pain

## TREATMENT OF OVERDOSE:

Naloxone 0.2-0.8 mg **IV** (caution in physically dependent patients), $O_2$, **IV** fluids, vasopressors

## meropenem (Rx)

(mer-oh-pen'em)
**Merrem IV**
*Func. class.:* Antiinfective—miscellaneous

**ACTION:** Interferes with cell wall replication of susceptible organisms

**Therapeutic outcome:** Bactericidal action against the following: *Streptococcus pneumoniae,* group A β-hemolytic streptococci, *viridans* group streptococci, enterococcus; gram-negative organisms *Klebsiella, Proteus, Escherichia coli, Pseudomonas aeruginosa, Bacteroides fragilis, Bacteroides thetaiotaomicron,* bacterial meningitis (>3 mo old)

**USES:** *Acinetobacter, Aeromonas hydrophila, Bacteroides distasonis, Bacteroides fragilis, Bacteroides ovatus, Bacteroides thetaiotaomicron, Bacteroides uniformis, Bacteroides ureolyticus, Bacteroides vulgatus, Campylobacter jejuni, Citrobacter diversus, Citrobacter freundii, Clostridium difficile, Clostridium perfringens, Enterobacter cloacae, Enterococcus faecalis, Escherichia coli, Eubacterium lentum, Fusobacterium, Haemophilus influenzae* (beta-lactamase negative), *Haemophilus*

*influenzae* (beta-lactamase positive), *Hafnia alvei, Klebsiella oxytoca, Klebsiella pneumoniae, Moraxella catarrhalis, Morganella morganii, Neisseria meningitidis, Pasteurella multocida, Peptostreptococcus, Porphyromonas asaccharolytica, Prevotella bivia, Prevotella intermedia, Prevotella melaninogenica, Propionibacterium acnes, Proteus mirabilis, Proteus vulgaris, Pseudomonas aeruginosa, Salmonella, Serratia marcescens, Shigella, Staphylococcus aureus* (MSSA), *Staphylococcus epidermidis, Streptococcus agalactiae* (group B streptococci), *Streptococcus pneumoniae, Streptococcus pyogenes* (group A beta-hemolytic streptococci), *Viridans streptococci, Yersinia enterocolitica*; appendicitis, bacteremia, intraabdominal infections, meningitis, peritonitis, skin/skin structure infections

## CONTRAINDICATIONS

Hypersensitivity to meropenem, carbapenems: hypersensitivity to cephalosporins, penicillins

**Precautions:** Pregnancy, breastfeeding, geriatric, renal disease, seizure disorder, gram-negative infection, pneumonia, hypersensitivity to pneumonia

## DOSAGE AND ROUTES

### Intraabdominal infections (complicated appendicitis, peritonitis)

**Adult/adolescent/child >50 kg: IV** 1 g q8hr or 500 mg q6hr

**Adolescent/child ≤50 kg/infant ≥3 mo: IV** 20 mg/kg q8hr

### Complicated skin and skin structure infections

**Adult/adolescent/child >50 kg: IV** 500 mg q8hr

**Adolescent/child ≤50 kg/infant ≥3 mo: IV** 10 mg/kg q8hr

### Bacterial meningitis

**Adult: IV** 2 g q8hr

**Adolescent/child ≤50 kg/infant: IV** 40 mg/kg q8hr

### Renal dose

**Adult:** IV CCr 26-50 ml/min give dose q12hr; CCr 10-25 ml/min give ½ dose q12hr; CCr <10 ml/min give ½ dose q24hr

**Available forms:** Powder for inj 500 mg, 1 g

### Implementation

**Direct IV route**

- Monitor injection site for redness, inflammation, phlebitis periodically
- Reconstitute 500 mg or 1 g vials with 10, 20 ml of sterile water for inj respectively, shake to dissolve and let stand until clear (average conc 50 mg/ml) reconstituted sol may be stored for 3 hr at room temperature or 13 hr refrigerated, inject up to 1 g in 5-20 ml over 3-5 min

**Intermittent IV infusion route**

- Vials may be directly constituted with compatible inf fluid (NS, $D_5W$) to 2.5-50 mg/ml vials; vials with 0.9% NaCl can be stored up to 2 hr at room temperature, or 18 hr refrigerated, $D_5W$ may be stored up to 1 hr at room temperature or up to 15 hr refrigerated, infuse over 15-30 min

**Continuous IV infusion route (unlabeled)**

- **3 g/day continuous IV infusion:** Constitute a 1 g vial according to manufacturer's recommendations; further dilute in 50 ml or 250 ml of NS and run over 8 hr for cont inf, administer a new infusion bag q8hr
- **4 g/day continuous IV infusion:** Constitute a 1 g vial according to manufacturer recommendations. Further dilute in 100 ml of NS and administer over 6 hr. For cont inf, administer a new infusion bag q6hr
- **3 g/day IV continuous infusion in ambulatory infusion pump with freezer packs:** Reconstitute 1 g vial according to manufacturer recommendations by adding 20 ml of NS into each vial. Add 3 g (60 ml) to a 100-ml medication cassette reservoir and bring the final volume to 100 ml (final concentration, 30 mg/ml) run over 24 hr

**Y-site compatibilities:** Alemtuzumab, aminocaproic acid, aminophylline, anidulafungin, argatroban, atenolol, atropine, azithromycin, bivalirudin, bleomycin, CARBOplatin, carmustine, caspofungin, cimetidine, CISplatin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, doxacurium, DOXOrubicin liposomal, enalaprilat, eptifibatide, etoposide, etoposide phosphate, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gallium, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, granisetron, heparin sodium, HYDROmorphone, ifosfamide, insulin (regular), irinotecan, lepirudin, leucovorin, linezolid injection, LORazepam, mechlorethamine, methotrexate, metoclopramide, metroNIDAZOLE, milrinone, mitoXANtrone, morphine, nesiritide, norepinephrine, octreotide, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, PHENobarbital, potassium acetate/chloride, rocuronium, teniposide, thiotepa, tigecycline, tirofiban, TNA (3-in-1) Total Nutrient Admixture, vancomycin, vasopressin, vecuronium, vinBLAStine, vinCRISTine, vinorelbine, voriconazole, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Fever, somnolence, *seizures,* dizziness, *headache,* myoclonia, confusion
**CV:** Hypotension, tachycardia
**ENDO:** Hypoglycemia
**GI:** Diarrhea, nausea, vomiting, pseudomembranous colitis, hepatitis, glossitis, jaundice
**HEMA:** Eosinophilia, neutropenia, decreased Hgb, Hct, agranulocytosis
**INTEG:** *Rash,* urticaria, *pruritus,* pain at inj site, phlebitis, erythema at inj site
**RESP:** Chest discomfort, apnea, pneumonia, pulmonary embolism
**SYST:** Anaphylaxis, Stevens-Johnson syndrome, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 1 hr; increased in renal disease |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | Dose dependent |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Probenecid: increased meropenem levels, avoid concurrent use
Valproic acid: decreased effect of valproic acid, monitor for seizures

### Drug/herb

Do not use acidophilus with antiinfectives; separate by several hours

### Drug/lab test

Increased: AST, ALT, LDH, BUN, alkaline phosphatase, bilirubin, creatinine
Increase or decrease: INR, platelets, PT, PTT
False positive: direct Coombs' test, urine glucose

## NURSING CONSIDERATIONS

### Assessment

- **Infection:** Appearance of wound, urine, sputum, temperature, WBC
- Assess patient for previous sensitivity reaction to carbapenem antiinfectives, penicillins, cephalosporins, before starting this product
- **Assess patient for signs and symptoms of infection,** including characteristics of wounds, sputum, urine, stool, WBC >10,000/100 $mm^3$, fever; obtain baseline information before, during treatment
- Complete C&S tests before beginning product therapy to identify if correct treatment has been initiated
- **Seizures:** may occur in those with brain lesions, seizure disorder, bacterial meningitis, or renal disease; stop product, notify prescriber if seizures occur, seizure threshold is lowered, if seizures occur, stop product, notify provider
- **Assess for allergic reactions, anaphylaxis:** rash, urticaria, pruritus, chills, fever, joint pain; angioedema may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available for anaphylactic reaction; identify if there has been hypersensitivity to penicillins, cephalosporins, beta-lactams: cross-sensitivity may occur, have emergency equipment nearby
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also check for increased BUN, creatinine
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- Assess bowel pattern daily; if severe diarrhea occurs, product should be discontinued; may indicate pseudomembranous colitis
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
- **Assess for overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- **Pregnancy/breastfeeding:** Use only if clearly needed, no well-controlled studies, use cautiously in breastfeeding, excreted in breast milk

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection; seizures
- Advise patient to avoid breastfeeding; product is excreted in breast milk
- Advise patient to notify prescriber of diarrhea with blood or pus; may indicate pseudomembranous colitis

### Evaluation

**Positive therapeutic outcome**

- Absence of signs/symptoms of infection (WBC <10,000/$mm^3$, temp WNL, absence of red draining wounds)
- Reported improvement in symptoms of infection

**TREATMENT OF ANAPHYLAXIS:** EPINEPHrine, antihistamines, resuscitate if needed

## mesalamine, 5-ASA (Rx)

(mez-al′a-meen)

**Apriso, Asacol, Asacol HD, Canasa, Delzicol, Lialda, Mesasal, Mezavant, Pentasa, Rowasa, SF Rouasa Salofalk**

*Func class.:* GI antiinflammatory

*Chem. class.:* 5-Aminosalicylic acid

**Do not confuse:** Asacol/Ansaid/Os-Cal

**ACTION:** May diminish inflammation by blocking cyclooxygenase, inhibiting prostaglandin production in colon, local action only

**Therapeutic outcome:** Decreased cramping, pain in GI conditions

**USES:** Mild to moderate active distal ulcerative colitis, proctitis

**Unlabeled uses:** Crohn's disease

## CONTRAINDICATIONS

Hypersensitivity to this product or salicylates, 5-aminosalicylates

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal disease, sulfite sensitivity, pyloric stenosis, GI obstruction

## DOSAGE AND ROUTES

### Treatment of ulcerative colitis

**Adult:** RECT 60 ml (4 g) at bedtime, retained for 8 hr × 3-6 wk; del rel tab (Lialda) 2.4-4.8 g/day × 8 wk; del rel tab (Asacol) 1.6 g × 6 wk; cont rel cap (Pentasa) 1 g qid up to 8 wk; RECT SUPP 500 mg bid retained for 1-3 hr × 3-6 wk until remission, may increase to tid if needed; del rel cap (Delzicol) 800 mg tid ×6 wk

### Maintenance of remission

**Adult:** PO (delayed release tabs: Asacol) 800 mg bid or 400 mg qid; (delayed release caps: Apriso) 1500 mg (4 caps) each AM; (delayed release tabs: Lialda) 2.4 g (2 tab)/day with a meal; del rel cap (Delzicol) 800 mg bid

**Available forms:** Rectal Susp 4 g/60 ml (Rowasa, ss Rowasa); del rel tabs 400 mg (Asacol); 800 mg (Asacol HD); ext rel tab 500 mg; ext rel cap 250 mg, 500 mg (Pentasa); del rel tab (Lialda) 1.2 g; 0.375 g (Apriso); rect supp 1000 mg; del rel cap (Delzicol) 400 mg; enema suspension 4 g/60 ml (sfRowasa)

### Implementation

**PO route**

- Do not break, crush, or chew del rel tabs
- **Lialda:** take with a meal
- **Apriso caps:** without regard to meals in AM
- **Delzicol caps:** give ≥1 hr before a meal or 2 hr after a meal

**Rectal route (susp)**

- Give at bedtime, retained until AM; empty bowel before insertion
- Store at room temperature
- Usual course of therapy is 3-6 wk
- Give after shaking bottle well

## ADVERSE EFFECTS

**CNS:** *Headache, fever, dizziness,* insomnia, asthenia, weakness, fatigue

**CV:** Chest pain, palpitations

**EENT:** Sore throat, cough, pharyngitis, rhinitis

**GI:** *Cramps, gas, nausea, diarrhea,* rectal pain, constipation, vomiting

**GU:** Nephrotoxicity, interstitial nephritis

**INTEG:** *Rash, itching,* acne

**SYST:** *Flulike symptoms, malaise,* back pain, peripheral edema, leg and joint pain, arthralgia, dysmenorrhea, anaphylaxis, acute intolerance syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 20%-30% (PO), 10%-25% (RECT) |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Feces |
| **Half-life** | 1 hr; metabolite 5-10 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Azathioprine, mercaptopurine: increased action of each product

Lactulose: decreased mesalamine absorption

Omeprazole: increased mesalamine absorption

Warfarin: decreased effect of warfarin

### Drug classifications

$H_2$ blockers: do not give with Apriso

NSAIDs: increased nephrotoxicity

Antacids: decreased mesalamine absorption

### Drug/lab test

Increased: AST, ALT, alkaline phosphatase, LDH, GGTP, amylase, lipase

## NURSING CONSIDERATIONS

### Assessment

- Assess for GI symptoms: cramping, gas, nausea, diarrhea, rectal pain, abdominal pain; if severe, the product should be discontinued
- Assess for allergy to salicylates, sulfonamides, sulfites; if allergic reactions occur, discontinue product
- Assess renal function before, during treatment: BUN, creatinine periodically; increase fluids to maintain urine at ≥ 1200 ml/day to prevent crystalluria
- **Pregnancy/breastfeeding:** Avoid in pregnancy, breastfeeding, excreted in breast milk

### Patient/family education

- Teach patient that usual, initial course of therapy is 3-6 wk; to notify provider if symptoms do not improve after 2 mo of treatment, to continue to take even if feeling better, do not miss or take double doses, if a dose is missed take when remembered, if almost time for next dose skip it
- Advise patient to notify prescriber if abdominal pain, cramping, diarrhea with blood, headache, fever, rash, chest pain occur; product should be discontinued, rash, bruising, bleeding, fever, mouth sores
- Teach correct administration for PO or enema, to notify provider if symptoms do not improve after 2 mo of treatment

### Evaluation

**Positive therapeutic outcome**

- Absence of pain, bleeding from GI tract

**⚠ HIGH ALERT**

## metFORMIN (Rx)

(met-for′min)

**Fortamet, Glucophage, Glucophage XR, Glumetza, Glycon, Riomet**

*Func. class.:* Antidiabetic, oral

*Chem. class.:* Biguanide

**Do not confuse:** metFORMIN/metroNIDAZOLE, Glucophage/Glucovance/Glucotrol

**ACTION:** Inhibits hepatic glucose production and increases sensitivity of peripheral tissue to insulin

**Therapeutic outcome:** Blood glucose at normal levels

**USES:** Type 2 diabetes mellitus

## CONTRAINDICATIONS

Creatinine ≥1.5 mg/ml (males); diabetic ketoacidosis, metabolic acidosis, renal failure, radiographic contrast use

**Precautions:** Pregnancy, breastfeeding, geriatric, thyroid disease, previous HF, hypersensitivity; hepatic disease; alcoholism; cardiopulmonary disease; acidemia; acute MI; cardiogenic shock; renal disease, heart failure

**BLACK BOX WARNING:** Lactic acidosis

## DOSAGE AND ROUTES

### Type 2 diabetes mellitus

**Adult:** PO 500 mg bid or 850 mg/day initially, then 500 mg weekly or 850 mg q2wk up to 2000 mg/day in divided doses; dosage adjustment q2-3wk or 850 mg/day with morning meal with dosage increased every other week, max 2550 mg/day; ext rel (Glucophage XR) 500 mg qd with evening meal; may increase by 500 mg qwk, max 2000 mg/day; (Glumetza) 1000 mg qd with food, preferably with the PM meal, may increase by 500 mg qwk, max 2000 mg/day; (Fortamet) 500-1000 mg qd with PM meal, may increase by 500 mg qwk, max 2550 mg/day

### Renal dose

**Adult:** PO eGFR 30-45 ml/min/1.73 $m^2$ avoid use, if >45 ml/min/1.73 $m^2$ then falls <45 ml/min/1.73 $m^2$ assess benefits/risks of treatment; discontinue if falls <30 ml/min/1.73$m^2$

**Geriatric:** PO use lowest effective dose

**Available forms:** Tabs 500, 850, 1000 mg; ext rel tabs 500, 750, 850, 1000 mg; oral sol (Riomet) 500 mg/5 ml

### Implementation

- Monitor eGFR at least annually
- Do not use in dialysis
- Conversion from other oral hypoglycemic agents; change may be made without gradual dosage change; monitor serum or urine glucose and ketones tid during conversion
- **Immediate rel:** give twice a day with meals to decrease GI upset and provide best absorption
- Give immediate rel tabs crushed and mixed with meal or fluids for patients with difficulty swallowing
- **Extended release product:** may also be taken as a single dose; titrate slowly to therapeutic response, side-effect tolerance
- Do not break, crush, or chew ext rel tabs
- May be given with evening meal
- Store in tight container in cool environment
- **Oral solution:** Use calibrated spoon, oral syringe, or container to measure, give with meals

## ADVERSE EFFECTS

**CNS:** *Headache, weakness, dizziness, drowsiness,* tinnitus, fatigue, vertigo, *agitation*

**CV:** Heart failure

**ENDO:** Lactic acidosis, hypoglycemia

**GI:** Nausea, vomiting, diarrhea, heartburn, anorexia, metallic taste
**HEMA:** Thrombocytopenia, decreased vit $B_{12}$ levels
**INTEG:** Rash

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys, unchanged (35%-50%) |
| **Half-life** | 1½-6 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 hr (immediate rel); 7 hr (ext rel); 2.5 hr (sol) |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Cimetidine, digoxin, morphine, procainamide, quiNIDine, ranitidine, triamterene, vancomycin: increased metFORMIN level, monitor blood glucose
β-blockers, phenytoin: increased hyperglycemia
Digoxin: increased digoxin levels, monitor digoxin levels
Dofetilide: increased lactic acidosis, do not use together
Radiologic contrast media: do not give together; may cause renal failure

### Drug classifications

Calcium channel blockers, contraceptives (oral), corticosteroids, diuretics, estrogens, phenothiazines, sympathomimetics: increased hypoglycemia, monitor blood glucose

### Drug/herb

Garlic, green tea: increased hypoglycemia
Glucosamine: increased hyperglycemia

### Drug/lab test

Decreased: Vitamin $B_{12}$

## NURSING CONSIDERATIONS

### Assessment

- Assess for hypoglycemic reactions (sweating, weakness, dizziness, anxiety, tremors, hunger), hyperglycemic reactions soon after meals; these occur rarely with this product
- Monitor CBC (baseline, q3mo) during treatment; check liver function tests (AST, LDH) and renal tests (BUN, creatinine) periodically during treatment; glucose, A1c; folic acid, vitamin $B_{12}$ q1-2yr
- **Surgery:** product should be discontinued temporarily for surgical procedures when patient is NPO, or if contrast media is used; resume when patient is eating
- **Megaloblastic anemia:** Monitor vitamin $B_{12}$, calcium levels q2yr

**BLACK BOX WARNING:** Monitor for **lactic acidosis:** malaise, myalgia, abdominal distress; risk increases with age, poor renal function; monitor electrolytes, lactate, pyruvate, blood pH, ketones, glucose; suspect in any diabetic patient with metabolic acidosis, with ketoacidosis; immediately stop product if hypoxemia, or significant renal dysfunction occurs; do not use in those >80 yr unless CCr is normal, alcohol use may increase lactic acidosis risk

- **Pregnancy/breastfeeding:** Avoid using in pregnancy, do not use in breastfeeding, if an antidiabetic is needed during pregnancy, insulin is usually used

### Patient/family education

- Teach patient to regularly self-monitor blood glucose using blood glucose meter
- Teach patient symptoms of hypo/hyperglycemia, what to do about each (rare)
- Advise patient that product must be continued on daily basis; explain consequence of discontinuing product abruptly
- Advise patient to take product in morning to prevent hypoglycemic reactions at night
- Advise patient to avoid OTC medications, alcohol unless approved by the prescriber
- Teach patient that diabetes is a lifelong illness; that this product controls symptoms, but does not cure the condition
- Teach patient to report adverse reactions if GI upset occurs, it decreases over time

**BLACK BOX WARNING:** **Teach patient symptoms of lactic acidosis**—hyperventilation, fatigue, malaise, myalgia, chills, somnolence—and to stop product/notify prescriber immediately, not to use in excess with chronic alcohol intake

- Teach patient to carry/wear emergency ID and glucagon emergency kit for emergencies
- Advise patient that glucophage XR tab may appear in stool
- Advise patient to take with meals, not to break, crush, chew ext rel product
- **Pregnancy:** Teach patient that PCOS patients with insulin resistance may be at risk of pregnancy; to use adequate contraception if pregnancy is not desired

## Evaluation

**Positive therapeutic outcome**
• Decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; blood glucose, A1C at normal level

**⚠ HIGH ALERT**

## methadone (Rx)

(meth'a-done)
**Dolophine, Metadol, Methadose**
*Func. class.:* Opioid analgesic
*Chem. class.:* Synthetic diphenylheptane derivative
**Controlled substance schedule II**

**Do not confuse:** methadone/methylphenidate

**ACTION:** Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors; produces CNS depression

**Therapeutic outcome:** Relief of pain; successful opioid withdrawal

**USES:** Severe pain, opiate withdrawal

**Unlabeled uses:** Bone pain

## CONTRAINDICATIONS

Hypersensitivity to this product, or hypersensitivity to chlorobutanol (inj route), asthma, ileus

**BLACK BOX WARNING:** Respiratory depression

**Precautions:** Pregnancy, breastfeeding, children <18 yr, geriatric, addictive personality, increased ICP, MI (acute), severe heart disease, respiratory depression, renal/hepatic disease, respiratory insufficiency, torsades de pointes, pulmonary disease, COPD, seizures

**BLACK BOX WARNING:** QT prolongation, pain, coadministration with other CNS depressants, IV use, pregnancy, requires an experienced clinician

## DOSAGE AND ROUTES

### Severe pain

**Adult:** PO 2.5 mg q8-12hr in opioid-naive, titrate; IV/IM/SUBCUT 2.5-10 mg q8-12hr in opioid-naive

### Opiate withdrawal

**Adult including pregnant women:** PO 20-30 mg initially, unless low opioid tolerance is expected, additional 5-10 mg q2-4hr as needed after initial dose, if symptoms continue may give for up to 5 days

### Renal/hepatic dose

**Adult:** PO may need to be modified

**Available forms:** Inj 10 mg/ml; tabs 5, 10 mg; oral sol 5, 10 mg/5 ml/(concentrate); 10 mg/ml/(concentrate); dispersible tabs 40 mg

## Implementation

• Medication should be slowly withdrawn after long-term use to prevent withdrawal symptoms

**PO route**
• When using during a methadone maintenance program, use only PO according to NATA guidelines
• May be given with food or milk to lessen GI upset
• Store in light-resistant container at room temperature
• PO is half as potent as parenteral

**IM/SUBCUT route**
• Do not give if cloudy or a precipitate has formed
• Give deeply in large muscle mass (IM); rotate inj sites
• Pain and induration may occur at site
• Protect from light

**IV route**
• Used as PCA
• Protect from light

## ADVERSE EFFECTS

**CNS:** *Drowsiness, dizziness, confusion, headache, sedation,* euphoria, seizures
**CV:** Palpitations, bradycardia, change in B/P, cardiac arrest, shock, hypotension, torsades de pointes, QT prolongation
**EENT:** Tinnitus, blurred vision, miosis, diplopia
**GI:** *Nausea, vomiting, anorexia, constipation, cramps,* biliary tract spasm
**GU:** Increased urinary output, dysuria, urinary retention, impotence
**INTEG:** *Rash,* urticaria, bruising, flushing, diaphoresis, pruritus
**RESP:** Respiratory depression, respiratory arrest

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, SUBCUT, IM) |
| **Distribution** | Widely distributed; crosses placenta, half as active PO, as inj |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 2-3 hr; extended interval with continued dosing |

### Pharmacodynamics

| | PO | IM/SUBCUT |
|---|---|---|
| **Onset** | ½-1 hr | 20 min |
| **Peak** | 1-1.5 hr | 1½-2 hr |
| **Duration** | 4-12 hr | 4-6 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased respiratory depression, hypotension, sedation

Nalbuphine, pentazine, phenytoin, rifampin: decreased analgesia

Selegiline: do not use within 2 wk of methadone

### Drug classifications

Antipsychotics, opiates, sedative/hypnotics, skeletal muscle relaxants: increased respiratory depression, hypotension

Class IA antiarrhythmics (disopyramide, procainamide, quiNIDine), class III antiarrhythmics (amiodarone, bretylium, dofetilide, ibutilide, sotalol), astemizole, arsenic trioxide, bepridil, cisapride, chloroquine, clarithromycin, levomethadyl, pentamidine, some phenothiazines, pimozide, probucol, sparfloxacin, terfenadine: increased QT prolongation

CYP3A4 inducers (barbiturates, bosentan, carBAMazepine, efavirenz, phenytoins, nevirapine, rifabutin, rifampin): decreased methadone effect, withdrawal symptoms may occur

CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, FLUoxetine, fluvoxaMINE, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole): increased toxicity

MAOIs: do not use for 2 wk before taking methadone: unpredictable reactions

### Drug/food

Avoid use with grapefruit juice

### Drug/herb

Chamomile, hops, kava, valerian: increased CNS depression

St. John's wort: avoid use, withdrawal may result

### Drug/lab test

Increased: amylase, lipase

## NURSING CONSIDERATIONS

### Assessment

- **Assess for pain:** type, location, intensity, grimacing before and 1½-2 hr after administration; use pain scoring
- Monitor VS after parenteral route; note muscle rigidity, product history, liver, kidney function tests
- Monitor CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- Monitor allergic reactions: rash, urticaria
- Monitor opioid detoxification: no analgesia occurs, only prevention of withdrawal symptoms
- **Beers:** Avoid in older adults unless safer alternatives are not available, may cause ataxia, impaired psychomotor function

**BLACK BOX WARNING:** Monitor B/P, pulse, ECG: hypotension, palpitations may occur

- Monitor bowel changes; bulk, fluids, laxatives should be used for constipation

**BLACK BOX WARNING: Respiratory dysfunction:** respiratory depression, character, rate, rhythm; notify prescriber if respirations <10/min, avoid use with other CNS depressants (benzodiazepines)

**BLACK BOX WARNING: QT prolongation:** may be dose related or use with other products that increase QT, titrate dose carefully

**BLACK BOX WARNING: Accidental exposure:** make sure product is not accessible to children, pets, may be fatal

**BLACK BOX WARNING: Overdose, poisoning:** advise persons involved in correct use

**BLACK BOX WARNING: Substance abuse:** may occur but has less psychological dependence than other opiate agonists

- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding, neonatal opioid withdrawal syndrome may occur and serious sedation of the infant

### Patient/family education

- Instruct patient to report any symptoms of CNS changes, allergic reactions, extreme sedation, trouble breathing; to avoid CNS depressants (alcohol, sedative-hypnotics) for at least 24 hr after taking this product
- Discuss with patient that dizziness, drowsiness, and confusion are common; to avoid getting up without assistance
- Discuss in detail with patient all aspects of the product
- **Pregnancy/breastfeeding:** Caution the patient not to use in pregnancy, breastfeeding

- Caution patient to make position changes slowly to prevent orthostatic hypotension
- Teach patient withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia
- Advise patient to maintain proper hydration, avoid alcohol use
- Teach patient to avoid use with other products without approval of prescriber; many drug interactions
- Teach patient to use exactly as directed, do not increase unless directed by prescriber
- Teach patient that drowsiness, dizziness may occur, not to perform hazardous tasks until effect is known, to ask for assistance when getting out of bed
- Teach patient that regular ECGs will be needed
- Teach patient to change positions slowly to minimize orthostatic hypotension
- Teach patient to advise all providers of product taken

### Evaluation

**Positive therapeutic outcome**
- Decreased pain
- Successful opioid withdrawal

## TREATMENT OF OVERDOSE:
Naloxone (Narcan) 0.2-0.8 mg **IV**, $O_2$, **IV** fluids, vasopressors

## methimazole (Rx)
(meth-im′a-zole)
**Tapazole**
*Func. class.:* Thyroid hormone antagonist (antithyroid)
*Chem. class.:* Thioamide

**Do not confuse:** methimazole/metoprolol/minoxidil

**ACTION:** Inhibits synthesis of thyroid hormones by decreasing iodine use in the manufacture of thyroglobin and iodothyronine; does not affect already formed hormones, does not affect circulatory $T_4$, $T_3$

**Therapeutic outcome:** Decreased $T_4$ levels, hyperthyroid symptoms

**USES:** Hyperthyroidism, preparation for thyroidectomy

## CONTRAINDICATIONS
Pregnancy, breastfeeding, hypersensitivity

**Precautions:** Infection, bone marrow depression, hepatic disease, bleeding disorders

## DOSAGE AND ROUTES
### Hyperthyroidism
**Adult:** PO 15 mg/day (mild hyperthyroidism); 30-40 mg/day (moderate-severe); 60 mg/day (severe); maintenance dosage 5-15 mg/day, may be divided
**Child:** PO 0.4 mg/kg/day in divided doses q8hr; continue until euthyroid; maintenance dosage 0.2 mg/kg/day in divided doses q8hr, max 30 mg/24 hr, may be divided

### Preparation for thyroidectomy
**Adult and child:** PO same as above; iodine may be added for 10 days before surgery

### Thyrotoxic crisis
**Adult and child:** PO same as hyperthyroidism with iodine and propranolol

**Available forms:** Tabs 5, 10, 15, 20 mg

### Implementation
- Give with meals to decrease GI upset; give at same time each day to maintain product level
- Give lowest dosage that relieves symptoms
- Store in light-resistant container
- Increase fluids to 3-4 L/day, unless contraindicated

## ADVERSE EFFECTS
**CNS:** *Drowsiness, headache, vertigo, fever,* paresthesias, neuritis
**ENDO:** *Enlarged thyroid*
**GI:** *Nausea, diarrhea, vomiting, jaundice,* hepatitis, loss of taste
**GU:** Nephritis
**HEMA:** Agranulocytosis, leukopenia, thrombocytopenia, hypothrombinemia, lymphadenopathy, bleeding, vasculitis
**INTEG:** *Rash, urticaria, pruritus, alopecia, hyperpigmentation,* lupuslike syndrome
**MS:** Myalgia, arthralgia, nocturnal muscle cramps

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, unchanged; breast milk |
| **Half-life** | 5-13 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | Peak 1-2 hr |
| **Duration** | 4-6 hr |

## INTERACTIONS

### Individual drugs

Amiodarone, potassium iodide: decreased effectiveness, methimazole dose may need to be increased
Digoxin: increased response, monitor digoxin level
Radiation: increased bone marrow depression
Warfarin: decreased anticoagulant effect, monitor coagulation studies

### Drug classifications

Antineoplastics: increased bone marrow depression

### Drug/lab test

Increased: pro-time, AST, ALT, alkaline phosphatase

## NURSING CONSIDERATIONS

### Assessment

- **Hyperthyroidism:** Assess for palpitations, nervousness/loss of hair, insomnia, heat intolerance, weight loss, diarrhea
- **Hypothyroidism:** Assess for constipation, dry skin, weakness, fatigue, headache, intolerance to cold, weight gain; adjustment may be needed
- Monitor pulse, B/P, temp; check I&O ratio; check for edema (puffy hands, feet, periorbitis); indicates hypothyroidism
- Check weight daily; same clothing, scale, time of day
- Monitor $T_3$, $T_4$, which are increased; serum TSH, which is decreased; free thyroxine index, which is increased if dosage is too low; discontinue product 3-4 wk before radioactive iodine uptake
- **Monitor blood studies:** CBC for blood dyscrasias (leukopenia, thrombocytopenia, agranulocytosis); if these occur, product should be discontinued and other treatment initiated; LFTs, may occur at higher doses >40 mg/day
- **Assess for hypersensitivity** (rash, enlarged cervical lymph nodes); product may have to be discontinued
- **Assess for hypoprothrombinemia** (bleeding, petechiae, ecchymosis)
- Monitor clinical response: after 3 wk should include increased weight, pulse, decreased $T_4$
- **Assess for bone marrow depression:** sore throat, fever, fatigue
- Check weight daily, same clothing, time of day, scale; weight increase or decrease is a sign of product need for adjustment
- **Pregnancy/breastfeeding:** May cause fetal harm, do not use in pregnancy, avoid use in breastfeeding

### Patient/family education

- Advise patient to abstain from breastfeeding after delivery; product appears in breast milk
- Instruct patient to take pulse daily; to keep graph of weight, pulse, mood
- Advise patient to report redness, swelling, sore throat, mouth lesions, which indicate blood dyscrasias
- Caution patient to avoid OTC products that contain iodine; that seafood and other iodine-containing products may be restricted by prescriber
- Caution patient not to discontinue this medication abruptly; thyroid crisis may occur; stress patient compliance
- Advise patient that response may take several mo if thyroid is large
- **Teach patient symptoms/signs of overdose:** periorbital edema, cold intolerance, mental depression; notify prescriber at once
- **Teach patient symptoms of inadequate dosage**: tachycardia, diarrhea, fever, irritability; prescriber should be notified to adjust
- Teach patient to take medication exactly as prescribed, not to skip or double doses; missed doses should be taken when remembered up to 1 hr before next dose
- Instruct patient to carry ID describing medication taken and condition being treated
- Teach patient to report yellowing of skin/legs, dark urine, anorexia, right upper abdominal pain, may indicate hepatic dysfunction

### Evaluation

**Positive therapeutic outcome**

- Decreased weight gain
- Decreased pulse
- Decreased $T_4$
- Decreased B/P

**⚠ HIGH ALERT**

## methotrexate (Rx)

(meth-oh-trex′ate)
**Rheumatrex, Trexall, Metoject**, **Otrexup, Xatmep, Rasuvo**
*Func. class.:* Antineoplastic, antimetabolite
*Chem. class.:* Folic acid antagonist

**Do not confuse:** methotrexate/metolazone/mitoxantene

**ACTION:** Inhibits an enzyme that reduces folic acid, which is needed for nucleic acid synthesis in all cells; cell cycle specific (S phase); immunosuppressive

**Therapeutic outcome:** Prevention of rapidly growing malignant cells; immunosuppression

**USES:** Acute lymphocytic leukemia, in combination for breast, lung, head, neck carcinoma, lymphoma, sarcoma, gestational choriocarcinoma, hydatidiform mole, psoriasis, rheumatoid arthritis, mycosis fungoides, osteosarcoma

## CONTRAINDICATIONS

Hypersensitivity, leukopenia (<3500/mm$^3$), thrombocytopenia (<100,000/mm$^3$), anemia, psoriatic patients with severe renal disease, alcoholism, HIV infection, AIDS

**BLACK BOX WARNING:** Pregnancy, exfoliative dermatitis, bone marrow suppression

**Precautions:** Breastfeeding, children

**BLACK BOX WARNING:** Renal disease, ascites, diarrhea, infection, intrathecal administration, lymphoma, pleural effusion, pulmonary toxicity, radiation therapy, stomatitis, tumor lysis syndrome, ascites, stomatitis, gastroenteritis, GI bleeding, perforation, hepatotoxicity, intrauterine fetal death, neurotoxicity, requires experienced clinician

## DOSAGE AND ROUTES

### Acute lymphocytic leukemia

**Adult and child:** PO/IM/**IV** 3.3 mg/m$^2$/day × 4-6 wk until remission with prednisone 60 mg/m$^2$/day, then 20-30 mg/m$^2$ PO/IM qwk in 2 divided doses or 2.5 mg/kg **IV** q2wk

### Burkitt's lymphoma (stages I, II, III) (unlabeled)

**Adult:** PO 10-25 mg/day × 4-8 days with 7-day rest period

**Child ≥3 yr:** intrathecally 12 mg q2-5days; child 2-3 yr 10 mg q2-5days; child 1-2 yr: 8 mg q2-5days

### Meningeal leukemia

**Adult:** 12 mg/m$^2$ IT q2-5days until CSF is normal, then one additional dose, max 15 mg

### Choriocarcinoma, hydatidiform mole

**Adult and child:** PO/IM 15-30 mg/kg/day × 5 days, then off 1 wk; may repeat m × 5 courses

### Breast cancer

**Adult:** **IV** 40-60 mg/m$^2$ on day 1 of every 21-28 days with other antineoplastics

### Epidermal head/neck cancer

**Adult/child:** **IV** 40 mg/m$^2$ on days 1 and 15, q21 days alone or in combination with bleomycin, CISplatin

**Adult:** PO 25-50 mg/m$^2$ q7 days
**Child:** PO 7.5-30 mg/m$^2$ q7-14 days

### Rheumatoid arthritis

**Adult:** PO 7.5 mg/wk or divided doses of 2.5 mg q12hr × 3 dose qwk, max 20 mg/wk

### Polyarticular-course juvenile RA

**Child:** PO/IM 10 mg/m$^2$ qwk

### Osteosarcoma

**Adult and child:** **IV** 12 g/m$^2$ given over 4 hr, then leucovorin rescue is given

### Mycosis fungoides

**Adult:** PO 2.5-10 mg/day until cleared (may be many mo); IM 50 mg qwk or 15-37.5 mg 2 ×/wk

### Psoriasis

**Adult:** PO/IM/**IV** 10-25 mg qwk or 2.5 mg PO q12hr × 3 doses qwk; may increase to 25 mg qwk, max 30 mg/wk

### Renal/hepatic dose

**Adult:** PO/IM/IV
CCr 46-60 ml/min give 65% of standard dose;
CCr 31-45 ml/min give 50% of standard dose;
CCr ≤30 ml/min not recommended

**Available forms:** Tabs 2.5, 5, 7.5, 10, 15 mg; inj 25 mg/ml (2, 4, 8, 10, 20, 40 vials); 25 mg/ml (2,10 ml vials with benzyl alcohol); lyophilized powder: 2.5 mg/ml, 2.5 mg/ml in 1000 mg preservative-free vials; oral solution 2.5 mg/ml; autoinjector: 7.5 mg/0.15 ml, 7.5 mg/0.4 ml, 10 mg/0.2 ml, 10 mg/0.4 ml, 12.5 mg/0.25 ml, 15 mg/0.3 ml, 15 mg/0.4 ml, 17.5 mg/0.35 ml, 20 mg/0.4 ml, 22.5 mg/0.45 ml, 25 mg/0.4 ml, 25 mg/0.5 ml, 27.5 mg/0.55 ml, 30 mg/0.6 ml

### Implementation

- Avoid contact with skin, since product is very irritating; wash completely to remove
- **Leucovorin rescue:** Administer leucovorin calcium within 24 hr of giving this product to prevent tissue damage; check agency policy; continue until methotrexate level <$10^{-8}$ m
- Give antiemetic 30-60 min before giving product and prn to prevent vomiting; administer antibiotics for infection prophylaxis
- Give in AM so product can be eliminated before bedtime
- Provide liquid diet: carbonated beverages; gelatin may be added if patient is not nauseated or vomiting

**PO route**

- Give 1 hr before or 2 hr after meals to prevent vomiting
- Make sure product is taken weekly in RA, JRA

**IM route**
- Give deeply in large muscle mass
- Store in tightly closed container in cool environment; store inj, powder for inj in dark, dry area
- Use safe handling procedures for chemotherapeutic agents

**PO route**
- This route is preferred for low-dose therapy
- Methotrexate absorption is dose dependent; absorption of single doses more than 40 mg/m$^2$ is significantly less than that of lower doses
- Weekly therapy with Rheumatrex Dose Packs is not intended for doses more than 15 mg PO/wk

**Oral liquid formulations**
- Instruct patients and caregivers that the recommended dose should be taken weekly as directed. Mistaken daily use of the recommended dose has led to fatal toxicity
- Measure using a calibrated oral measuring device for accurate dosage administration
- **Storage:** Store at room temperature (68 to 77° F) for up to 60 days

**Injectable routes**
- Visually inspect parenteral products for particulate matter and discoloration before use
- The preserved solutions contain benzyl alcohol and should not be used for intrathecal, intermediate-, or high-dose therapy

**Reconstitution of lyophilized powders:** Reconstitute each vial with an appropriate sterile, preservative-free solution such as 5% dextrose injection or 0.9% sodium chloride injection. Reconstitute the 25-mg vial to a concentration no greater than 25 mg/ml. The 1-g vial should be reconstituted with 19.4 ml to a concentration of 50 mg/ml; prepare immediately before use. Discard any unused portions

**IV route**

**Direct IV injection:** Inject as a slow push via Y-site or three-way stopcock into a free-flowing IV infusion

**Intermittent/continuous IV infusion:** Further dilute solution in 5% dextrose injection, 5% dextrose, and 0.9% sodium chloride injection, or 0.9% sodium chloride injection; before infusion, check vein patency by flushing with 5 to 10 ml of 5% dextrose injection or 0.9% sodium chloride injection; infuse at a rate recommended by the prescriber. After infusion, flush the IV tubing.

**Guidelines for IV infusion of intermediate- or high-dose methotrexate (500 mg/m$^2$ over less than 4 hr or more than 1 g/m$^2$ over more than 4 hr):**
- Before use, the following laboratory parameters should be confirmed: WBC >1,500/mm$^3$, neutrophil count >200/mm$^3$, platelet count >75,000/mm$^3$, serum bilirubin <1.2 mg/dl, normal serum creatinine, and SGPT <450 U. Creatinine clearance should be >60 ml/min. If serum creatinine has increased by 50% or more compared with a prior value, creatinine clearance should be measured and documented as more than 60 ml/min even if the serum creatinine is still within normal limits
- Previous mucositis should be healed and persistent effusions should be drained before use
- Give 1 L/m$^2$ of IV over 6 hr before initiation of the methotrexate infusion; continue hydration at 125 ml/m$^2$/hr during the methotrexate infusion and for 2 days after the infusion has been completed
- Alkalinize the urine using sodium bicarbonate to maintain the urine pH more than 7 during the methotrexate infusion and leucovorin therapy. This can be done orally or by incorporating the sodium bicarbonate in the intravenous fluids.
- Repeat serum creatinine and methotrexate serum level determinations 24 hr after starting methotrexate and at least daily until the methotrexate level is below 5 × 10-8mol/L (0.05 micro-M)

**IM route**
- Inject deeply into a large muscle
- Aspirate before injection to avoid injection into a blood vessel

**SUBCUT route**
- Otrexup and Rasuvo are methotrexate formulations for SUBCUT use only
- Both Otrexup and Rasuvo are single-use autoinjectors. Otrexup is available in 5-mg increments for doses between 10 and 25 mg; Rasuvo is available in 2.5-mg increments for doses between 7.5 and 30 mg. Otrexup is yellow in color, and Rasuvo is yellow to brown in color. Neither formulation should have lumps or particles floating in it
- Administer Otrexup and Rasuvo in the abdomen or thigh; do NOT administer within 2 inches of the navel; on the arms; on any other areas of the body; or on skin that is tender, bruised, red, scaly, hard, or has scars or stretch marks
- If self-injection is deemed appropriate, patients or caregivers should practice injections using a training device with guidance from a health care professional.

**Use of the Otrexup autoinjector**
- Immediately before use, twist cap to remove; flip the safety clip

• Place the needle end of Otrexup against the thigh or stomach (abdomen) at a 90-degree angle and firmly push until you hear a click; hold for 3 sec before removing the autoinjector
• Press a cotton ball or gauze on the area for 10 sec; do not rub the injection site
• After use, the viewing window will be blocked to show that the medicine was given. If the viewing window is not blocked, call your doctor, pharmacist, or 855-Otrexup (855-687-3987) for help
• Do not inject another Otrexup dose without talking to your doctor

**Use of the Rasuvo autoinjector**

• Immediately before use, pull the yellow cap straight off. Do not twist the cap
• Pinch a pad of skin surrounding a cleaned injection site (thigh or abdomen) with the thumb and forefinger. Position the uncapped transparent end of the autoinjector at a 90-degree angle to the skin. Without pressing the button, push firmly onto the skin until the stop point is felt, which will unlock the yellow injection button
• Press the yellow injection button until a click is heard, which indicates the start of the injection. Hold Rasuvo against the skin until all medication is injected. This can take up to 5 sec. It is not necessary to keep the button of the Rasuvo autoinjector pressed down after the injection has begun
• To avoid incomplete injection, do not remove Rasuvo from the skin before the end of the injection. Look at the transparent control zone while injecting to make sure the entire dose is injected. When movement stops, the injection is complete
• Pull straight up to remove Rasuvo from the injection site. The protective needle shield should automatically move into place
• Visually inspect the transparent control zone to ensure no liquid is left in the syringe. If liquid is left, not all of the medicine was injected. The physician should be contacted. Do not use another Rasuvo unless advised by the doctor

**Intrathecal administration**

• Use preservative-free solutions. The preserved solutions contain benzyl alcohol and should NOT be used for intrathecal therapy
• Reconstitute the preservative-free powder for injection with preservative-free 0.9% sodium chloride injection. The desired dose should be drawn into a 5- to 10-ml syringe
• After lumbar puncture is complete, withdraw an amount of CSF equivalent to the volume of methotrexate injection to be administered. If the puncture was traumatic, wait 2 days before attempting to administer methotrexate intrathecally
• Allow CSF (approximately 10% of estimated CSF total volume) to flow into the syringe and mix with the product
• Inject intrathecally over 15 to 30 sec with the bevel of the needle directed upward

**Y-site compatibilities:** Acyclovir, alemtuzumab, alfentanye, allopurinol, amifostine, aminophylline, asparaginase, aztreonam, bleomycin, cefepime, cefTRIAXone, cimetidine, CISplatin, cyclophosphamide, cytarabine, DAUNOrubicin, dexchlorpheniramine, diphenhydrAMINE, doripenem, DOXOrubicin, etoposide, famotidine, filgrastim, fludarabine, fluorouracil, furosemide, gallium, ganciclovir, granisetron, heparin, HYDROmorphone, imipenem-cilastatin, leucovorin, LORazepam, melphalan, mesna, methylPREDNISolone, metoclopramide, mitoMYcin, morphine, ondansetron, oxacillin, PACLitaxel, piperacillin/tazobactam, prochlorperazine, ranitidine, sargramostim, teniposide, thiotepa, vinBLAStine, vinCRIStine, vinorelbine, zoledronic acid

**Y-site incompatibilities:** Droperidol, IDArubicin

**Solution compatibilities:** Amino acids, 4.25%/$D_{25}$, $D_5W$, sodium bicarbonate 0.05 mol/L, 0.9% NaCl

**BLACK BOX WARNING: Intrathecal route:** use preservative-free solutions, reconstitute with normal saline, the dose should be drawn into a 5-10 ml syringe after lumbar puncture, the volume of CSF should be withdrawn equal to volume of methotrexate, allow CSF to flow into syringe and mix, inject over 15-30 sec with bevel of needle upward

## ADVERSE EFFECTS

**CNS:** Dizziness, seizures, headache, confusion, encephalopathy, hemiparesis, malaise, fatigue, chills, fever, leukoencephalopathy, arachnoiditis (intrathecal)
**EENT:** Blurred vision, optic neuropathy
**GI:** *Nausea, vomiting, anorexia, diarrhea, ulcerative stomatitis,* hepatotoxicity, cramps, ulcer, gastritis, GI hemorrhage, abdominal pain, hematemesis, hepatic fibrosis, acute toxicity
**GU:** Urinary retention, renal failure, menstrual irregularities, defective spermatogenesis, hematuria, azotemia, uric acid nephropathy
**HEMA:** Leukopenia, thrombocytopenia, myelosuppression, anemia
**INTEG:** *Rash, alopecia,* dry skin, urticaria, photosensitivity, folliculitis, vasculitis, petechiae,

ecchymosis, acne, alopecia, severe fatal skin reactions
**RESP:** Methotrexate-induced lung disease
**SYST:** Sudden death, *Pneumocystis jiroveci* pneumonia, tumor lysis syndrome, secondary malignancy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (GI) |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys, unchanged; breast milk (minimal) |
| **Half-life** | Terminal 10-12 hr; increased in renal disease |

### Pharmacodynamics

| | PO | IM/IV | IT |
|---|---|---|---|
| **Onset** | Unknown | Unknown | Unknown |
| **Peak** | 1-4 hr | ½-2 hr | Unknown |
| **Duration** | Unknown | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Acitretin: increased hepatitis; avoid concurrent use
Alcohol, phenylbutazone, probenecid, radiation, theophylline: increased toxicity
Digoxin (PO), fosphenytoin, phenytoin: decreased effect of each specific product
Folic acid: decreased effect of methotrexate, asparaginase
Radiation: increased bone marrow suppression

### Drug classifications

Anticoagulants (oral): increased hypoprothrombinemia
Antineoplastics, NSAIDs, penicillins, salicylates, sulfa products: increased toxicity
Live virus vaccines: decreased antibodies
Proton pump inhibitors: do not use concurrently

## NURSING CONSIDERATIONS

### Assessment

- Assess buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia; obtain prescription for viscous lidocaine (Xylocaine)
- **Assess symptoms indicating severe allergic reaction:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing
- Assess tachypnea, ECG changes, dyspnea, edema, fatigue; identify dyspnea, crackles, unproductive cough, chest pain, tachypnea

**BLACK BOX WARNING: Infection:** those with active infections should be treated for infection prior to product use; monitor temperature, fever may indicate beginning of infection, more common during neutropenia

- **Bone marrow suppression:** Monitor CBC, differential, platelet count weekly; avoid use until WBC is >1500/mm$^3$ or platelet count is >75,000/mm$^3$, neutrophils >200/mm$^3$, notify prescriber of results if WBC <20,000/mm$^3$, platelets <150,000/mm$^3$; WBC, platelet nadirs occur on day 7; monitor
- Assess for increased uric acid levels, swelling, joint pain primarily in extremities; patient should be well hydrated to prevent urate deposits
- Make sure drug-drug interacting products are discontinued prior to therapy, and do not resume until methotrexate level is safe

**BLACK BOX WARNING: Nephrotoxicity:** avoid use in renal failure; monitor renal function studies: BUN, creatinine, serum uric acid, urine CCr before, during therapy; check I&O ratio; report fall in urine output to <30 ml/hr

**BLACK BOX WARNING: Hepatotoxicity:** monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; check for jaundice of skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea (hepatotoxicity)

- **Bleeding:** Assess for bleeding: blood in emesis hematuria, stool guaiac, bruising or petechiae, mucosa or orifices; check for inflammation of mucosa, breaks in skin, avoid IM injections, rectal temperature when platelets are low
- Identify effects of alopecia on body image; discuss feelings about body changes
- Identify edema in feet, joint and stomach pain, shaking; prescriber should be notified
- Monitor methotrexate levels, adjust leucovorin dose based on the level
- Monitor vital signs during use, report changes if significant
- Monitor for stomatitis, diarrhea, abdominal cramping or pain, if severe discontinue product
- Anemia: Assess for extreme fatigue, increased heartbeat, dyspnea, headache, dizziness, pale skin
- Gout: Assess for joint warmth, pain, edema, increased uric acid level, use allopurinol and alkalinization of urine will decrease uric acid

M

**BLACK BOX WARNING: Pulmonary toxicity:** those with ascites or pleural effusions are at greater risk for toxicity, fluid should be removed before treatment, monitor plasma methotrexate level, may start with dry, nonproductive cough

**BLACK BOX WARNING: Tumor lysis syndrome:** hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia, decreased urine output; use aggressive hydration and allopurinol to correct severe electrolyte imbalances, renal toxicity

**BLACK BOX WARNING: Serious skin reaction:** Stevens-Johnson syndrome, exfoliative dermatitis, skin necrosis, erythema multiforme may occur within days of receiving product by any route; product should be discontinued

- **Strokelike encephalopathy:** common in high-dose therapy; assess for confusion, hemiparesis, seizures, coma; usually transient
- **Rheumatoid arthritis:** ROM, pain, joint swelling, prior to and during treatment
- **Psoriasis:** assess skin lesions prior to and during treatment

### Patient/family education

- Encourage patient to rinse mouth tid-qid with water, club soda; brush teeth bid-qid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

**BLACK BOX WARNING: Pregnancy, breastfeeding:** Advise patient that contraceptive measures for women and men are recommended during therapy; product is teratogenic; contraception should be used for 3 mo (male) and 4-6 wk (female); to discontinue breastfeeding; toxicity to infant may occur

**BLACK BOX WARNING:** Teach patient to avoid use of products containing aspirin or NSAIDs, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)

- Caution patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath); seizures
- **Pulmonary toxicity:** Advise patient to report any changes in breathing or coughing even several mo after treatment; to avoid crowds and persons with respiratory tract or other infections
- Advise patient to report stomatitis: any bleeding, white spots, ulcerations in mouth to prescriber; tell patient to examine mouth daily, report symptoms, use good oral hygiene
- Teach patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture
- Caution patient not to have any vaccinations without the advice of the prescriber; serious reactions can occur
- Advise patient to use sunblock or protective clothing to prevent burns
- Teach patient to use good dental care, to prevent overgrowth of infection in the mouth, to use soft bristle toothbrush
- Teach patient how to use this product with leucovorin rescue
- Teach patient to continue leucovorin until told it is safe to stop
- Teach patient to report CNS symptoms, vision changes
- Teach patient to report fever, other symptoms of infection
- Teach patient to report decreased urine output
- Teach patient to advise all providers that methotrexate is being used, not to take Rx, OTC, herbs, supplements unless approved by prescriber
- SUBCUT route: Teach patient self-injection technique and use, disposal of equipment

### Evaluation

**Positive therapeutic outcome**

- Prevention of rapid division of malignant cells
- Decreased joint inflammation in RA

**⚠ HIGH ALERT**

## methyldopa/methyldopate (Rx)

(meth-ill-doe'pa)

*Func. class.:* Antihypertensive

*Chem. class.:* Centrally acting α-adrenergic inhibitor

**Do not confuse:** methyldopa/L-dopa (levodopa)

**ACTION:** Stimulates central inhibitory $\alpha_2$-adrenergic receptors or acts as false transmitter, resulting in reduction of arterial pressure

**Therapeutic outcome:** Decreased B/P in hypertension

**USES:** Hypertension, hypertensive crisis

**CONTRAINDICATIONS**

Active hepatic disease, hypersensitivity, MAOI therapy

**Precautions:** Pregnancy, geriatric patients, cardiac disease, autoimmune disease, depression, dialysis, hemolytic anemia, Parkinson's disease, pheochromocytoma, sulfite hypersensitivity

## DOSAGE AND ROUTES

### Hypertension/hypertensive crisis

**Adult:** PO 250-500 mg bid or tid, then adjusted q2day prn, 0.5-2 g/day in 2-4 divided doses (maintenance), max 3 g/day; **IV** 250-500 mg in 100 ml $D_5W$ q6hr, run over 30-60 min, max 1 g q6hr, switch to PO as soon as possible

**Child:** PO 10 mg/kg/day in 2-4 divided doses, max 65 mg/kg or 3 g/day, whichever is less; **IV** 20-40 mg/kg/day in 4 divided doses, max 65 mg/kg or 3 g, whichever is less

### Renal dose

**Adult:** PO CCr 10-50 ml/min dose q8-12hr; CCr <10 ml/min dose q12-24hr

**Available forms:** Methyldopa: tabs 125, 250, 500 mg; methyldopate: inj 50 mg/ml (250 mg/5 ml)

### Implementation

#### PO route

- Give before meals
- Shake susp before using
- Store in airtight container at room temperature
- Product should not be withdrawn abruptly
- Increase in dose should be done in the evening to minimize drowsiness

#### Intermittent IV infusion route

- Give after diluting in 100 ml of 0.9% NaCl, $D_5W$, $D_2$/0.9% NaCl, 5% sodium bicarbonate, Ringer's; administer over 30-60 min

**Y-site compatibilities:** Alemtuzumab, alfentanil, amikacin, aminophylline, anidulafungin, ascorbic acid, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cephalothin, chlorproMAZINE, cimetidine, clindamycin, cyanocobalamin, cycloSPORINE, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, DOPamine, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, insulin(regular), irinotecan, isoproterenol, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methoxamine, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, ritodrine, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, voriconazole, zoledronic acid

**Solution compatibilities:** $D_5W$, $D_2$/0.9% NaCl, Ringer's, sodium bicarbonate 5%, 0.9% NaCl, amino acids 4.25%/$D_{25}$, Dextran$_6$/0.9% NaCl, Normosol R, Normosol M/$D_5W$

## ADVERSE EFFECTS

**CNS:** *Drowsiness, weakness, dizziness, sedation, headache,* depression, psychosis, paresthesias, parkinsonism, Bell's palsy, nightmares, drug fever

**CV:** Bradycardia, myocarditis, orthostatic hypotension, angina, edema, weight gain, HF, paradoxical pressor response (**IV** use)

**EENT:** Nasal congestion

**ENDO:** Breast enlargement, gynecomastia, amenorrhea

**GI:** Nausea, vomiting, diarrhea, constipation, hepatic dysfunction, sore or "black" tongue, pancreatitis, colitis, flatulence

**GU:** Impotence, failure to ejaculate

**HEMA:** Leukopenia, thrombocytopenia, hemolytic anemia, granulocytopenia, positive Coombs' test

**INTEG:** Lupuslike syndrome, rash, toxic epidural necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 50% (PO) |
| **Distribution** | Crosses placenta, blood-brain barrier |
| **Metabolism** | Liver, moderately |
| **Excretion** | Kidneys, unchanged (partially) |
| **Half-life** | 1½ hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Onset 4-6 hr | Unknown |
| **Peak** | 4-6 hr | Onset 4-6 hr |
| **Duration** | 24-48 hr | 10-16 hr |

## INTERACTIONS

### Individual drugs

Alcohol: CNS depression
Haloperidol: increased psychosis
Iron: decreased methyldopa absorption
Levodopa: increased CNS toxicity, hypotension
Lithium: increased lithium toxicity
TOLBUTamide: increased hypoglycemia

### Drug classifications

Amphetamines, antidepressants (tricyclics), barbiturates, NSAIDs, phenothiazines: decreased antihypertensive effect
Analgesics, antidepressants, antihistamines, sedative/hypnotics: increased CNS depression
Antihypertensives, diuretics: increased hypotension
β-Adrenergic blockers: increased B/P
MAOIs: increased pressor effect, do not use concurrently
Sympathomimetic amines: increased pressor effect

### Drug/lab test

Increased: creatinine, LFTs
Decreased: platelets, WBC, Hgb/Hct
Interference: urinary uric acid, serum creatinine, AST
False increase: urinary catecholamines

## NURSING CONSIDERATIONS

### Assessment

- **Hemolytic anemia:** monitor blood tests: CBC, neutrophils, decreased platelets; direct Coombs' test before, after 6, 12 mo of therapy; a positive test may indicate hemolytic anemia; usually reverses within weeks to months after discontinuing treatment, monitor Hgb/Hct and RBC, do not start therapy in those with hemolytic anemia
- Monitor renal studies: protein, BUN, creatinine; watch for increased levels that may indicate nephrotic syndrome: polyuria, oliguria, frequency; report weight gain >5 lb
- **Drug-induced hepatitis/drug fever:** usually subsides within 3 months of discontinuing therapy
- **Product tolerance:** may occur within 3 mo of starting treatment; dosage change and other products may be needed
- Obtain baselines in renal, liver function tests before therapy begins; check potassium levels, although hyperkalemia rarely occurs
- Monitor B/P, pulse if the product is being used for hypertension; notify prescriber of changes
- Monitor edema in feet, legs daily; monitor I&O; check weight for decreasing output
- Assess for allergic reaction: rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help
- Monitor CNS symptoms, especially in the geriatric; depression; change in mental status
- **Pregnancy/breastfeeding:** Use cautiously in pregnancy, breastfeeding; has been used for pregnancy-induced hypertension

### Patient/family education

- Instruct patient not to discontinue product abruptly, or withdrawal symptoms may occur: anxiety, increased B/P, headache, insomnia, increased pulse, tremors, nausea, sweating
- Caution patient not to use OTC (cough, cold, or allergy) products unless directed by prescriber
- Teach patient about excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P; consult prescriber if these occur
- Advise patient that product may cause dizziness, fainting; light-headedness may occur during 1st few days of therapy; that product may cause dry mouth, use hard candy, saliva product, or frequent rinsing of mouth; caution patient to change position slowly, to rise slowly to sitting or standing position to minimize orthostatic hypotension, especially geriatric
- Caution patient that compliance is necessary; not to skip or stop product unless directed by prescriber
- Teach patient that product may cause skin rash
- Teach patient to avoid hazardous activities, since product may cause drowsiness, dizziness
- **Beers:** Avoid in older adults, high risk of CNS effects, may cause bradycardia and orthostatic hypotension

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P

## TREATMENT OF OVERDOSE:

Gastric evacuation, sympathomimetics may be indicated if severe; hemodialysis

## methylergonovine (Rx)

(meth-ill-er-goe-noe'veen)
**Methergine**
*Func. class.:* Oxytocic
*Chem. class.:* Ergot alkaloid

**ACTION:** Stimulates uterine and vascular smooth muscle, causing contractions, decreased bleeding, arterial vasoconstriction

**Therapeutic outcome:** Absence of hemorrhage

**USES:** Prevention, treatment of hemorrhage postpartum or after abortion, uterine contractions

## CONTRAINDICATIONS

Pregnancy (4th stage of labor [other than obstetric delivery/abortion]), hypersensitivity to ergot preparations, preeclampsia, eclampsia, elective induction of labor

**Precautions:** Severe renal/hepatic disease, jaundice, diabetes mellitus, seizure disorders, sepsis, CAD, last stage of labor

## DOSAGE AND ROUTES

**Adult:** PO 200 mcg tid-qid up to 7 days; IM/**IV** 200 mcg q2-4hr for 1-5 doses

**Available forms:** Inj 200 mcg/ml; tabs 200 mcg

### Implementation

**PO route**

- PO is the preferred route
- Do not exceed dosage limits
- Store tabs at room temperature
- Give with water

**IM route**

- Give inj deeply in large muscle mass, aspirate
- Protect from light

**Direct IV route**

- Give by this route for severe, life-threatening hemorrhage
- Give directly undiluted or diluted with 5 ml of 0.9% NaCl given through Y-site or 3-way stopcock; give 0.2 mg/min; use clear, colorless sol
- Store up to 2 mo if unused

**Y-site compatibilities:** Heparin, hydrocortisone sodium succinate, potassium chloride, vit B/C

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness,* seizures, hallucinations, stroke (IV)
**CV:** Hypotension, chest pain, palpitations, *hypertension,* dysrhythmias; CVA (**IV**)
**EENT:** Tinnitus
**GI:** *Nausea, vomiting*
**GU:** Cramping
**INTEG:** Sweating, rash, allergic reactions
**MS:** Leg cramps
**RESP:** *Dyspnea*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, IM) |
| **Distribution** | Unknown |
| **Metabolism** | Liver, possibly |
| **Excretion** | Unknown |
| **Half-life** | ½-2 hr |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | 5-15 min | 5 min | Immediate |
| **Peak** | Unknown | Unknown | Unknown |
| **Duration** | 3 hr | 3 hr | Unknown |

## INTERACTIONS

### Individual drugs

Smoking: increased vasoconstriction

### Drug classifications

CYP3A4 inhibitors: increased ergot toxicity, do not use together
Vasopressors, ergots, anesthetics (regional): increased vasoconstriction

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P, pulse; watch for change that may indicate hemorrhage
- Assess fundal tone, nonphasic contractions; check for relaxation or severe cramping
- **Assess for ergotism or overdose:** nausea, vomiting, weakness, muscular pain, insensitivity to cold, paresthesia of extremities; product should be decreased or infusion discontinued
- Before administering ergonovine, check calcium levels; if hypocalcemia is present, correction should be made to increase effectiveness of this product
- Monitor prolactin levels and for decreased breast milk production
- **Pregnancy/breastfeeding:** Do not use in pregnancy except after obstetric delivery or abortion to reduce hemorrhage risk, may breastfeed 1 wk postpartum to control uterine bleeding

### Patient/family education

- Inform patient that abdominal cramps are a side effect of this medication
- Instruct patient to notify prescriber if chest pain, nausea, vomiting, headache, muscle pain, weakness, or cold, numb extremities occur

### Evaluation

**Positive therapeutic outcome**

- Prevention of hemorrhage

## methylnaltrexone (Rx)

(meth-il-nal-trex′one)
**Relistor**
*Chem. class.:* Opioid antagonist
*Func. class.:* GI agent

**ACTION:** Peripheral mu-opioid receptor antagonist that reduces constipation associated with opiate agonists

**Therapeutic outcome:** Decreased constipation

**USES:** Treatment of opioid-induced constipation in patients with advanced illness who are receiving palliative care when response to laxative therapy has been insufficient, opioid-induced constipation in chronic noncancer pain

## CONTRAINDICATIONS

Hypersensitivity, GI obstruction, **IV** route, eclampsia, elective induction of labor, hypertension, preeclampsia, pregnancy

**Precautions:** Pregnancy, breastfeeding, renal disease, children, diarrhea, driving, operating machinery, geriatric patients, neoplastic disease, Crohn's disease, peptic ulcer, ulcerative colitis

## DOSAGE AND ROUTES

### Opiate-agonist induced constipation

**Adult >114 kg:** SUBCUT 0.15 mg/kg every other day prn
**Adult 62-114 kg:** SUBCUT 12 mg every other day prn, max 12 mg/24 hr
**Adult 38-62 kg:** SUBCUT 8 mg every other day prn, max 8 mg/24 hr
**Adult <38 kg:** SUBCUT 0.15 mg/kg every other day prn, max 0.15 mg/kg/24 hr

### Opioid-induced constipation with noncancer pain

**Adult:** SUBCUT 12 mg qday, discontinue laxative before starting this product

### Renal dose

**Adult:** SUBCUT CCr <60 ml/min, reduce normal adult dose by 50%

**Available forms:** Solution for inj 12 mg/0.6 ml, (single-use vials) 8 mg/0.4 ml (prefilled syringes); tab 150 mg

### Implementation

- Give SUBCUT only; oral dose is investigational and not currently available
- Do not give **IV; IV** dosing for urinary retention is investigational
- Store at 15°-30° C (59°-86° F); do not freeze
- Store away from light

**SUBCUT route**

- Inspect the solution before use; it should be a clear, colorless to pale yellow aqueous solution; do not use if particulate matter or discoloration are present
- Withdraw the needed amount of solution into a sterile syringe; if immediate administration is impossible, the syringe may be kept at room temperature for up to 24 hr; the syringe does not need to be kept away from light during the 24-hr period; immediately discard any unused portion in the vial; no preservatives are present
- Administer into the upper arm, abdomen, or thigh no more than 1 ×/24 hr; rotate inj sites; do not inject the same spot each time; do not inject into areas where skin is tender, bruised, red, or hard; avoid areas with scars or stretch marks
- If using with retractable needle, slowly push down on the plunger past the resistance point until the syringe is empty and a click is heard

## ADVERSE EFFECTS

**CNS:** Dizziness
**GI:** Nausea, vomiting, diarrhea, flatulence, abdominal pain, GI perforation
**INTEG:** Hyperhidrosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 11%-15.3% |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Terminal 8 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 30 min (SUBCUT) |
| **Duration** | Unknown |

## NURSING CONSIDERATIONS

### Assessment

- Monitor serum creatinine
- **Opioid-induced constipation:** assess for stool characteristics: amount, consistency; bowel sounds during treatment
- Teach patient to notify prescriber before taking all other OTC, Rx, or herbal products
- Teach patient not to drive or perform other hazardous activities until response is known, dizziness may occur
- Teach patient to continue other products for constipation unless directed by prescriber not to
- **Pain:** Monitor characteristics of pain, this product does not effect analgesics
- **Beers:** Avoid in older adults unless safer alternatives are not available, may cause ataxia, impaired psychomotor function

• **Opioid withdrawal:** Teach patient to report severe diarrhea, abdominal pain, chills

### Patient/family education

• Teach patient that after 30 min, toilet facilities should be nearby, bowel relaxation occurs, not to use more than one dose in 24 hr
• Advise patient to notify prescriber of abdominal pain, continuous or severe diarrhea, nausea or vomiting
• Teach patient to avoid use in pregnancy unless absolutely necessary; avoid in breastfeeding

### Evaluation

**Positive therapeutic outcome**
• Decreased constipation

## methylphenidate (Rx)

(meth-ill-fen'i-date)
**Biphentin, Concerta, Daytrana, Methidate, Methylin, QuillChew, Quillivant XR, Ritalin, Ritalin LA, Ritalin SR**
*Func. class.:* Cerebral stimulant
*Chem. class.:* Piperidine derivative
**Controlled substance schedule II**

**Do not confuse:** methylphenidate/methadone, Metadate ER/methadone, Ritalin/Ritalin LA/ritodrine

**ACTION:** Increases release of norepinephrine and dopamine in cerebral cortex to reticular activating system; exact action not known

**Therapeutic outcome:** Increased alertness, decreased fatigue, ability to stay awake (narcolepsy), increased attention span, decreased hyperactivity (ADHD)

**USES:** Attention deficit disorder with hyperactivity (ADHD), narcolepsy (except Concerta, Metadate CD, Ritalin LA), attention deficit disorder (ADD)

## CONTRAINDICATIONS

Hypersensitivity, anxiety, history of Tourette's syndrome, glaucoma, hereditary fructose intolerance, glaucoma

**Precautions:** Pregnancy, breastfeeding, hypertension, depression, seizures, abrupt discontinuation, acute MI, aortic stenosis, arteriosclerosis, bipolar disorder, cardiac dysrhythmias, cardiomyopathy, chemical leukoderma, child depression, dysphagia, esophageal stricture, growth inhibition, heart failure, hepatic disease, hyperthyroidism, ileus, mania, peripheral vascular disease, PKU, psychosis, Raynaud's, schizophrenia, stroke, suicidal ideation, visual disturbances

**BLACK BOX WARNING:** Substance abuse, alcoholism

## DOSAGE AND ROUTES

### Attention-deficit/hyperactivity disorder (ADHD) initial treatment (not currently on methylphenidate)

#### >> Regular release: Ritalin, Methylin, Methylin oral sol, Methylin chew tabs

**Adult: PO** 20-30 mg/day, range 10-60 mg/day in 2-3 divided doses, 30-45 min before meals
**Child ≥6 yr: PO** 5 mg bid initially, increase 5-10 mg/day qwk, usual dose 0.3-2 mg/kg/day, max 60 mg/day

#### >> Extended release: Ritalin SR, Metadate ER, Methylin ER

**Adult/adolescent/child ≥6 yr: PO** max 20-30 mg tid

#### >> Extended-release once-daily tabs: Concerta

**Adult: PO** 18-36 mg/day initially, then adjust by 18 mg q wk, max 72 mg/day
**Adolescent: PO** 18 mg/day initially, then adjust by 18 mg q wk, max 72 mg/day
**Child ≥6 yr: PO** 18 mg/day initially, then adjust by 18 mg q wk, max 54 mg/day

#### >> Extended-release once-daily capsules: Ritalin LA

**Adult/adolescent/child ≥6 yr: PO** 10-20 mg/day in AM initially, adjust by 10 mg qwk, max 60 mg/day

#### >> Transdermal: Daytrana

**Adolescent/child ≥6 yr: TD** wk 1: 10 mg/day (9-hr patch); wk 2: 15 mg/day (9-hr patch); wk 3: 20 mg/day (9-hr patch); wk 4: 30 mg/day (9-hr patch)

### Conversion to once-daily from other forms for ADHD

#### >> Extended-release once-daily capsules: Ritalin LA

**Adult/adolescent/child ≥6 yr: PO** give no more than total daily dose of other forms, may adjust by 10 mg qwk, max 60 mg/day

#### >> Extended-release once-daily tablets: Concerta

**Adult/adolescent/child ≥6 yr (currently receiving 10-15 mg/day): PO** 18 mg q AM initially, adjust by 18 mg qwk, max 72 mg/day (adult); max 72 mg/day, 2 mg/kg/day (adolescent); 54 mg/day (child)
**Adult/adolescent/child ≥6 yr (currently receiving 20-30 mg/day): PO** 36 mg q AM, adjust by 18 mg qwk, max 72 mg/day (adult); 72 mg/day, 2 mg/kg/day (adolescent); 54 mg/day (child)

**Adult/adolescent/child ≥6 yr (currently receiving 30-45 mg/day): PO** 54 mg q AM, adjust by 18 mg qwk, max 72 mg/day (adult); 72 mg/day, 2 mg/kg/day (adolescent); 54 mg/day (child)
**Adult/adolescent/child ≥6 yr (currently receiving 40-60 mg/day): PO** 72 mg q AM, 72 mg/day

### >> Extended-release once daily tabs: Quillivant XR

**Child > 6 yr/adolescent: PO** 20 mg/day in AM, may increase by 10-20 mg qwk

### >> Transdermal: Daytrana

**Adolescent and child ≥6 yr: TD** wk 1: 10 mg/day (9-hr patch); wk 2: 15 mg/day (9-hr patch); wk 3: 20 mg/day (9-hr patch); wk 4: 30 mg/day (9-hr patch)

## Narcolepsy

### >> Immediate release: Ritalin, Methylin oral sol, Methylin chew tabs

**Adult: PO** 20-30 mg/day, range 10-60 mg/day in 2-3 divided doses
**Child ≥6 yr: PO** 5 mg bid, may increase by 5-10 mg qwk, max 60 mg/day

### >> Extended-release tabs: Ritalin SR, Metadate ER

**Adult/adolescent/child ≥6 yr: PO** max 20 mg tid

## Poststroke depression; major depression (unlabeled)

**Adult and geriatric: PO** (immediate rel tabs) 2.5 mg bid morning/noon, may increase by 2.5-5 mg q2-3days

**Available forms:** Tabs 5, 10, 20 mg; ext rel tabs 10, 20, mg; ext rel tabs (Concerta) 18, 27, 36, 54 mg; ext rel caps 10, 20, 30, 40 mg; oral sol 5 mg, 10 mg/ml; chew tabs (Methylin) 2.5, 5, 10 mg; transdermal patch 12.5 $cm^2$ (10 mg), 18.75 $cm^2$ (15 mg), 25 $cm^2$ (20 mg), 37.5 $cm^2$ (30 mg)

## Implementation

**PO route**

- **Methylin chewable tablets:** Give with at least 8 oz of fluid to avoid choking
- **Immediate-release dosage forms (Ritalin, Methylin, Metadate, generic equivalents):** Give 30 to 45 min before meal; depending on the patient's needs, twice-daily dosages may be used in the morning and around noon. Individualized timing of the midday dose is usually necessary, as determined by the loss of positive drug effect, which occurs in a range of 2 to 6 hr after the AM dose
- **Extended-release tablets (Ritalin SR, Metadate ER, generic methylphenidate ER):** May be given without regard to meals. Give whole; do not cut, crush, or chew. Give the last dose of the day several hours before bedtime. Extended-release tablets may be used when the determined 8-hr dose of immediate-release methylphenidate tablets equals the 8-hr dosage of the extended-release tablets
- **Once-daily extended-release tablets (Concerta):** May be given without regard to meals. Give whole; do not cut, crush, or chew; a portion of this tablet may appear intact in the stool; this is normal
- **Once-daily extended-release capsules (Ritalin LA, Aptensio XR):** May be given without regard to meals; however, patients should establish a routine pattern with regard to meals. Give with an adequate amount of fluid. Do not cut, crush, or chew. If swallowing is difficult, capsule may be opened and the contents sprinkled on one Tbsp of applesauce and swallowed immediately. The capsule contents (beads) should not be crushed or chewed. Instruct the patient to drink fluids (water, milk, or juice) after taking sprinkles with applesauce
- **Once-daily extended-release chewable tablets (QuilliChew ER):** Give qday in the morning with or without food. The tablet may be broken in half for 10-mg and 15-mg doses
- **Once-daily extended-release orally disintegrating tablets (Cotempla XR-ODT):** Give qday in the morning consistently either with or without food. Do not remove tablet from the blister pack until just before use; use dry hands when opening the blister pack. Remove the tablet by peeling back the foil; do not push the tablet through the foil. Place the whole tablet on the tongue and allow it to disintegrate without chewing or crushing. No liquid is needed

**Immediate-release oral solution (Methylin)**

- Measure dose with an oral syringe or calibrated measuring device
- Give 30 to 45 min before meals in divided doses two to three times/day. Twice-daily dosages may be administered in the morning and around noon. Individualized timing of the midday dose is usually necessary, as determined by the loss of positive drug effect, which occurs 2 to 6 hr after the morning dose. Give the last dose of the day before 6 PM

**Once-daily extended-release oral suspension (Quillivant XR)**

- Vigorously shake before use, measure dose with the calibrated oral dosing dispenser provided
- Give in the morning without regard to meals

**Reconstitution of once-daily extended-release oral suspension (Quillivant XR)**
• Review the manufacturer's reconstitution instructions for the particular product and package size
• Before reconstitution, tap the bottle several times to loosen the powder
• To prepare the suspension, add the specified amount of water to the bottle, fully insert the bottle adapter into the bottle neck, replace the cap, and vigorously shake the bottle for at least 10 sec
• **Storage:** Store reconstituted suspension at 77° F; dispense in original packaging (bottle in container). The reconstituted suspension is stable for 4 mo from date of reconstitution

**Topical route**

**Daytrana transdermal system:**
• Patch should be applied 2 hr before the effect is needed
• Do not cut or trim patch
• Apply patch immediately after opening the pouch and removing protective liner. Do not use if pouch seal is broken. Do not touch the adhesive side of the patch during application to avoid absorption. Wash hands immediately if adhesive side of the patch is touched. Discard the patch if difficulty is encountered in separating the patch from the release liner or if tearing or other damage occurs. Discard patch if adhesive containing medication has transferred to the liner during removal of the patch from the liner
• Place on a dry, clean area of the hip and hold in place for 30 sec with the palm of the hand. Do not apply to oily, damaged, or irritated skin. Do not apply topical preparations to the application site immediately before patch application. Avoid the waistline area where the patch could be rubbed by clothing
• Applications sites should be alternated from one hip to the next each day, avoiding sites where a patch was recently placed, when possible
• Instruct patient on proper application and disposal of patch. Adherence of the patch may be affected by showering, bathing, or swimming. The carton contains an administration chart that can help the patient monitor application and removal time, which the patient and/or caregiver should be encouraged to use. If a patch was removed without the caregiver's knowledge, or if a patch is missing from the tray, the caregiver should be encouraged to ask the child when and how the patch was removed
• Avoid exposing the application site to hair dryers, heating pads, electric blankets, heated water beds, or other direct external heat sources. The rate and extent of absorption of methylphenidate are significantly increased during application of heat to the patch during use. Temperature-dependent increases in absorption may be greater than twofold, potentially resulting in overdose
• Do not apply or reapply the patch with dressings, tape, or adhesives. If the patch is not fully adhered to the skin during application or wear time, discard the patch according to disposal instructions and apply a new patch
• The total daily wear time should not exceed 9 hr, regardless of patch replacement
• Patches should be peeled off slowly. Patch removal may be aided by applying an oil-based product (petroleum jelly, mineral oil, olive oil) to the patch edges and gently working the oil underneath the edges of the patch
• **Disposal:** Instruct patient and/or caregiver to fold used patches so that the adhesive side of the patch adheres to itself, and then flush it down the toilet or dispose of in an appropriate lidded container. If the patient stops using the prescription, each unused patch should be removed from its pouch, separated from the protective liner, folded onto itself, and flushed down the toilet or disposed of in an appropriate lidded container. Do not flush pouch and protective liner down the toilet. Instead, dispose of them in an appropriate container with a lid

## ADVERSE EFFECTS

**CNS:** *Hyperactivity, insomnia, restlessness, talkativeness,* dizziness, headache, akathisia, dyskinesia, masking or worsening of Tourette's syndrome, seizures, drowsiness, toxic psychosis, hallucinations, neuroleptic malignant syndrome, aggression, cerebral vasculitis, hemorrhage, stroke (rare)
**CV:** *Palpitations, tachycardia,* B/P changes, angina, dysrhythmias, sudden death
**ENDO:** Growth retardation
**GI:** Nausea, anorexia, dry mouth, weight loss, abdominal pain
**HEMA:** Leukopenia, anemia, thrombocytopenic purpura
**INTEG:** Exfoliative dermatitis, urticaria, rash, erythema multiforme, hypersensitivity reactions; patch: permanent loss of skin color, anaphylaxis, angioedema
**MISC:** Fever, arthralgia, scalp hair loss, rhabdomyolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO); delayed (ext rel) |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 1-3 hr |

### Pharmacodynamics

| | PO | PO–ext rel |
|---|---|---|
| **Onset** | Varies with formulation | 2 hr |
| **Peak** | 1-3 hr | 4 hr |
| **Duration** | | 6-8 hr |

## INTERACTIONS

### Individual drugs

Guanethidine: decreased effect of guanethidine

### Drug classifications

Anticonvulsants, antidepressants (tricyclics), SNRIs, CNS stimulants, selective serotonin reuptake inhibitors (SSRIs): increased effects, monitor for adverse effects

MAOIs (or within 14 days of MAOIs), vasopressors: increased hypertensive crisis

Antihypertensives: decreased effects of antihypertensives

### Drug/herb

Cola nut, guarana, horsetail, yerba maté, yohimbe: increased CNS stimulation

Melatonin: synergistic effect

### Drug/food

Caffeine: increased stimulation

## NURSING CONSIDERATIONS

### Assessment

- **ADHD:** In children or adults with ADHD, monitor for improved organizational skills, attention span, attending to tasks, impulse control, socialization, and ability to get along better with others

**BLACK BOX WARNING: Substance abuse:** there is a high potential for abuse, use caution in those with history of substance abuse

- Monitor VS, B/P, since this product may reverse antihypertensives; check patients with cardiac disease more often for increased B/P
- Perform CBC, urinalysis; for diabetic patients monitor blood glucose, urine glucose; insulin changes may be required, since eating will decrease, but decreased growth will resume when product is discontinued
- Monitor height and weight q3mo since growth rate in children may be decreased; appetite is suppressed, weight loss is common during the first few mo of treatment
- Monitor mental status: mood, sensorium, affect, stimulation, insomnia; aggressiveness may occur; depression with crying spells may occur after product has worn off, may produce euphoria, rebound depression after product wears off
- Assess for tolerance; should not be used for extended time except in ADHD; dosage should be discontinued gradually to prevent withdrawal symptoms
- Assess for narcoleptic symptoms before medication and after; ability to stay awake should increase significantly
- **Assess for withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; product tolerance will develop after long-term use; dosage should not be increased if tolerance develops, usually not associated with drug holidays
- Assess appetite, sleep, speech patterns
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, no well-controlled studies, cautious use in breastfeeding
- **Beers:** Avoid use in older adults, CNS stimulant effects
- Skin pigmentation when using TD product, may cause loss of pigmentation around site

### Patient/family education

- **Seizures: Those with seizure disorder may have lower seizure threshold**
- Teach patient to decrease caffeine consumption (coffee, tea, cola, chocolate); not to use guarana, cola nut, yerba maté, which may increase irritability and stimulation; to avoid OTC preparations unless approved by prescriber; to avoid alcohol ingestion; these may cause serious product interactions, to always use dosing dispenser provided for oral suspension dose
- Advise patient to taper off product over several wk, or depression, increased sleeping, lethargy may occur
- Notify prescriber if skin irritation or rash occurs if patch comes off, use a new one on a different skin site, tell child not to remove or share with others
- Instruct patient not to double doses if medication is missed; prescriber may suggest product holidays (ADHD) during the school year to assess progress and determine continued product necessity
- Instruct patient/family to notify prescriber if significant side effects occur: tremors, insomnia, palpitations, restlessness; product changes may be needed

- Inform patient that if dry mouth occurs to use frequent sips of water, sugarless gum, hard candy during beginning therapy; dry mouth lessens with continued treatment
- Encourage patient to get needed rest; patient will feel more tired at end of day; to take last dose at least 6 hr before bedtime to avoid insomnia
- Advise patient that shell of Concerta tab may appear in stools

### Evaluation

**Positive therapeutic outcome**
- Decreased hyperactivity in ADHD
- Improved attention span in ADHD
- Absence of sleeping during day in narcolepsy

## TREATMENT OF OVERDOSE:
Administer fluids, hemodialysis, peritoneal dialysis, antihypertensives for increased B/P; administer short-acting barbiturate before lavage

## methylPREDNISolone (Rx)
(meth-ill-pred-niss′oh-lone)
**A-Methapred, Depo-Medrol, Medrol, Solu-MEDROL**
*Func. class.:* Corticosteroid, synthetic
*Chem. class.:* Glucocorticoid, immediate acting

**Do not confuse:** methylPREDNISolone/medroxyPROGESTERone/predniSONE/methylTESTOSTERone/predniSONE/Methylprednisone

**ACTION:** Decreases inflammation by suppression of migration of polymorphonuclear leukocytes, fibroblasts; reverses increased capillary permeability and lysosomal stabilization

**Therapeutic outcome:** Decreased inflammation

**USES:** Severe inflammation, shock, adrenal insufficiency, collagen disorders, management of acute spinal cord injury, multiple sclerosis

## CONTRAINDICATIONS
Hypersensitivity, intrathecal use, neonates

**Precautions:** Pregnancy, breastfeeding, diabetes mellitus, glaucoma, osteoporosis, seizure disorders, ulcerative colitis, HF, myasthenia gravis, renal disease, esophagitis, peptic ulcer; tartrazine, benzyl alcohol, corticosteroid hypersensitivity; viral infection, TB, traumatic brain injury, Cushing's syndrome, measles, varicella, fungal infections

## DOSAGE AND ROUTES
### Adrenal insufficiency/inflammation
**Adult:** PO 4-48 mg in 4 divided doses; IM 10-120 mg (acetate); IM/**IV** 10-40 mg (succinate); intraarticular 4-80 mg (acetate)
**Child:** **IV** 0.5-1.7 mg/kg in 3-4 divided doses (succinate)

### Multiple sclerosis
**Adult:** PO 160 mg/day × 1 wk, then 64 mg every other day × 30 days

**Available forms:** Tabs 2, 4, 6, 8, 16, 32 mg; inj 20, 40, 80 mg/ml acetate; inj 40, 125, 500, 1000, 2000 mg/vial succinate

### Implementation
**PO route**
- Give with food or milk to decrease GI symptoms
- Single daily dose should be given in AM to coincide with body's normal cortisol secretion

**IM route**
- Give IM inj deep in large muscle mass; rotate sites; avoid deltoid; use 21-G needle; injection site reaction may occur (induration, pain at site, atrophy)
- Give in one dose in AM to prevent adrenal suppression; avoid SUBCUT administration; may damage tissue

**IV route**
- Use only methylPREDNISolone sodium succinate (Solu-MEDROL) IV, never use methylPREDNISolone acetate suspension IV
- Give after diluting with provided diluent, agitate slowly; give directly over 3-15 min; doses ≥2 mg/kg or 250 mg should be given by intermittent IV infusion unless potential benefits outweigh potential risks

**Intermittent/continuous IV infusion route**
- Dilute further in $D_5W$, 0.9% NaCl, $D_5NS$, haze may form, give over 15-60 min, large doses (≥500 mg) give over 30-60 min
- Give after shaking susp (parenteral)
- Give titrated dosage; use lowest effective dosage

**Y-site compatibilities:** Acetaminophen, acyclovir, amifostine, aztreonam, cefepime, CISplatin, cladribine, cyclophosphamide, cytarabine, DOPamine, DOXOrubicin, enalaprilat, famotidine, fludarabine, granisetron, heparin, inamrinone, melphalan, meperidine, methotrexate, metroNIDAZOLE, midazolam, morphine, piperacillin/tazobactam, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, vit B with C

**Y-site incompatibilities:** Ondansetron, PACLitaxel, sargramostim, vinorelbine

**Inhalation route**

- Give inh with water to decrease possibility of fungal infections
- Give titrated dosage; use lowest effective dosage
- Clean aerosol topically daily with warm water; dry thoroughly
- Store in cool environment; do not puncture or incinerate container

**Topical route**

- Cleanse area before applying product
- Apply only to affected areas; do not get in eyes
- Apply medication, then cover with occlusive dressing (only if prescribed); seal to normal skin; change q12hr; systemic absorption may occur
- Apply only to dermatoses; do not use on weeping, denuded, or infected area
- Apply treatment for a few days after area has cleared
- Store at room temperature

## ADVERSE EFFECTS

**CNS:** Depression, flushing, sweating, headache, mood changes
**CV:** Hypertension, circulatory collapse, thrombophlebitis, embolism, tachycardia
**EENT:** Fungal infections, increased intraocular pressure, blurred vision, cataracts
**GI:** Diarrhea, nausea, abdominal distention, GI hemorrhage, increased appetite, pancreatitis
**HEMA:** Thrombocytopenia
**INTEG:** Acne, poor wound healing, ecchymosis, petechiae
**MS:** Fractures, osteoporosis, weakness

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO); systemic (topical) |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidney |
| **Half-life** | 3-5 hr (plasma) 18-36 hr (tissue); adrenal suppression 3-4 days |

### Pharmacodynamics

| | PO | IM | IV | Topical |
|---|---|---|---|---|
| **Onset** | Unknown | Unknown | Rapid | Min to hr |
| **Peak** | 2 hr | 4-8 days | Unknown | Hr to days |
| **Duration** | 1½ days | 1-4 wk | Unknown | Hr to days |

## INTERACTIONS

### Individual drugs

Amphotericin B: increased side effects
Insulin: increased need for insulin
Phenytoin, rifampin: decreased action; increased metabolism
Somatrem: decreased effect

### Drug classifications

Contraceptives, oral: increased methylPREDNISolone action
CYP3A4 inducers (barbiturates, bosentan, carBAMazepine, efavirenz, phenytoins, nevirapine, rifabutin, rifampin): decreased methylPREDNISolone effect
CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, FLUoxetine, fluvoxaMINE, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole): increased adrenal suppression
Diuretics: increased side effects
Hypoglycemic agents: increased need for hypoglycemic agents
Vaccines: decreased effects of vaccines

### Drug/herb

St. John's wort: avoid use

### Drug/food

Grapefruit juice: increased methylPREDNISolone level; do not use concurrently

### Drug/lab test

Increased: cholesterol, blood glucose
Decreased: calcium, potassium, $T_4$, $T_3$, thyroid radioactive iodine uptake test, urine 17-OHCS, 17-KS
False negative: skin allergy tests

## NURSING CONSIDERATIONS

### Assessment

- **Adrenal insufficiency:** assess for weight loss, nausea, vomiting, confusion, anxiety, hypotension, weakness
- Monitor plasma cortisol levels during long-term therapy (normal level 138-635 nmol/L when drawn at 8 AM)
- Monitor potassium, blood glucose, urine glucose while patient is on long-term therapy; hypokalemia and hyperglycemia
- Monitor weight daily; notify prescriber of weekly gain >5 lb
- Monitor B/P q4hr, pulse; notify prescriber if chest pain occurs
- Monitor I&O ratio; be alert for decreasing urinary output and increasing edema
- Monitor adrenal function periodically for hypothalamic-pituitary-adrenal axis suppression

• **Assess for infection:** increased temp, WBC even after withdrawal of medication; product masks infection symptoms
• Assess for potassium depletion: paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness
• Assess for edema, hypertension, cardiac symptoms
• Assess mental status: affect, mood, behavioral changes, aggression
• Check temp; if fever develops, product should be discontinued
• Assess for systemic absorption: increased temp, inflammation, irritation (topical)

### Patient/family education

• Teach patient that emergency ID as corticosteroid user should be carried/worn
• Advise patient to notify prescriber if therapeutic response decreases; dosage adjustment may be needed
• Caution patient not to discontinue abruptly; adrenal crisis can result
• Teach patient to take PO with food, milk, to decrease GI symptoms
• Caution patient to avoid OTC products: salicylates, alcohol in cough products, cold preparations unless directed by prescriber
• Teach patient all aspects of product use including cushingoid symptoms
• Teach patient symptoms of **adrenal insufficiency:** nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain
• Inform patient that long-term therapy may be needed to clear infection (1-2 mo depending on type of infection)

**Nasal route**

• Advise patient to clear nasal passages if sneezing attack occurs; repeat dose
• Advise patient to continue using product even if mild nasal bleeding occurs; is usually transient
• Teach patient method of instillation after providing written instructions from manufacturer
• Teach patient to recognize **cushingoid symptoms:** buffalo hump, moon face, rapid weight gain, excess sweating
• **Beers:** Avoid in older adults with or at high risk for delirium, assess for confusion, delirium frequently
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excreted in breast milk
• **Infection:** Teach patient to avoid persons with known infections; corticosteroids can mask symptoms of infection

**Topical route**

• Advise patient to avoid sunlight on affected area; burns may occur

### Evaluation

**Positive therapeutic outcome**

• Ease of respirations, decreased inflammation
• Absence of severe itching, patches on skin, flaking (top)

## metipranolol ophthalmic

*See Appendix B*

## metoclopramide (Rx)

(met-oh-kloe-pra′mide)
**Apo-Metoclop** 🍁, **Metozolv ODT, Reglan**
*Func. class.:* Cholinergic, antiemetic
*Chem. class.:* Central dopamine receptor antagonist

**Do not confuse:** **metoclopramide**/metolazone, **Reglan**/Megace/Renagel

**ACTION:** Enhances response to acetylcholine of tissue in upper GI tract, which causes contraction of gastric muscle, relaxes pyloric, duodenal segments, increases peristalsis without stimulating secretions, blocks dopamine in chemoreceptor trigger zone of CNS

**Therapeutic outcome:** Decreased symptoms of delayed gastric emptying, decreased nausea, vomiting

**USES:** Prevention of nausea, vomiting induced by chemotherapy, radiation; delayed gastric emptying, gastroesophageal reflux

### CONTRAINDICATIONS

Hypersensitivity to this product or procaine or procainamide, seizure disorder, pheochromocytoma, GI obstruction

**Precautions:** Pregnancy, breastfeeding, GI hemorrhage, Parkinson's disease, abrupt discontinuation, cardiac disease, children, depression, diabetes mellitus, G6PD deficiency, geriatrics, heart failure, hypertension, infertility, malignant hyperthermia, methemoglobinemia, procainamide/paraben hypersensitivity, renal impairment, breast cancer (prolactin dependent)

**BLACK BOX WARNING:** Tardive dyskinesia

### DOSAGE AND ROUTES

**Nausea/vomiting (chemotherapy)**

**Adult: IV** 1-2 mg/kg 30 min before administration of chemotherapy, then q2hr × 2 doses, then q3hr × 3 doses
**Child (unlabeled): IV** 1-2 mg/kg/dose

### Facilitation of small bowel intubation in radiologic exams

**Adult and child >14 yr:** **IV** 10 mg over 1-2 min
**Child 6-14 yr:** **IV** 2.5-5 mg
**Child <6 yr:** **IV** 0.1 mg/kg

### Diabetic gastroparesis

**Adult:** PO 10 mg 30 min before meals, at bedtime × 2-8 wk
**Geriatric:** PO 5 mg ½ hr before meals, at bedtime, increase to 10 mg if needed

### Gastroesophageal reflux

**Adult:** PO 10-15 mg qid 30 min before meals and at bedtime
**Child:** PO 0.4-0.8 mg/kg/day divided in 4 doses

### Renal dose

**Adult: PO/IV CCr** ≥40 ml/min, no change; CCr <40 ml/min: Reduce initial recommended dose by 50%. Thereafter dose may be increased or decreased as needed or CCr >50 ml/min: Give 100% of the normal dose; CCr 10 to 50 ml/min: Give 75% of the normal dose; CCr <10 ml/min: Give 50% of the normal dose
**Child:** PO/IV CCr 30 to 50 ml/min: Give 75% of the normal dose; CCr 10 to 29 ml/min: Give 50% of the normal dose; CCr <10 ml/min: Give 25% of the normal dose

**Available forms:** Tabs 5, 10 mg; syr 5 mg/5 ml; inj 5 mg/ml; orally disintegrating tab 5, 10 mg; oral sol 5 mg/5 ml

### Implementation

**PO route**
- Use gum, hard candy, frequent rinsing of mouth for dryness of oral cavity
- Give ½-1 hr before meals for better absorption
- **Oral disintegrating:** place on tongue, allow to dissolve, swallow, remove from bottle immediately before use

**IM route**
- Give for postop nausea and vomiting before end of surgery

**Direct IV route**
- Give **IV** undiluted if dose is ≤10 mg; give over 2 min
- Give diphenhydrAMINE **IV** or benztropine IM for EPS
- Discard open ampules

**Intermittent IV infusion route**
- Dilute more than 10 mg in 50 ml or more $D_5W$, NaCl, Ringer's, LR and give over 15 min or more

**Y-site compatibilities:** Acetaminophen, acyclovir, aldesleukin, alfentanil, amifostine, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azaTHIOprine, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxapram, DOXOrubicin hydrochloride, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, folic acid, foscarnet, gallium nitrate, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methadone, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, minocycline, mitoMYcin, morphine, moxalactam, multiple vitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pantoprazole, papaverine, PEMEtrexed, penicillin G, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine

**Y-site incompatibilities:** Amphotericin B cholesteryl/colloidal, amphotericin B liposome,

amsacrine, cefepime, dantrolene, diazepam, diazoxide, DOXOrubicin liposome, ganciclovir, inamrinone, phenytoin, propofol, trimethoprim/sulfamethoxazole

## ADVERSE EFFECTS

**CNS:** *Sedation, fatigue, restlessness, headache, sleeplessness, dystonia,* dizziness, drowsiness, suicidal ideation, seizures, EPS, neuroleptic malignant syndrome; tardive dyskinesia (>3 mo, high doses)
**CV:** Hypotension, supraventricular tachycardia
**GI:** Dry mouth, constipation, nausea, anorexia, vomiting, diarrhea
**GU:** Decreased libido, prolactin secretion, amenorrhea, galactorrhea
**HEMA:** Neutropenia, leukopenia, agranulocytosis
**INTEG:** Urticaria, rash

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO) |
| **Distribution** | Widely distributed; crosses blood-brain barrier, placenta |
| **Metabolism** | Liver, minimally |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 2.5-6 hr |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | ½-1 hr | 10-15 min | 1-3 min |
| **Peak** | Unknown | Unknown | Unknown |
| **Duration** | 1-2 hr | 1-2 hr | 1-2 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased sedation
Haloperidol: increased extrapyramidal reaction

### Drug classifications

Anticholinergics, opiates: decreased action of metoclopramide
CNS depressants: increased sedation
MAOIs: avoid use
Phenothiazines: increased extrapyramidal reaction

### Drug/lab test

Increased: prolactin, aldosterone, thyrotropin

## NURSING CONSIDERATIONS

### Assessment

- Assess GI complaints: nausea, vomiting, anorexia, constipation, abdominal distention before, after administration

**BLACK BOX WARNING: Assess for EPS and tardive dyskinesia** (more likely to occur in treatment >3 mo, geriatric): rigidity, grimacing, shuffling gait, tremors, rhythmic involuntary movements of tongue, mouth, jaw, feet, hands; these side effects should be reported to prescriber immediately; some effects may be irreversible; assess for involuntary movements frequently

- Assess mental status: depression, anxiety, irritability during treatment
- **Neuroleptic malignant syndrome:** assess for hyperthermia, change in B/P, pulse, tachycardia, sweating, rigidity, altered consciousness
- **Pregnancy/breastfeeding:** Use only if clearly needed, do not breastfeed, excreted in breast milk
- **Beers:** Avoid in older adults unless for gastroparesis, can cause extrapyramidal effects, monitor for EPS frequently

### Patient/family education

- Instruct patient to avoid driving, other hazardous activities until stabilized on this medication
- Advise patient to avoid alcohol and other CNS depressants that enhance sedating properties of this product
- Advise patient to notify prescriber if involuntary movements occur

### Evaluation

**Positive therapeutic outcome**

- Absence of nausea, vomiting, anorexia, fullness

## metolazone (Rx)

(me-tole'a-zone)
Func. class.: Diuretic, antihypertensive
*Chem. class.:* Thiazide-like quinazoline derivative

**Do not confuse:** metolazone/methotrexate/metoclopramide

**ACTION:** Acts on the distal tubule and cortical thick ascending limb of the loop of Henle in the kidney, increasing excretion of sodium, water, chloride, magnesium, potassium, and bicarbonate, decreases GFR

**Therapeutic outcome:** Decreased B/P, decreased edema in lung tissue and peripherally

**USES:** Edema, hypertension

## CONTRAINDICATIONS

Pregnancy (preeclampsia, intrauterine growth retardation), hypersensitivity to thiazides or

sulfonamides, anuria, coma, hepatic encephalopathy

**Precautions:** Pregnancy, breastfeeding, geriatric, hypokalemia, renal/hepatic disease, gout, COPD, lupus erythematosus, diabetes mellitus, hypotension, history of pancreatitis, hypersensitivity to sulfonamides, thiazides, electrolyte imbalance

## DOSAGE AND ROUTES

### Edema

**Adult:** PO 5-10 mg/day; max 20 mg/day

### Hypertension

**Adult:** PO 2.5-5 mg/day
**Child:** PO 0.2-0.4 mg/kg/day in divided doses q12-24hr

**Available forms:** Tabs 2.5, 5, 10 mg

### Implementation

- Give in AM to avoid interference with sleep
- Provide potassium replacement if potassium level is 3.0; product may be crushed if patient is unable to swallow
- Give with food; if nausea occurs, absorption may be increased

## ADVERSE EFFECTS

**CNS:** drowsiness, lethargy
**CV:** *Orthostatic hypotension,* palpitations, chest pain, hypotension
**ELECT:** *Hypokalemia,* hypercalcemia, hyponatremia
**GI:** *Nausea, vomiting, anorexia,* constipation, diarrhea, cramps, pancreatitis, GI irritation, dry mouth, jaundice, hepatitis
**GU:** *Frequency,* polyuria, uremia, glucosuria, nocturia, impotence, *hyperuricemia*
**HEMA:** Aplastic anemia, hemolytic anemia, leukopenia, agranulocytosis, neutropenia
**INTEG:** *Rash,* urticaria, purpura, photosensitivity, fever, dry skin, toxic epidermal necrolysis, Stevens-Johnson syndrome
**META:** *Hyperglycemia,* increased creatinine, BUN
**MS:** Muscle cramps, joint pain, swelling

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | GI tract (10%-20%) |
| **Distribution** | Crosses placenta; protein binding 33% |
| **Metabolism** | Urine, unchanged |
| **Excretion** | Breast milk |
| **Half-life** | 8 hr (extended); 14 hr (prompt) |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 8 hr |
| **Duration** | 12-24 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased hypotension (large amounts)
Amphotericin B, digoxin, mezlocillin, piperacillin: increased hypokalemia
Lithium: increased toxicity

### Drug classifications

Antidiabetics: increased hyperglycemia
Antihypertensives: increased antihypertensive effect
Barbiturates, nitrates, opioids: increased hypotension
Diuretics (loop): increased metolazone effect
Glucocorticoids, laxatives (stimulant): increased hypokalemia
NSAIDs, salicylates: decreased action of metolazone

### Drug/food

Licorice: increased severe hypokalemia

### Drug/herb

Ephedra (ma huang): decreased antihypertensive effect
Hawthorn: increased antihypertensive effect

### Drug/lab test

Increased: calcium, cholesterol, glucose, triglycerides
Decreased: potassium, sodium, chloride, magnesium

## NURSING CONSIDERATIONS

### Assessment

- **Hypertension:** assess B/P before, during therapy with patient lying, standing, and sitting as appropriate; orthostatic hypotension can occur rapidly
- Monitor blood glucose if patient is diabetic
- **HF:** assess for improvement in feet, legs, sacral area daily if medication is being used
- Check for rashes, temp elevation daily
- Monitor patients receiving cardiac glycosides for increased hypokalemia
- **Hypokalemia:** assess for postural hypotension, malaise, fatigue, tachycardia, leg cramps, weakness

**BLACK BOX WARNING:** Hepatic encephalopathy: do not use in hepatic coma or precoma, fluctuations in electrolytes can occur rapidly and precipitate hepatic coma, use caution in those with impaired hepatic function

• Assess and record fluid volume status: I&O ratios; monitor weight, distended red veins, crackles in lung, color, quality, and specific gravity of urine; skin turgor, adequacy of pulses, moist mucous membranes, bilateral lung sounds, peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth and mucous membranes should be reported
• Monitor electrolytes: potassium, sodium, calcium, magnesium; also include BUN, blood pH, ABGs, uric acid, CBC, blood glucose
• **Pregnancy/breastfeeding:** Use in pregnancy only if needed, do not breastfeed, excreted in breast milk
• **Beers:** Use with caution in older adults, may exacerbate or cause SIADH, monitor sodium level frequently

### Patient/family education

• Teach patient to take the medication early in the day to prevent nocturia
• Instruct patient to take with food or milk if GI symptoms of nausea and anorexia occur
• Teach patient to maintain a weekly record of weight and notify prescriber of weight loss >5 lb
• Caution patient that this product causes a loss of potassium, so foods rich in potassium should be added to the diet; refer to a dietitian for assistance in planning
• Caution the patient to rise slowly from sitting or reclining positions, not to exercise in hot weather or stand for prolonged periods, since orthostatic hypotension will be enhanced; lie down if dizziness occurs
• Teach patient not to use alcohol or any OTC medications without prescriber's approval; serious product reactions may occur
• Emphasize the need to contact prescriber immediately if muscle cramps, weakness, nausea, dizziness, or numbness occur
• Teach patient to take own B/P and pulse and record
• Advise patient to use sunscreen to prevent burns
• Teach patient to continue taking medication even if feeling better; this product controls symptoms but does not cure the condition
• Advise patient with hypertension to continue other medical regimen (exercise, weight loss, relaxation techniques, smoking cessation)
• Do not stop product abruptly

### Evaluation

**Positive therapeutic outcome**
• Decreased edema
• Decreased B/P

## TREATMENT OF OVERDOSE:

Lavage if taken orally, monitor electrolytes; administer dextrose in saline; monitor hydration, CV, renal status

**⚠ HIGH ALERT**

## metoprolol (Rx)

(met-oh-proe'lole)
**Lopressor, Nu-Metop ✱, Toprol-XL**
*Func. class.:* Antihypertensive, antianginal
*Chem. class.:* $\beta_1$-Adrenergic blocker

**Do not confuse:** Lopressor/Lyrica
Toprol-XL/Topamax

**ACTION:** Lowers B/P by β-blocking effects; reduces elevated renin plasma levels; blocks $\beta_2$-adrenergic receptors in bronchial, vascular smooth muscle only at high doses, negative chronotropic effect

**Therapeutic outcome:** Decreased B/P, heart rate, AV conduction

**USES:** Mild to moderate hypertension, acute MI to reduce cardiovascular mortality, angina pectoris, New York Heart Association class II, III heart failure, cardiomyopathy

## CONTRAINDICATIONS

Hypersensitivity to β-blockers, cardiogenic shock, heart block (2nd and 3rd degree), sinus bradycardia, pheochromocytoma, sick sinus syndrome

**Precautions:** Pregnancy, breastfeeding, geriatric, major surgery, diabetes mellitus, thyroid/renal/hepatic disease, COPD, CAD, nonallergic bronchospasm, HF, bronchial asthma, CVA, children, depression, vasospastic angina

**BLACK BOX WARNING:** Abrupt discontinuation

## DOSAGE AND ROUTES

### Hypertension

**Adult:** PO 50 mg bid, or 100 mg/day; may give 100-450 mg in divided doses; ext rel 25-100 mg qd, titrate at weekly intervals, max 400 mg/day
**Child/adolescent 6-16 yr:** PO ext rel 1 mg/kg up to 50 mg qd
**Geriatric:** PO 25 mg/day initially, increase weekly as needed

### Myocardial infarction

**Adult:** **IV** BOL (early treatment) 5 mg q2min × 3 doses, then 50 mg PO 15 min after last dose and q6hr × 48 hr (late treatment); PO maintenance 50-100 mg bid for 1-3 yr

### Heart failure (NYHA class II/III)
**Adult:** PO ext rel 25 mg qd × 2 wk (class II); 12.5 mg qd (class III)

### Angina
**Adult:** PO 100 mg/day as a single dose or in 2 divided doses, increase qwk as needed, or 100 mg ext rel tab daily, max 400 mg/day ext rel

### Migraine prevention (unlabeled)
**Adult:** PO 25-100 mg bid-qid; 50-200 mg daily (XL)

**Available forms:** Tabs 25, 50, 100 mg; inj 1 mg/ml; ext rel tabs (tartrate) 100 mg; ext rel tabs (succinate) (XL) 25, 50, 100, 200 mg

### Implementation
**PO route**
- Take apical pulse before giving, if <50 bpm hold and notify prescriber
- Do not break, crush, or chew ext rel tabs
- Give regular release tab before meals, at bedtime; tab may be crushed or swallowed whole; give with food to prevent GI upset; reduced dosage in renal dysfunction; give at same time each day
- Store in dry area at room temp; do not freeze

**Direct IV route**
- Check dose with another person to prevent errors that could be fatal
- Give 5 mg/2 min or more × 3 doses at 2 min intervals, start PO 15 min after last **IV** dose

**Y-site compatibilities:** Abciximab, acyclovir, alemtuzumab, alfentanil, alteplase, amikacin, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, midazolam, milrinone, mitoXANtrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pancuronium, papaverine, PEMEtrexed, penicillin G, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, rocuronium, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole

**Y-site incompatibilities:** Allopurinol, amphotericin B cholesteryl/colloidal/lipid complex, dantrolene, diazepam, diazoxide, lepirudin, pantoprazole, phenytoin, trimethoprim/sulfamethoxazole

## ADVERSE EFFECTS
**CNS:** *Insomnia, dizziness,* mental changes, hallucinations, depression, anxiety, headaches, nightmares, confusion, fatigue
**CV:** HF, *palpitations,* dysrhythmias, cardiac arrest, AV block, *hypotension,* bradycardia, pulmonary/peripheral edema, chest pain
**EENT:** Sore throat, dry burning eyes
**GI:** *Nausea, vomiting,* colitis, cramps, *diarrhea,* constipation, flatulence, dry mouth, *hiccups*
**GU:** Impotence
**HEMA:** Agranulocytosis, eosinophilia, thrombocytopenic purpura
**INTEG:** Rash, purpura, alopecia, dry skin, urticaria, pruritus
**RESP:** Bronchospasm, dyspnea, wheezing

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Well absorbed (PO); completely absorbed (**IV**) |
| **Distribution** | Crosses blood-brain barrier, placenta |
| **Metabolism** | Liver, extensively by CYP2D6 |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 3-7 hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | 15 min | Immediate |
| **Peak** | 2-4 hr | 20 min |
| **Duration** | 6-19 hr | 5-8 hr |

## INTERACTIONS

### Individual drugs

Cimetidine: increased metoprolol level
EPINEPHrine, hydrALAZINE, methyldopa prazosin, reserpine: increased hypotension, bradycardia
Insulin: increased hypoglycemia

### Drug classifications

Antidiabetics (oral): increased hypoglycemia
Amphetamines, calcium channel blockers, histamine $H_2$ antagonists: increased hypotension, bradycardia
Barbiturates: decreased metoprolol level
MAOIs: do not use together
NSAIDs, salicylates: decreased antihypertensive effect
Xanthines: decreased effects of xanthines

### Drug/food

Increased: absorption with food

### Drug/lab test

Increased: BUN, potassium, ANA titer, serum lipoprotein, triglycerides, uric acid, alkaline phosphatase, LDH, AST, ALT

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Abrupt withdrawal:** may cause MI, ventricular dysrhythmias, myocardial ischemia; taper dose over 7-14 days

- **Hypertension/angina:** monitor ECG directly when giving IV during initial treatment
- Monitor B/P during beginning treatment, periodically thereafter; pulse q4hr; note rate, rhythm, quality; check apical/radial pulse before administration; notify prescriber of any significant changes (pulse <50 bpm)
- Check for baselines in renal, liver function tests before therapy begins and periodically thereafter
- Assess for edema in feet, legs daily; monitor I&O, daily weight; check for jugular vein distention, crackles bilaterally, dyspnea (HF)
- **Pregnancy/breastfeeding:** Use only if clearly needed, excreted in breast milk in small quantities, the American Academy of Pediatrics considers this product to be compatible with breastfeeding

### Patient/family education

**BLACK BOX WARNING:** Teach patient not to discontinue product abruptly; taper over 2 wk; may cause precipitate angina if stopped abruptly

- Teach patient not to use OTC products containing α-adrenergic stimulants (such as nasal decongestants, cold preparations); to avoid alcohol, smoking and to limit sodium intake as prescribed
- Teach patient how to take pulse and B/P at home; advise when to notify prescriber
- Instruct patient to comply with weight control, dietary adjustments, modified exercise program
- Tell patient to carry/wear emergency ID to identify product being taken, allergies; tell patient product controls symptoms but does not cure
- Caution patient to avoid hazardous activities if dizziness, drowsiness is present, to avoid driving until product response is known
- Teach patient to report symptoms of HF; difficult breathing, especially with exertion or when lying down, night cough, swelling of extremities or bradycardia, dizziness, confusion, depression, fever, decreased vision
- Teach patient to take product as prescribed, not to double doses or skip doses; take any missed doses as soon as remembered if at least 4 hr until next dose
- Advise to monitor blood glucose closely if diabetic
- Advise to report Raynaud's symptoms

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P in hypertension (after 1-2 wk)
- Absence of dysrhythmias
- Decreased anginal pain

## TREATMENT OF OVERDOSE:

Lavage, **IV** atropine for bradycardia, **IV** theophylline for bronchospasm, digoxin, $O_2$, diuretic for cardiac failure, hemodialysis, **IV** glucose for hyperglycemia, **IV** diazepam (or phenytoin) for seizures

## metroNIDAZOLE (Rx)

(me-troe-ni'da-zole)
**Flagyl, Flagyl ER, Flagyl IV, Flagyl IV RTU, Florazone ER, Novonidazole**
*Func. class.:* Antiinfective, miscellaneous
*Chem. class.:* Nitroimidazole derivative

**ACTION:** Direct-acting amebicide/trichomonacide; binds, degrades DNA structure, inhibiting bacterial nucleic acid synthesis

**Therapeutic outcome:** Trichomonacidal, amebicidal, bactericidal for the following susceptible organisms: *Bacteroides, Clostridium, Trichomonas vaginalis, Giardia lamblia, Entamoeba histolytica*

**USES:** Intestinal amebiasis, amebic abscess, trichomoniasis, refractory trichomoniasis, bacterial anaerobic infections, giardiasis; septicemia, endocarditis, bone, joint, and lower respiratory tract infections, rosacea

**Unlabeled uses:** Crohn's disease

## CONTRAINDICATIONS

Pregnancy (1st trimester), breastfeeding, hypersensitivity to this product

**Precautions:** Pregnancy (2nd/3rd trimesters), candidal infections, heart failure, fungal infection, geriatric, dental disease, bone marrow suppression, hematologic disease, renal/hepatic/GI disease, contracted visual or color fields, blood dyscrasias, CNS disorders

**BLACK BOX WARNING:** Secondary malignancy

## DOSAGE AND ROUTES

### Trichomoniasis

**Adult:** PO 500 mg bid × 7 days or 2 g in single dose; do not repeat treatment for 4-6 wk
**Child ≥45 kg (unlabeled):** PO 2 g once
**Child <45 kg (unlabeled):** PO 15 mg/kg/day divided in 3 doses × 7-10 days

### Amebic hepatic abscess

**Adult:** PO 750 mg tid × 7-10 days
**Child:** PO 35-50 mg/kg/day in 3 divided doses × 7-10 days

### Intestinal amebiasis

**Adult:** PO 750 mg tid × 7-10 days
**Child:** PO 35-50 mg/kg/day in 3 divided doses × 7-10 days; then oral iodoquinol

### Anaerobic bacterial infections

**Adult: IV** INF 15 mg/kg/over 1 hr, then 7.5 mg/kg **IV** or PO q6hr, max 4 g/day; first maintenance dose should be administered 6 hr after loading dose

### Bacterial vaginosis

**Adult:** PO reg rel 500 mg bid or 250 mg tid × 7 days; ext rel 750 mg/day × 7 days

### Giardiasis (unlabeled)

**Adult:** PO 250 mg tid × 5-7 days
**Child:** PO 5 mg/kg divided tid × 5 days

### Antibiotic-associated pseudomembranous colitis

**Adult (unlabeled):** PO 250-500 mg 3 times per day × 10-14 days
**Child:** PO 20 mg/kg/day (max 2 g) divided q6hr

**Available forms:** Tabs 250, 500 mg; ext rel tabs 750 mg; caps 375 mg; inj sol 5 mg/ml

### Implementation

- Store in light-resistant container; do not refrigerate

**PO route**

- Give with or after a meal to avoid GI symptoms, metallic taste; crush tab if needed, give on empty stomach

**Topical route**

- A thin coating should be applied to affected area after cleaning with soap and water and patting dry

**IV route**

- Give intermittent **IV** prediluted; for Flagyl **IV** dilute with 4.4 ml of sterile water or 0.9% NaCl; must be diluted further with ≤8 mg/ml 0.9% NaCl, $D_5W$, or LR; must neutralize with 5 mEq of $NaCO_3$/500 mg; $CO_2$ gas will be generated and may require venting; run over 1 hr or more; primary **IV** must be discontinued; may be given as cont inf; do not use aluminum products; **IV** may require venting

**Y-site compatibilities:** Acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, atracurium, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate/chloride/gluconate, CARBOplatin, ceFAZolin, cefepime, cefoperazone, cefoTEtan, cefotaxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhyDRINATE, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin, DOXOrubicin liposome, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, methylPREDNISolone,

metoclopramide, metoprolol, midazolam, milrinone, mitoXANtrone, morphine, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pancuronium, pentamidine, pentazocine, PENTobarbital, perphenazine, PHENobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium chloride/phosphates, prochlorperazine, promethazine, propranolol, ranitidine, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trastuzumab, trimethobenzamide, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

**Y-site incompatibilities:** Amphotericin B cholesteryl/colloidal/liposome, aztreonam, dantrolene, DAPTOmycin, diazepam, drotrecogin, filgrastim, ganciclovir, pantoprazole, PEMEtrexed, phenytoin, procainamide, quinupristin/dalfopristin

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness,* confusion, irritability, restlessness, ataxia, depression, fatigue, drowsiness, insomnia, paresthesia, peripheral neuropathy, seizures, incoordination, depression, encephalopathy, aseptic meningitis (IV)
**CV:** Flat T-waves
**EENT:** Blurred vision, sore throat, retinal edema, dry mouth, metallic taste, furry tongue, glossitis, stomatitis, photophobia, optic neuritis
**GI:** *Nausea, vomiting, diarrhea,* epigastric distress, *anorexia,* constipation, *abdominal cramps,* pseudomembranous colitis, xerostomia, metallic taste, abdominal pain, pancreatitis
**HEMA:** Leukopenia, bone marrow depression, aplasia, thrombocytopenia
**INTEG:** Rash, pruritus, urticaria, flushing, phlebitis at injection site, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 80% (PO) |
| **Distribution** | Widely distributed, crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | Urine, unchanged; feces |
| **Half-life** | 6-11 hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Rapid | Immediate |
| **Peak** | 1-2 hr | Infusion's end |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol, oral ritonavir, any product with alcohol: increased disulfiram-like reaction
AzaTHIOprine, fluorouracil: increased leukopenia
Amprenavir, disulfiram: do not use bortezomib; norfloxacin, zalcitabine: avoid use
Busulfan: increased busulfan toxicity, avoid concurrent use
Cholestyramine: decreased metroNIDAZOLE, toxicity
Fosphenytoin, lithium, phenytoin, warfarin: increased action of these drugs

### Drug classifications

Barbiturates: decreased metroNIDAZOLE half-life
CYP3A4 substrates: increased levels

### Drug/lab test

Altered: AST, ALT, LDH
Decrease: WBC, neutrophils
False decrease: triglycerides

## NURSING CONSIDERATIONS

### Assessment

- **Assess patient for signs and symptoms of infection** including characteristics of wounds, WBC >10,000/mm$^3$, vaginal secretions, fever; obtain baseline information and during treatment
- Obtain C&S before beginning product therapy to identify if correct treatment has been initiated
- **Assess for allergic reactions:** rash, urticaria, pruritus
- Identify urine output; if decreasing, notify prescriber **(may indicate nephrotoxicity)**; also check for increased BUN, creatinine
- Assess bowel pattern daily; if severe diarrhea occurs, product should be discontinued
- Assess for overgrowth of infection: perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- Teach patient to notify prescriber if pregnancy is planned or suspected

**BLACK BOX WARNING: Secondary malignancy:** use only when indicated, avoid unnecessary use

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection
- Advise patient to notify physician of numbness or tingling of extremities
- Teach trichomoniasis patient that both partners need to be treated; condoms should be used during intercourse to prevent reinfection
- **Pregnancy/breastfeeding:** Not to be used in breastfeeding or first trimester of pregnancy
- Advise patient of disulfiramlike reaction to alcohol ingestion; alcohol should not be used within 48 hr of this product
- Inform patient product has a metallic taste and urine may turn dark
- Advise patient to contact prescriber if pregnancy is suspected
- Advise patient to use sips of water, sugarless gum, candy for dry mouth

### Evaluation

**Positive therapeutic outcome**

- Decreased symptoms of infection

## metroNIDAZOLE topical
*See Appendix B*

## micafungin (Rx)

(my-ca-fun′gin)

**Mycamine**

*Func. class.:* Antifungal, systemic

*Chem. class.:* Echinocandin

**ACTION:** Inhibits an essential component in fungal cell walls; causes direct damage to fungal cell wall

**Therapeutic outcome:** Prevention of *Candida* infection in hematopoietic stem cell transplantation (HSCT); or decreased symptoms of *Candida* infection, negative culture

**USES:** Treatment of esophageal candidiasis; prophylaxis of *Candida* infections in patients undergoing HSCT; susceptible *Candida* species: *C. albicans, C. glabrata, C. krusei, C. parapsilosis, C. tropicalis,* prophylaxis of HIV-related esophageal candidiasis

## CONTRAINDICATIONS

Hypersensitivity to this product or other echinocandins

**Precautions:** Pregnancy, breastfeeding, children, geriatric, severe hepatic disease, renal impairment, hemolytic anemia

## DOSAGE AND ROUTES

### Candidemia/acute disseminated candidiasis, abscess, peritonitis

**Adult: IV** 100 mg/day over 1 hr

### Esophageal candidiasis

**Adult: IV** 150 mg/day, given over 1 hr

### Prophylaxis of *Candida* infections

**Adult: IV** 50 mg/day, given over 1 hr

**Available forms:** Powder for injection 50 mg, in single-dose vials; 50, 100 mg vial

### Implementation

- Protect diluted sol from light
- Do not use if cloudy or precipitated; do not admix product
- Flush line before, after administration with 0.9% NaCl

**IV route**

- **For *Candida* prevention:** reconstitute with provided diluent 0.9% NaCl without bacteriostatic product; 50 mg vial/5 ml (10 mg/ml), swirl to dissolve, do not shake; further dilute with 100 ml 0.9% NaCl, only; run over 1 hr
- **For *Candida* infection:** reconstitute with provided diluent 50 mg/5 ml (10 mg/ml); further dilute 3 reconstituted vials in 100 ml of 0.9% NaCl, run over 1 hr
- Store at room temperature, away from light; do not freeze; discard unused solution

**Y-site compatibilities:** Aminophylline, bumetanide, calcium chloride/gluconate, cycloSPORINE, DOPamine, eptifibatide, esmolol, fenoldopam, furosemide, heparin, HYDROmorphone, lidocaine, LORazepam, magnesium sulfate, milrinone, nitroglycerin, nitroprusside, norepinephrine, phenylephrine, potassium chloride, potassium phosphate, tacrolimus, vasopressin

**Y-site incompatibilities:** Albumin, amiodarone, cisatracurium, diltiazem, DOBUTamine, EPINEPHrine, insulin, labetalol, meperidine, midazolam, morphine, mycophenolate mofetil, nesiritide, niCARdipine, octreotide, ondansetron, phenytoin, telavancin, vecuronium

## ADVERSE EFFECTS

**CNS:** Convulsions, dizziness, *headache, somnolence,* fever, anxiety

**CV:** Flushing, hypertension, phlebitis, tachycardia, atrial fibrillation

**GI:** Abdominal pain, *nausea, anorexia, vomiting, diarrhea,* hepatitis

**GU:** Renal failure
**HEMA:** Neutropenia, thrombocytopenia, leukopenia, coagulopathy, anemia, hemolytic anemia
**INTEG:** *Rash, pruritus, inj site pain*
**META:** Hypokalemia, hypocalcemia, hypomagnesemia
**MS:** *Rigors*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| Distribution | Protein binding 99% |
| Metabolism | Liver |
| Excretion | Feces, urine |
| Half-life | Terminal 14-17.2 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Itraconazole, sirolimus, NIFEdipine: increased plasma concentrations; may need dosage reduction

### Drug/lab test

Increased: ALT/AST, alk phos, bilirubin
Decreased: blood glucose, potassium sodium

## NURSING CONSIDERATIONS

### Assessment

- Assess for signs and symptoms of infection, clearing of cultures during treatment; obtain culture baseline, throughout; product may be started as soon as culture is taken (esophageal candidiasis); monitor cultures during HSCT, for prevention of *Candida* infections
- Monitor CBC (RBC, Hct, Hgb), differential, platelet count periodically; notify prescriber of results
- Monitor renal studies: BUN, urine CCr, electrolytes before, during therapy
- Monitor hepatic studies before, during treatment: bilirubin, AST, ALT, alkaline phosphatase, as needed
- Assess for bleeding: hematuria, heme-positive stools, bruising or petechiae of mucosa or orifices; blood dyscrasias can occur
- Assess for hypersensitivity: rash, pruritus, facial swelling; also for phlebitis
- Assess for hemolytic anemia
- Assess **GI symptoms:** frequency of stools, cramping; if severe diarrhea occurs, electrolytes may need to be given
- **Pregnancy/breastfeeding:** Use cautiously in breastfeeding, in pregnancy use only if benefits outweigh fetal risk

### Patient/family education

- Advise patient to notify prescriber if pregnancy is suspected or planned
- Teach patient to avoid breastfeeding while taking this product
- Teach patient to inform prescriber of renal or hepatic disease
- Teach patient to report bleeding, facial swelling, wheezing, difficulty breathing, itching, rash, hives, increasing warmth, flushing
- Instruct patient to report signs of infection: increased temp, sore throat, flulike symptoms
- Advise patient to notify prescriber of nausea, vomiting, diarrhea, jaundice, anorexia, clay-colored stools, dark urine; hepatotoxicity may occur

### Evaluation

**Positive therapeutic outcome**

- Prevention of *Candida* infection in HSCT; decreased symptoms of *Candida* infection, negative culture

## miconazole (Rx, OTC)

(mi-kon'a-zole)
**Oravig**
## miconazole nitrate
**Femizole-M 🍁, Monistat, Monistat 3, Monistat 7, Monistat-Derm, Monistat Dual-Pak, Dual Pack; topical: Micatin, Micatin Liquid, Vagistat 3**
*Func. class.:* Antifungal
*Chem. class.:* Imidazole

**ACTION:** Alters cell membranes, inhibits fungal enzymes, inhibits sterols so intracellular contents are lost, prevents biosynthesis of phospholipids/triglycerides

**Therapeutic outcome:** Fungistatic/fungicidal against *Aspergillus, Coccidioides, Cryptococcus, Candida, Dermatophytes, Histoplasma*

**USES:** Coccidioidomycosis, candidiasis, cryptococcosis, paracoccidioidomycosis, chronic mucocutaneous candidiasis, fungal meningitis; **IV** used for severe infections only; topical for tinea pedis, tinea cruris, tinea corporis, tinea versicolor, vaginal or vulva candidal infections

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, renal/hepatic disease

## DOSAGE AND ROUTES

### Oropharyngeal candidiasis (thrush)

**Adult/adolescent ≥16 yr:** Buccal apply 1 tab (50 mg) to upper gum region just above incisor tooth q day × 14 days

**Adult: IV** INF 200-3600 mg/day; may be divided in 3 INF at 200-1200 mg/INF; may have to repeat course; IT 20 mg given simultaneously with **IV** for fungal meningitis q1-2day
**Child: IV** 20-40 mg/kg/day, max 15 mg/kg/day
**Adult and child:** TOP apply to affected area bid × 2-4 wk
**Adult:** Intravaginal 200 mg SUPP at bedtime × 3 days or 100 mg SUPP × 1 wk

**Available forms:** Inj 10 mg/ml; aerosol 2%; cream 2%; lotion 2%; powder 2%; spray 2%; vag cream 2%; vag supp 100, 200 mg; buccal tab 50 mg

### Implementation

• Have adrenalin, suction, tracheostomy set, endotracheal intubation equipment available

**Transmucosal use (adhesive buccal tablet)**

• Apply tab in the morning after brushing the teeth; use dry hands
• Place the rounded surface of the tab against the upper gum just above the incisor tooth; hold in place with a slight pressure over the upper lip for 30 seconds to ensure adhesion
• Although the tab is rounded on one side for comfort, the flat side may also be applied to the gum
• The tab will gradually dissolve
• Administration of subsequent tabs should be made to alternating sides of the mouth
• Before applying the next tab, clear away any remaining tab material
• Do not crush, chew or swallow; food and drink can be taken normally; avoid chewing gum
• If tab does not adhere or falls off within the first 6 hr, the same tab should be repositioned immediately. If the tab still does not adhere, a new tab should be used
• If the tab falls off or is swallowed after it was in place for 6 hr or more, a new tab should not be applied until the next regularly scheduled dose

**Topical route**

• Apply after cleansing area with soap and water before each application; use enough medication to cover lesions completely; dry well
• Store at room temperature in dry place

**Vaginal route**

• Administer 1 applicator full every night high into the vagina
• Store at room temperature in dry place

**IV route**

• Give 200 mg initially to prevent severe hypersensitive reaction
• Give **IV** after diluting in ≤1 g/10 ml of sterile water, $D_5W$, or 0.45% NaCl over 3-5 min
• Give by intermittent **IV** after diluting in 200 ml or more $D_5W$ or 0.9% NaCl; give over 30-60 min
• Store at room temperature; reconstituted sol is stable for 24 hr refrigerated

**Y-site compatibilities:** Allopurinol, filgrastim, foscarnet, granisetron, melphalan, ondansetron, propofol, sargramostim, teniposide, thiotepa, vinorelbine

**Y-site incompatibilities:** Fludarabine

## ADVERSE EFFECTS

**CNS:** Drowsiness, headache, lethargy
**CV:** Tachycardia, dysrhythmias (rapid **IV**)
**GI:** Nausea, vomiting, anorexia, diarrhea, cramps
**GU:** Vulvovaginal burning, itching, hyponatremia, pelvic cramps (topical forms)
**HEMA:** Decreased Hct, thrombocytopenia, hyperlipidemia
**INTEG:** Pruritus, rash, fever, flushing, hives
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poorly absorbed (PO) |
| **Distribution** | Widely distributed (**IV**); bound to serum proteins (90%) |
| **Metabolism** | Liver, extensively |
| **Excretion** | Unknown |
| **Half-life** | Triphasic: 0.4, 2.1, 24 hr |

### Pharmacodynamics

| | IV | Topical | Vag |
|---|---|---|---|
| **Onset** | Rapid | Unknown | Unknown |
| **Peak** | Infusion's end | Unknown | Unknown |
| **Duration** | Unknown | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Amphotericin B: decreased effect of amphotericin B
Amphotericin B, isoniazid, rifampin: decreased effect of miconazole
Phenytoin: increased effect
Warfarin: increased anticoagulant effect

### Drug classifications

Sulfonylureas: increased effect

### Drug/lab test

False positive: urine glucose, urine protein

## NURSING CONSIDERATIONS

### Assessment

• Assess for signs and symptoms of infection: drainage, sore throat, urinary pain, hematuria, fever

• Obtain C&S before beginning treatment; therapy may be started after culture is taken; monitor signs of infection before, throughout treatment
• Monitor bowel pattern before, during treatment; diarrhea may occur
• Monitor cardiac system: B/P, pulse; watch for increasing pulse, cardiac dysrhythmias; product should be discontinued
• Monitor blood studies: WBC, RBC, Hgb, Hct, bleeding time; patients taking anticoagulants may need a decreased dosage; monitor liver and renal studies periodically for patients on long-term therapy
• Monitor I&O ratio; watch for decreasing urinary output, change in specific gravity; discontinue product to prevent renal damage; patients with renal disease may require lowered dose
• Monitor **IV** site for thrombophlebitis; site should be changed q48-72hr
• Monitor for allergies before initiation of treatment and reaction to each medication; highlight allergies on chart; check for allergic reaction: burning, stinging, swelling, redness (topical); observe for skin eruptions after administration of product to 1 wk after discontinuing product
• **Pregnancy/breastfeeding:** Use cautiously in breastfeeding, use PO form in pregnancy only if benefits outweigh fetal risk

### Patient/family education

• Inform patient that culture may be performed after completed course of medication
• Advise patient to notify nurse of diarrhea, symptoms of candidal vaginitis

**Topical route**

• Teach patient to use medical asepsis (hand washing) before, after each application; to apply with glove to prevent further infection; to avoid contact with eyes; not to use occlusive dressings
• Caution patient to avoid use of OTC creams, ointments, lotions unless directed by prescriber
• Instruct patient to notify prescriber if condition does not improve in 4 wk or if symptoms return in 2 mo; pregnancy or a serious medical condition may be the cause
• Teach patient to use for full prescribed treatment time, or reinfection may occur

**Vaginal route**

• Instruct patient in asepsis (hand washing) before, after each application
• Teach patient to apply with applicator only; to avoid use of any other vaginal product unless directed by prescriber; sanitary napkin may prevent soiling of undergarments; to abstain from sexual intercourse until treatment is completed or reinfection and irritation may occur; not to use tampons, douches, spermicides; not to engage in sexual activity; product may damage condoms, diaphragms, cervical caps
• Instruct patient to notify prescriber if symptoms persist

### Evaluation

**Positive therapeutic outcome**

• Decreasing oral candidiasis, fever, malaise, rash
• Negative C&S for infectious organism
• Decrease in size, number of lesions
• Decrease in itching or white discharge (vaginal)

### TREATMENT OF OVERDOSE:

Withdraw product; maintain airway; administer EPINEPHrine, aminophylline, $O_2$, **IV** corticosteroids for anaphylaxis

## miconazole topical

*See Appendix B*

## miconazole vaginal antifungal

*See Appendix B*

M

**⚠ HIGH ALERT**

## midazolam (Rx)

(mid'ay-zoe-lam)
*Func. class.:* Sedative/hypnotic, antianxiety
*Chem. class.:* Benzodiazepine, short-acting
**Controlled substance schedule IV**

**ACTION:** Depresses subcortical levels in CNS; may act on limbic system, reticular formation; may potentiate GABA by binding to specific benzodiazepine receptors

**Therapeutic outcome:** Sedation for anesthesia induction and procedures

**USES:** Preoperative sedation, general anesthesia induction, sedation for diagnostic endoscopic procedures, intubation, anxiety

**Unlabeled uses:** Refractory status epilepticus, alcohol withdrawal, agitation

**CONTRAINDICATIONS**

Pregnancy, hypersensitivity to benzodiazepines, acute closed-angle glaucoma, epidural/intrathecal use

**Precautions:** Breastfeeding, children, geriatric, COPD, HF, chronic renal failure, chills, debilitated, hepatic disease, shock, coma, alcohol intoxication, status asthmaticus

**BLACK BOX WARNING:** Neonates (contains benzyl alcohol), **IV** administration, respiratory depression/insufficiency, specialized care setting, experienced clinician, coadministration with other CNS depressants

## DOSAGE AND ROUTES

### Preoperative sedation/amnesia induction

**Adult and child ≥12 yr:** IM 0.07-0.08 mg/kg 30-60 min before general anesthesia
**Child 6 mo-5 yr:** **IV** 0.05-0.1 mg/kg, a total dose of 0.6 mg/kg may be needed
**Child 6-12 yr:** **IV** 0.025-0.05 mg/kg, a total dose of 0.4 mg/kg may be needed

### Induction of general anesthesia

**Adult >55 yr:** (ASA I/II) **IV** 150-300 mcg/kg over 30 sec; (ASA III/IV) limit dose to 250 mcg/kg (nonpremedicated) or 150 mcg/kg (premedicated)
**Adult <55 yr:** **IV** 200-350 mcg/kg over 20-30 sec; if patient has not received premedication, may repeat by giving 20% of original dose; if patient has received premedication reduce dosage by 50 mcg/kg
**Child:** No safe and effective dosage is established; however, doses of 50-200 mcg/kg **IV** have been used

### Continuous infusion for mechanical ventilation (critical care)

**Adult:** **IV** 0.01-0.05 mg/kg over several min; repeat at 10-15 min intervals until adequate sedation, then 0.02-0.10 mg/kg/hr maintenance; adjust as needed
**Child:** **IV** 0.05-0.2 mg/kg over 2-3 min, then 0.06-0.12 mg/kg/hr by CONT INF; adjust as needed
**Neonate:** **IV** 0.03 mg/kg/hr titrate using lowest dose

### Alcohol withdrawal (unlabeled)

**Adult:** **IV** 1-5 mg q1-2hr (mild-moderate symptoms); cont IV inf 1-20 mg q1-2hr (delirium tremens)

**Available forms:** Inj 1, 5 mg/ml, 25 mg/5 ml, 50 mg/10 ml; syr 2 mg/ml

### Implementation

- Store at room temperature; protect from light

**PO route**

- Remove cap of press-in bottle adaptor and push adaptor into neck of bottle; close with cap, remove cap, and insert tip of dispenser and insert into adaptor; turn upside-down and withdraw correct dose; place in mouth

**IM route**

- Give inj deep into large muscle mass

**IV route**

- Give **IV** undiluted or after diluting with $D_5W$ or 0.9% NaCl to a conc of 0.25 mg/ml; give over 2 min (conscious sedation) or over 30 sec (anesthesia induction)
- Ensure immediate availability of resuscitation equipment, $O_2$ to support airway; do not give by rapid bol

**Y-site compatibilities:** Abciximab, acetaminophen, alemtuzumab, alfentanil, amikacin, amiodarone, anidulafungin, argatroban, atracurium, atropine, aztreonam, benztropine, calcium gluconate, ceFAZolin, cefotaxime, cefOXitine, cefTRIAXone, cimetidine, ciprofloxacin, CISplatin, clindamycin, cloNIDine, cyanocobalamin, cycloSPORINE, DACTINomycin, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxal, DOPamine, doxycycline, enalaprilat, EPINEPHrine, erythromycin, esmolol, etomidate, etoposide, famotidine, fentaNYL, fluconazole, folic acid, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, HYDROmorphone, hydrOXYzine, inamrinone, isoproterenol, labetalol, lactated Ringer's, levofloxacin, lidocaine, linezolid, LORazepam, magnesium, mannitol, meperidine, methadone, methyldopa, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, milrinone, morphine, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, PACLitaxel, palonosetron, pancuronium, papaverine, phentolamine, phytonadione, piperacillin, potassium chloride, propanolol, protamine, pyridoxine, ranitidine, remifentanil, sodium nitroprusside, streptokinase, succinylcholine, SUFentanil, teniposide, theophylline, thiotepa, ticarcillin, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, voriconazole, zoledronic acid

**Y-site incompatibilities:** Foscarnet

## ADVERSE EFFECTS

**CNS:** Retrograde amnesia, euphoria, confusion, headache, anxiety, insomnia, slurred speech, paresthesia, tremors, weakness, chills, agitation, paradoxical reactions
**CV:** Hypotension, PVCs, tachycardia, bigeminy, nodal rhythm, cardiac arrest
**EENT:** Blurred vision, nystagmus, diplopia, loss of balance
**GI:** *Nausea, vomiting,* increased salivation, hiccups
**INTEG:** Urticaria, pain at injection site, swelling at inj site, rash, pruritus at injection site

**RESP:** Coughing, apnea, bronchospasm, laryngospasm, dyspnea, respiratory depression

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Crosses placenta, blood-brain barrier; protein binding 97% |
| **Metabolism** | Liver; by CYP3A4 to metabolites excreted in urine |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 1-5 hr |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | 10-30 min | 15 min | 1.5-5 min |
| **Peak** | Unknown | ½-1 hr | Unknown |
| **Duration** | Unknown | 2-3 hr | <2 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased respiratory depression
Cimetidine, erythromycin, ranitidine, theophylline: decreased midazolam metabolism
FluvoxaMINE, indinavir, ritonavir, verapamil, protease inhibitors: increased respiratory depression

### Drug classifications

Antihypertensives, nitrates, opiates: increase in hypotension
Barbiturates, opiate analgesics, other CNS depressants: increased respiratory depression
CYP3A4 inducers (azole antifungals, theophylline): increased half-life of midazolam
CYP3A4 inhibitors: increased levels of midazolam

### Drug/herb

Kava, valerian: increased sedation
St. John's wort: decreased midazolam

### Drug/food

Grapefruit juice: increased midazolam effect (PO)

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P, pulse, respiration during **IV;** $O_2$ and emergency equipment should be nearby
- Monitor inj site for redness, pain, swelling
- Assess degree of amnesia in geriatric; may be increased
- Assess anterograde amnesia
- Assess vital signs for recovery period in obese patient, since half-life may be extended
- **Respiratory depression/insufficiency:** assess for apnea, respiratory depression, which may be increased in the geriatric
- **Beers:** Avoid in older adults with or at high risk for delirium, assess frequently for confusion, delirium
- **Pregnancy/breastfeeding:** Do not use in pregnancy, avoid use in breastfeeding, excreted in breast milk

### Patient/family education

- Inform patient that amnesia occurs; events might not be remembered
- Caution patient to avoid CNS depressants including alcohol for 24 hr after taking this product

### Evaluation

**Positive therapeutic outcome**
- Induction of sedation, amnesia

**TREATMENT OF OVERDOSE:** $O_2$, flumazenil

**⚠ HIGH ALERT**

## milrinone (Rx)

(mill-re'none)
*Func. class.:* Inotropic/vasodilator agent with phosphodiesterase activity
*Chem. class.:* Bipyridine derivative

**ACTION:** Positive inotropic agent with vasodilator properties; increases contractility of cardiac muscle; reduces preload and afterload by direct relaxation of vascular smooth muscle; increases myocardial contractility

**Therapeutic outcome:** Increased inotropic effect resulting in increased cardiac output

**USES:** Short-term management of advanced HF that has not responded to other medication

## CONTRAINDICATIONS

Hypersensitivity to this product, severe aortic disease, severe pulmonic valvular disease, acute MI

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal/hepatic disease, atrial flutter/fibrillation

## DOSAGE AND ROUTES

**Adult: IV** BOL 50 mcg/kg given over 10 min; start INF of 0.375-0.75 mcg/kg/min; reduce dosage in renal impairment

### Renal dose

**Adult:** IV CCr 41-50 ml/min 0.43 mcg/kg/min, titrate up; CCr 31-40 ml/min 0.38 mcg/kg/min, titrate up; CCr 21-30 ml/min 0.33 mcg/kg/min, titrate up; CCr 11-20 ml/min 0.28 mcg/kg/min; CCr 6-10 ml/min 0.23 mcg/kg/min; CCr <6 ml/min 0.20 mcg/kg/min; max all dosages 0.75 mcg/kg/min

**Available forms:** Inj 1 mg/ml; premixed inj 200 mcg/ml in $D_5W$

### Implementation

**Direct IV route**
- Give **IV** loading dose undiluted over 10 min; use controlled-rate device
- Administer by direct **IV** into inf through Y-connector or directly into tubing

**Continuous IV infusion route**
- Dilute 20 mg vial with 80, 112, 180 ml of 0.45% NaCl, 0.9% NaCl, or $D_5W$ to a concentration of 200, 150, 100 mcg/ml respectively
- Do not mix directly with glucose sol (chemical reaction occurs over 24 hr) precipitate forms if milrinone and furosemide come into contact
- Titrate rate based on hemodynamic and clinical response, use controlled device
- Administer potassium supplements if ordered for potassium levels <3.0 mg/dl

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, atenolol, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diltiazem, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, DOXOrubicin, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, ertapenem, erythromycin, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, methohexital, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, mitoXANtrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride/phosphates, prochlorperazine, promethazine, propofol, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, torsemide, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CV:** Dysrhythmias, hypotension, chest pain, PVCs
**GI:** Nausea, vomiting, anorexia, abdominal pain, hepatotoxicity, jaundice
**HEMA:** Thrombocytopenia
**MISC:** Headache, hypokalemia, tremor, injection site reactions

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver (50%) |
| **Excretion** | Kidney, unchanged (83%), metabolites (12%) |
| **Half-life** | 2.4 hr; increased in HF |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 2-5 min |
| **Peak** | 10 min |
| **Duration** | Variable |

## INTERACTIONS

### Drug classifications

Antihypertensives, diuretics: increased effects

## NURSING CONSIDERATIONS

### Assessment

- Monitor for hypokalemia: acidic urine, reduced urine, osmolality, nocturia; hypotension, broad T-wave, U-wave, ectopy, tachycardia, weak pulse; muscle weakness, altered LOC, drowsiness, apathy, lethargy, confusion, depression; anorexia, nausea, cramps, constipation, distention, paralytic ileus; hypoventilation, respiratory muscle weakness
- Assess fluid volume status: complete I&O ratio and record; note weight, distended red veins, crackles in lung; color, quality, and specific gravity of urine; skin turgor, adequacy of pulses, moist mucous membranes, bilateral lung sounds, peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth and mucous membranes should be reported

• Monitor electrolytes: potassium, sodium, calcium, magnesium; also include BUN, blood pH, ABGs
• Monitor B/P and pulse, ECG continuously during IV; ventricular dysrhythmia can occur; PCWP, CVP, index often during inf; if B/P drops 30 mm Hg, stop inf and call prescriber
• Monitor ALT, AST, bilirubin daily; if these are elevated, hepatotoxicity is suspected
• Monitor platelets; if <150,000/mm$^3$, product is usually discontinued and another product started
• Assess for extravasation: change site q48hr
• **Pregnancy/breastfeeding:** Only use in pregnancy if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

### Patient/family education
• Teach patient reason for medication and expected results
• Instruct patient to make position changes slowly; orthostatic hypotension may occur
• Teach patient signs and symptoms of hypersensitivity reactions and hypokalemia

### Evaluation
**Positive therapeutic outcome**
• Increased cardiac output
• Decreased PCWP, adequate CVP
• Decreased dyspnea, fatigue, edema, ECG

## TREATMENT OF OVERDOSE:
Discontinue product, support circulation

## RARELY USED

## miltefosine
(mil′-te-foe′-seen)
**Impavido**
*Func. class.:* antiprotozoal/antileishmanial

## USES:
Treatment of visceral leishmaniasis caused by *L. donovani;* mucosal leishmaniasis caused by *L. braziliensis;* and cutaneous leishmaniasis caused by *L. braziliensis, L. guyanensis,* and *L. panamensis*

## CONTRAINDICATIONS
Hypersensitivity, pregnancy

## DOSAGE AND ROUTES
**Adult/adolescent/child ≥ 12 yr and ≥45 kg:**
**PO** 50 mg tid × 28 days
**Adult/adolescent/child ≥ 12 yr and 30 to 44 kg:**
**PO** 50 mg bid × 28 days; HIV guidelines suggest 100 mg qday × 4 wk in adults and adolescents regardless of weight

## minocycline (Rx)
(min-oh-sye′kleen)
**Arestin, Minocin, Solodyn**
*Func. class.:* Broad-spectrum antiinfective
*Chem. class.:* Tetracycline

## ACTION:
Inhibits protein synthesis and phosphorylation in microorganisms by binding to 30S ribosomal subunits and reversibly binding to 50S ribosomal subunits; bacteriostatic

**Therapeutic outcome:** Bactericidal action against susceptible organisms, including *Neisseria meningitidis, Neisseria gonorrhoeae, Treponema pallidum, Chlamydia trachomatis, Ureaplasma urealyticum, Mycoplasma pneumoniae, Nocardia, Rickettsia*

## USES:
Syphilis, chlamydial infection, gonorrhea, lymphogranuloma venereum, rickettsial infections, inflammatory acne, meningitis carriers, periodontitis, methicillin-resistant *Staphylococcus aureus* (MRSA) infections, nonnodular moderate to severe acne vulgaris, *Rickettsia* sp.

## CONTRAINDICATIONS
Pregnancy, hypersensitivity to tetracyclines, children <8 yr

**Precautions:** Breastfeeding, hepatic disease

## DOSAGE AND ROUTES
**Adult:** PO/**IV** 200 mg, then 100 mg q12hr, max 400 mg/24 hr **IV;** subgingival insert into periodontal pocket
**Child >8 yr:** PO/**IV** 4 mg/kg then 4 mg/kg/day PO in divided doses q12hr

### Rickettsial infections
**Adult:** PO/**IV** 200 mg, then 100 mg q12hr
**Adolescent/child ≥8 yr:** PO/**IV** 4 mg/kg, then 2 mg kg q12hr, max adult dose

### Gonorrhea
**Adult:** PO 200 mg, then 100 mg q12hr × 4 days or more

### Syphilis
**Adult:** PO 200 mg, then 100 mg q12hr × 10-15 days

### Uncomplicated gonococcal urethritis in men
**Adult:** PO 100 mg q12hr × 5 days

### Rheumatoid arthritis (unlabeled)
**Adult:** PO 100 mg bid for ≤48 wk

### Acne vulgaris (solodyn only)
**Adult/adolescent/child ≥12 yr:** ext rel 1 mg/kg/day × 12 wk or those weighing 126-136 kg: 135 mg/day; 111-125 kg: 115 mg/day; 97-110 kg:

105 mg/day; 85-96 kg: 90 mg/day; 72-84 kg: 80 mg/day; 60-71 kg: 65 mg/day; 50-59 kg: 55 mg/day; 45-49 kg: 45 mg/day

### Acne vulgaris (all except solodyn)

**Adult/adolescent/child ≥12 yr:** ext rel 1 mg/kg × 12 wk or 91-136 kg/135 mg/day; 60-90 kg 90 mg/day; 45-59 kg 45 mg/day

**Available forms:** Caps 50, 75, 100 mg; powder for inj 100 mg; pellet-filled caps 50, 100 mg; tabs 50, 75, 100 mg; ext rel tabs 45, 55, 65, 80, 90, 105, 115, 135 mg

### Implementation

- Store in airtight, light-resistant container at room temp

**PO route**

- Give around the clock to maintain proper blood levels; give with food to increase absorption of product; do not give within 3 hr of other agents; product interactions may occur
- Give with 8 oz of water 1 hr before bedtime to prevent ulceration
- Shake liquid preparation well before giving; use calibrated device for proper dosing
- Do not give with iron, calcium, magnesium products, or antacids, which decrease absorption and form insoluble chelate

**IV route**

- Check for irritation, extravasation, phlebitis daily; change site q72hr
- For intermittent inf, dilute each 100 mg/10 ml of 0.9% NaCl, sterile water for inj; further dilute in 500-1000 ml of 0.9% NaCl, $D_5W$, Ringer's, LR, $D_5$/LR; give over 6 hr

**Y-site compatibilities:** Alfentanil, amikacin, atracurium, benztropine, bretylium, buprenorphine, butorphanol, calcium chloride, CARBOplatin, caspofungin, cefonicid, chlorproMAZINE, cimetidine, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, dexmedetomidine, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, doxacurium, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, eptifibatide, etoposide, fenoldopam, fentaNYL, fludarabine, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, IDArubicin, ifosfamide, inamrinone, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, metaraminol, methotrexate, methyldopa, metoclopramide, metoprolol, midazolam, mitoXANtrone, nalbuphine, naloxone, perphenazine, potassium chloride, sargramostim, sodium succinate, vinorelbine, vit B/C

**Y-site incompatibilities:** Aztreonam, filgrastim, HYDROmorphone, meperidine, morphine, teniposide

## ADVERSE EFFECTS

**CNS:** *Dizziness,* fever, light-headedness, vertigo, seizures, increased intracranial pressure
**CV:** Pericarditis
**EENT:** Dysphagia, glossitis, decreased calcification, permanent discoloration of teeth, oral candidiasis
**GI:** *Nausea,* abdominal pain, *vomiting, diarrhea,* anorexia, enterocolitis, hepatotoxicity, flatulence, abdominal cramps, epigastric burning, stomatitis, pseudomembranous colitis
**GU:** Increased BUN, polyuria, polydipsia, renal failure, nephrotoxicity
**HEMA:** Eosinophilia, neutropenia, thrombocytopenia, hemolytic anemia, pancytopenia
**INTEG:** *Rash, urticaria, photosensitivity, increased pigmentation,* exfoliative dermatitis, pruritus, blue-gray color of skin and mucous membranes
**MS:** Myalgia, arthritis, bone discoloration, joint stiffness
**SYST:** Angioedema, Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO) |
| **Distribution** | Widely distributed; some distribution in CSF, crosses placenta |
| **Metabolism** | Liver, some |
| **Excretion** | Kidneys, unchanged (20%), bile, feces |
| **Half-life** | 11-17 hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Rapid | Rapid |
| **Peak** | 2-3 hr | Infusion's end |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Calcium: forms chelates, decreased absorption
CarBAMazepine, phenytoin: decreased effect
Digoxin: increased effect
Insulin: increased effect
Kaolin/pectin, sodium bicarbonate, cimetidine, quinapril, sucralfate, iron: decreased minocycline effect
Theophylline: increased effect
Warfarin: increased effect

### Drug classifications

Alkali products, antacids: decreased minocycline effect
Anticoagulants (oral neuromuscular blockers): increased effect
Barbiturates, penicillins: decreased effect
Retinoids: increased chance of pseudomotor cerebri, do not use concurrently

### Drug/lab test

False negative: urine glucose with Clinistix, Tes-Tape

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction
- **Assess patient for signs and symptoms of infection** including characteristics of wounds, sputum, urine, stool, WBC >10,000/mm$^3$, fever; obtain baseline information before, during treatment
- Obtain C&S before beginning product therapy to identify if correct treatment has been initiated
- **Assess for allergic reactions:** rash, urticaria, pruritus, angioedema
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, alkaline phosphatase, amylase monthly if patient is on long-term therapy
- **Pseudomembranous colitis:** assess bowel pattern daily; if severe diarrhea occurs, product should be discontinued
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy; blood dyscrasias may occur
- **Assess for overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum; black, furry tongue

**BLACK BOX WARNING: Cardiac disease:** May cause reflex increase in heart rate and decrease B/P

- **Beers:** Avoid use in older adults, may exacerbate syncope, monitor frequently for syncope
- **Pregnancy/breastfeeding:** Do not use in pregnancy, can cause fetal harm, if pregnancy occurs, stop immediately, do not breastfeed, excreted in breast milk

### Patient/family education

- Teach patient to use sunscreen when outdoors to decrease photosensitivity reaction
- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection; report itching, rash, pruritus, urticaria
- Instruct patient to take all medication prescribed for the length of time ordered; product must be taken around the clock to maintain blood levels; do not give medication to others; take with a full glass of water; may take with food; not to use outdated product, Fanconi's syndrome may occur

### Evaluation

**Positive therapeutic outcome**

- Absence of signs/symptoms of infection (WBC <10,000/mm$^3$, temp WNL, absence of red, draining wounds)
- Reported improvement in symptoms of infection

## minoxidil (Rx, OTC)

(mi-nox'i-dill)
**Rogaine (TOP)**
*Func. class.:* Antihypertensive, hair growth stimulant
*Chem. class.:* Vasodilator, peripheral

**ACTION:** Directly relaxes arteriolar smooth muscle, causing vasodilation; reduces peripheral vascular resistance, decreases B/P; increased cutaneous blood flow; stimulation of hair follicles

**Therapeutic outcome:** Decreased B/P in hypertension; hair growth

**USES:** Severe hypertension unresponsive to other therapy (use with diuretic and β-blocker); topically to treat alopecia, anal fissures

## CONTRAINDICATIONS

Dissecting aortic aneurysm, hypersensitivity, pheochromocytoma

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal disease, CVD, acute MI

**BLACK BOX WARNING:** CAD, HF, cardiac disease, cardiac tamponade, edema, hypotension, orthostatic hypotension, pericardial effusion

## DOSAGE AND ROUTES

### Severe hypertension

**Adult:** PO 5 mg/day in 1-2 divided doses, max 100 mg/day; usual range 10-40 mg/day divided in 1-2 doses
**Geriatric:** PO 2.5 mg/day, may be increased gradually
**Child <12 yr:** PO initial 0.1-0.2 mg/kg/day; effective range, 0.25-1 mg/kg/day; max, 50 mg/day

### Alopecia
**Adult:** TOP 1 ml bid, rub into scalp daily, max 2 ml/day

### Renal dose
**Adult:** PO CCr 10-15 ml/min extend interval to q24hr; CCr <10 ml/min not recommended

### Anal fissures (unlabeled)
**Adult/adolescent:** TOP (0.5% minoxidil in white paraffin base) 0.5 g each compounded minoxidil and lignocaine ointment q8hr

**Available forms:** Tabs 2.5, 10 mg; topical 2%, 5% sol, topical foam 5%

### Implementation
**PO route**
- Administer without regard to meals
- Give with β-blockers and/or diuretic for hypertension
- Store protected from light and heat

**Topical route**
- Administer 1 ml dose no matter how much balding has occurred; increasing dose does not speed hair growth
- Treatment must continue long term or new hair will be lost again

## ADVERSE EFFECTS
### Systemic
**CNS:** Headache, fatigue
**CV:** *Severe rebound hypertension (on withdrawal in children),* tachycardia, angina, increased T-wave, HF, pulmonary edema, pericardial effusion, edema, sodium retention, water retention, *hypotension*
**GI:** Nausea, vomiting
**GU:** Breast tenderness
**HEMA:** Hct, Hgb, erythrocyte count may decrease initially, leukopenia
**INTEG:** Pruritus, Stevens-Johnson syndrome, rash, hirsutism, contact dermatitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO); minimally absorbed (topical) |
| **Distribution** | Widely distributed, protein binding minimal |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 4.2 hr |

### Pharmacodynamics

| | PO | Topical |
|---|---|---|
| **Onset** | ½ hr | 4 mo |
| **Peak** | 2-3 hr | Unknown |
| **Duration** | 75 hr | 4 mo |

## INTERACTIONS
### Individual
Guanethidine, nitroprusside: increased hypotension

### Drug classifications
Antihypertensives, MAOIs, nitrates: increased hypotension
Estrogens, NSAIDs, salicylates: decreased antihypertensive effect

### Drug/herb
Hawthorn: increased antihypertensive effect

### Drug/lab test
Increased: renal function tests
Decreased: Hgb, Hct, RBC

## NURSING CONSIDERATIONS
### Assessment
- Monitor closely; usually given with β-blocker to prevent tachycardia and increased myocardial workload; usually given with diuretic to prevent serious fluid accumulation; patient should be hospitalized during beginning treatment
- Monitor B/P, pulse, jugular venous distention periodically throughout treatment
- Monitor electrolytes, blood studies: potassium, sodium, chloride, CBC, serum glucose
- Monitor weight daily, I&O; assess edema in feet, legs daily; check skin turgor, dryness of mucous membranes for hydration status
- Assess for crackles, dyspnea, orthopnea, peripheral edema, fatigue, weight gain, jugular vein distention (HF)
- Assess for signs of hyperglycemia: acetone breath, increased urinary output, severe thirst, lethargy, dizziness
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not use in breastfeeding

### Patient/family education
**Topical route**
- Teach patient that new hair will be soft and hardly visible, use on clean, dry scalp before styling aids, wash hands after each use
- Caution patient not to use on other parts of the body; product is to be used on the scalp only
- Instruct patient that hair should be clean before applying medication; do not get on clothing
- Caution patient not to get medication near mucous membranes (mouth, nose, eyes) and to contact prescriber if burning, stinging, or rash occurs

### Evaluation
**Positive therapeutic outcome**
- Decreased B/P in hypertension
- Hair growth (TOP)

## mirabegron

(mir′a-beg′ron)
**Myrbetriq**
*Func. class.:* Bladder antispasmodic
*Chem. class.:* $\beta_2$-Adrenergic receptor agonist

**ACTION:** Relaxes smooth muscles in urinary tract

**Therapeutic outcome:** Decreasing dysuria, frequency, nocturia, incontinence

**USES:** Overactive bladder (urinary frequency, urgency), urinary incontinence

### CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, kidney/liver disease, bladder obstruction, dialysis, hypertension

### DOSAGE AND ROUTES

**Adult: PO** 25 mg/day, may increase to 50 mg/day if needed

**Hepatic/renal dose**
**Adult:** PO Child–Pugh B or (CCr 15-29 ml/min, max 25 mg/day; Child–Pugh C or CCr 15 ml/min, not recommended

**Available forms:** Tabs ext rel 25, 50 mg

#### Implementation

- Give whole; take with liquids; do not crush, chew, or break ext rel product; use without regard to meals

### ADVERSE EFFECTS

**CNS:** Fatigue, dizziness, headache
**CV:** Hypertension
**EENT:** Xerophthalmia, blurred vision
**GI:** Nausea, vomiting, anorexia, abdominal pain, constipation, diarrhea, dyspepsia
**GU:** Dysuria, urinary retention, frequency, UTI, bladder discomfort
**INTEG:** Rash, pruritus
**MISC:** Arthralgia, back pain
**RESP:** Pharyngitis
**SYST:** Stevens–Johnson syndrome

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 71% protein binding |
| **Metabolism** | Unknown |
| **Excretion** | 25% unchanged in urine |
| **Half-life** | Terminal 50 hr |

#### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3.5 hr |
| **Duration** | Unknown |

### INTERACTIONS

#### Individual drugs

CYP3A4 inhibitors: increased mirabegron effect
CYP2D6 substrates: increased effect of these substrates
Digoxin, warfarin, desipramine, thioridazine, flecainide, propafenone: increased effect of these agents

#### Drug classifications

Antimuscarinic agents (e.g., atropine, scopolamine): increased risk of urinary retention

### NURSING CONSIDERATIONS

#### Assessment

- Urinary patterns: Assess for distention, nocturia, frequency, urgency, incontinence
- Monitor LFTs at baseline, periodically
- Monitor B/P

#### Patient/family education

- Teach patient to avoid hazardous activities; dizziness can occur, may take up to 8 wk for full effect
- Advise patient not to drink liquids before bedtime
- Inform patient about the importance of bladder maintenance
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, discontinue breastfeeding or product, excretion unknown

#### Evaluation

**Positive therapeutic outcome**

- Decreasing dysuria, frequency, nocturia, incontinence

## mirtazapine (Rx)

(mer-ta′za-peen)
**Remeron, Remeron Soltab**
*Func. class.:* Antidepressant
*Chem. class.:* Tetracyclic

**ACTION:** Blocks reuptake of norepinephrine, serotonin into nerve endings, increasing action of norepinephrine, serotonin in nerve cells; antagonist of central $\alpha_2$-receptors, blocks histamine receptors; has anticholinergic action

**Therapeutic outcome:** Decreased symptoms of depression after 2-3 wk

**USES:** Depression, dysthymic disorder, bipolar disorder: depression, agitated depression

## CONTRAINDICATIONS

Hypersensitivity to tricyclics, recovery phase of MI, agranulocytosis, jaundice

**Precautions:** Pregnancy, geriatric, suicidal patients, severe depression, increased intraocular pressure, closed-angle glaucoma, urinary retention, cardiac/renal/hepatic disease, hypo/hyperthyroidism, electroshock therapy, elective surgery, seizure disorder, bone marrow suppression, thrombocytopenia

**BLACK BOX WARNING:** Suicidal ideation, children

## DOSAGE AND ROUTES

**Adult:** PO 15 mg/day at bedtime, maintenance to continue for 6 mo, titrate up to 45 mg/day; orally disintegrating tabs open blister pack, place tab on tongue, allow to disintegrate, swallow
**Geriatric:** PO 7.5 mg nightly, increase by 7.5 mg q1-2wk to desired dose, max 45 mg/day

**Available forms:** Tabs 15, 30, 45 mg; orally disintegrating tabs (Soltab) 15, 30, 45 mg

### Implementation

- Administer without regard to meals; crush if patient is unable to swallow medication whole
- Give dose at bedtime if oversedation occurs during day; may take entire dose at bedtime; geriatric may not tolerate once/day dosing
- Store in tight container at room temperature; do not freeze
- Allow **orally disintegrating tablets** to dissolve on tongue; no water needed; do not split; contain phenylalanine
- **Serotonin syndrome, neuroleptic malignant syndrome:** assess for increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer a serotonin antagonist if needed; at least 2 wk should elapse between discontinuation of serotoninergic agents and start of this product

## ADVERSE EFFECTS

**CNS:** *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, stimulation, weakness, nightmares, EPS (geriatric), increased psychiatric symptoms, seizures, abnormal dreams
**CV:** *Orthostatic hypotension, ECG changes, tachycardia, hypertension,* palpitations
**EENT:** *Blurred vision,* tinnitus, mydriasis
**GI:** *Diarrhea, dry mouth,* nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, jaundice, hepatitis, stomatitis, constipation, weight gain
**GU:** *Retention,* acute renal failure, urinary frequency
**HEMA:** Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia
**INTEG:** Rash, urticaria, sweating, pruritus, photosensitivity
**MS:** Back pain, myalgia
**RESP:** Cough
**SYST:** Flulike symptoms, increased lipid levels

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Slow, complete |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Feces; breast milk |
| **Half-life** | 20-40 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
CloNIDine: decreased effects
Fenfluramine, dexfenfluramine, sibutramine, nefazodone: increased serotonin syndrome

### Drug classifications

Barbiturates, benzodiazepines, CNS depressants (other): increased effects
MAOIs: hypertensive episode, seizures, hyperpyretic crisis
Sympathomimetics, indirect acting (ePHEDrine): decreased effects
SSRIs, SNRIs, serotonin-receptor agonists: increased serotonin syndrome

### Drug/herb

Kava: increased CNS depression
St. John's wort, SAM-e: serotonin syndrome

### Drug/lab test

Increased: serum bilirubin, blood glucose, alkaline phosphatase
Decreased: VMA, 5-HIAA
False increase: urinary catecholamines

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P (with patient lying, standing), pulse q4hr during beginning treatment; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS q4hr in patients with CV disease

• Monitor blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy, LFTs, serum creatinine/BUN
• Monitor liver function tests: AST, ALT, bilirubin
• Check weight weekly; product may increase appetite
• Assess ECG for flattening of T wave, bundle branch block, AV block, dysrhythmias in cardiac patients
• Assess for EPS primarily in geriatric: rigidity, dystonia, akathisia
• Assess mental status: mood, sensorium, affect, suicidal tendencies; assess increase in psychiatric symptoms: depression, panic
• Identify alcohol consumption; if alcohol is consumed, hold dose until AM
• **Pregnancy/breastfeeding:** Use only if clearly needed, excreted in breast milk, discontinue product or breastfeeding

### Patient/family education

• Inform patient that therapeutic effects may take 2-3 wk; take at bedtime, do not discontinue abruptly
• Advise patient to use caution in driving and other activities requiring alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting to standing, especially geriatric
• Caution patient to avoid alcohol ingestion, other CNS depressants
• Teach patient to increase fluids, bulk in diet if constipation, urinary retention occur, especially geriatric
• Teach patient to use gum, hard sugarless candy, or frequent sips of water for dry mouth
• Advise not to use within 14 days of MAOIs

**BLACK BOX WARNING:** Notify prescriber of suicidal thoughts, behavior

### Evaluation

**Positive therapeutic outcome**

• Decrease in depression
• Absence of suicidal thoughts

## TREATMENT OF OVERDOSE:

ECG monitoring, lavage, administer anticonvulsant

**RARELY USED**

## misoprostol (Rx)

(mye-soe-prost'ole)

**Cytotec**

*Func. class.:* Gastric mucosa protectant; antiulcer

*Chem. class.:* Prostaglandin $E_1$ analog

**Do not confuse:** misoprostol/metoprolol, Cytotec/Cytoxan

## ACTION:

Inhibits gastric acid secretion; may protect gastric mucosa; can increase bicarbonate, mucus production

**Therapeutic outcome:** Prevention of gastric ulcers

## USES:

Prevention of NSAID-induced gastric ulcers

## CONTRAINDICATIONS

Hypersensitivity to this product or prostaglandins

**BLACK BOX WARNING:** Pregnancy, females

**Precautions:** Breastfeeding, children, geriatric, renal disease, CV disease, abnormal fetal position, cardiac/renal/inflammatory bowel disease, C-section, dehydration, diarrhea, fever, ectopic pregnancy, fetal distress, sepsis, vaginal bleeding

## DOSAGE AND ROUTES

**Adult:** PO 200 mcg qid with food for duration of NSAID therapy with last dose at bedtime; if 200 mcg is not tolerated, 100 mcg may be given

**Available forms:** Tabs 100, 200 mcg

### Implementation

• Give with meals for prolonged product effect; avoid use of magnesium antacids
• Store at room temp

## ADVERSE EFFECTS

**GI:** *Diarrhea,* nausea, vomiting, flatulence, constipation, dyspepsia, abdominal pain
**GU:** Spotting, cramps, hypermenorrhea, menstrual disorders

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | ½-1 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½ hr |
| **Peak** | Unknown |
| **Duration** | 3 hr |

## INTERACTIONS

### Drug/food

Maximum concentrations when taken with food

## NURSING CONSIDERATIONS

### Assessment

• **NSAID-induced ulcer prophylaxis:** monitor patient for GI symptoms: hematemesis, occult or frank blood in stools, also severe abdominal pain, cramping, severe diarrhea

**BLACK BOX WARNING:** Pregnancy: obtain a negative pregnancy test in women of childbearing age before starting medication; miscarriages are common

### Patient/family education

- Advise patient to avoid black pepper, caffeine, alcohol, harsh spices, extremes in temperature of food, which may aggravate condition
- Caution patient to avoid OTC preparations: aspirin, cough, cold preparations; condition may worsen
- Teach patient that product must be continued for prescribed time to be effective and taken exactly as prescribed; doses are not to be doubled
- Instruct patient to report to prescriber diarrhea, black tarry stools, abdominal pain, cramping, menstrual disorders

**BLACK BOX WARNING:** Caution patient to prevent pregnancy while taking this product; spontaneous abortion may occur, pregnancy

### Evaluation

**Positive therapeutic outcome**

- Prevention of ulcers

**⚠ HIGH ALERT**

## mitoMYcin (Rx)

(mye-toe-mye′sin)

**Mutamycin**

*Func. class.:* Antineoplastic, antibiotic

**Do not confuse:** mitoMYcin/mithramycin/mitotane/mitoXANtrone

**ACTION:** Inhibits DNA synthesis, primarily; derived from *Streptomyces caespitosus;* appears to cause cross-linking of DNA; a vesicant

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Pancreas, stomach, colorectal, bladder cancer

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, as a single agent, coagulation disorders

**BLACK BOX WARNING:** Thrombocytopenia

**Precautions:** Accidental exposure, acute bronchospasm, anemia, children, dental disease/work, extravasation, females, hemolytic-uremic syndrome, infection, radiation therapy, surgery, vaccines, renal/respiratory disease

**BLACK BOX WARNING:** Bone marrow suppression, hemolytic uremic syndrome, leukopenia, requires a specialized care setting/experienced clinician

## DOSAGE AND ROUTES

**Adult: IV** 10-20 mg/m$^2$ q6-8wk

**Available forms:** Inj 5, 20, 40 mg/vial

### Implementation

**Direct IV route**

- Use cytotoxic handling procedures
- Give antiemetic 30-60 min before product to prevent vomiting
- Use port or central line if possible, product is very irritating to tissues
- Reconstitute 5 mg/10 ml; 20 mg/40 ml; 40 mg/80 ml of sterile water for injection (0.5 mg/ml); shake to dissolve, let stand until completely dissolved; stable for 1 wk at room temperature, 2 wk refrigerated, can be further diluted to 20-40 mcg/ml
- Inject reconstituted injection slowly over 5-10 min **IV** push into free-flowing **IV** infusion of 0.9% NaCl or $D_5W$
- Avoid excessive heat, store reconstituted product in refrigerator, discard after 2 wk, store unreconstituted product at room temp

**Y-site compatibilities:** Allopurinol, amifostine, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, atenolol, bivalirudin, bleomycin, caspofungin, CISplatin, cyclophosphamide, DACTINomycin, dolasetron, DOXOrubicin, droperidol, epirubicin, ertapenem, fluorouracil, furosemide, granisetron, heparin, leucovorin, melphalan, methotrexate, metoclopramide, nesiritide, octreotide, ondansetron, oxaliplatin, PACLitaxel, palonosetron, PEMEtrexed, riTUXimab, teniposide, thiotepa, tigecycline, tirofiban, trastuzumab, vinBLAStine, vinCRIStine, voriconazole, zoledronic acid

**Y-site incompatibilities:** Sargramostim, vinorelbine

## ADVERSE EFFECTS

**CNS:** Fever, headache, confusion, drowsiness, syncope, fatigue
**EENT:** Blurred vision
**GI:** *Nausea, vomiting, anorexia, stomatitis,* hepatotoxicity, diarrhea
**GU:** Urinary retention, renal failure, edema
**HEMA:** Thrombocytopenia, leukopenia, anemia
**INTEG:** *Rash,* alopecia, extravasation, nail discoloration
**MISC:** Hemolytic uremic syndrome, HF
**RESP:** Fibrosis, pulmonary infiltrate, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability |
| **Distribution** | Widely distributed; concentrates in tumor |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, unchanged |
| **Half-life** | 1 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Radiation: increased toxicity

### Drug classifications

Anticoagulants, NSAIDs: increased bleeding risk
Antineoplastics: increased toxicity
Vaccines: avoid concurrent use

### Drug/herb

Black cohosh: avoid use

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess for fatal hemolytic uremic syndrome: hypertension, thrombocytopenia, microangiopathic hemolytic anemia; occurs during long-term therapy

- Assess buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia; obtain prescription for viscous lidocaine (Xylocaine)
- **Assess symptoms indicating severe allergic reaction:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing

**BLACK BOX WARNING: Bone marrow suppression:** Monitor CBC, differential, platelet count weekly; withhold product if WBC is $<4000/mm^3$ or platelet count is $<100,000/mm^3$ or serum creatinine $>1.7$ mg/dl; notify prescriber; bleeding: hematuria, guaiac, bruising, petechiae, mucosa, or orifices

- Monitor renal function tests: BUN, creatinine, serum uric acid, urine CCr before, during therapy; check I&O ratio; report fall in urine output to $<30$ ml/hr; adjust dose based on renal function
- Assess for pulmonary fibrosis, bronchospasm, dyspnea, crackles, unproductive cough, chest pain, tachypnea, fatigue, increased pulse, pallor, lethargy
- Monitor temp q4hr (may indicate beginning of infection)
- **Hepatotoxicity** Monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; check for jaundiced skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea
- Assess for bleeding: hematuria, stool guaiac, bruising or petechiae, mucosa or orifices q8hr
- Identify effects of alopecia on body image; discuss feelings about body changes
- Identify edema in feet, joint pain, stomach pain, shaking; check for inflammation of mucosa, breaks in skin
- **Pregnancy/breastfeeding:** Do not use in pregnancy or breastfeeding

### Patient/family education

- Advise patient to get adequate fluids 2-3 L/day unless contraindicated
- Encourage patient to rinse mouth tid-qid with water, club soda, brush teeth bid-qid with soft brush or cotton-tipped applicators for stomatitis, use unwaxed dental floss
- Teach patient to avoid use of products containing aspirin or ibuprofen, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
- Caution patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath)
- Advise patient to report any changes in breathing or coughing even several mo after treatment; to avoid crowds and persons with respiratory tract or other infections
- Teach patient to report signs of IV site reaction, redness, inflammation, burning, pain
- Inform patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture
- **Infection:** teach patient to report fever, flulike symptoms, sore throat
- Advise patient not to have any vaccinations without the advice of the prescriber; serious reactions can occur
- Teach patient that contraception is needed during treatment and for several mo after completion of therapy
- Teach patient to report immediately urine retention, absence of urine, dyspnea, bleeding, jaundice, signs of pulmonary toxicity

### Evaluation

**Positive therapeutic outcome**
- Prevention of rapid division of malignant cells

**⚠ HIGH ALERT**

## mitoXANtrone (Rx)

(mye-toe-zan'trone)
**Novantrone**
*Func. class.:* Antineoplastic-antibiotic, immunomodulator
*Chem. class.:* Synthetic anthraquinone

**Do not confuse:** mitoXANtrone/mitoMYcin/mithramycin/mitotane

**ACTION:** DNA reactive agent; cytocidal effect on both proliferating and nonproliferating cells; topoisomerase II inhibitor; a vesicant

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Acute myelogenous leukemia (adult), relapsed leukemia, breast cancer, multiple sclerosis; used with steroids to treat bone pain (advanced prostate cancer); multiple sclerosis

**Unlabeled uses:** Liver malignancies, non-Hodgkin's lymphoma, breast cancer, ALL, bone marrow ablation, CLL, hepatocellular cancer, ovarian cancer, pleural effusion, stem cell transplant preparation

## CONTRAINDICATIONS

Pregnancy, hypersensitivity

**Precautions:** Breastfeeding, children, myelosuppression, cardiac/renal/hepatic disease, gout

**BLACK BOX WARNING:** Secondary malignancy, neutropenia, intrathecal administration, extravasation, heart failure

## DOSAGE AND ROUTES

### Acute nonlymphatic leukemia/induction

**Adult: IV** INF 12 mg/m$^2$/day on days 1-3, and 100 mg/m$^2$ cytosine arabinoside × 7 days as a CONT 24-hr INF

### Consolidation

**Adult: IV** INF 12 mg/m$^2$ given as a short 5-15 min INF for 2 days with cytarabine × 5 days

### Advanced prostate cancer

**Adult: IV** 12-14 mg/m$^2$ as a single dose or short INF q21day

### Multiple sclerosis, relapsing

**Adult: IV** INF 12 mg/m$^2$ as a 5-15 min INF q3mo, cumulative lifetime dose 140 mg/m$^2$

**Available forms:** Inj 2, 10, 12.5, 15 mg/ml

### Implementation

- Do not mix with any other product
- Avoid contact with skin, since medication is very irritating; wash completely to remove
- Give fluids **IV** or PO before chemotherapy to hydrate patient
- Give antacid before oral agent; give product after evening meal, before bedtime; provide antiemetic 30-60 min before giving product and prn to prevent vomiting; administer antibiotics for prophylaxis of infection
- Give topical or systemic analgesics for pain
- Liquid diet: carbonated beverages; gelatin may be added if patient is not nauseated or vomiting
- Sol should be prepared by qualified personnel only under controlled conditions in a biological cabinet using mask, gloves, gown
- Use Luer-Lok tubing to prevent leakage; do not let sol come in contact with skin; if contact occurs, wash well with soap and water

**Direct IV route**
- Give after diluting with 50 ml or more of 0.9% NaCl or $D_5W$; give over 3-5 min into running **IV** of $D_5W$ or 0.9% NaCl

**Intermittent IV infusion route**
- May be diluted further in $D_5W$, 0.9% NaCl and run over 15-30 min; check for extravasation

**Continuous IV infusion route**
- Give over 24 hr

**Y-site compatibilities:** Acyclovir, alemtuzumab, alfentanil, allopurinol, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, atracurium, bivalirudin, bleomycin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, CARBOplatin, carmustine, caspofungin, cefoTEtan, ceftizoxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, codeine, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, DAUNOrubicin citrate liposome, dexmedetomidine, dexrazoxane, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, erythromycin l, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, hydrALAZINE, hydrocortisone sodium succinate, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, inamrinone, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol,

leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, metaraminol, methohexital, methotrexate, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mivacurium, morphine sulfate, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, polymyxin B, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine hydrochloride, propranolol, quiNIDine gluconate, quinupristin-dalfopristin, ranitidine, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, zidovudine, zoledronic acid

**Y-site incompatibilities:** PACLitaxel

**Additive incompatibilities:** Heparin

**Solution compatibilities:** $D_5$/0.9 NaCl, $D_5W$, 0.9% NaCl

## ADVERSE EFFECTS

**CNS:** Headache, seizures, fatigue
**CV:** HF, cardiomyopathy, dysrhythmias
**EENT:** Conjunctivitis, blue-green sclera, blurred vision
**GI:** *Nausea, vomiting, diarrhea, anorexia, mucositis,* hepatotoxicity, abdominal pain, constipation, jaundice
**GU:** Amenorrhea, menstrual disorders
**HEMA:** Thrombocytopenia, leukopenia, myelosuppression, anemia, secondary leukemia
**INTEG:** *Rash,* necrosis at inj site, alopecia, dermatitis, thrombophlebitis at inj site
**MISC:** Fever, hyperuricemia, infections
**RESP:** Cough, dyspnea
**SYST:** Tumor lysis syndrome, sepsis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed |
| **Distribution** | Widely distributed, protein binding 78% |
| **Excretion** | Bile; kidneys, unchanged (<10%) |
| **Half-life** | 23-215 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Digoxin, phenytoin: increased mitoXANtrone effects
Radiation: increased toxicity, bone marrow suppression
Trastuzumab: increased adverse reactions

### Drug classifications

Anticoagulants, NSAIDs: increased bleeding risk
Antineoplastics: increased toxicity, bone marrow suppression
Live virus vaccines: increased adverse reactions

### Drug/herb

Black cohosh, dong quai: avoid use

### Drug/lab test

Increased: LFTs, uric acid
Decreased: Hct/Hgb, platelets, WBC

## NURSING CONSIDERATIONS

### Assessment

- **Multiple sclerosis:** obtain baseline multigated angiogram, left ventricular ejection fraction (LVEF) if symptoms of HF occur, repeat LVEF or if cumulative dose is >100 mg/m$^2$; do not administer to patients who have received a lifetime dose of ≥140 mg/m$^2$ or if LVEF is <50% or significant decrease in LVEF
- Do not administer in multiple sclerosis if neutrophils <1500/mm$^3$
- Obtain pregnancy test in all women of childbearing age

**BLACK BOX WARNING: Cardiotoxicity**
Monitor ECG; watch for ST-T wave changes, low QRS and T, possible dysrhythmias (sinus tachycardia, heart block, PVCs); also monitor ECHO, MUGA, chest x-ray, RAI angiography to assess ejection fraction before, during treatment; product is cardiotoxic: may develop during treatment or months to years after treatment; risk is greater in cumulative dose >140 mg/m$^2$

- Assess buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia; obtain prescription for viscous lidocaine (Xylocaine)
- **Assess symptoms indicating severe allergic reaction:** rash, pruritus, urticaria, purpuric skin lesions, itching, flushing
- Assess tachypnea, ECG changes, dyspnea, edema, fatigue
- Monitor CBC, differential, platelet count weekly; withhold product if WBC is <1500/mm$^3$;

leukopenia, neutropenia, thrombocytopenia are expected—leukocyte nadir 10-14 days, recovery in 2-3 wk
• Assess for increased uric acid levels, swelling, joint pain primarily in extremities; patient should be well hydrated to prevent urate deposits
• Monitor renal function tests: BUN, creatinine, urine CCr before, during therapy; determine I&O ratio
• Monitor temp q4hr: may indicate beginning of infection
• **Hepatotoxicity:** monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; dose reduction needed in hepatic disease; check for jaundiced skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea
• **Assess for bleeding:** hematuria, stool guaiac, bruising or petechiae, mucosa or orifices q8hr; check for inflammation of mucosa, breaks in skin
• Identify effects of alopecia on body image; discuss feelings about body changes
• **Assess for multiple sclerosis:** obtain MUGA, LVEF baselines; repeat LVEF if symptoms of HF occur or if cumulative dose is >100 mg/m$^2$; do not give to patients who have received a lifetime dose of ≥140 mg/m$^2$ or if LVEF is <50% or significant LVEF

**BLACK BOX WARNING:** Assess for secondary acute myelogenous leukemia (AML), which can develop after taking this product

• **Pregnancy/breastfeeding:** Do not use in pregnancy or breastfeeding

### Patient/family education

• Encourage patient to rinse mouth tid-qid with water, club soda; brush teeth bid-qid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss
• Teach patient to avoid use of products containing aspirin or NSAIDs, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
• Caution patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath)
• Inform patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture
• Caution patient not to have any vaccinations without the advice of the prescriber; serious reactions can occur
• Advise patient that contraception is needed during treatment and for several mo after completion of therapy
• Teach patient to notify prescriber if pregnancy is planned or suspected
• Advise patient that sclera, urine may turn blue or green
• Advise patient to increase fluids to 2-3 L/day unless contraindicated
• Teach patient to avoid crowds, persons with infections
• Teach patient to report immediately bleeding, dyspnea, possible infections, seizure, jaundice, fever, cough or dyspnea

### Evaluation

**Positive therapeutic outcome**
• Prevention of rapid division of malignant cells

## modafinil (Rx)

(mo-daf'i-nil)
**Alertec, Provigil**
*Func. class.:* CNS stimulant
*Chem. class.:* Racemic compound
**Controlled substance IV**

**ACTION:** Similar action as sympathomimetics; does not alter release of dopamine, norepinephrine

**Therapeutic outcome:** Ability to stay awake

**USES:** Narcolepsy, shift work sleep disturbance, obstructive sleep apnea

**Unlabeled uses:** Fatigue in MS, ADHD, symptoms of major depression

## CONTRAINDICATIONS

Hypersensitivity, ischemic heart disease, left ventricular hypertrophy, chest pain, dysrhythmias

**Precautions:** Pregnancy, breastfeeding, child <16 yr, geriatric, unstable angina, history of MI, severe hepatic disease

## DOSAGE AND ROUTES

### To improve wakefulness with daytime sleepiness

**Adult/adolescent ≥16 yr:** PO 200 mg qd

### Hepatic dose (severe hepatic disease)

**Adult:** PO 100 mg qd

### Multiple sclerosis fatigue (unlabeled)

**Adult/elderly/child ≥6 yr:** PO 200-400 mg/day in the AM

### Major depression symptoms (unlabeled)

**Adult:** PO 100 mg/day, max 400 mg/day

### Available forms:

Tabs 100, 200 mg

### Implementation

- Give 1 hr before start of shift work, or in the AM for those with narcolepsy or sleep apnea
- Store at room temperature
- Give without regard to food

## ADVERSE EFFECTS

**CNS:** *Headache,* anxiety, cataplexy, depression, dizziness, insomnia, amnesia, confusion, ataxia, tremors, paresthesia, dyskinesia, suicidal ideation

**CV:** Dysrhythmias, hyper/hypotension, chest pain, vasodilation

**EENT:** Change in vision, *rhinitis,* pharyngitis, epistaxis

**GI:** Nausea, vomiting, changes in LFTs, anorexia, diarrhea, thirst, mouth ulcers

**GU:** Ejaculation disorder, urinary retention, albuminuria

**HEMA:** Eosinophilia

**INTEG:** Rash, dry skin, herpes simplex, Stevens-Johnson syndrome

**MISC:** Infection, hyperglycemia, neck pain

**RESP:** *Dyspnea,* lung changes

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid |
| **Distribution** | 60% protein binding |
| **Metabolism** | Liver (90%) |
| **Excretion** | Unknown |
| **Half-life** | 15 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CycloSPORINE, theophylline: decreased effects of these drugs

Methylphenidate: delayed effect of modafinil by 1 hr

### Drug classifications

Antidepressants (tricyclics): increased effects

CYP3A4 inhibitors (azole antibiotics, some SSRIs): altered levels of these agents, reaction difficult to predict

CYP2C19 substrates (diazepam, phenytoin, some tricyclics): increased levels of these agents

CYP3A4 inducers (carBAMazepine, phenytoin, rifampin; cycloSPORINE, theophylline): altered levels of these agents

Hormonal contraceptives: decreased effects

### Drug/herb

Coffee, cola nut, guarana, mate, tea: increased stimulation

### Drug/lab test

Increased: eosinophils, glucose, LFTs

## NURSING CONSIDERATIONS

### Assessment

- For narcolepsy, shift work, history of sleep apnea
- For depression, suicidal ideation
- Monitor B/P in those with hypertension
- **Stevens-Johnson syndrome:** Assess for rash, fever, fatigue, blisters; discontinue immediately if these occur, provide supportive therapy
- **Beers:** Avoid in older adults, CNS stimulant effects
- **Pregnancy/breastfeeding:** Only use in pregnancy if clearly needed, use cautiously in breastfeeding, excretion unknown

### Patient/family education

- Advise patient to take only as directed; may be taken with or without food
- Advise patient to use other form of contraception during and at least 30 days after discontinuing medication, if using hormonal birth control; advise patient to notify prescriber if pregnancy is planned or suspected or if breastfeeding
- Advise patient to notify prescriber of allergic reaction, tremors, confusion
- Teach patient to avoid all OTC medications unless approved by prescriber
- Teach patient to avoid hazardous activities until drug effect is known

### Evaluation

**Positive therapeutic outcome**

- Ability to stay awake

## montelukast (Rx)

(mon-teh-loo'kast)

**Singulair**

*Func. class.:* Bronchodilator

*Chem. class.:* Leukotriene antagonist, cysteinyl

**Do not confuse:** Singulair/SINEquan

**ACTION:** Inhibits leukotriene ($LTD_4$) formation; leukotrienes exert their effects by increasing neutrophil, eosinophil migration; aggregation of

neutrophils, monocytes; smooth muscle contraction, capillary permeability; these actions further lead to bronchoconstriction, inflammation, edema

**Therapeutic outcome:** Ability to breathe with ease

## USES:
Chronic asthma in adults and children, seasonal allergic rhinitis, bronchospasm prophylaxis

**Unlabeled uses:** Chronic urticaria

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children <6 yr, acute attacks of asthma, alcohol consumption, severe hepatic disease, corticosteroid withdrawal, phenylketonuria, suicidal ideation, depression

## DOSAGE AND ROUTES
### Asthma
**Adult and child ≥15 yr:** PO 10 mg/day PM
**Child 6-14 yr:** PO 5 mg chew tabs/day PM
**Child 2-5 yr:** PO (chew tabs, granules) 4 mg/day
**Child 12-23 mo:** PO 1 packet of granules taken PM

### Exercise-induced bronchoconstriction
**Adult/child ≥6 yr:** PO 10 mg 2 hr prior to exercise; do not take another dose within 24 hr

**Available forms:** Tabs 10 mg; chewable tabs 4, 5 mg; oral granules 4 mg/packet

### Implementation
**PO route**
- Give PO in PM daily for all uses except exercise-induced bronchoconstriction; then take 2 hr prior to exercise
- Do not open packet until ready to use; mix whole dose, give within 15 min
- Granules may be given directly in mouth or mixed with a spoonful of soft food (carrots, applesauce, ice cream, rice)

## ADVERSE EFFECTS
**CNS:** Dizziness, fatigue, headache, behavior changes, seizures, agitation, anxiety, depression, fever, hallucinations, drowsiness, suicidal ideation, memory impairment, hostility, somnambulism
**GI:** Abdominal pain, dyspepsia, nausea, vomiting, diarrhea, pancreatitis
**HEMA:** Thrombocytopenia
**INTEG:** Rash, pruritus, erythema
**MS:** Asthenia, myalgia, muscle cramps
**RESP:** Influenza, cough, nasal congestion
**SYST:** Anaphylaxis, angioedema, Churg-Strauss syndrome, Stevens-Johnson syndrome, toxic epidermal necrolysis

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Protein binding 99% |
| **Metabolism** | Liver |
| **Excretion** | Bile |
| **Half-life** | 2.7-5.5 hr |

### Pharmacodynamics
| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3-4 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Rifabutin, rifapentine, carBAMazepine, fosphenytoin, phenytoin, rifampin: decreased montelukast levels

### Drug classifications
Barbiturates: decreased montelukast levels

### Drug/herb
Tea (green, black), guarana: increased stimulation

### Drug/lab test
Increased: ALT, AST

## NURSING CONSIDERATIONS
### Assessment
- Assess adult patients carefully for symptoms of Churg-Strauss syndrome (rare), including eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications and/or neuropathy
- Monitor CBC, blood chemistry during treatment
- Assess for behavior changes and suicidal ideation, other neuropsychiatric reactions
- **Severe hepatic disease:** use cautiously
- **Anaphylaxis, Stevens-Johnson syndrome:** Assess for rash, fever, blisters, fatigue, muscle/joint aches, if these occur discontinue, provide supportive therapy
- **Pregnancy/breastfeeding:** Use in pregnancy only if clearly needed, use cautiously in breastfeeding, excretion unknown

### Patient/family education
- Advise patient to avoid hazardous activities; dizziness may occur
- Teach patient that product is not to be used for acute asthma attacks
- Advise patient to avoid NSAIDs if sensitive to aspirin

• Advise patient to continue to use inhaled β-agonists if exercise-induced asthma occurs
• **Granules:** instruct patient to take directly by mouth or mixed in a spoonful of room temperature soft food (use only applesauce, carrots, rice, or ice cream); use within 15 min of opening packet, discard used portions

### Evaluation

**Positive therapeutic outcome**
• Increased ease of breathing
• Decreased bronchospasm

**⚠ HIGH ALERT**

## morphine (Rx)

(mor'feen)
**Astramorph PF, Depo Dur, Infumorph PF, Kadian, M.O.S. 🍁, Duramorph PH, Statex 🍁**
*Func. class.:* Opioid analgesic
*Chem. class.:* Alkaloid
**Controlled substance schedule II**

**Do not confuse:** morphine/HYDROmorphone, MS Contin/oxyCONTIN

**ACTION:** Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors

**Therapeutic outcome:** Decreased pain

**USES:** Moderate to severe pain

**Unlabeled uses:** Agitation, bone/dental pain, dyspnea in end-stage cancer or pulmonary disease, sedation induction, rapid-sequence intubation

## CONTRAINDICATIONS

Hypersensitivity, addiction (opioid/alcohol), hemorrhage, bronchial asthma, increased ICP, paralytic ileus, hypovolemic shock, MAOI therapy

**BLACK BOX WARNING:** Respiratory depression

**Precautions:** Pregnancy, breastfeeding, children <18 yr, geriatric, addictive personality, acute MI, severe heart disease, renal/hepatic disease, bowel impaction, abrupt discontinuation, seizures

**BLACK BOX WARNING:** Accidental exposure, epidural/intrathecal/IM/subcut administration, opioid-naive patients, substance abuse

## DOSAGE AND ROUTES

### Acute moderate to severe pain

#### >> PO regular-release

**Adult ≥50 kg:** Initially, 10-30 mg q3-4hr as needed
**Adult <50 kg/geriatric patient:** May require lower doses and/or extended dosing intervals; doses should be titrated carefully
**Child/infant ≥6 mo:** 0.2-0.5 mg/kg q4-6hr as needed
**Infant <6 mo/neonate:** 0.1 mg/kg PO q3-4hr

#### >> IV/IM/subcut

**Adult ≥50 kg:** 2.5-15 mg q2-6hr as needed, titrate or a loading dose of 0.05-0.1 mg/kg **IV**, followed by 0.8-10 mg/hr **IV**, titrate
**Adult <50 kg/geriatric patient:** May require lower doses and/or extended dosing intervals 0.1 mg/kg q3-4hr, titrate
**Child/infant ≥6 mo:** 0.05-0.2 mg/kg q2-4hr, titrate to relief max initial doses 15 mg/dose
**Neonate/infant <6 mo:** 0.03-0.05 mg/kg q3-8hr, titrate to relief

#### >> Epidural (morphine sulfate injection, but NOT DepoDur)

**Adult:** Initially, 5 mg in the lumbar region; if pain relief does not occur in 1 hr, give 1-2 mg epidurally; max 10 mg/24 hr; **continuous epidural infusion,** 2-4 mg/24 hr; may give another 1-2 mg

#### >> Intrathecal dosage (morphine sulfate injection, but NOT DepoDur)

Do not inject >2 ml of the 0.5 mg/ml or 1 ml of the 1 mg/ml ampule
**Adult:** 0.2-1 mg in the lumbar area as a single dose or to establish dosage for continuous intrathecal infusion; repeated injections are not recommended

#### >> Rectal dosage

**Adult:** 10-20 mg PR q4hr, as needed
**Child:** Individualize

### Chronic moderate and severe pain

• Do not use extended-release cap or tab as prn analgesics, for acute pain, or if the pain is mild or not expected to persist for an extended period of time. Use for postoperative pain only if the patient is receiving chronic opioid therapy prior to surgery or if the postoperative pain is expected to be moderate to severe and persist for an extended period of time. Do not use controlled-release tablets (MS Contin) immediately after surgery (for the first 24 hr) in patients not previously taking the drug

• **Do not use in opioid-naive patients:** 100 mg, 130 mg, 150 mg, 200 mg morphine extended-release capsules (Kadian), 100 mg, 200 mg morphine control-release tablets (MS Contin); patients considered opioid tolerant are those who are taking at least 60 mg/day oral morphine, 30 mg/day of oral oxyCODONE, 8 mg/day oral HYDROmorphone, or an equal dose of another opioid, for a wk or longer

### >> PO [extended-release tab (MS Contin, Oramorph SR) or caps (Kadian)] (opiate naïve)

**Adult:** 15-30 mg q12hr (tabls); 10 mg bid or 20 mg/day (Kadian); titrate; Kadian should be increased ≤20 mg q1-2 days, taper gradually; to discontinue, gradually decrease Kadian over 2-4 days

**Child (unlabeled):** 0.3-0.6 mg/kg q12hr (tablets)

### >> IV/subcut route (opiate naïve)

**Adult: IV** 2-10 mg loading dose, then 0.8-10 mg/hour **IV,** titrate; maintenance 0.8-80 mg/hour **IV**

**Child/infant ≥6 mo: IV** Initially, 0.04-0.07 mg/kg/hr (range: 0.025-2.6 mg/kg/hr), **Subcut inf** 0.025-0.179 mg/kg/hr

**Infant <6 mo/neonate: IV** 0.01 mg/kg/hour **IV,** initially, infusion rates max 0.015-0.02 mg/kg/hour **IV**

## Breakthrough pain in patients receiving long-acting or continuous infusion morphine

### >> PO (regular-release)

**Adult/child:** The dose is usually one-fourth to one-third the 8- to 12-hour extended-release dose q4-6hr as needed

**Adult/child:** For PCA, intermittent dose is usually 25%-30% of the hourly rate IV/SC q6-15min as needed; intermittent IV injection dosage is 25%-30% of the hourly rate given IV/SC q1-2hr as needed

**Available forms: HCL:** suppositories 10, 20, 30 mg; syrup 1, 5, 10, 20, 50 mg/ml; tabs 10, 20, 40, 60 mg; **Sulfate:** caps ext rel microgranules 10, 15, 30, 60, 100, 200 mg; caps ext rel pellets (Kadian) 10, 20, 30, 40, 50, 60, 70, 80, 100, 130, 150, 200 mg; drops: 20, 50 mg/ml; injection epidural: 0.5, 1, 10, 15 mg/ml; injection (Preservative): 0.5, 1, 2, 10, 15, 25, 50 mg/ml; injection (Corpuject/prefilled syringes): 2, 4, 8, 10, 15 mg/ml; oral solution 10, 20 mg/ml, 20 mg/ml (concentrate); suppositories 5, 10, 20, 30 mg; syrup 1, 5, 10 mg/ml; tab 5, 10, 15, 25, 30, 50 mg; tabs ext rel 15, 30, 60, 100, 200 mg

## Implementation

### >> PO route

• Give with food or milk to minimize GI effects

**Immediate-release cap**

• May swallow whole, or opened and contents sprinkled on cool food (pudding or applesauce), or added to juice (given immediately) or delivered via gastric or NG tube by either adding to or following with liquid

**Extended-release and controlled-release tabs**

• Swallow whole; do not crush, break, dissolve, or chew.

• The use of MS Contin 100 mg or 200 mg tabs should be limited to opioid-tolerant patients requiring oral doses equivalent to ≥200 mg/day. Use of the 100 mg or 200 mg tablet is only recommended for patients who have already been titrated to a stable analgesic regimen using lower strengths of MS Contin or other opioids

**Sustained-release caps**

• Swallow; do not chew, crush, or dissolve

• Caps may be opened and contents sprinkled on applesauce (at room temperature or cooler) immediately prior to ingestion. Do not chew, crush, or dissolve the pellets/beads inside the cap. The applesauce should be swallowed without chewing. If the pellets/beads are chewed, an immediate release of a potentially fatal morphine dose may be delivered. Rinse mouth to ensure all the pellets/beads have been swallowed. Do not separate applesauce into separate doses; the entire portion should be taken. Discard unused portion

• Kadian caps may be given through a 16 French gastrostomy tube; flush with water, and sprinkle the cap contents into 10 ml of water. Using a funnel and a swirling motion, pour the pellets and water into the tube. Rinse the beaker with 10 ml of water, and pour the water into the funnel. Repeat until no pellets remain in the beaker

• Do NOT administer Kadian through a nasogastric tube

• Consumption of alcohol while taking the ext rel capsules may result in the rapid release and absorption of a potentially fatal dose of morphine

• Kadian 100 mg, 130 mg, 150 mg or 200 mg caps should be given only to opioid tolerant patients

• Begin with immediate release products and titrate to correct dose and convert to a sustained release product

**Oral liquid**
• Check dose prior to use; many concentrations of oral sol are available; may be diluted in fruit juice; protect from light

## >> Injectable administration

• Visually inspect for particulate matter and discoloration before use; do not use if a precipitate is present after shaking; do not use the Duramorph solution if a precipitate is present or if the color is darker than pale yellow

**IV route**
• Prior or to use, an opiate antagonist and emergency facilities should be available
• Do not use the highly concentrated morphine injections (i.e., 10-25 mg/ml) for IV, IM, or SC administration of single doses. These injection solutions are intended for use via continuous, controlled-microinfusion devices

**Direct IV route**
• Dilute dose with ≥5 ml of sterile water for injection or NS injection
• Inject 2.5-15 mg directly into a vein or into the tubing of a freely flowing IV solution over 4-5 min; do not give rapidly

**Continuous IV infusion**
• Dilute in 5% dextrose; use a controlled-infusion device
• Adjust dose and rate based on patient response

**Patient-controlled analgesia (PCA)**
• A compatible patient-controlled infusion device must be used
• Dilute solutions to obtain a concentration of 1 or 10 mg/ml for ease in calculations and programming of PCA pumps
• Adjust dose and rate based on patient response. Consult the patient-controlled infusion device manual for directions on rate of infusion

**Subcut route**
• Inject taking care not to inject intradermally

**Continuous SC infusion**
• Morphine is not approved by the FDA for subcut use
• Dilute to an appropriate concentration in $D_5W$; administer using a portable, controlled, subcut device; adjust rate based on patient response and tolerance
• Max subcut rate 2 ml/hr/site

**Intrathecal/epidural route**
• Morphine sulfate injection is not interchangeable with morphine sulfate extended-release liposome injection (DepoDur), DepoDur is only for epidural administration
• Do not use Infumorph (10 mg/ml or 25 mg/ml) for single-dose neuraxial injection because lower doses can be more reliably administered with Duramorph (0.5 mg/ml or 1 mg/ml)

## >> Rectal route

• Moisten the suppository with water prior to insertion. If suppository is too soft, chill in the refrigerator for 30 min or run cold water over it before removing the wrapper

## >> Oral solid formulations

**Immediate-release capsules administration**
• May be swallowed whole or opened and the contents sprinkled on cool food such as pudding or applesauce
• Capsule contents may be added to juice and administered immediately or delivered via gastric or NG tube by either adding to or following with liquid

## >> Extended-release and controlled-release tablets administration

• Swallow whole; do not crush, break, dissolve, or chew
• The use of MS Contin 100 mg or 200 mg tablets should be limited to opioid-tolerant patients requiring oral doses equivalent to ≥200 mg/day. Use of the 100 mg or 200 mg tablet is only recommended for patients who have already been titrated to a stable analgesic regimen using lower strengths of MS Contin or other opioids

**Sustained-release capsule administration**
• Capsules should be swallowed; do not chew, crush, or dissolve
• Capsules may be opened and the contents sprinkled on applesauce (at room temperature or cooler) immediately prior to ingestion; no other food has been tested. Do not chew, crush, or dissolve the pellets/beads inside the capsule. The applesauce needs to be swallowed without chewing. If the pellets/beads are chewed, an immediate release of a potentially fatal morphine dose may be delivered. Rinse mouth to ensure all the pellets/beads have been swallowed. Do not separate applesauce into separate doses; the entire portion should be taken. Discard any unused portion of the capsules after the contents have been sprinkled on the applesauce
• Kadian capsules may be administered through a 16 French gastrostomy tube. Flush the tube with water, and sprinkle the capsule contents into 10 ml of water. Using a funnel and a swirling motion, pour the pellets and water into the tube. Rinse the beaker with 10 ml of water, and pour the water into the funnel. Repeat until no pellets remain in the beaker
• Do NOT administer Kadian through a nasogastric tube
• Consumption of alcohol while taking the extended-release capsules may result

in the rapid release and absorption of a potentially fatal dose of morphine
• Kadian 100 mg, 130 mg, 150 mg or 200 mg capsules should be limited to opioid tolerant patients

## >> Oral liquid formulations

**Oral solution administration**

• Carefully check dose prior to dispensing medication as many concentrations of morphine oral solution are available
• May be diluted in fruit juice prior to administration
• Protect from light

**Injectable administration**

• Visually inspect parenteral products for particulate matter and discoloration prior to administration whenever solution and container permit. Unopened solutions should be discarded if a precipitate is present that does not disappear with shaking. Do not use the Duramorph solution if a precipitate is present or if the color is darker than pale yellow

## >> Intravenous administration

• Prior to administration, an opiate antagonist and facilities for administration of oxygen and control of respiration should be available
• Do not use the highly concentrated morphine injections (i.e., 10-25 mg/ml) for IV, IM, or SC administration of single doses. These injection solutions are intended for use via continuous, controlled-microinfusion devices

**Direct IV injection**

• Dilute appropriate dose with at least 5 ml of sterile water for injection or NS injection
• Inject 2.5-15 mg directly into a vein or into the tubing of a freely flowing IV solution over 4-5 minutes. Rapid IV injection of morphine may result in an increased frequency of adverse effects. For example, the maximum CNS effects occur 30 minutes after administration. Rapid intravenous administration could result in an overdose

**Continuous IV infusion**

• Dilute in 5% dextrose
• Administer using a controlled-infusion device
• Adjust dose and rate based on patient response

**Patient-controlled analgesia (PCA)**

• A compatible patient-controlled infusion device must be used
• Dilute solutions to obtain morphine concentration of 1 or 10 mg/ml for ease in calculations and programming of PCA pumps
• Adjust dose and rate based on patient response. Consult the patient-controlled infusion device operator's manual for directions on administering the drug at the desired rate of infusion

## >> Subcutaneous administration

• Inject subcutaneously taking care not to inject intradermally

**Continuous SC infusion**

• Morphine is not approved by the FDA for subcutaneous administration
• Dilute to an appropriate concentration in $D_5W$ and administer using a portable, controlled, subcutaneous infusion device. Adjust rate based on patient response and tolerance
• Maximum SC rate of infusion is 2 ml/hour/site

## >> Intrathecal administration

• Intrathecal dose is approximately one-tenth (1/10) the epidural dose
• Morphine sulfate injection is not interchangeable with morphine sulfate extended-release liposome injection (DepoDur). DepoDur is only for epidural administration (see below)
• Do not use Infumorph (10 mg/ml or 25 mg/ml) for single-dose neuraxial injection because lower doses can be more reliably administered with Duramorph (0.5 mg/ml or 1 mg/ml)
• Epidural or intrathecal administration should only be used by specially trained healthcare professionals
• May be given as intermittent bolus, continuous infusion, or as patient-controlled epidural analgesia. Infumorph is only indicated for intrathecal or epidural infusion; Infumorph is not recommended for single-dose intravenous, intramuscular, or subcutaneous administration because of the very large amount of morphine in the ampul and the associated overdosage risk
• Prior to administration, an opiate antagonist and facilities for administration of oxygen and control of respiration should be available. The patient should be in a setting where adequate monitoring is possible. Immediate availability of naloxone injection and resuscitative equipment is also needed during Infumorph reservoir refilling or reservoir manipulation
• Placement of epidural catheter and administration should be at a site near the dermatomes covering the field of pain to decrease dose requirements and increase specificity. For example, for thoracic surgery placement at T2-T8, upper abdominal surgery, T4-L1, lower abdominal surgery, T10-L3, upper extremity surgery, C2-C8 and lower extremity surgery, T12-L3
• Visually inspect parenteral products for particulate matter and discoloration prior to administration whenever solution and container permit. Unopened Infumorph solution should be discarded if a precipitate is present that does not disappear with shaking or if it is not colorless or pale yellow. Do not use the Duramorph

solution if a precipitate is present or if the color is darker than pale yellow

**Intrathecal injection (morphine sulfate injection)**

- No more than 2 or 1 ml of the injection containing 0.5 or 1 mg/ml, respectively, should be injected intrathecally
- After ensuring proper placement of the needle or catheter, inject appropriate dose intrathecally. Monitor patient in a fully equipped and staffed environment for at least 24 hr after each dose, as severe respiratory depression may occur up to 24 hr after drug administration. Repeated intrathecal injections are not recommended other than for establishing initial intrathecal dosage for continuous intrathecal infusion

**Continuous intrathecal infusion (morphine sulfate injection)**

- Intrathecal dose is approximately one-tenth (1/10) the epidural dose. Epidural dose is usually considered to be one-tenth (1/10) the IV dose
- A controlled-infusion device must be used. For highly concentrated injections, an implantable controlled-microinfusion device is used. Patients should be monitored in a fully equipped and staffed environment for several days following implantation of the device
- If dilution of the injection is necessary, NS injection is recommended
- The infusion device reservoir should only be filled by fully trained and qualified healthcare professionals. Strict aseptic technique must be used. Withdraw dose from the ampul through a 5-µm (or smaller pore diameter) microfilter to avoid contamination with glass or other particles. Ensure proper placement of the needle when filling the reservoir to avoid accidental overdosage
- To avoid exacerbation of severe pain and/or reflux of CSF into the reservoir, depletion of the reservoir should be avoided

## >> Other injectable administration

**Epidural administration**

- Intrathecal dose is approximately one-tenth (1/10) the epidural dose. Epidural dose is usually considered to be one-tenth (1/10) the IV dose
- Morphine sulfate injection is not interchangeable with morphine sulfate extended-release liposome injection (DepoDur). DepoDur is only for epidural administration (see below)
- Do not use Infumorph (10 mg/ml or 25 mg/ml) for single-dose neuraxial injection because lower doses can be more reliably administered with Duramorph (0.5 mg/ml or 1 mg/ml)
- Epidural administration should only be used by specially trained healthcare professionals
- May be given as intermittent bolus, cont inf, or as patient-controlled epidural analgesia. Infumorph is only indicated for intrathecal or epidural infusion; Infumorph is not recommended for single-dose intravenous, intramuscular, or subcutaneous administration because of the very large amount of morphine in the ampul and the associated overdosage risk
- Prior to administration, an opiate antagonist and facilities for administration of oxygen and control of respiration should be available. The patient should be in a setting where adequate monitoring is possible. Immediate availability of naloxone injection and resuscitative equipment is also needed during Infumorph reservoir refilling or reservoir manipulation
- Placement of epidural catheter and administration should be at a site near the dermatomes covering the field of pain to decrease dose requirements and increase specificity. For example, for thoracic surgery placement at T2-T8, upper abdominal surgery, T4-L1, lower abdominal surgery, T10-L3, upper extremity surgery, C2-C8 and lower extremity surgery, T12-L3

**Epidural injection (morphine sulfate injection)**

- After ensuring proper placement of the needle or catheter, inject appropriate dose into the epidural space. Monitor patient in a fully equipped and staffed environment for at least 24 hr after each dose, as severe respiratory depression may occur up to 24 hr after drug administration

**Continuous epidural infusion (morphine sulfate injection)**

- Intrathecal dose is approximately one-tenth (1/10) the epidural dose. Epidural dose is usually considered to be one-tenth (1/10) the IV dose
- A controlled-infusion device must be used. For highly concentrated injections, an implantable controlled-microinfusion device is used. Patients should be monitored in a fully equipped and staffed environment for several days following implantation of the device
- If dilution of the injection is necessary, NS injection is recommended
- The infusion device reservoir should only be filled by fully trained and qualified healthcare professionals. Strict aseptic technique must be used. Withdraw dose from the ampul through a 5-µm (or smaller pore diameter) microfilter to avoid contamination with glass or other particles. Ensure proper placement of the needle when filling the reservoir to avoid accidental overdosage
- To avoid exacerbation of severe pain and/or reflux of CSF into the reservoir, depletion of the reservoir should be avoided

### >> Epidural administration (morphine sulfate extended-release liposome injection [DepoDur] ONLY)

- Morphine sulfate ext rel liposome injection (DepoDur) is not interchangeable with other morphine sulfate injections
- DepoDur is only for epidural administration. Do not administer by any other parenteral route
- Epidural administration should only be used by specially trained healthcare professionals
- Prior to administration, an opiate antagonist and facilities for administration of oxygen and control of respiration should be available. The patient should be in a setting where adequate monitoring is possible. Monitor patient in a fully equipped and staffed environment for at least 48 hr after each dose, as severe respiratory depression may occur
- Invert the vial to resuspend particles immediately before withdrawal. Administer DepoDur within 4 hr after withdrawal from the vial when kept at controlled room temperature 59-86° F (15-30° C). The product does not contain any bacteriostatic agents or preservatives. Do not heat- or gas-sterilize

**Epidural injection [morphine sulfate extended-release liposome injection (DepoDur)]**

- Placement of epidural needle or catheter and administration should be at the lumbar level. Due to lack of study data, administration of DepoDur at the thoracic level or higher is not recommended
- Determine proper needle or catheter placement by aspiration to check for blood or cerebrospinal fluid and/or by administration of a test dose of 3 ml of 1.5% preservative-free lidocaine and EPINEPHrine (1:200,000). If tachycardia or sudden onset of segmental anesthesia occurs, the needle or catheter is in the intrathecal space and thus, needs to be repositioned. If a test dose is given, flush the catheter with 1 ml of preservative-free normal saline injection and wait at least 15 minutes after test dose administration before administration of DepoDur
- Inject DepoDur at the lumbar level undiluted or diluted up to 5 ml total volume with preservative-free normal saline. During administration, do not use an inline filter or mix DepoDur with any medication. Additionally, do not administer any medication into the epidural space within 48 hr of DepoDur receipt

### >> Rectal administration

- Instruct patient on proper use of suppository (see Patient Information)
- Moisten the suppository with water prior to insertion. If suppository is too soft because of storage in a warm place, chill in the refrigerator for 30 minutes or run cold water over it before removing the wrapper

**Y-site compatibilities:** Acetaminophen, aldesleukin, allopurinol, amifostine, amikacin, aminophylline, amiodarone, atenolol, atracurium, aztreonam, bumetanide, calcium chloride, cefamandole, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, ceftAZidime, ceftizoxime, ceftRIAXone, cefuroxime, cephalothin, chloramphenicol, cladribine, clindamycin, cyclophosphamide, cytarabine, dexamethasone, digoxin, diltiazem, DOBUTamine, DOPamine, doxycycline, enalaprilat, EPINEPHrine, erythromycin, esmolol, etomidate, famotidine, fentaNYL, filgrastim, fluconazole, fludarabine, foscarnet, gentamicin, granisetron, heparin, hydrocortisone, HYDROmorphone, kanamycin, labetalol, lidocaine, LORazepam, magnesium sulfate, melphalan, meropenem, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, nafcillin, niCARdipine, nitroglycerin, norepinephrine, ondansetron, oxacillin, oxytocin, PACLitaxel, pancuronium, penicillin G potassium, piperacillin, piperacillin/tazobactam, potassium chloride, propranolol, ranitidine, sodium bicarbonate, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tigecycline, tobramycin, vancomycin, vecuronium, vinorelbine, vit B/C, warfarin, zidovudine, zoledronic acid

**Y-site incompatibilities:** Furosemide, minocycline, tetracycline

## ADVERSE EFFECTS

**CNS:** Drowsiness, dizziness, *confusion,* headache, *sedation,* euphoria, insomnia, seizures
**CV:** Palpitations, bradycardia, change in B/P, shock, cardiac arrest, chest pain, hyper/hypotension, edema, tachycardia
**EENT:** Blurred vision, miosis, diplopia
**ENDO:** Gynecomastia
**GI:** Nausea, vomiting, anorexia, *constipation,* cramps, biliary tract pressure
**GU:** Urinary retention, impotence, gonadal suppression
**HEMA:** Thrombocytopenia
**INTEG:** Rash, urticaria, bruising, flushing, diaphoresis, pruritus
**RESP:** Respiratory depression, respiratory arrest, apnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Variably absorbed (PO); well absorbed (IM, SUBCUT, RECT); completely absorbed (**IV**) |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys |
| **Half-life** | 1½-2 hr; IM 3-4 hr; AVINza 24 hr; Kadian 11-13 hr |

### Pharmacodynamics

| | PO | PO EXT REL | IM | SUBCUT | RECT | IV | IT |
|---|---|---|---|---|---|---|---|
| **Onset** | Variable | Unknown | 10-30 min | 20 min | Unknown | Rapid | Rapid |
| **Peak** | 1 hr | Unknown | 30-60 min | 1-1½ hr | ½-1 hr | 20 min | Unknown |
| **Duration** | 4-5 hr | 8-12 hr | 4-5 hr | 4-5 hr | 3-7 hr | 4-5 hr | Ext |

## INTERACTIONS

### Individual drugs

Alcohol: increased effects with other CNS depressants

Rifampin: decreased analgesic action

### Drug classifications

Antipsychotics, opiates, sedative-hypnotics, skeletal muscle relaxants: increased effects with other CNS depressants

MAOIs: unpredictable reaction may occur; avoid use

### Drug/herb

Chamomile, hops, kava, St. John's wort, valerian: increased CNS depression

### Drug/lab test

Increased: amylase

## NURSING CONSIDERATIONS

### Assessment

- Assess pain: location, type, character, intensity; give dose before pain becomes extreme
- Monitor I&O ratio; check for decreasing output; may indicate urinary retention; check for constipation; increase fluids, bulk in diet if needed, or stimulant laxatives may be prescribed; monitor serum sodium

**BLACK BOX WARNING:** Abrupt discontinuation: gradually taper to prevent withdrawal symptoms; decrease by 50% q1-2 days, avoid use of narcotic antagonist

- Monitor CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reactions
- Monitor allergic reactions: rash, urticaria

**BLACK BOX WARNING:** Accidental exposure: if Duramorph or Infamorph gets on skin, remove contaminated clothing and rinse affected area with water

**BLACK BOX WARNING:** Assess respiratory dysfunction: depression, character, rate, rhythm; notify prescriber if respirations are <12/min; accidental overdose has occurred with high-potency oral sol

- **Pregnancy/breastfeeding:** Only use if benefits outweigh fetal risk, use can result in opioid withdrawal syndrome, do not use in breastfeeding

### Patient/family education

- Advise patient to report any symptoms of CNS changes, allergic reactions
- Caution patients to avoid CNS depressants (alcohol, sedative/hypnotics) for at least 24 hr after taking this product
- Discuss with patient that dizziness, drowsiness, and confusion are common; to avoid getting up without assistance
- Discuss in detail all aspects of the product and expected response

### Evaluation

**Positive therapeutic outcome**

- Decreased pain

## TREATMENT OF OVERDOSE:

Naloxone (Narcan) 0.2-0.8 **IV** (caution with opioid-tolerant individuals), $O_2$, **IV** fluids, vasopressors

## moxifloxacin (Rx)

(mox-i-floks'a-sin)

**Avelox, Avelox IV, Moxeza, Vigamox**

*Func. class.:* Antiinfective

*Chem. class.:* Fluoroquinolone

**Do not confuse:** moxifloxacin/gatifloxacin/ciprofloxacin/levoFLOXacin

**ACTION:** Interferes with conversion of intermediate DNA fragments into high molecular weight DNA in bacteria; DNA gyrase inhibitor

**Therapeutic outcome:** Bactericidal action against the following: *Staphylococcus aureus, Streptococcus pneumoniae, Haemophilus influenzae, Haemophilus parainfluenzae, Moraxella catarrhalis, Klebsiella pneumoniae, Mycoplasma pneumoniae, Chlamydia pneumoniae; Streptococcus pyogenes, Escherichia coli, Bacteroides fragilis, Streptococcus anginosus, Streptococcus constellatus, Enterococcus faecalis, Proteus mirabilis, Clostridium perfringens, Bacteroides thetalomicron, Peptostreptococcus, Enterobacter cloacae*

**USES:** Acute bacterial sinusitis, acute bacterial exacerbation of chronic bronchitis, community-acquired pneumonia (mild to moderate), uncomplicated skin/skin structure infections, complicated intraabdominal infections including

polymicrobial infections, complicated skin/skin structure infections

**Unlabeled uses:** Anthrax treatment/prophylaxis, gastroenteritis, MAC, nongonococcal urethritis, shigellosis, surgical infection prophylaxis, TB

## CONTRAINDICATIONS

Hypersensitivity to quinolones

**Precautions:** Pregnancy, breastfeeding, children, renal/hepatic/cardiac disease, epilepsy, uncorrected hypokalemia, prolonged QT interval, patients receiving class IA, III antidysrhythmics, GI disease, seizure disorder, pseudomembranous colitis, diabetes mellitus

**BLACK BOX WARNING:** Tendon pain/rupture, tendinitis, myasthenia gravis

## DOSAGE AND ROUTES

### Acute bacterial sinusitis

**Adult:** PO/**IV** 400 mg q24hr × 10 days

### Acute bacterial exacerbation of chronic bronchitis

**Adult:** PO/**IV** 400 mg q24hr × 5 days

### Community-acquired pneumonia

**Adult:** PO/**IV** 400 mg q24hr × 7-14 days

### Uncomplicated skin/skin structure infections

**Adult:** PO/**IV** 400 mg q24hr × 7 days

### Complicated intraabdominal infections

**Adult:** **IV** 400 mg/day × 5-14 days

### Complicated skin/skin structure infections

**Adult:** PO/**IV** 400 mg/day × 7-21 days

**Available forms:** Tabs 400 mg; inj premix 400 mg/250 ml

### Implementation

- Do not use theophylline with this product; may cause toxicity

**PO route**

- Give once a day for 5-10 days depending on condition
- Give without regard to food
- Store at room temperature

**IV route**

- Discontinue primary **IV** while administering moxifloxacin, give over 60 min
- Do not give SUBCUT, IM
- Available as premixed sol, may be diluted at ratios from 1:10 to 10:1, do not refrigerate, give by direct infusion or through Y-type infusion set, do not add other medications to sol or infuse through same IV line at same time
- Do not refrigerate
- Flush line with compatible sol before and after use
- Do not admix

**Solution compatibilities:** 0.9% NaCl, $D_5$, $D_{10}$, LR, sterile water for inj

## ADVERSE EFFECTS

**CNS:** Headache, dizziness, fatigue, insomnia, depression, restlessness, seizures, confusion, increased intracranial pressure, peripheral neuropathy, pseudotumor cerebri, fever

**CV:** Prolonged QT interval, dysrhythmias, torsades de pointes, tachycardia

**EENT:** Blurred vision, tinnitus, taste changes

**GI:** Nausea, increased ALT, AST, flatulence, heartburn, vomiting, diarrhea, oral candidiasis, dysphagia, pseudomembranous colitis, abdominal pain, dyspepsia, constipation, gastroenteritis, xerostomia

**GU:** Renal failure

**INTEG:** Rash, pruritus, urticaria, photosensitivity, flushing, fever, chills, injection site reactions

**MISC:** Candidiasis vaginitis

**MS:** Tremor, arthralgia, tendon rupture, myalgia

**SYST:** Anaphylaxis, Stevens-Johnson syndrome, angioedema, toxic epidermal necrolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (75%) (PO) |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | Increased in renal disease |

### Pharmacodynamics

| | PO |
|---|---|
| **Onset** | Rapid |
| **Peak** | 1 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Aluminum hydroxide, calcium, didanosine, iron, sucralfate, zinc sulfate: decreased absorption of moxifloxacin

CycloSPORINE: increased cycloSPORINE effect

Haloperidol, chloroquine, droperidol, pentamidine; arsenic trioxide, levomethadyl: increased QT prolongation

Probenecid: increased blood levels

Warfarin: increased warfarin effect

### Drug classifications

Antacids (magnesium), iron salts: decreased absorption of moxifloxacin

Class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation

NSAIDs: increased seizure risk

**BLACK BOX WARNING:** Corticosteroids: increased tendon rupture

### Drug/food

Enteral feeding: decreased absorption of moxifloxacin

### Drug/lab test

Increased: glucose, amylase, lipids, triglycerides, uric acid, LDH

Decreased: potassium

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction
- Assess patient for signs and symptoms of infection including characteristics of wounds, sputum, urine, stool, WBC $>10{,}000/mm^3$, fever baseline, during treatment
- Obtain C&S before beginning product therapy to identify if correct treatment has been initiated
- **Assess for allergic reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, and anaphylaxis:** rash, urticaria, pruritus, chills, fever, joint pain; may occur a few days after therapy begins; EPINEPHrine and resuscitation equipment should be available for anaphylactic reaction
- Assess for CNS symptoms: headache, dizziness, fatigue, insomnia, depression, **seizures**
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also check for increased BUN, creatinine, electrolytes
- Monitor blood tests: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium chloride monthly if patient is on long-term therapy
- **Pseudomembranous colitis:** assess for diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC and low serum albumin; stop product and usually give either vancomycin or IV metroNIDAZOLE
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
- Assess for overgrowth of infection: perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

**BLACK BOX WARNING:** Assess for tendon pain, rupture, tendinitis; if tendon becomes inflamed, drug should be discontinued, more common in achilles tendon

- **QT prolongation:** Monitor ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea
- **Pregnancy/breastfeeding:** Only use if benefits outweigh fetal risk

### Patient/family education

**BLACK BOX WARNING:** Notify prescriber of tendon pain, inflammation, stop drug

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection; report itching, rash, pruritus, urticaria
- Instruct patient to take all medication prescribed for the length of time ordered; not to give medication to others
- Advise patient to notify prescriber of diarrhea with blood or pus
- Advise patient to rinse mouth frequently, use sugarless candy or gum for dry mouth
- Advise patient to take as prescribed, not to double or miss doses

### Evaluation

**Positive therapeutic outcome**

- Absence of signs/symptoms of infection (WBC $<10{,}000/mm^3$, temp WNL)
- Reported improvement in symptoms of infection

## moxifloxacin ophthalmic

*See Appendix B*

## mupirocin topical

*See Appendix B*

## mycophenolate (Rx)

(mie-koe-feen'oh-late)

**Mycophenolate Mofetil CellCept, Myfortic (Rx)**

*Func. class.:* Immunosuppressant

**ACTION:** Inhibits inflammatory responses that are mediated by the immune system; prolongs survival of allogenic transplants

**Therapeutic outcome:** Absence of graft rejection

**USES:** Organ transplants to prevent rejection (renal); prophylaxis of rejection in allogenic cardiac, hepatic, renal transplants

**Unlabeled uses:** Refractory uveitis, 2nd-line therapy for Churg-Strauss syndrome, diffuse proliferative lupus nephritis (in combination), rheumatoid arthritis, psoriasis

## CONTRAINDICATIONS

Hypersensitivity to this product or mycophenolic acid

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Breastfeeding, lymphomas, neutropenia, renal disease, accidental exposure, anemia

**BLACK BOX WARNING:** Infection, neoplastic disease, requires a specialized care setting, requires an experienced clinician

## DOSAGE AND ROUTES

### Renal transplant (to prevent organ rejection)

**Adult:** PO mycophenolate mofetil 1 g or 720 mg mycophenolate sodium mg bid given to renal transplant patients in combination with corticosteroids and cycloSPORINE

**Child:** SUSP 600 mg bid or PO cap 750 mg bid body surface area (BSA) of 1.25 to 1.5 $m^2$ or 1 g bid BSA >1.5 $m^2$

### Renal dose

**Adult:** PO/IV GFR <25 ml/min, max 2 g/day

### Cardiac transplant (to prevent organ rejection)

**Adult:** PO/**IV** 1.5 g bid, **IV** can be started ≤24 hr after transplant, switch to PO when able

### Hepatic transplant (to prevent organ rejection)

**Adult:** PO 1.5 g bid, **IV** 1 g over ≥2 hr

**Available forms:** Caps 250 mg; tabs 500 mg; inj (powder) 500 mg/20 ml vial; powder for oral susp 200 mg/ml; ext rel tab (Myfortic) 180, 360 mg

### Implementation

- May be given in combination with corticosteroids and cycloSPORINE

**PO route**

- Do not crush, chew tabs; do not open caps; avoid inhalation or direct contact with skin, mucous membranes; teratogenic in animals
- Give alone for better absorption
- Delayed rel tabs and caps; oral **susp** and tab are not interchangeable

**Intermittent IV infusion route**

- Reconstitute each vial with 14 ml $D_5W$, shake gently, further dilute to 6 mg/ml, dilute 1-g doses in 140 ml $D_5W$, and 1.5-g doses in 210 ml $D_5W$, give by slow **IV** infusion ≥2 hr, never give by bolus or rapid **IV** injection
- Do not give with other medications or solutions

**Y-site compatibilities:** Alemtuzumab, alfentanil, amikacin, anidulafungin, argatroban, bivalirudin, caspofungin, cefepime, DAPTOmycin, DOPamine, norepinephrine, octreotide, oxytocin, tacrolimus, tigecycline, tirofiban, vancomycin, zoledronic acid

**Y-site incompatibilities:** Acyclovir, allopurinol, amifostine, aminocaproic acid, aminophylline, amphotericin B, colloidal/lipid complex/liposome, ampicillin, atenolol, azithromycin, aztreonam

## ADVERSE EFFECTS

**CNS:** *Tremor, dizziness, insomnia, headache, fever,* progressive multifocal leukoencephalopathy, asthenia, paresthesia, anxiety, pain

**CV:** *Hypertension, chest pain,* hypotension, edema

**GI:** *Nausea, vomiting,* stomatitis, *diarrhea, constipation,* GI bleeding, abdominal pain, anorexia, dyspepsia

**GU:** *UTI, hematuria,* renal tubular necrosis, polyomavirus-associated nephropathy

**HEMA:** Leukopenia, thrombocytopenia, anemia, pancytopenia, pure red cell aplasia, neutropenia

**INTEG:** *Rash*

**META:** *Peripheral edema, hypercholesterolemia, hypophosphatemia, edema, hypo/hyperkalemia, hyperglycemia,* hypocalcemia, hypomagnesemia

**MS:** Arthralgia, muscle wasting, back pain, weakness

**RESP:** *Dyspnea, respiratory infection, increased cough, pharyngitis, bronchitis, pneumonia,* pleural effusion, pulmonary fibrosis

**SYST:** Lymphoma, nonmelanoma skin carcinoma, sepsis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid and complete |
| **Distribution** | Unknown |
| **Metabolism** | To active metabolite (MPA) |
| **Excretion** | Urine, feces |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Acyclovir, ganciclovir, valacyclovir: increased toxicity
AzaTHIOprine: increased bone marrow suppression
Cholestyramine, cycloSPORINE, rifamycin: decreased levels of mycophenolate
Phenytoin: increased effects; decreased protein binding of phenytoin
Probenecid: increased levels of mycophenolate
Theophylline: increased effects; decreased protein binding of theophylline

### Drug classifications

Antacids (magnesium, aluminum): decreased levels of mycophenolate
Anticoagulants, NSAIDs, thrombolytics, salicylates: increased risk of bleeding
Contraceptives (oral), live attenuated vaccines: decreased effects
Immunosuppressives, salicylates: increased levels of mycophenolate

### Drug/herb

Astragalus, echinacea, melatonin: interferes with immunosuppression

### Drug/food

Decreased absorption if taken with food

### Drug/lab test

Increased: serum creatinine, BUN, potassium, cholesterol, glucose, abnormal LFTs
Decreased: WBC, platelets, neutrophils

## NURSING CONSIDERATIONS

### Assessment

- **Progressive multifocal leukoencephalopathy; may be fatal:** ataxia, confusion, apathy, hemiparesis, visual problems, weakness; side effects should be reported to the FDA

**BLACK BOX WARNING: Infection/lymphoma:** may occur from immunosuppressives, increased infections including BK virus, and may cause kidney graft loss

- Monitor blood tests: CBC monthly during treatment
- Monitor liver function tests: alkaline phosphatase, AST, ALT, bilirubin
- Monitor renal studies: BUN, CCr, electrolytes
- **Pregnancy:** obtain pregnancy test within 1 wk prior to initiation of treatment; confirm negative pregnancy test, do not use in pregnancy

### Patient/family education

- Advise patient that repeated lab tests are necessary
- Instruct patient to notify prescriber if pregnancy is planned or suspected (D), to use two forms of contraception before, during, and 6 wk after therapy

**BLACK BOX WARNING:** Advise patient that infection and lymphomas may occur

- Teach patient to take on empty stomach, not to crush, chew, break ext rel caps

**BLACK BOX WARNING:** Infection: Teach patient to report fever, chills, sore throat, fatigue, serious infection may occur, avoid crowds, persons with known infections

**BLACK BOX WARNING: Neoplastic disease:** Teach patient lymphoma and other neoplastic diseases may occur, particularly skin cancer, limit UV exposure by wearing protective clothing, sunscreen

*Chem. class.:* β-Adrenergic receptor blocker

**Do not confuse:** Corgard/Cognex/Coreg

**ACTION:** Long-acting, nonselective β-adrenergic receptor blocking agent, blocks $\beta_1$ in the heart and $\beta_2$ in the lungs, uterus, and circulatory system; mechanism is similar to that of propranolol

**Therapeutic outcome:** Decreased B/P, heart rate

**USES:** Chronic stable angina pectoris, mild to moderate hypertension, atrial fibrillation

**Unlabeled uses:** Tachydysrhythmias, anxiety, tremors, esophageal varices (rebleeding only)

## CONTRAINDICATIONS

Hypersensitivity to this product, cardiac failure, cardiogenic shock, 2nd- or 3rd-degree heart block, bronchospastic disease, sinus bradycardia, HF, COPD, asthma

**Precautions:** Pregnancy, breastfeeding, diabetes mellitus, renal disease, hyperthyroidism, peripheral vascular disease, myasthenia gravis, major surgery, nonallergic bronchospasm

**BLACK BOX WARNING:** Abrupt discontinuation

## DOSAGE AND ROUTES

### Angina pectoris/hypertension

**Adult:** PO 40 mg/day; increase by 40-80 mg q2-14 days; maintenance 40-240 mg/day for angina, 40-320 mg/day for hypertension

**Geriatric:** PO 20 mg/day, may increase by 20 mg until desired dose

### Renal dose

**Adult:** PO CCr 31-50 ml/min give q24-36hr; CCr 10-30 ml/min give q24-48hr; CCr <10 ml/min give q40-60hr

### Esophageal varices (unlabeled)

**Adult:** PO 40 mg qday

**Available forms:** Tabs 20, 40, 80, 160 mg

### Implementation

- Give at bedtime; tab may be crushed or swallowed whole; give with food to prevent GI upset; give reduced dosage in renal dysfunction; check apical pulse prior to use, if <50 bpm, withhold dose and notify prescriber
- Store protected from light, moisture; place in cool environment
- Check apical pulse before each dose hold if <60 bpm, notify prescriber
- Give without regard to food
- Discontinue other antihypertensives gradually

**BLACK BOX WARNING:** Taper over 1-2 wk to discontinue, do not stop abruptly

## ADVERSE EFFECTS

**CNS:** Depression, *dizziness,* fatigue, lethargy, paresthesia, headache, *weakness,* insomnia, memory loss, nightmares

**CV:** *Bradycardia, hypotension,* HF, palpitations, AV block, chest pain, peripheral ischemia, flushing, edema, vasodilatation, conduction disturbances

**EENT:** Blurred vision, dry eyes, nasal congestion

**ENDO:** Hyperglycemia, hypoglycemia

**GI:** Nausea, vomiting, diarrhea, colitis, constipation, cramps, dry mouth, flatulence, hepatomegaly, pancreatitis, taste distortion

**GU:** *Impotence,* decreased libido

**HEMA:** Agranulocytosis, thrombocytopenia

**INTEG:** Rash, pruritus, fever, alopecia

**RESP:** Dyspnea, respiratory dysfunction, bronchospasm, cough, wheezing, pharyngitis, laryngospasm, pulmonary edema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Variably absorbed |
| **Distribution** | Crosses placenta; minimal concentration in CNS, protein binding 30% |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys, unchanged |
| **Half-life** | 10-24 hr; increased in renal disease |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Variable |
| **Peak** | 3-4 hr |
| **Duration** | 10-24 hr |

## INTERACTIONS

### Individual drugs

CloNIDine, EPINEPHrine: increased hypotension, bradycardia, monitor for bradycardia

Digoxin: increased bradycardia

Thyroid: decreased β-blocking effect

### Drug classifications

Antidiabetics, insulins: Increase: lack of dose stability

Antihypertensives: increased hypotension

Ergots: peripheral ischemia

MAOIs: increased orthostatic hypotension, monitor B/P

NSAIDs: decreased antihypertensive effect
Phenothiazines, general anesthetics: increased hypotensive effects

### Drug/herb
Dong quai, garlic, ginseng, yohimbe: increased hypertension, avoid concurrent use

### Drug/lab test
Increased: serum potassium, serum uric acid, ALT, AST, alkaline phosphatase, LDH, blood glucose, cholesterol, ANA, triglycerides

## NURSING CONSIDERATIONS
### Assessment
- **Hypertension:** check that prescriptions have been filled
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, discontinue product or breastfeeding, excreted in breast milk
- **Angina:** monitor frequency of angina, alleviating factors
- Monitor B/P at beginning of treatment, periodically thereafter; note rate, rhythm, quality of apical/radial pulse before administration; notify prescriber of any significant changes (pulse <60 bpm), orthostatic hypotension, if severe hypotension occurs, may use vasopressors to raise B/P
- Check for baselines in renal, liver function tests before therapy begins
- Assess for edema in feet, legs daily; monitor I&O, daily weight; check for jugular vein distention and crackles bilaterally, dyspnea (HF)
- Headache, light-headedness, decreased B/P; may indicate a need for decreased dosage

**BLACK BOX WARNING: Abrupt discontinuation:** can result in MI, myocardial ischemia, ventricular dysrhythmias, severe hypertension, withdraw slowly by tapering over 1-2 wk, if symptoms return, restart

### Patient/family education
- Teach patient not to discontinue product abruptly; taper over 1-2 wk; may cause precipitate angina, serious dysrhythmias if stopped abruptly
- Teach patient not to use OTC products containing α-adrenergic stimulants (such as nasal decongestants, cold preparations); to avoid alcohol and smoking and to limit sodium intake as prescribed, to take as prescribed at same time each day; do not double; take missed dose as soon as remembered if before 8 hr prior to next dose
- Teach patient how to take pulse and B/P at home; to hold dose if pulse is ≤50 bpm, systolic B/P <90 mm Hg; advise when to notify prescriber; to take missed dose as soon as possible if less than 8 hr
- **Hypertension:** instruct patient to comply with weight control, dietary adjustments, modified exercise program; to report weight gain >5 lb, swelling, unusual bruising, bleeding
- Advise patient to carry/wear emergency ID to identify product being taken, allergies; teach patient product controls symptoms but does not cure condition
- Caution patient to avoid hazardous activities if dizziness, drowsiness are present; to rise slowly to prevent orthostatic hypotension
- **Teach patient to report symptoms of HF:** difficult breathing, especially on exertion or when lying down, night cough, swelling of extremities or bradycardia, dizziness, confusion, depression, fever
- Teach patient to take product as prescribed, not to double doses, skip doses; take any missed doses as soon as remembered if at least 4 hr until next dose

### Evaluation
**Positive therapeutic outcome**
- Decreased B/P in hypertension

## nafcillin (Rx)
(naf-sill'in)
**Nallpen, Unipen** 🍁
*Func. class.:* Antiinfective, broad-spectrum
*Chem. class.:* Penicillinase-resistant penicillin

**ACTION:** Interferes with cell wall replication of susceptible organisms; osmotically unstable cell wall swells, bursts from osmotic pressure

**Therapeutic outcome:** Bactericidal effects for gram-positive cocci *Staphylococcus aureus, Streptococcus viridans, Streptococcus pneumoniae* and infections caused by penicillinase-producing *Staphylococcus*

**USES:** Infections caused by penicillinase-producing staphylococci, streptococci; respiratory tract, skin, skin structure, urinary tract, bone, joint infections; sinusitis; endocarditis; septicemia; meningitis

## CONTRAINDICATIONS
Hypersensitivity to penicillins or corn

**Precautions:** Pregnancy, breastfeeding, neonates, GI disease, asthma, hypersensitivity to cephalosporins or carbapenems, electrolyte imbalances, hepatic/renal disease, pseudomembranous colitis

## DOSAGE AND ROUTES

**Systemic infections caused by susceptible organisms (methicillin-sensitive *S. aureus*)**

**Adult: IV** 500-1000 mg q4hr; IM 500-1000 mg q6-8hr, max 12 g/day

**Infant and child >1 mo: IV** 150-200 mg/kg/day in divided doses q4-6hr

**Neonate >7 days (weight >2 kg): IV** 25 mg/kg q6hr

**Neonate ≤7 days (weight ≤2 kg): IV** 25 mg/kg q8hr

**Available forms:** Powder for inj 1 premixed or Add-Vantage vials (1 g)

### Implementation

**IM route**

- Reconstitute vials: Add 1.7 (1.8 Nafcil), 3, 4, or 6.4 ml (6.6 ml NaCl) (sterile water for INJ, 0.9% NaCl, bacteriostatic water for INJ with benzyl alcohol or parabens) to vials with 1 g, 2g of nafcillin, respectively (250 mg/ml)
- No further dilution needed; after reconstitution, inject in deep muscle mass

**IV route**

- Reconstitute vials: add 1.7, 3, 4, or 6.4 ml sterile water for inj, 0.9% NaCl, bacteriostatic water for inj with benzyl alcohol or parabens to vials with 500 mg, 1 g, 2 g of nafcillin, respectively (250 mg/ml); pharmacy bulk pack reconstitute 10 g/93 ml sterile water inj or 0.9% NaCl (100 mg/ml)

**Direct IV INJ route**

- Further dilute the reconstituted sol in 15-30 ml of sterile water for inj, 0.45% NaCl, 0.9% NaCl; inj slowly over 5-10 min into the tubing of a free-flowing compatible IV solution

**Intermittent IV route**

- Vials, further dilute reconstituted solution to 2-40 mg/ml, for peripheral vein inf ≤20 mg/ml (preferred); piggyback unit no further dilution needed; infuse ≥30-60 min, make sure entire dose is given before 10% or more of solution is inactivated
- Extravasation management: stop infusion and disconnect; gently aspirate extravasated solution; do not flush line; use hyaluronidase; remove cannula/needle; apply dry cold compresses; elevate extremity

**Y-site compatibilities:** Acyclovir, alfentanil, amikacin, aminophylline, amphotericin B lipid complex (Abelcet), anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, cefamandole, ceFAZolin, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, DACTINomycin, DAPTOmycin, DAUNOrubicin liposome, dexamethasone, digoxin, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin liposomal, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, erythromycin, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, foscarnet, furosemide, gallium, ganciclovir, gatifloxacin, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, imipenem-cilastatin, indomethacin, isoproterenol, ketorolac, lactated Ringer's, lepirudin, leucovorin, lidocaine, linezolid injection, LORazepam, magnesium sulfate, mannitol, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, milrinone, morphine, multiple vitamins injection, naloxone, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel (solvent/surfactant), pamidronate, pancuronium, pantoprazole, PEMEtrexed, penicillin G potassium/sodium, PENTobarbital, perphenazine, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, polymyxin B, potassium acetate/chloride, procainamide, prochlorperazine, propofol, propranolol, ranitidine, ringer's injection, sodium bicarbonate, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin clavulanate, tigecycline, tirofiban, TNA (3-in-1), tobramycin, tolazoline, TPN (2-in-1), urokinase, vasopressin, vinBLAStine, voriconazole, zidovudine, zoledronic acid

**Y-site incompatibilities:** Droperidol, fentaNYL/droperidol, labetalol, nalbuphine, pentazocine, regular insulin, verapamil

## ADVERSE EFFECTS

**CNS:** Lethargy, hallucinations, anxiety, depression, muscle twitching, coma, seizures

**GI:** *Nausea, vomiting, diarrhea,* increased AST, ALT, abdominal pain, glossitis, pseudomembranous colitis

**GU:** Oliguria, proteinuria, hematuria, vaginitis, moniliasis, glomerulonephritis, interstitial nephritis

**HEMA:** Anemia, increased bleeding time, bone marrow depression, neutropenia, agranulocytosis

**INTEG:** Tissue necrosis, extravasation injury at injection site

**SYST:** Anaphylaxis, serum sickness, Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM); erratic (PO) |
| **Distribution** | Widely distributed; crosses placenta, 90% protein bound |
| **Metabolism** | Liver; 70% |
| **Excretion** | Kidneys, unchanged; breast milk |
| **Half-life** | 30-90 min; increased in renal disease |

### Pharmacodynamics

| | PO | IM | IV |
|---|---|---|---|
| **Onset** | ½ hr | ½ hr | Immediate |
| **Peak** | 1-2 hr | 1-2 hr | Infusion end |
| **Duration** | Unknown | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

CycloSPORINE: decreased effect of cycloSPORINE
Probenecid: increased nafcillin levels

### Drug classifications

Tetracyclines, aminoglycosides: avoid use

### Drug/food

Food, carbonated drinks, citrus fruit juices: decreased absorption

### Drug/lab test

False positive: urine glucose, urine protein
Decreased: potassium, Hgb/Hct, neutrophils

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction to penicillins or other cephalosporins; cross-sensitivity between penicillins and cephalosporins is common
- Assess patient for signs and symptoms of infection including characteristics of wounds, sputum, urine, stool, WBC $>10,000/mm^3$, earache, fever; obtain information baseline, during treatment
- Obtain C&S before beginning product therapy to identify if correct treatment has been initiated
- **Assess for allergic reactions, anaphylaxis:** rash, urticaria, pruritus, chills, fever, dyspnea, laryngeal edema, joint pain; angioedema may occur a few days after therapy begins; cross-sensitivity with cephalosporins may occur; EPINEPHrine, resuscitation equipment should be available for anaphylactic reaction
- Assess renal function tests: urinalysis, protein, blood, BUN, creatinine; abnormal urinalysis may indicate nephrotoxicity
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity)
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy, electrolytes
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- **Pseudomembranous colitis:** assess for diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC and low serum albumin; stop product and usually give either vancomycin or IV metroNIDAZOLE
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
- Assess for overgrowth of infection: perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- **IV site:** assess for redness, swelling, pain at site
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection
- Instruct patient to take all medication prescribed for the length of time ordered
- Advise patient to notify prescriber of diarrhea with blood or pus, which may indicate pseudomembranous colitis
- Advise patient to carry/wear emergency ID if allergic to penicillins
- Teach patient to avoid use with other products unless approved by prescriber

### Evaluation

#### Positive therapeutic outcome

- Absence of signs/symptoms of infection (WBC $<10,000/mm^3$, temp WNL, absence of red, draining wounds, earache)
- Reported improvement in symptoms of infection

**TREATMENT OF ANAPHYLAXIS:** Withdraw product, maintain airway, administer EPINEPHrine, aminophylline, $O_2$, **IV** corticosteroids

**⚠ HIGH ALERT**

## nalbuphine (Rx)

(nal′byoo-feen)
**Nubain**
*Func. class.:* Opioid analgesic
*Chem. class.:* Synthetic opioid agonist/antagonist

**Do not confuse:** nalbuphine/naloxone

**ACTION:** Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors

**Therapeutic outcome:** Relief of pain

**USES:** Moderate to severe pain, supplement to anesthesia

## CONTRAINDICATIONS

Hypersensitivity to this product or parabens, addiction (opioid)

**Precautions:** Pregnancy, breastfeeding, addictive personality, increased ICP, MI (acute), severe heart disease, respiratory depression, renal/hepatic disease, bowel impaction, abrupt discontinuation

## DOSAGE AND ROUTES

### Analgesic

**Adult:** SUBCUT/IM/**IV** max 10 mg q3-6hr prn, max 160 mg/day

### Balanced anesthesia adjunct

**Adult:** **IV** 0.3-3 mg/kg given over 10-15 min; may give 0.25-0.5 mg/kg as needed (maintenance)

**Available forms:** Inj 10, 20 mg/ml

### Implementation

- Give by inj (IM, **IV**), only with resuscitative equipment available; give slowly to prevent rigidity
- Store in light-resistant area at room temperature

**IM route**

- Give inj deeply in large muscle mass; rotate inj sites; protect vial from light

**Direct IV route**

- Give direct **IV** undiluted 10 mg or less over 3-5 min or more into free-flowing IV line of $D_5W$, NS, LR

**Syringe incompatibilities:** Diazepam, PENTobarbital

**Y-site incompatibilities:** Nafcillin, sargramostim

## ADVERSE EFFECTS

**CNS:** *Drowsiness, dizziness, confusion, headache, sedation, euphoria,* dysphoria (high doses), hallucinations, increased dreaming, tolerance, physical and psychological dependency
**CV:** Bradycardia, change in B/P, cardiac arrest
**EENT:** Blurred vision, miosis, diplopia
**GI:** *Nausea, vomiting, anorexia, constipation, cramps,* abdominal pain, dyspepsia, xerostomia, bitter taste
**GU:** Urinary urgency
**INTEG:** *Rash,* urticaria, flushing, *diaphoresis,* pruritus
**RESP:** Respiratory depression/arrest, pulmonary edema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (SUBCUT, IM); completely absorbed (**IV**) |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Feces, kidneys, unchanged (small amounts); breast milk |
| **Half-life** | 3-6 hr |

### Pharmacodynamics

| | IM | SUBCUT | IV |
|---|---|---|---|
| **Onset** | Up to 15 min | Up to 15 min | 2-3 min |
| **Peak** | 1 hr | Unknown | ½ hr |
| **Duration** | 3-6 hr | 3-6 hr | 3-6 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased respiratory depression, hypotension, sedation

### Drug classifications

Antipsychotics, CNS depressants, sedative/hypnotics, skeletal muscle relaxants: increased respiratory depression, hypotension
Opiates: increased effects with other CNS depressants
MAOIs: increase: severe reactions, decrease dose

### Drug/herb

Increase: CNS depression, kava, valerian, hops, chamomile

## NURSING CONSIDERATIONS

### Assessment

- **Assess pain characteristics** (location, intensity, type) before medication administration, 30-60 min after treatment, titrate upward by 25%-50% until pain is reduced by 50%

• Assess bowel status; constipation is common, may need laxative or stool softener
• Monitor VS after parenteral route; note muscle rigidity, product history, liver, kidney function tests; respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min
• **Monitor CNS changes:** dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
• Monitor allergic reactions: rash, urticaria
• Monitor withdrawal reactions in opiate-dependent individuals: PE, vascular occlusion, abscesses, ulcerations, nausea, vomiting, seizures; low potential for dependence
• **Respiratory dysfunction:** Monitor respiratory depression, character; rate, rhythm; notify prescriber if respirations <10/min
• **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding

### Patient/family education

• Instruct patient to report any symptoms of CNS changes, allergic reactions
• Teach patient that physical dependency can result from long-term use, although there is a low potential for dependency, profuse sweating, twitching; without treatment, symptoms resolve in 5-14 days; chronic abstinence syndrome may last 2-6 mo
• Caution patients to avoid CNS depressants: alcohol, sedative/hypnotics for at least 24 hr after taking this product
• Discuss with patient that dizziness, drowsiness, confusion are common; to avoid getting up without assistance
• Discuss in detail all aspects of the product: reason for taking product and expected results
• Instruct patient to change position slowly to prevent orthostatic hypotension
• Teach patient that withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia, profuse sweating, twitching; without treatment symptoms resolve in 5-14 days, chronic abstinence syndrome may last 2-6 mo

### Evaluation

**Positive therapeutic outcome**
• Relief of pain without respiratory depression

## TREATMENT OF OVERDOSE:

Naloxone (Narcan) 0.2-0.8 **IV,** $O_2$, **IV** fluids, vasopressors

## naloxone (Rx)

(nal-oks′one)
**Evzio, Narcan**
*Func. class.:* Opioid antagonist, antidote
*Chem. class.:* Thebaine derivative

**Do not confuse:** naloxone/naltrexone nalbuphine Narcan/Norcuron

**ACTION:** Competes with opioids at opioid-receptor sites

**Therapeutic outcome:** Absence of opioid overdose

**USES:** Respiratory depression induced by opioids; refractory circulatory shock, asphyxia neonatorum, coma, hypotension, opiate agonist overdose

**Unlabeled uses:** IBS, opiate agonist dependence, opiate agonist-induced constipation, pruritus

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, neonates, children, CV disease, opioid dependency, seizure disorder, drug dependency, hepatic disease

## DOSAGE AND ROUTES

### Opioid-induced respiratory depression (known or suspected opiate agonist overdose)

**Adult: IV**/SUBCUT/IM 0.4-2 mg; repeat q2-3min if needed, max 10 mg; **IV** infusion loading dose 0.005 mg/kg, then 0.0025 mg/kg/hr; nasal spray 1 spray, may repeat q2-3min in alternate nostril if needed
**Child <5 yr or ≤20 kg: IV**/intraosseous 0.01 mg/kg slowly followed by 0.1 mg/kg if needed; **IV** infusion (PALS) 0.04-0.16 mg/kg/hr, titrate; nasal spray 1 spray, may repeat q2-3min in alternate nostril if needed

### Postoperative opioid-induced respiratory depression

**Adult: IV** 0.1-0.2 mg q2-3min prn
**Child: IV** 0.005-0.01 mg/kg q2-3min prn

### Nausea/vomiting from continuous morphine infusion/urinary retention (unlabeled)

**Adult: IV** 0.2 mg

**Available forms:** Inj 0.4, 1 mg/ml; nasal spray 4 mg/0.1 ml

### Implementation

• Store at room temperature and protect from light
• Double-check dose; those taking opioids (>1 wk) are sensitive to this product

**Direct IV route**
- Give undiluted (suspected opioid overdose); give 0.4 mg or less over 15 sec or titrate inf to response

**Continuous IV infusion route**
- Dilute 2 mg/500 ml 0.9% NaCl or $D_5W$ (4 mcg/ml), titrate to response
- Give only with resuscitative equipment, $O_2$ nearby
- Use only sol prepared within 24 hr

**Y-site compatibilities:** Acyclovir, alfentanil, amikacin, aminocaproic acid, aminophylline, anidulafungin, ascorbic acid, atenolol, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cephalothin, cephapirin, chloramphenicol, chlorproMAZINE, cimetidine, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins, mycophenolate, nafcillin, nalbuphine, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, rocuronium, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Nervousness, seizures, tremor, opioid withdrawal symptoms
**CV:** Rapid pulse, ventricular tachycardia, fibrillation, increased systolic B/P (high doses), hypo/hypertension, cardiac arrest, sinus tachycardia
**GI:** Nausea, vomiting
**RESP:** Pulmonary edema, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (SUBCUT, IM); completely absorbed (**IV**) |
| **Distribution** | Rapidly distributed; crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 1 hr; up to 3 hr (neonates) |

### Pharmacodynamics

| | IV | IM/SUBCUT |
|---|---|---|
| **Onset** | 1 min | 2-5 min |
| **Peak** | Unknown | Unknown |
| **Duration** | 45 min | 30-81 min |

## INTERACTIONS

### Individual drugs

TraMADol: increased seizures, overdose

### Drug classifications

Analgesics (opioids): decreased effects of opioid analgesics

### Drug/lab test

Interference: urine VMA, 5-HIAA, urine glucose

## NURSING CONSIDERATIONS

### Assessment

- **Assess for signs of opioid withdrawal** in drug-dependent individuals: cramping, hypertension, anxiety, vomiting; may occur up to 2 hr after administration, severity depends on length of time opioids were taken, naloxone dose
- **Assess for pain:** duration, intensity, location before, after administration; may be used for respiratory depression analgesia will be decreased

• **Assess for respiratory dysfunction:** respiratory depression, character, rate, rhythm; if respirations are <10/min, probably due to opioid overdose, administer naloxone; monitor LOC, ECG, B/P
• **Acute opioid reversal:** Patients may become very agitated and violent after use
• **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding

### Patient/family education
• Explain reason for and expected results of medication when patient is alert

### Evaluation
**Positive therapeutic outcome**
• Reversal of respiratory depression
• LOC: alert

## naphazoline ophthalmic
*See Appendix B*

## naproxen
(na-prox′en)
**Aleve, Anaprox, Anaprox DS, Apo-Napro-Na, Midol Extended Relief, Nu-Naprox, TH Naproxen**
*Func. class.:* Nonsteroidal antiinflammatory, nonopioid analgesic
*Chem. class.:* Propionic acid derivative

**ACTION:** Completely inhibits COX-1, COX-2 by blocking arachidonate; analgesic, antiinflammatory, antipyretic

**Therapeutic outcome:** Decreased pain, inflammation

**USES:** Mild to moderate pain, osteoarthritis, rheumatoid arthritis, gouty arthritis, primary dysmenorrhea, tendinitis, ankylosing spondylitis, bursitis, myalgia, dental pain, juvenile rheumatoid arthritis

## CONTRAINDICATIONS
Pregnancy, hypersensitivity to NSAIDs, salicylates, perioperative pain in CABG surgery/MI/stroke

**Precautions:** Pregnancy (1st trimester), breastfeeding, children <2 yr, geriatric, bleeding disorders, GI/cardiac disorders, hypersensitivity to other antiinflammatory agents, CCr <30 ml/min, asthma, renal failure, hepatic disease

**BLACK BOX WARNING:** GI bleeding, stroke

## DOSAGE AND ROUTES
200 mg base = 220 mg naproxen sodium

### Antiinflammatory/analgesic/antidysmenorrheal
**Adult:** PO 250-500 mg bid, max 1250 mg/day; DEL REL TAB 375-500 mg bid
**Child ≥2 yr:** PO 7 mg/kg/12 hr

### Antigout
**Adult:** PO 750 mg, then 250 mg q8hr

### OTC use
**Adult:** PO 220 mg q8-12hr or 440 mg, then 220 mg q12hr, max 660 mg/24 hr, taken no longer than 10 days
**Geriatric >65 yr:** PO max 220 mg q12hr

**Available forms: Naproxen:** tabs: 250, 375, 500 mg; del rel tabs (EC-Naprosyn, Naprosyn-E) 250, 375, 500 mg; oral susp 125 mg/5 ml; ext rel tabs (CR) 375, 500, 750 mg; **naproxen sodium;** tabs 220, 275, 550 mg; ext rel tab 220 mg

### Implementation
• Store at room temp
• Administer to patient crushed or whole **(regular release)**; do not crush, break, or chew **extended rel tab**
• Give OTC for 10 days or less unless approved by prescriber
• Adequately hydrate those taking angiotensin receptor blockers/angiotensin-converting enzyme inhibitors
• Give with food or milk to decrease gastric symptoms; give ½ hr before or 2 hr after meals for better absorption
• Patient should take with 8 oz of water and sit upright for 30 min after dose to prevent ulceration

## ADVERSE EFFECTS
**CNS:** Dizziness, drowsiness, fatigue, tremors, confusion, insomnia, anxiety, depression
**CV:** Tachycardia, peripheral edema, palpitations, dysrhythmias, MI, stroke
**EENT:** Tinnitus, hearing loss, blurred vision
**GI:** Nausea, anorexia, vomiting, diarrhea, jaundice, hepatitis, constipation, flatulence, cramps, peptic ulcer, GI ulceration, bleeding, perforation
**GU:** Nephrotoxicity: dysuria, hematuria, oliguria, azotemia
**HEMA:** Blood dyscrasias
**INTEG:** Purpura, rash, pruritus, sweating
**SYST:** Anaphylaxis, Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed |
| **Distribution** | Crosses placenta, 99% protein binding |
| **Metabolism** | Liver, extensively |
| **Excretion** | Breast milk |
| **Half-life** | 10-20 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1 hr |
| **Peak** | 2-4 hr |
| **Duration** | <7 hr |

## INTERACTIONS

### Individual drugs

Adefovir, cidofovir: increased nephrotoxicity, avoid concurrent use

Alcohol, aspirin: increased risk of GI side effects

Clopidogrel, eptifibatide, plicamycin, ticlopidine, tirofiban: increased bleeding risk

Lithium, methotrexate, probenecid, radiation: increased toxicity

Cholestyramine, sucralfate: decreased/delayed absorption of naproxen

### Drug classifications

ACE inhibitors: possible renal impairment

Antacids: decreased/delayed absorption of naproxen

Anticoagulants, SSRIs, SNRIs, thrombolytics, tricyclics: increased risk of bleeding

Antihypertensives: decreased effect of antihypertensives

Antineoplastics: increased risk of hematologic toxicity

Corticosteroids, NSAIDs: increased risk of GI adverse reactions

Diuretics: decreased effectiveness of diuretics

### Drug/herb

Fenugreek, feverfew, garlic, ginger, ginkgo, ginseng *(Panax)*, licorice: increased bleeding risk

### Drug/lab test

Increased: BUN, alkaline phosphatase, LFTs, potassium, glucose, cholesterol

Decreased: potassium, sodium

False: increased 5-HIAA, 17KS

## NURSING CONSIDERATIONS

### Assessment

- **Cardiac status:** CV thrombotic events, MI, stroke; may be fatal; not to be used in CABG

**BLACK BOX WARNING: GI status:** ulceration, bleeding, perforation; may be fatal

- Monitor liver function, renal function, other blood tests: AST, ALT, bilirubin, creatinine, BUN, CBC, Hct, Hgb, pro-time, LDH, blood glucose, WBC, platelets; if patient is on long-term therapy
- Check I&O ratio; decreasing output may indicate renal failure (long-term therapy)
- **Assess hepatotoxicity:** dark urine, clay-colored stools, yellowing of the skin and sclera, itching, abdominal pain, fever, diarrhea if patient is on long-term therapy
- Assess for allergic reactions: rash, urticaria; if these occur, product may have to be discontinued
- **Assess for ototoxicity:** tinnitus, ringing, roaring in ears; audiometric testing needed before, after long-term therapy
- Assess for vision changes: blurring, halos if taking long term; may indicate corneal, retinal damage
- Check for edema in feet, ankles, legs
- Identify prior product history; there are many product interactions
- **Monitor pain:** location, frequency, duration, characteristics, type, intensity before dose and 1 hour after
- **Arthritis:** Assess ROM, pain, swelling before and 1-2 hr after use
- **Fever:** Assess before use and 1 hr after use
- Assess for asthma, aspirin hypersensitivity, or nasal polyps, increased risk of hypersensitivity
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, avoid in >30 wk gestation, cautious use in breastfeeding
- **Beers:** Avoid chronic use in older adults unless other alternatives are not available, increased GI, bleeding risk, peptic ulcer disease

### Patient/family education

- Teach patient to report any symptoms of renal/hepatic toxicity, vision changes, ototoxicity, allergic reactions, bleeding (long-term therapy); to report use to all health care providers, **signs of MI, stroke**
- Caution patient not to exceed recommended dosage; acute poisoning may result; to take as prescribed, do not double dose

**BLACK BOX WARNING:** Teach patient to read label on other OTC products; many contain other antiinflammatories; caution patient to avoid alcohol ingestion; GI bleeding may occur

- Inform patient that the therapeutic response takes 2 wk (arthritis)
- Teach patient to report tinnitus, confusion, diarrhea, sweating, hyperventilation, blurred vision, fever, joint aches, black stools, flulike symptoms

• Teach patient to notify prescriber if pregnancy is planned or suspected, pregnancy (C), avoid breastfeeding

### Evaluation

**Positive therapeutic outcome**
- Decreased pain
- Decreased inflammation
- Increased mobility

## naratriptan (Rx)

(nair'ah-trip-tan)
**Amerge**
*Func. class.:* Antimigraine agent
*Chem. class.:* 5-$HT_1$-like receptor agonist

**Do not confuse:** Amerge/Altace/Amaryl

**ACTION:** Binds selectively to the vascular 5-$HT_1$ receptor subtype, exerts antimigraine effect; causes vasoconstriction in cranial arteries

**Therapeutic outcome:** Decreased intensity and incidence of migraines

**USES:** Acute treatment of migraine with or without aura

## CONTRAINDICATIONS

Angina pectoris, history of MI, documented silent ischemia, ischemic heart disease, concurrent ergotamine-containing preparations, uncontrolled hypertension, hypersensitivity, severe renal disease (CCr <15 ml/min), severe hepatic disease (Child-Pugh grade C), CV syndromes, hemiplegic or basilar migraines

**Precautions:** Pregnancy, breastfeeding, children, geriatric, postmenopausal women, men >40 yr, risk factors for CAD, hypercholesterolemia, obesity, diabetes, impaired renal/hepatic function, peripheral vascular disease

## DOSAGE AND ROUTES

**Adult:** PO 1 or 2.5 mg with fluids; if headache returns, repeat once after 4 hr, max 5 mg/24 hr

### Renal/hepatic dose

**Adult:** PO CCr 15-39 ml/min Max 2.5 mg/24 hr

**Available forms:** Tabs 1, 2.5 mg

### Implementation

- Do not use product if another 5-$HT_1$ agonist or an ergot preparation has been used in past 24 hr
- Give with fluids as soon as symptoms appear; may take another dose after 4 hr; max 5 mg in any 24-hr period
- Provide a quiet, calm environment with decreased stimulation, including noise, bright light, excessive talking

## ADVERSE EFFECTS

**CNS:** Dizziness, sedation, fatigue
**CV:** Increased B/P, palpitations, tachydysrhythmias, PR and $QT_C$ prolongation, ST/T wave changes, PVCs, atrial flutter, fibrillation, coronary vasospasm
**EENT:** EENT infections, photophobia
**GI:** *Nausea, vomiting*
**MISC:** Temp change sensations, tightness, pressure sensations
**MS:** *Weakness, neck stiffness,* myalgia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 28%-31% protein binding |
| **Metabolism** | Liver (metabolite) |
| **Excretion** | Urine/feces |
| **Half-life** | 6 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-3 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Sibutramine: increased serotonin syndrome risk

### Drug classifications

5-$HT_1$ agonists, ergot derivatives: increased vasospastic effect
MAOIs: increased risk of adverse reactions, do not use together
SSRIs (FLUoxetine, fluvoxaMINE, PARoxetine, sertraline), SNRIs, serotonin receptor agonists, sibutramine: increased serotonin syndrome, neuroleptic malignant syndrome

### Drug/herb

SAMe, St. John's wort: increased serotonin syndrome

## NURSING CONSIDERATIONS

### Assessment

- **Serotonin syndrome, neuroleptic malignant syndrome:** assess for increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer a serotonin antagonist if needed; at least 2 wk should elapse between discontinuing serotoninergic agents and starting this product
- **Migraines:** assess for aura, duration, effect of lifestyle, aggravating/alleviating factors
- Cardiac status: ECG, increased B/P, dysrhythmias, monitor for PR, QT prolongation, ST-T wave changes, PVCs in those with cardiac disease

• Assess for stress level, activity, recreation, coping mechanisms
• Assess neurologic status: LOC, blurred vision, nausea, tics preceding headache
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, has been shown to increase birth defects, cautious use in breastfeeding

### Patient/family education

• Teach patient to report pain, tightness in chest, neck, throat, or jaw; notify prescriber immediately if sudden, severe abdominal pain occurs
• Teach patient to use contraception while taking product, to notify prescriber if pregnancy is planned or suspected
• Teach patient not to use if another 5-$HT_1$ agonist or an ergot preparation has been used in the past 24 hr; avoid using >2 days/wk, rebound headache may occur

### Evaluation

**Positive therapeutic outcome**
• Absence of migraine headaches

## natamycin ophthalmic

*See Appendix B*

**⚠ HIGH ALERT**

## nebivolol (Rx)

(ne-biv′oh-lol)
**Bystolic**
*Func. class.:* Antihypertensive
*Chem. class.:* $\beta_1$-Blocker

**ACTION:** Competitively blocks stimulation of β-adrenergic receptors within vascular smooth muscle; decreases rate of SA node discharge, increases recovery time, slows conduction of AV node resulting in decreased heart rate (negative chronotropic effect), which decreases $O_2$ consumption in myocardium due to $\beta_1$-receptor antagonism; also decreases renin-aldosterone-angiotensin system at high doses, inhibits $\beta_2$-receptors in bronchial system (high doses)

**Therapeutic outcome:** Decreased B/P after 1-2 wk

**USES:** Hypertension alone or in combination

**Unlabeled uses:** Heart failure

### CONTRAINDICATIONS

Cardiogenic shock, acute sick sinus syndrome, AV heart block, hypersensitivity to this agent or β-blockers, heart failure, severe hepatic disease, severe bradycardia

**Precautions:** Pregnancy, breastfeeding, children, major surgery, peripheral vascular disease, diabetes mellitus, thyrotoxicosis, COPD, asthma, well-compensated heart failure, renal/hepatic disease, abrupt discontinuation, acute bronchospasm

### DOSAGE AND ROUTES

**Hypertension**
**Adult:** PO 5 mg/day, may be increased to desired response q2wk; max 40 mg/day
**Geriatric:** PO max 40 mg/day

**Renal dose**
**Adult:** PO CCr <30 ml/min, 2.5 mg/day; may increase cautiously

**Hepatic dose**
**Adult:** PO (Child-Pugh class B) 2.5 mg qd; use dose escalation cautiously

**Heart failure (unlabeled)**
**Adult:** PO 1.25 mg titrated to max 10 mg/day

**Available forms:** Tabs 2.5, 5, 10, 20 mg

### Implementation

**PO route**
• Give without regard for meals; tab may be crushed or swallowed whole; give with food to prevent GI upset
• Taper over 1-2 wk when discontinuing; minimize physical exertion; if angina recurs give nebivolol
• Store protected from light, moisture; place in cool environment

### ADVERSE EFFECTS

**CNS:** *Insomnia, fatigue, dizziness, mental changes,* drowsiness, *headache*
**CV:** Bradycardia, MI, AV heart block, edema
**GI:** *Nausea, diarrhea,* vomiting, abdominal pain
**GU:** *Impotence*
**HEMA:** Thrombocytopenia
**INTEG:** Rash, pruritus, vasculitis, urticaria, psoriasis, angioedema
**MISC:** Renal failure, pulmonary edema, hyperuricemia, hypercholesterolemia, withdrawal symptoms
**RESP:** Bronchospasm, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | In liver by CYP2D6 |
| **Excretion** | 38% excreted in urine, 44% in feces |
| **Half-life** | 12 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1.5-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Cimetidine: increased nebivolol action
Mefloquine: do not give
Sildenafil: decreased nebivolol action

### Drug classifications

β-blockers, others: do not use concurrently
Calcium channel blockers (nondihydropyridine), CYP2D6 inhibitors (amiodarone, buPROPion, chloroquine, chlorpheniramine, chlorproMAZINE, cinacalcet, diphenhydrAMINE, DULoxetine, FLUoxetine, haloperidol, imatinib, PARoxetine, promethazine, propoxyphene, quiNIDine, quiNINE, ritonavir, terbinafine, thioridazine): increased nebivolol action
CYP2D6 inducers (rifampin): decreased nebivolol action

### Drug/herb

Hawthorn: may increase nebivolol effect
Ephedra: decreased nebivolol effect

### Drug/lab test

Increased: serum lipoprotein levels, BUN, potassium, triglyceride, uric acid, LDH, AST, ALT, alkaline phosphatase
Decreased: platelets

## NURSING CONSIDERATIONS

### Assessment

- **Hypertension:** monitor B/P during beginning treatment, periodically thereafter; assess apical/radial pulse before administration; notify prescriber of any significant changes (pulse <50 bpm); **signs of HF** (dyspnea, crackles, weight gain, jugular vein distention)
- Assess baselines in renal/hepatic studies before therapy begins and periodically, do not use in Child-Pugh class >B
- Monitor I&O, edema in feet, legs daily
- Monitor skin turgor, dryness of mucous membranes for hydration status, especially geriatric patients
- Assess blood glucose in diabetics
- Pregnancy/breastfeeding: Use only if benefits outweigh fetal risk, avoid breastfeeding

### Patient/family education

- Caution patient not to discontinue product abruptly; severe cardiac reactions may occur; taper over 2 wk; do not double dose; if a dose is missed, take as soon as remembered up to 4 hr before next dose
- Inform patient product may mask signs of hypoglycemia or alter blood glucose levels
- Advise patient not to use OTC products containing α-adrenergic stimulants (such as nasal decongestants, OTC cold preparations) unless directed by prescriber
- Instruct patient to report low pulse, dizziness, confusion, depression, fever
- Teach patient to take pulse, B/P at home; advise when to notify prescriber
- Advise patient to comply with weight control, dietary adjustments, modified exercise program
- Instruct patient to carry emergency ID to identify product, allergies
- Caution patient to avoid hazardous activities if dizziness, drowsiness are present
- **Instruct patient to report symptoms of HF:** difficulty breathing, especially on exertion or when lying down, night cough, swelling of extremities
- Teach patient to continue with required lifestyle changes (exercise, diet, weight loss, stress reduction)

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P after 1-2 wk
- Decreased dysrhythmias

## TREATMENT OF OVERDOSE:

Lavage, **IV** atropine for bradycardia, **IV** theophylline for bronchospasm, digoxin, $O_2$, diuretic for cardiac failure, **IV** glucose for hypoglycemia, **IV** diazepam (or phenytoin) for seizures, **IV** fluids, **IV** pressors

**RARELY USED**

# nebivolol/valsartan

(ne-bivoh-lol/val-sartan)
**Byvalson**
*Func. class.: Antihypertensive combination*

**USES:** For the treatment of hypertension

## CONTRAINDICATIONS

AV block, bradycardia, cardiogenic shock, heart failure, hepatic disease, sick sinus syndrome

## DOSAGE AND ROUTES

**Adult:** PO 1 tablet of nebivolol/valsartan 5 mg/80 mg qday as initial therapy in those not adequately controlled on valsartan 80 mg or nebivolol, up to and including 10 mg. The combination product may be substituted for its components in patients already receiving 5 mg nebivolol and 80 mg valsartan.

## nelfinavir (Rx)

(nell-fin'a-veer)
**Viracept**
*Func. class.:* Antiretroviral
*Chem. class.:* Protease inhibitor

**Do not confuse:** Viracept/viramune

**ACTION:** Inhibits HIV-1 protease, which prevents maturation of the infectious virus

**USES:** HIV-1 in combination with other antiretrovirals

## CONTRAINDICATIONS

Hypersensitivity to protease inhibitors

**Precautions:** Pregnancy, breastfeeding, hemophilia, PKU, renal/hepatic disease, pancreatitis, diabetes, infection

## DOSAGE AND ROUTES

### HIV infection

**Adult and child >13 yr:** PO 750 mg tid or 1250 mg bid, max 2500 mg/day bid in combination
**Child 2-12 yr:** PO 25-30 mg/kg tid or 45-55 mg/kg bid, max 2500 mg/day bid

### Prevention of HIV infection after exposure (unlabeled)

**Adult:** PO 1250 mg bid with two other antiretroviral agents × 4 wk

**Available forms:** Tabs 250, 625 mg

### Implementation

- Administer with food

## ADVERSE EFFECTS

**CNS:** Headache, asthenia, poor concentration, seizures, suicidal ideation
**CV:** Bleeding
**ENDO:** Hyperglycemia, hyperlipidemia
**GI:** Diarrhea, nausea, anorexia, dyspepsia, *flatulence*, hepatitis, pancreatitis
**HEMA:** Anemia, leukopenia, thrombocytopenia, Hgb abnormalities
**INTEG:** Rash, dermatitis, anaphylaxis
**MS:** Pain, arthralgia, myalgia, myopathy
**OTHER:** Hypoglycemia, redistribution/accumulation of body fat, immune reconstitution syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 98% protein binding |
| **Metabolism** | Liver (minimal) |
| **Excretion** | Feces/urine |
| **Half-life** | 3½-5 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Amiodarone, lovastatin, midazolam, pimozide, quiNIDine, salmeterol, simvastatin, triazolam: increased serious dysrhythmias
Alfentanil, alosetron, atorvastatin, azithromycin, bortezomib, buprenorphine, busPIRone, cilostazol, cycloSPORINE, disopyramide, DOCEtaxel, dofetilide, donepezil, ethosuximide, fentaNYL, galantamine, gefitinib, halofantrine, indinavir, levomethadyl, systemic lidocaine, PACLitaxel, rifabutin, saquinavir, sibutramine, sildenafil, sirolimus, SUFentanil, tacrolimus, traZODone, ziprasidone, zonisamide: increased effect of each product
CarBAMazepine, nevirapine, PHENobarbital, phenytoin, rifamycin: decreased nelfinavir levels
Delavirdine: increased protease inhibitor levels
Didanosine, methadone, phenytoin: decreased effect
Indinavir, ketoconazole, ritonavir: increased nelfinavir levels

### Drug classifications

Calcium channel blockers, tricyclic antidepressants, vinca alkaloids: increased effects
Contraceptives (oral): decreased effect
Ergots: increased serious dysrhythmias
HIV protease inhibitors: increased protease inhibitor levels

### Drug/herb

St. John's wort: decreased antiretroviral effect, do not use concurrently

### Drug/food

Increased: absorption with food

### Drug/lab test

Increased: AST, ALT, alkaline phosphatase, total bilirubin, CPK, LDH, lipids, uric acid
Decreased: WBC, platelets

## NURSING CONSIDERATIONS

### Assessment

- **Pregnancy:** Enroll pregnant patient in Antiretroviral Pregnancy Registry (800-258-4264), use only if potential benefit is greater than risk, do not breastfeed
- **HIV:** Monitor blood studies: serum lipid profile, plasma HIV RNA, blood glucose, viral load, CD4 cell counts baseline, throughout treatment

- Assess resistance testing at initiation and failure of treatment
- Assess signs of infection, anemia
- Monitor liver function tests: ALT, AST
- Assess bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- **Anaphylaxis, hypersensitivity reaction:** assess for wheezing, flushing, swelling of lips, tongue, throat, skin eruptions, rash, urticaria, itching
- **Immune reconstitution syndrome:** occurs with combination therapy; includes MAC, CMV, PCP, TB that require treatment
- **Phenylketonuria:** powder contains phenylalanine

### Patient/family education

- Advise patient to take with meal or snack; if dose is missed, take as soon as remembered up to 1 hr before next dose; do not double dose
- Advise patient to avoid taking with other medications, unless directed by prescriber
- Teach patient that diarrhea is the most common side effect; may use loperamide to control
- Teach patient that product does not cure, but manages symptoms; does not prevent transmission of HIV to others
- **Pregnancy:** Teach patient to use nonhormonal form of contraception while taking this product if using contraceptives
- Teach to report symptoms of hyperglycemia
- Advise all providers of this product; advise prescriber of all OTC, Rx, herbal products

### Evaluation

**Positive therapeutic outcome**

- Decreasing symptoms of HIV
- Improving viral load and CD4 cell counts

## nepafenac ophthalmic

*See Appendix B*

## nevirapine (Rx)

(ne-veer'a-peen)
**Viramune, Viramune XR**
*Func. class.:* Antiretroviral
*Chem. class.:* Non-nucleoside reverse transcriptase inhibitor (NNRTI)

**Do not confuse:** nevirapine/nelfinavir, Viramune/Viracept

**ACTION:** Binds directly to reverse transcriptase and blocks RNA, DNA, causing a disruption of the enzyme's site

**Therapeutic outcome:** Improvement of HIV-1 infection

**USES:** HIV-1 in combination with other highly active antiretroviral treatments (HAART) hypersensitivity

## CONTRAINDICATIONS

**BLACK BOX WARNING:** Hepatic disease

**Precautions:** Pregnancy, breastfeeding, children, renal disease, Hispanic patients, hepatitis

**BLACK BOX WARNING:** Females, serious rash

## DOSAGE AND ROUTES

### HIV infection in combination with other antiretrovirals

**Adult and adolescent:** PO 200 mg/day × 2 wk, then 200 mg bid in combination; ext rel tab (adults not currently taking immediate release nevirapine) 200 mg/day (immediate rel tab) × 14 days with other antiretrovirals; if rash develops during lead-in period and persists beyond 14 days, do not use ext rel tab; if no consistent rash is present then give 400 mg/day ext rel tab with other antiretrovirals; if interrupted > 7 days, restart 14-day lead-in dosing; adults switched from immediate-release tab, 400 mg/day ext rel tab
**Neonate ≥15 days old/infant/child:** PO 150 mg/m$^2$/day × 14 days, then 150 mg/m$^2$ bid; max 400 mg/day

### Perinatal transmission prophylaxis (unlabeled)

**Females with no previous antiretroviral therapy:** PO 200 mg as a single dose at onset of labor with zidovudine 2 mg/kg over 1 hr followed by zidovudine 1 mg/kg/hr until delivery
**Neonate ≥34 wk gestation:** PO nevirapine 2 mg/kg as a single dose at age 48-72 hr and PO zidovudine 2 mg/kg q6hr for 6 wk

### Hepatic dose

**Adult:** PO do not use in Child-Pugh B or C

**Available forms:** Tabs 200 mg; oral susp 50 mg/5 ml; ext rel tabs: 400 mg

### Implementation

- Do not initiate treatment in females when CD4 counts >250 cells/mm$^3$, or in males when >400 cells/mm$^3$ unless benefit outweighs risks
- Give without regard to meals
- Use in combination with at least 1 other antiretroviral
- Give at equal intervals around the clock to maintain blood levels

## ADVERSE EFFECTS

**CNS:** *Paresthesia, headache, fever, peripheral neuropathy*
**GI:** *Diarrhea,* abdominal pain, *nausea, stomatitis,* hepatotoxicity, hepatic failure
**HEMA:** Neutropenia, anemia, thrombocytopenia
**INTEG:** *Rash,* toxic epidermal necrolysis
**MISC:** Stevens-Johnson syndrome, anaphylaxis
**MS:** Pain, myalgia, rhabdomyolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid |
| **Distribution** | Protein binding 60% |
| **Metabolism** | Liver, by P450 enzyme system |
| **Excretion** | 91% urine |
| **Half-life** | 25-30 hr 50% removed by peritoneal dialysis; slower clearance rate in Hispanics, African Americans |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Cimetidine: increased nevirapine levels
ClonazePAM, diazepam, warfarin: decreased nevirapine level
Itraconazole: decreased effect of itraconazole
Ketoconazole: decreased effect of ketoconazole
Methadone: decreased effect of methadone

### Drug classifications

Anticonvulsants, rifamycins: decreased nevirapine levels
Antiinfectives, macrolides: increased nevirapine levels
Oral contraceptives, protease inhibitors: decreased action

### Drug/herb

St. John's wort: decreased nevirapine levels, do not use together

### Drug/lab test

Increased: ALT, AST, GGT, bilirubin, Hgb
Decreased: neutrophil count

## NURSING CONSIDERATIONS

### Assessment

- Use resistance testing before starting and when therapy fails

**BLACK BOX WARNING: Hepatotoxicity:** May be fatal, usually occurs within the first 18 wk of treatment, high risk in females

- **Assess signs of infection,** anemia, hepatotoxicity, immune reconstitution syndrome
- **HIV:** Assess liver, renal, blood tests: ALT, AST, viral load, CD4, plasma HIV RNA, glucose levels in diabetic patients; if liver function tests are elevated significantly, product should be withheld; if treatment is interrupted by >1 wk, restart at initial dose
- Assess bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- Assess skin eruptions; rash, urticaria, itching; if rash is severe or systemic symptoms occur, discontinue immediately
- Assess allergies before treatment, reaction to each medication
- **Rhabdomyolysis:** assess for pain, tenderness, weakness, edema; product should be discontinued
- Stevens-Johnson syndrome, toxic epidermal necrolysis, assess for allergies before treatment, reaction to each medication; skin eruptions; rash, urticaria, itching; if rash is severe or systemic symptoms occur, discontinue immediately
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding

### Patient/family education

**BLACK BOX WARNING:** Instruct patient to report immediately any right quadrant pain, yellowing of eyes/skin, dark urine, nausea, anorexia, muscle pain/tenderness, rash

- Inform patient that product may be taken with food, antacids
- Advise patient to take as prescribed; if dose is missed, take as soon as remembered up to 1 hr before next dose; do not double dose
- Advise patient that product must be taken in equal intervals around the clock to maintain blood levels for duration of therapy
- Advise patient that product is not a cure, controls symptoms of HIV, does not prevent transmission
- Instruct patient to avoid OTC agents unless approved by prescriber
- Advise patients who are using contraceptives to use a nonhormonal form of contraception during treatment

### Evaluation

**Positive therapeutic outcome**
- Improving viral load and CD4 cell counts
- Absence of AIDS-defining symptoms
- Improvement in quality of life

**RARELY USED**

## niacin (Rx, OTC)
(nye'a-sin)
**Equaline Niacin, Niaspan, Ni-Odan 🍁, Slo-Niacin**

## niacinamide (Rx, OTC)
(nye-a-sin'a-mide)
*Func. class.:* Vitamin $B_3$ lipid-lowering product
*Chem. class.:* Water-soluble vitamin

**Therapeutic outcome:** Decreasing cholesterol and LDL levels, $B_3$ supplementation

**USES:** Pellagra, hyperlipidemias (types IV, V), peripheral vascular disease that presents a risk for pancreatitis

### CONTRAINDICATIONS
Breastfeeding, hypersensitivity, peptic ulcer, hepatic disease, hemorrhage, severe hypotension

### DOSAGE AND ROUTES
#### Niacin deficiency
**Adult:** PO 100-500 mg/day in divided doses; IM/SUBCUT 50-100 mg 5 or more times a day; **IV** 25-100 mg bid or tid
**Child:** PO up to 300 mg/day in divided doses

#### Adjunct in hyperlipidemia
**Adult:** 250 mg after evening meal, may increase dosage at 1-4 wk intervals to 1-2 g tid, max 6 g/day; ext rel 500 mg at bedtime, ×4 wk, then 1000 mg at bedtime for wk 5-8, do not increase by more than 500 mg q4wk, max 2000 mg/day

#### Pellagra
**Adult:** PO 300-500 mg/day in divided doses, IM 50-100 mg 5 ×/day or IV 25-100 mg bid by slow IV INF
**Child:** PO 100-300 mg/day in divided doses; IV up to 300 mg/day by slow IV/INF

#### Peripheral vascular disease (unlabeled)
**Adult:** PO 250-800 mg/day in 3-5 divided doses

## niCARdipine (Rx)
(nye-card'i-peen)
**Cardene IV, Cardene SR**
*Func. class.:* Calcium channel blocker, antianginal, antihypertensive
*Chem. class.:* Dihydropyridine

**Do not confuse:** niCARdipine/NIFEdipine, Cardene/Cardizem

**ACTION:** Inhibits calcium ion influx across cell membrane during cardiac depolarization, produces relaxation of coronary vascular smooth muscle and peripheral vascular smooth muscle, dilates coronary arteries, increases myocardial oxygen delivery in patients with vasospastic angina

**Therapeutic outcome:** Decreased angina pectoris, decreased B/P in hypertension

**USES:** Chronic stable angina pectoris, hypertension

### CONTRAINDICATIONS
Sick sinus syndrome, 2nd- or 3rd-degree heart block, hypersensitivity to this product or dihydropyridine, advanced aortic stenosis

**Precautions:** Pregnancy, breastfeeding, children, geriatric, HF, hypotension, hepatic injury, renal disease

### DOSAGE AND ROUTES
#### Hypertension
**Adult:** PO 20 mg tid initially; may increase after 3 days (range 20-40 mg tid) or SUS REL 30 mg bid; may increase to 60 mg bid **IV** 5 mg/hr; may increase by 2.5 mg/hr q15min; max 15 mg/hr

#### Angina
**Adult:** PO 20 mg tid, may be adjusted q3day, may use 20-40 mg tid

#### Renal dose
**Adult:** PO 20 mg tid or SUS REL 30 mg bid

#### Hepatic dose
**Adult:** PO 20 mg bid

**Available forms:** Caps 20, 30 mg; sus rel caps 30, 45, 60 mg; inj 2.5 mg/ml, premixed 20 mg/200 ml, 40 mg/200 ml

#### Implementation
**PO route**
- Do not break, crush, chew, or open sus rel caps
- Give without regard to meals
- To start PO give 1 hr before discontinuing IV nicardipine
- Store in airtight container at room temperature

**IV route**
- To convert/substitute PO to IV for adults, if PO 20 mg q8hr, start infusion at 0.5 mg/hr; if PO 30 mg q8hr, start infusion at 1.2 mg/hr; if PO 40 mg q8hr, start infusion at 2.2 mg/hr
- Dilute each 25 mg/240 ml of compatible sol (0.1 mg/ml), give slowly, titrate to patient's response, stable for 24 hr at room temperature, change IV site q12 hrs

**Solution compatibilities:** $D_5W$, $D_5$/0.45% NaCl, $D_5$/0.9% NaCl

**Y-site compatibilities:** Alemtuzumab, amikacin, aminophylline, aztreonam, bivalirudin, butorphanol, calcium gluconate, CARBOplatin, caspofungin, ceFAZolin, ceftizoxime, chloramphenicol, cimetidine, CISplatin, clindamycin, cytarabine, DAPTOmycin, dexmedetomidine, diltiazem, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin hydrochloride, enalaprilat, EPINEPHrine, epirubicin, erythromycin, esmolol, famotidine, fenoldopam, fentaNYL, gentamicin, hydrocortisone, HYDROmorphone, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mechlorethamine, methylPREDNISolone, metroNIDAZOLE, midazolam, milrinone, morphine, nafcillin, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, palonosetron, penicillin G potassium, potassium chloride/phosphate, quinupristin-dalfopristin, ranitidine, rocuronium, tacrolimus, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinCRIStine, voriconazole, zoledronic acid

**Y-site incompatibilities:** Amphotericin B liposome/lipid complex, ampicillin, ampicillin/sulbactam, cefepime, cefoperazone, ertapenem, fluorouracil, furosemide, methotrexate, micafungin, pantoprazole, PEMEtrexed, thiopental, thiotepa, tigecycline

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness,* anxiety, depression, confusion, paresthesia, somnolence, *flushing*
**CV:** Edema, bradycardia, hypotension, palpitations, pulmonary edema, chest pain, tachycardia, increased angina, arrhythmias, HF
**GI:** Nausea, vomiting, gastric upset, constipation, hepatitis, abdominal cramps, dry mouth, sore throat
**GU:** Nocturia, polyuria
**INTEG:** Rash, infusion site discomfort, Stevens-Johnson syndrome
**MISC:** Blurred vision, flushing, sweating, SOB, impotence

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO); bioavailability poor |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys 60%, feces 35% |
| **Half-life** | 2-5 hr |

### Pharmacodynamics

| | PO | PO SUS REL | IV |
|---|---|---|---|
| **Onset** | 20 min | Unknown | 1 min |
| **Peak** | 1-2 hr | | 45 min |
| **Duration** | 8 hr | 10-12 hr | |

## INTERACTIONS

### Individual drugs

Alcohol: increased hypotension
CarBAMazepine, cycloSPORIINE, prazosin, propranolol, quiNIDine: increased risk of toxicity
Cimetidine: increased niCARdipine effects
Digoxin, quiNIDine, theophylline: increased effects
Rifampin: decreased antihypertensive effect

### Drug classifications

Antihypertensives, neuromuscular blocking agents, nitrates: increased hypotension
NSAIDs: decreased antihypertensive effect

### Drug/herb

Ginkgo, ginseng, hawthorn: increased effect
Ephedra, melatonin, St. John's wort, yohimbe: decreased effect

### Drug/food

Grapefruit juice, grapefruit: increased hypotensive effect

### Drug/lab test

Increased: LFTs
Decreased: potassium (IV), phosphate, platelets

## NURSING CONSIDERATIONS

### Assessment

- Assess fluid volume status (I&O ratio) and record weight, color, quality, and specific gravity of urine, skin turgor, adequacy of pulses, moist mucous membranes, bilateral lung sounds, peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth, and mucous membranes should be reported
- **Monitor for HF:** weight gain, crackles, peripheral edema jugular venous distention, dyspnea
- **Allergic reactions (Stevens-Johnson syndrome):** If rash is severe with and accompanied by joint aches, mouth lesions, discontinue immediately

• **Hypertension:** assess for decreasing B/P; salt in diet, smoking, exercise, diet, weight, monitor B/P baseline and often
• **Assess anginal pain:** intensity, location, duration, alleviating factors
• Monitor potassium, renal/liver function tests, periodically if on long-term treatment
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding

### Patient/family education

• Advise patient to avoid hazardous activities until stabilized on product and dizziness is no longer a problem
• Instruct patient to limit caffeine consumption; to avoid alcohol and OTC products unless directed by a prescriber, to take without regard to food, avoid high-fat foods, to swallow sus rel product whole
• **Hypertension:** instruct patient to comply with all areas of medical regimen: diet, exercise, stress reduction, product therapy
• Instruct patient to notify prescriber of irregular heartbeat, shortness of breath, swelling of feet and hands, pronounced dizziness, constipation, nausea, hypotension, change in severity/pattern/incidence of angina
• Teach patient to use medication as directed even if feeling better; may be taken with other cardiovascular products (nitrates, β-blockers)
• Teach patient to take medication exactly as prescribed
• Advise patient to contact prescriber if anginal attacks continue or become worse

### Evaluation

**Positive therapeutic outcome**
• Decreased angina attacks
• Decreased B/P

## TREATMENT OF OVERDOSE:

Defibrillation, atropine for AV block, vasopressor for hypotension

## nicotinamide

*See niacin*

## nicotine

(nik′o-teen)

## nicotine chewing gum

**Nicorette, Thrive**

## nicotine inhaler (OTC, Rx)

**Nicotrol Inhaler**

## nicotine lozenge (OTC)

**Commit, Nicorette**

## nicotine nasal spray (Rx)

**Nicotrol NS**

## nicotine transdermal (OTC, Rx)

**Nicoderm CQ**

*Func. class.:* Smoking deterrent
*Chem. class.:* Ganglionic cholinergic agonist

## ACTION:

Agonist at nicotinic receptors in the peripheral and central nervous systems; acts at sympathetic ganglia, on chemoreceptors of the aorta and carotid bodies; also affects adrenaline-releasing catecholamines

**Therapeutic outcome:** Decreased withdrawal effects when smoking cessation is attempted

## USES:

Deter cigarette smoking

**Unlabeled uses:** Tourette's syndrome

## CONTRAINDICATIONS

Pregnancy (transdermal, inhaler), hypersensitivity, immediate post-MI recovery period, severe angina pectoris

**Precautions:** Pregnancy (gum), breastfeeding, vasospastic disease, dysrhythmias, diabetes mellitus, hyperthyroidism, pheochromocytoma, coronary disease, esophagitis, peptic ulcer, renal/hepatic disease; MRI (patch); soy hypersensitivity (mint lozenge)

## DOSAGE AND ROUTES

### Nicotine chewing gum

**Adult:** If patient smokes ≤25 cigarettes/day, start with 2 mg gum; if >25 cigarettes/day, start with 4 mg gum; then 1 piece of gum q1-2hr × 6 wk, then 1 piece of gum q2-4hr × 2 wk, then 1 piece of gum q4-8hr × 2 wk, then discontinue; max 24/day

### Nicotine inhaler

**Adult:** Inhale 6 cartridges/day for first 3-6 wk, max 16/day × 12 wk

### Nicotine lozenge

**Adult:** If cigarette is desired >30 min after awakening, start with 1-2–mg lozenge; if <30 min after awakening, start with 4-mg lozenge; then 1 q1-2hr, max 20 lozenges/day or 5 lozenges/6 hr × 6 wk, then 1 lozenge q2-4hr × 2 wk, then 1 lozenge q4-8hr × 2 wk, then discontinue

### Nicotine nasal spray

**Adult:** 1 spray in each nostril 1-2 ×/hr, max 5 ×/hr or 40 ×/day, max 3 mo

## Nicotine transdermal/inhaler system

### NicoDerm
**Adult:** 21 mg/day × 4-8 wk; 14 mg/day × 2-4 wk; 7 mg/day × 2-4 wk

### Nicotrol
**Adult:** 15 mg/day × 12 wk; 10 mg/day × 2 wk; 5 mg/day × 2 wk

### Nicotrol inhaler
**Adult:** Delivers 30% of what a smoker receives from an actual cigarette

### Tourette's syndrome (unlabeled)
**Adult and child:** Chewing gum 2 mg chewed × ½ hr bid × 1-6 mo; transdermal 7 or 10 mg patch daily × 2 days

**Available forms:** Gum: 2, 4 mg/piece; nicotine transdermal system (NicoDerm, Nicotine Transdermal System); 7, 14, 21 mg/day delivered; (NicoDerm) 5, 10, 15 mg/day; nicotine inhaler: 4 mg delivered; nasal spray: 0.5 mg of nicotine/actuation; lozenge: 2 mg, 4 mg

### Implementation
- Give only prescribed amount, or toxicity may occur
- **Gum:** chew gum slowly for 30 min to promote buccal absorption of the product; do not chew > 45 min
- Begin product withdrawal after 3 mo of use; do not exceed 6 mo
- Do not expose to light, gum will turn color
- **Transdermal patch:** apply once a day to a nonhairy, clean, dry area of skin on upper body or upper outer arm; rotate sites to prevent skin irritation, can remove before bed if patient has strange dreams
- **Nasal spray/Inhaler:** puffing on mouthpiece delivers nicotine through the mouth
- **Lozenge:** Allow to dissolve slowly

## ADVERSE EFFECTS
**CNS:** Dizziness, vertigo, insomnia, headache, confusion, seizures, depression, euphoria, numbness, tinnitus, strange dreams
**CV:** Dysrhythmias, tachycardia, palpitations, edema, flushing, hypertension
**EENT:** Jaw ache, irritation in buccal cavity
**GI:** *Nausea, vomiting, anorexia, indigestion,* diarrhea, abdominal pain, constipation, eructation, irritation
**RESP:** Breathing difficulty, cough, hoarseness, sneezing, wheezing, bronchial spasm

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Slowly absorbed, buccal cavity |
| **Distribution** | Unknown |
| **Metabolism** | Liver; some by lungs, kidneys |
| **Excretion** | Kidneys, unchanged (20%); breast milk |
| **Half-life** | 1-2 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | ½ hr |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Bromocriptine, cabergoline: increased vasoconstriction
Adenosine: increased effects
BuPROPion: increased B/P
Insulin: decreased effect
Cimetidine: decreased nicotine clearance

### Drug classifications
Ergots: increased vasoconstriction
α-Blockers: decreased effect

### Drug/food
Acidic foods (colas, coffee): avoid use of gum with and for 15 min after

## NURSING CONSIDERATIONS
### Assessment
- **Assess for adverse reaction to gum:** irritation of buccal cavity, dislike of taste, jaw ache
- **Assess for withdrawal symptoms:** headache, fatigue, drowsiness, restlessness, irritability, severe cravings for nicotine products before, during, and after treatment
- **Smoking:** obtain a nicotine assessment: brand of cigarettes, chewing tobacco, cigars, number of each used per day; what increases need or activities performed when each is used
- **Toxicity:** Assess for nausea, vomiting, diarrhea, headache, dizziness, dyspnea, hypotension
- Gum should not be used if temporomandibular condition exists
- **Assess for nicotine toxicity:** GI symptoms (nausea, vomiting, diarrhea), cardiopulmonary symptoms (decreased B/P, dyspnea, change in pulse), weakness, abdominal cramping, headache, blurred vision, tinnitus; product should be discontinued

• **Pregnancy/breastfeeding:** Whenever possible, avoid in pregnancy, cautious use in breastfeeding

### Patient/family education

• **Toxicity:** Teach patient signs of toxicity: nausea, vomiting, diarrhea, headache, dizziness, dyspnea, hypotension
• Advise patient to begin product withdrawal after 3 mo use; max 6 mo
• Teach patient all aspects of product; give package insert to patient and explain; caution patient not to exceed prescribed dose
• Caution patient not to use during pregnancy; birth defects may occur
• Discontinue if patient is unable to stop smoking after fourth week of therapy

**Gum**

• Advise patient to chew gum slowly for 30 min to promote buccal absorption of the product; do not chew over 45 min
• Inform patient that gum will not stick to dentures, dental appliances
• Caution patient that gum is as toxic as cigarettes; it is to be used only to deter smoking

**Transdermal patch**

• Caution patient that patch is as toxic as cigarettes; to be used only to deter smoking
• Caution patient not to use during pregnancy; birth defects may occur
• Instruct patient to keep used and unused system out of reach of children and pets
• Instruct patient to apply once a day to a non-hairy, clean, dry area of skin on upper body or upper outer arm; to rotate sites to prevent skin irritation
• Instruct patient to stop smoking immediately when beginning patch treatment
• Teach patient to apply promptly after removing from protective pouch; system may lose strength
• **Nasal spray:** tilt head back, do not swallow, do not chew or inhale during administration; after smoking is stopped, use spray up to 8 wk, then discontinue over 6 wk by tapering
• **Lozenges:** allow to dissolve, avoid swallowing
• **Inhalation:** use the inhaler for 20 min by frequent puffs
• Advise patient that puffing on mouthpiece delivers nicotine through the mouth lining

### Evaluation

**Positive therapeutic outcome**

• Decrease in urge to smoke
• Decreased need for gum after 3-6 mo

## NIFEdipine (Rx)

(nye-fed'i-peen)
**Adalat CC, Adalat XL, Afeditab CR, Nifedical XL Procardia, Procardia XL**
*Func. class.:* Calcium channel blocker, antianginal, antihypertensive
*Chem. class.:* Dihydropyridine

**Do not confuse:** NIFEdipine/niCARdipine/niMODipine Procardia XL/Protain XL

**ACTION:** Inhibits calcium ion influx across cell membrane during cardiac depolarization, produces relaxation of coronary vascular smooth muscle, dilates coronary vascular arteries, increases myocardial oxygen delivery in patients with vasospastic angina, dilates peripheral arteries

**Therapeutic outcome:** Decreased angina pectoris, decreased B/P in hypertension

**USES:** Chronic stable angina pectoris, variant angina, hypertension, migraine prophylaxis

### CONTRAINDICATIONS

Hypersensitivity to this product or dihydropyridine, cardiogenic shock

**Precautions:** Pregnancy, breastfeeding, children, hypotension, sick sinus syndrome, 2nd- or 3rd-degree heart block, hypotension less than 90 mm Hg systolic, hepatic injury, renal disease, acute MI, aortic stenosis, GERD, heart failure

### DOSAGE AND ROUTES

**Adult:** PO immediate release, 10 mg tid; increase in 10-mg increments q7-14day, max 180 mg/24 hr or single dose of 30 mg; sus rel 30-60 mg/day; may increase q7-14day; doses >120 mg not recommended

**Hypertension**

**Adult:** PO ext rel 30-60 mg qd, titrate upward as needed; max 90 mg/day (Adalat CC); 120 mg/day (Procardia XL)
**Adolescent/child (unlabeled):** PO ext rel 0.25-0.5 mg/kg/day, max 3 mg/kg/day

**Hiccups (unlabeled)**

**Adult:** PO 10-20 mg tid

**Available forms:** Caps 10, 20 mg; ext rel tabs (CC, XL) 30, 60, 90 mg

### Implementation

**PO route**

• Do not use immediate release caps within 7 days of MI, coronary syndrome; do not use SL caps to reduce severe hypertension, may cause death
• Give without regard to meals

• Store in airtight container at room temperature
• Protect caps from direct light, keep in dry area, do not freeze

**Sublingual route**

• Using a sterile needle, puncture the cap and squeeze medication in buccal/sublingual area (not an FDA-approved use), do not use in severe hypertension, may be fatal

## ADVERSE EFFECTS

**CNS:** *Headache,* fatigue, drowsiness, *dizziness,* anxiety, depression, weakness, insomnia, *light-headedness,* paresthesia, tinnitus, blurred vision, nervousness, tremor, flushing
**CV:** Dysrhythmias, edema, hypotension, palpitations, tachycardia
**GI:** *Nausea,* vomiting, diarrhea, gastric upset, constipation, increased LFTs, dry mouth, flatulence, gingival hyperplasia
**GU:** Nocturia, polyuria
**HEMA:** Bruising, bleeding, petechiae
**INTEG:** Rash, pruritus, *flushing,* hair loss, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis
**MISC:** Sexual difficulties, cough, fever, chills

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO) |
| **Distribution** | Protein binding 92% |
| **Metabolism** | Liver, extensively |
| **Excretion** | Unknown |
| **Half-life** | 2-5 hr |

### Pharmacodynamics

| | PO | PO EXT REL |
|---|---|---|
| **Onset** | 20 min | Unknown |
| **Peak** | 30 min-1 hr | 6 hr |
| **Duration** | 6-8 hr | 24 hr |

## INTERACTIONS

### Individual drugs

Cimetidine, ranitidine: increased risk of toxicity
CarBAMazepine, cycloSPORINE, phenytoin, prazosin, digoxin: increased levels of each product
QuiNIDine: decreased effects
Smoking: decreased NIFEdipine level

### Drug classifications

Strong CYP3A4 inducers: use is contraindicated
Antihypertensives, β-adrenergic blockers: increased effects
NSAIDs: decreased antihypertensive effect

### Drug/herb

Ginkgo biloba, ginseng, hawthorn: increased effect
Ephedra, melatonin, St. John's wort, yohimbe: decreased effect

### Drug/food

Grapefruit juice: increased NIFEdipine level

### Drug/lab test

Positive: ANA titer, direct Coombs' test
Increased: CPK, LDH, AST

## NURSING CONSIDERATIONS

### Assessment

• **Assess anginal pain:** location, intensity, duration, character, alleviating, aggravating factors
• **HF:** Peripheral edema, dyspnea, weight gain >5 lb, jugular venous distention, rales; monitor I&O ratios, daily weight
• Assess for bruising, petechiae, bleeding
• Monitor potassium, renal/liver function tests periodically during treatment; in those taking antihypertensives, beta blockers, monitor B/P often
• **Serious skin disorders:** rash starts suddenly, assess for fever, cutaneous lesions, may have pustules; discontinue product if rash present or if rash is severe, fatigue
• Assess fluid volume status (I&O ratio) and record weight, distended red veins, crackles in lung, color, quality, and specific gravity of urine, skin turgor, adequacy of pulses, moist mucous membranes, bilateral lung sounds, peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth, and mucous membranes should be reported
• Monitor cardiac status: B/P, pulse, respirations, ECG
• **GI obstruction:** ext rel products have been associated with rare reports of obstruction in those with strictures, and no known GI disease
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed
• **Beers:** Avoid in older adults, potential for hypotension, myocardial ischemia

### Patient/family education

• Advise patient to avoid hazardous activities until stabilized on product and dizziness is no longer a problem
• Instruct patient to limit caffeine consumption; to avoid alcohol and OTC products unless directed by prescriber
• Advise patient that empty tab shells may appear in stools and are not significant
• Give without regard to meals (exception: Adelat CC should be taken on empty stomach)
• **Hypertension:** instruct patient to comply in all areas of medical regimen: diet, exercise, stress reduction, product therapy
• Tell patient to notify prescriber of irregular heartbeat, SOB, swelling of feet and hands, pronounced dizziness, constipation, nausea,

hypotension, severe rash, changes in pattern/frequency/severity of angina
• Teach patient to use as directed even if feeling better; may be taken with other cardiovascular products (nitrates, β-blockers)
• Advise patient to increase fluid intake to prevent constipation
• Teach patient to check for gingival hyperplasia and report promptly
• Teach patient not to discontinue abruptly; gradually taper

### Evaluation

**Positive therapeutic outcome**
• Decreased angina attacks
• Decreased B/P

## TREATMENT OF OVERDOSE:
Defibrillation, atropine for AV block, vasopressor for hypotension

**⚠ HIGH ALERT**

## nilotinib (Rx)
(nye-loe'ti-nib)
**Tasigna**
*Func. class.:* Antineoplastic—miscellaneous
*Chem. class.:* Protein-tyrosine kinase inhibitor

## ACTION:
Inhibits BCR-ABL tyrosine kinase created in chronic myeloid leukemia (CML)

**Therapeutic outcome:** Decrease in progression of disease

## USES:
Chronic phase/accelerated phase Philadelphia chromosome–positive chronic myelogenous leukemia that is resistant/intolerant to imatinib

## CONTRAINDICATIONS
Pregnancy, breastfeeding, hypersensitivity

**BLACK BOX WARNING:** Hypokalemia, hypomagnesemia, QT prolongation, QT syndrome

**Precautions:** Children, women, geriatric patients, active infections, anemia, cardiac disease, bone marrow suppression, cholestasis, diabetes, gelatin hypersensitivity, infertility, galactose-free diet, lactase deficiency, neutropenia, pancreatitis, thrombocytopenia alcoholism, angina, ascites, tumor lysis syndrome, hepatic disease

## DOSAGE AND ROUTES
**Adult:** PO 400 mg q12h; continue until disease progression or unacceptable toxicity

### Escalation regimen for those taking a strong CYP3A4 inducer
**Adult:** PO increase dose as required

### Adjustment following discontinuation of a strong CYP3A4 inducer
**Adult:** PO reduce to 400 mg/bid

### Use with a strong CYP3A4 inhibitor
**Adult:** PO reduce dose to 400 mg/day

### QT prolongation
**QTcF >480 msec:** Withhold dose

### Myelosuppression
**ANC 1 × $10^9$/L or platelets <50 × $10^9$/L:** Withhold dose

### Hepatic Dose
**Adult:** PO (Child-Pugh classes A-C): newly diagnosed CML 200 mg bid, then escalation to 300 mg bid initially

**Available forms:** Caps 150, 200 mg

### Implementation
• Do not break, crush, or chew caps; if a whole capsule cannot be swallowed, disperse capsule contents in 1 tsp of applesauce
• Give without regard to meals; separate doses by 12 hr; a make-up dose should not be taken if a dose is missed
• Store at 15°-30° C (59°-86° F)

## ADVERSE EFFECTS
**CNS:** Headache, dizziness, fatigue, fever, flushing, paresthesia
**CV:** QT prolongation, palpitations, torsades de pointes, AV block
**GI:** *Nausea,* hepatotoxicity, vomiting, dyspepsia, *anorexia, abdominal pain,* constipation, pancreatitis, diarrhea, xerostomia
**HEMA:** Neutropenia, thrombocytopenia, anemia, pancytopenia
**INTEG:** *Rash,* alopecia, erythema
**META:** Hyperamylasemia, hyperbilirubinemia, hyperglycemia, hyperkalemia, hypocalcemia, hyponatremia, hypomagnesemia
**MISC:** Diaphoresis, anxiety
**MS:** Arthralgia, myalgia, back/bone pain, muscle cramps
**RESP:** Cough, dyspnea
**SYST:** Bleeding, tumor lysis syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 98%, plasma levels 3 hr |
| **Metabolism** | By CYP3A4 |
| **Excretion** | Unknown |
| **Half-life** | Elimination 17 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

• Product interactions are numerous

Acetaminophen: increased hepatotoxicity

CarBAMazepine, dexamethasone, PHENobarbital, phenytoin, rifampin: decreased concentrations

Clarithromycin, erythromycin, itraconazole, ketoconazole: increased concentrations

Haloperidol, chloroquine, droperidol, pentamidine, arsenic trioxide, levomethadyl: increased QT prolongation

Pimozide, ziprasidone: do not use concurrently

Simvastatin: increased plasma concentrations

Warfarin: increased plasma concentration; avoid use with warfarin, use low-molecular-weight anticoagulants instead

### Drug classifications

Class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation

Calcium channel blockers: increased plasma concentrations

Phenothiazines: do not use concurrently

### Drug/herb

St. John's wort: decreased concentration

### Drug/food

Grapefruit juice: increased plasma concentrations

## NURSING CONSIDERATIONS

### Assessment

• Assess ANC and platelets; if ANC $<1 \times 10^9$/L and/or platelets $<50 \times 10^9$/L, stop until ANC $>1.5 \times 10^9$/L and platelets $>75 \times 10^9$/L

• **Monitor CV status:** hypertension, QT prolongation can occur; monitor left ventricular ejection fraction (LVEF) baseline periodically

• **Assess for renal toxicity:** if bilirubin $>3 \times$ IULN, withhold until bilirubin levels return to $<1.5 \times$ IULN

• **Assess for hepatotoxicity:** monitor hepatic function tests, before treatment and qmo; if liver transaminases $>5 \times$ IULN, withhold until transaminase levels return to $<2.5 \times$ IULN

• **Myelosuppression:** Monitor CBC $\times$ 2 mo and then monthly; differential, platelet count weekly; withhold product if WBC is $<3500/mm^3$ or platelet count $<100,000/mm^3$; notify prescriber of these results; product should be discontinued

• Monitor for bleeding: epistaxis, rectal, gingival, upper GI, genital, and wound bleeding; tumor-related hemorrhage may occur rapidly

• **Tumor lysis syndrome:** maintain hydration, correct uric acid prior to use of this product

• **Monitor electrolytes:** calcium, potassium, magnesium, sodium; lipase, phosphate; hypokalemia, hypomagnesemia should be corrected prior to use

• AST/ALT/bilirubin/lipase/amylase if increased to grade 3, withhold product; resume at 400 mg qd when levels return to grade 1 or below

• **QT prolongation:** ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea

• **Pregnancy/breastfeeding:** Not to use in pregnancy, breastfeeding

### Patient/family education

• **Infection:** Teach patient to report immediately cough, fever, chills

• Instruct patient to report bleeding, bleeding gums, blood in stools, urine, emesis

• Instruct patient to report adverse reactions immediately: SOB, bleeding

• Inform patient reason for treatment, expected result

• Advise patient that many adverse reactions may occur

• Teach patient to avoid persons with known upper respiratory infections; immunosuppression is common

• Instruct in signs/symptoms of low potassium or magnesium

• **Pregnancy:** Use contraception during treatment, do not breastfeed

• Teach patient to notify prescriber of all OTC, Rx, herbal products used; not to receive vaccinations without prescriber's approval

### Evaluation

**Positive therapeutic outcome**

• Decrease in progression of disease

## niMODipine (Rx)

(ni-moe'dip-een)

**Nimotop, Nymalize**

*Func. class.:* Calcium channel blocker

*Chem. class.:* Dihydropyridine

**ACTION:** Unknown, may have greater effect on cerebral arteries

**Therapeutic outcome:** Prevention of vascular spasm (subarachnoid hemorrhage)

**USES:** Prevention of cerebrovascular spasm in subarachnoid hemorrhage

## CONTRAINDICATIONS
Sick sinus syndrome, 2nd- or 3rd-degree heart block, hypotension less than 90 mm Hg systolic, hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatric, HF, hypotension, hepatic injury, renal disease

## DOSAGE AND ROUTES
**Adult:** PO begin therapy within 96 hr, 60 mg q4hr × 21 days

**Available forms:** Caps 30 mg

### Implementation
- May puncture cap and dilute in water and give through nasogastric tube; flush tube with 0.9% NaCl
- Store in airtight container at room temperature

## ADVERSE EFFECTS
**CNS:** Headache, fatigue, drowsiness, dizziness, anxiety, depression, weakness, insomnia, confusion, paresthesia, somnolence
**CV:** Dysrhythmia, edema, HF, bradycardia, hypotension, palpitations, MI, pulmonary edema
**GI:** Nausea, vomiting, diarrhea, gastric upset, constipation, hepatitis, abdominal cramps
**GU:** Nocturia, polyuria, acute renal failure
**INTEG:** Rash, pruritus, urticaria, photosensitivity, hair loss
**MISC:** Blurred vision, flushing, nasal congestion, sweating, shortness of breath, gynecomastia, hyperglycemia, sexual difficulties

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed, poor bioavailability |
| **Distribution** | Crosses blood-brain barrier |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys |
| **Half-life** | 1-2 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Alcohol: increased hypotension
Digoxin: increased digoxin levels, bradycardia
PHENobarbital, phenytoin: decreased effectiveness
Propranolol: increased toxicity

### Drug classifications
Antihypertensives: increased hypotension
β-Adrenergic blockers: increased bradycardia
Nitrates: increased nitrates

### Drug/herb
Barberry, betel palm, burdock, goldenseal, khat, khella, lily of the valley, plantain: increased effect
Yohimbe: decreased effect

## NURSING CONSIDERATIONS
### Assessment
- Assess fluid volume status (I&O ratio) and record weight; distended red veins; crackles in lung; color, quality, and specific gravity of urine; skin turgor; adequacy of pulses; moist mucous membranes; bilateral lung sounds; peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth and mucous membranes should be reported
- Monitor B/P and pulse; if B/P drops 30 mm Hg, call prescriber
- Monitor ALT, AST, bilirubin daily; if these are elevated, hepatotoxicity is suspected

### Nursing diagnoses
- Injury, risk for (uses)
- Knowledge, deficient (teaching)

### Evaluation
**Positive therapeutic outcome**
- Prevention of neurologic damage from subarachnoid hemorrhage

N

## nitrofurantoin (Rx)
(nye-troe-fyoor′an-toyn)
**Furadantin, Macrobid, Macrodantin, Novo-Furantoin**
*Func. class.:* Urinary tract antiinfective
*Chem. class.:* Synthetic nitrofuran derivative

**ACTION:** Inhibits bacterial acetyl-CoA from interfering with carbohydrate metabolism

**Therapeutic outcome:** Resolution of infection

**USES:** Urinary tract infections caused by *Escherichia coli, Klebsiella, Pseudomonas, Proteus vulgaris, Proteus morganii, Serratia, Citrobacter, Staphylococcus aureus, Staphylococcus epidermidis, Enterococcus, Salmonella, Shigella*

## CONTRAINDICATIONS
Infants <1 mo, hypersensitivity, anuria, severe renal disease, CCr <60 ml/min, at term pregnancy (38-42 wk), labor, delivery, cholestatic jaundice due to nitrofurantoin therapy

**Precautions:** Pregnancy, breastfeeding, geriatric, G6PD deficiency, GI disease, diabetes

## DOSAGE AND ROUTES

### Active infections

**Adult:** PO 50-100 mg qid after meals or 50-100 mg at bedtime for long-term treatment
**Child:** PO 5-7 mg/kg/day in 4 divided doses; 1-2 mg/kg/day for long-term treatment; max 7 mg/kg/day

### Chronic suppression

**Adult:** PO 50-100 mg QPM
**Child:** PO 2 mg/kg/day QPM or 0.5-1 mg/kg q12hr if dose is not well tolerated

**Available forms:** Caps 25, 50, 100 mg; susp 25 mg/ml; macrocrystal caps (Macrodantin) 25, 50, 100 mg; cap (Macrobid) 100 mg (25 macrocrystals, 75 monohydrate)

### Implementation

- Give with meals
- Do not break, crush, chew, or open tabs, caps; store in original container
- Give after clean-catch urine for C&S
- Give two daily doses if urine output is high or if patient has diabetes

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache*, drowsiness, peripheral neuropathy, chills, confusion, vertigo
**CV:** Bundle branch block, chest pain
**GI:** *Nausea, vomiting, abdominal pain, diarrhea,* cholestatic jaundice, loss of appetite, pseudomembranous colitis, hepatitis, pancreatitis
**HEMA:** Anemia, agranulocytosis, hemolytic anemia, leukopenia, thrombocytopenia
**INTEG:** Pruritus, rash, urticaria, angioedema, alopecia, tooth staining, exfoliative dermatitis
**MS:** Arthralgia, myalgia, numbness, peripheral neuropathy
**RESP:** Cough, dyspnea, pneumonitis, pulmonary fibrosis/infiltrate
**SYST:** Stevens-Johnson syndrome, superinfection, SLE-like syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Readily absorbed |
| **Distribution** | Crosses placenta, excreted in breast milk |
| **Metabolism** | Liver, partially |
| **Excretion** | Kidneys, 30%-50% unchanged |
| **Half-life** | 20-60 min |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 30 min |
| **Duration** | 6-12 hr |

## INTERACTIONS

### Individual products

Magnesium trisilicate: decreased absorption
Norfloxacin: antagonist effect
Probenecid: increased nitrofurantoin levels

### Drug/lab test

Increased: BUN, alkaline phosphatase, bilirubin, creatinine, blood glucose

## NURSING CONSIDERATIONS

### Assessment

- Monitor blood count during chronic therapy
- Assess CNS symptoms: insomnia, vertigo, headache, drowsiness, seizures
- Assess allergy: fever, flushing, rash, urticaria, pruritus
- **Urinary tract infection:** assess for burning, pain on urination, fever; cloudy, foul-smelling urine; I&O ratio; C&S before treatment, after completion; serum creatinine, BUN
- **Hepatotoxicity:** assess for yellowing of skin, eyes, dark urine, clay-colored stools; monitor AST, ALT
- **Pulmonary fibrosis, pneumonitis:** assess for dyspnea, tachypnea, persistent cough
- **Serious skin disorders:** assess for fever, flushing, rash, urticaria, pruritus
- **Peripheral neuropathy:** assess for paresthesias (more common in diabetes mellitus, electrolyte imbalances, vit B deficiency, debilitated patients)
- **Pseudomembranous colitis:** assess for diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC and low serum albumin; stop product and usually give either vancomycin or IV metroNIDAZOLE
- Pregnancy/breastfeeding: Do not use in 38-42 wk gestation and labor/delivery, cautious use in breastfeeding, excreted in breast milk
- **Beers:** Avoid in older adults, potential for pulmonary, hepatic toxicity, peripheral neuropathy

### Patient/family education

- Teach patient to take with food or milk; avoid alcohol
- Teach patient to protect susp from freezing and shake well before taking
- Teach patient that product may cause drowsiness; instruct client to seek aid in walking and other activities; advise patient not to drive or operate machinery while on medication
- Teach patient that diabetics should monitor blood glucose level
- Teach patient that product may turn urine rust-yellow to brown
- **Teach patient to notify prescriber of symptoms of pseudomembranous colitis:** fever,

diarrhea with mucous, pus, or blood; report immediately

### Evaluation

**Positive therapeutic outcome**
- Decreased dysuria, fever; negative C&S

**⚠ HIGH ALERT**

## nitroglycerin (Rx)
(nye-troe-gli'ser-in)
## Intravenous (Rx)
**Nitrojet 🍁, Nitronel**
## extended release caps (Rx)
**Nitrogard SR 🍁, Nitro-Time**
## translingual spray (Rx)
**Nitrolingual, Nitromist**
## sublingual (Rx)
**Nitrostat**
## rectal ointment
**Rectiv**
## topical ointment (Rx)
**Nitro-Bid, Nitrol 🍁, Rho-Nitro 🍁, Trinipatch 🍁**
## transdermal (Rx)
**Minitran, Nitro-Dur**

*Func. class.:* Coronary vasodilator, antianginal
*Chem. class.:* Nitrate

**ACTION:** Decreases preload and afterload, which thus decreases left ventricular end-diastolic pressure and systemic vascular resistance; dilates coronary arteries and improves blood flow through coronary vasculature, dilates arterial, venous beds systemically

**Therapeutic outcome:** Prevention of anginal attack

**USES:** Chronic stable angina pectoris, prophylaxis of angina pain, HF associated with acute MI, controlled hypotension in surgical procedures, anal fissures

## CONTRAINDICATIONS
Hypersensitivity to this product or nitrites, severe anemia, increased ICP, cerebral hemorrhage, closed-angle glaucoma, cardiac tamponade, cardiomyopathy, constrictive pericarditis

**Precautions:** Pregnancy, breastfeeding, children, postural hypotension, severe renal/hepatic disease, acute MI, abrupt discontinuation, hyperthyroidism

## DOSAGE AND ROUTES
**Adult: SL** dissolve tab under tongue when pain begins; may repeat q5min until relief occurs; take no more than 3 tab/15 min; use 1 tab prophylactically 5-10 min before activities; **SUS REL** cap q6-12hr on empty stomach; **TOP** 1-2 inches q8hr; increase to 4 in q4hr as needed; **IV** 5 mcg/min, then increase by 5 mcg/min q3-5min; if no response after 20 mcg/min, increase by 10-20 mcg/min until desired response; **transdermal** apply a patch daily to a site free from hair; remove patch at bedtime to provide 10-12 hr nitrate-free interval to avoid tolerance
**Child: IV** initial 0.25-0.5 mcg/kg/min, titrate to patient response, usual dose 1-3 mcg/kg/min transmucosal

### Anal fissures (Rectiv)
**Adult:** rectal apply 1 in of 0.4% ointment q12hr × 3 wk

**Available forms:** Translingual aerosol 0.4 mg/m spray; sus rel tabs 2.5, 6.5, 9 mg; SL tabs 0.3, 0.4, 0.6 mg; topical joint 2%; trans syst 0.1, 0.2, 0.3, 0.4, 0.6, 0.8 mg/hr; inj 25 mg/250 ml, 50 mg/250 ml, 100 mg/250 ml, 50 mg/500 ml, 100 mg/500 ml, 200 mg/500 ml; rectal ointment 0.4% (Rectiv)

### Implementation
**PO route**
- Swallow sus rel tabs whole; do not break, crush, or chew sus rel tabs
- Give 1 hr before or 2 hr after meals with 8 oz of water

**SL route**
- Should be dissolved under tongue or placed between gum and cheek, not swallowed

**Aerosol route**
- Sprayed under tongue (nitrolingual); not inhaled, prime before 1st-time use or if product has not been used in > 6 wk; press valve head with forefinger

**Transmucosal route**
- Tab should be placed between cheek and gum line
- Do not take anything PO when tab is in place

**Topical ointment route**
- Apply ointment using dose-measuring papers supplied; apply to an area without hair; ointment should cover 2-3–inch area; may apply an occlusive dressing as directed

**Transdermal route**
- Apply transdermal patches to area without hair; press hard to adhere; if patch becomes dislodged, apply a new one

**SL route**
- Keep tab in original container

• If 3 SL tab in 15 min do not relieve pain, consider diagnosis of MI
• SL tab should be held under tongue or between gum and cheek until dissolved (a few min); do not take anything by mouth when SL tab is in place

**Rectal route**

• Cover finger with plastic wrap, disposable glove or finger cot, lay finger alongside 1 inch dosing line on carton, squeeze tube until equal to 1 inch dosing line, insert covered finger no further than 1st finger joint gently into anal canal and on sides, wash hands thoroughly, if too painful, apply directly to outside of anus

**Continuous IV infusion route**

• Diluted in $D_5$, $D_5W$, 0.9% NaCl for inf to 200-400 mcg/ml depending on patient's fluid status, common dilution is 50 mg/250 ml, use controlled inf device; use glass inf bottles, non–polyvinyl chloride inf tubing; titrate to patient response; do not use filters

**Y-site compatibilities:** Acyclovir, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atenolol, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, cefAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cephalothin, cephapirin, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cloNIDine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, doxycycline, drotrecogin alfa, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, ganciclovir, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, mezlocillin, micafungin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, ritodrine, rocuronium, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, warfarin, zoledronic acid

**Y-site incompatibilities:** Alteplase

## ADVERSE EFFECTS

**CNS:** *Headache, flushing, dizziness*
**CV:** *Postural hypotension,* tachycardia, collapse, syncope, palpitations
**GI:** Nausea, vomiting
**INTEG:** Pallor, sweating, rash

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, buccal, SL) |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidney |
| **Half-life** | 1-4 min |

### Pharmacodynamics

| | SUS REL | SL | TD | IV | TRANSMUCOSAL | AEROSOL | TOPICAL OINT |
|---|---|---|---|---|---|---|---|
| **Onset** | 20-45 min | 1-3 min | ½-1 hr | 1-2 min | 1-2 min | 2 min | ½-1 hr |
| **Peak** | Unknown | Unknown | Unknown | Unknown | Unknown | Unknown | Unknown |
| **Duration** | 3-8 hr | ½ hr | 12-24 hr | 3-5 min | 3-5 hr | ½-1 hr | 2-12 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased hypotension, CV collapse
Aspirin: increased nitrate level
Heparin: decreased effects (with IV nitroglycerin)
Avanafil, sildenafil, tadalafil, vardenafil: increased fatal hypotension, do not use together

### Drug classifications

Antihypertensives, β-adrenergic blockers, calcium channel blockers, diuretics: increased hypotension

### Drug/lab test

Increased: urine catecholamine, urine VMA
False increase: cholesterol

## NURSING CONSIDERATIONS

### Assessment

- Monitor orthostatic B/P, pulse
- **Assess pain:** duration, time started, activity being performed, character; check for tolerance if taken over long period
- Monitor for headache, light-headedness, decreased B/P; may indicate a need for decreased dosage
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding

### Patient/family education

- Instruct patient to avoid alcohol
- Advise patient that product may cause headache; tolerance usually develops; use nonopioid analgesic
- Teach patient that product may be taken before stressful activity, exercise, sexual activity
- Inform patient that SL tab may sting when product comes in contact with mucous membranes
- Caution patient to avoid hazardous activities if dizziness occurs
- Instruct patient to comply with complete medical regimen
- Advise patient to make position changes slowly to prevent fainting
- Advise patient to never use erectile dysfunction products (sildenafil, tadalafil, vardenafil); may cause severe hypotension, death

### Evaluation

**Positive therapeutic outcome**

- Decreased, prevention of anginal pain

**⚠ HIGH ALERT**

# nitroprusside (Rx)

(nye-troe-pruss'ide)
**Nitropress**
*Func. class.:* Antihypertensive, vasodilator

**ACTION:** Directly relaxes arteriolar, venous smooth muscle, resulting in reduction in cardiac preload, afterload

**Therapeutic outcome:** Decreased B/P in hypertensive crisis, decreased preload, afterload

**USES:** Hypertensive crisis/urgency/induction, to decrease bleeding by creating hypotension during surgery, acute HF

## CONTRAINDICATIONS

Hypersensitivity, hypertension (compensatory) due to aortic coarctation or AV shunting, acute HF associated with reduced peripheral vascular resistance, toxic amblyopia, hypothyroidism

**BLACK BOX WARNING:** Cyanide toxicity

**Precautions:** Pregnancy, breastfeeding, children, geriatric, fluid, electrolyte imbalances, renal/hepatic disease, hypothyroidism, anemia, increased intracranial pressure, hypovolemia

**BLACK BOX WARNING:** Hypotension

## DOSAGE AND ROUTES

**Adult and child: IV** INF 0.25-1.0 mcg/kg/min; max 10 mcg/kg/min

### Renal dose

**Adult:** IV INF CCr <60 ml/min maintain doses <3 mcg/kg/min to reduce thiocyanate accumulation

**Available forms:** Inj 50 mg 12 ml

### Implementation

**Continuous IV infusion route**

- Depending on B/P reading q15min
- Reconstitute 50 mg/2-3 ml of $D_5W$, further dilute in 250, 500, or 1000 ml of $D_5W$ to 200, 100, 50 mcg/ml respectively; use an infusion pump only; wrap bottle with aluminum foil to protect from light; observe for color change in the inf; discard if highly discolored (blue, green, dark red); titrate to patient response, protect from light
- Do not exceed max dose, cyanide may accumulate

**Y-site compatibilities:** Alfentanil, alprostadil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B

liposome, anidulafungin, argatroban, atenolol, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, ceftAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cephalothin, chloramphenicol, cimetidine, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diltiazem, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, inamrinone, indomethacin, insulin (regular), isoproterenol, ketorolac, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, micafungin, miconazole, midazolam, milrinone, minocycline, morphine, moxalactam, multiple vitamins injection, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, penicillin G potassium/sodium, pentamidine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride/phosphates, procainamide, propofol, propranolol, protamine, pyridoxine, ranitidine, ritodrine, rocuronium, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache,* agitation, twitching, decreased reflexes, *restlessness*
**CV:** *Bradycardia,* ECG changes, tachycardia, *hypotension*
**GI:** Nausea, vomiting, abdominal pain
**INTEG:** Pain, irritation at inj site, sweating
**MISC:** Cyanide, thiocyanate toxicity, flushing, hypothyroidism

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability |
| **Distribution** | Not known |
| **Metabolism** | RBCs, tissues |
| **Excretion** | Kidneys |
| **Half-life** | 2 min |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1-2 min |
| **Peak** | Rapid |
| **Duration** | 1-10 min |

## INTERACTIONS

### Individual drugs

Enflurane, halothane; severe hypotension

### Drug classifications

Circulatory depressants, ganglionic blockers, volatile liquid anesthetics: severe hypotension

### Drug/herb

Hawthorn: increased antihypertensive effect

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Hypotension:** monitor B/P q5min × 2 hr, then qhr × 2 hr; monitor pulse q4hr; monitor jugular venous distention q4hr; ECG should be monitored continuously; monitor PCWP; rebound hypertension may occur after nitroprusside is discontinued, give only with emergency equipment nearby, rapid decrease in B/P may occur

- Monitor electrolytes, blood studies: potassium, sodium, chloride, $CO_2$, CBC, serum glucose, serum methemoglobin if pulmonary oxygen levels are decreased, ABGs
- Check weight, I&O, edema in feet and legs daily; assess skin turgor, dryness of mucous membranes for hydration status
- Assess for signs of HF: dyspnea, edema, wet crackles
- Monitor for increased lactate, cyanide, thiocyanate levels if on long-term treatment; thiocyanate toxicity occurs at plasma levels of ≥50 mcg/ml
- Monitor for decrease in bicarbonate, $PaCO_2$, and blood pH; acidosis may occur with this product
- **Pregnancy/breastfeeding:** Prolonged use may result in fetal death (cyanide toxicity), do not breastfeed

### Patient/family education

- Teach patient to report headache, dizziness, loss of hearing, blurred vision, dyspnea, faintness; may indicate adverse reactions, pain at IV site

### Evaluation

**Positive therapeutic outcome**
- Decreased B/P in hypertension
- Absence of bleeding in surgery

## TREATMENT OF OVERDOSE:
Administer amyl nitrate inh until 3% sodium nitrate sol can be prepared for **IV** administration, then inject sodium thiosulfate **IV;** correct drop in B/P with vasopressor

**⚠ HIGH ALERT**

**RARELY USED**

## nivolumab
(nye-volue-mab)
**Opdivo**
*Func. class.:* Antineoplastic, monoclonal antibody

## USES:
Treatment of BRAF V600 mutation–positive unresectable/metastatic melanoma, Hodgkin's disease, non–small-cell lung cancer (NSCLC), renal cell cancer

## CONTRAINDICATIONS
Hypersensitivity

## DOSAGE AND ROUTES
**Adult: IV** INF 240 mg over 60 min q2wk until disease progression or unacceptable toxicity

**Available forms:** Injection 10 mg/ml

**⚠ HIGH ALERT**

## norepinephrine
(nor-ep-i-nef'rin)
**Levophed**
*Func. class.:* Adrenergic
*Chem. class.:* Catecholamine

**Do not confuse:** norepinephrine/EPINEPHrine

## ACTION:
Causes increased contractility and heart rate by acting on β-receptors in heart; also acts on a-receptors, thereby causing vasoconstriction in blood vessels; B/P is elevated, coronary blood flow improves, and cardiac output increases

**Therapeutic outcome:** Increased B/P with stabilization; adequate tissue perfusion

## USES:
Acute hypotension, shock

## CONTRAINDICATIONS
Hypersensitivity to this product or cyclopropane/halothane anesthesia; ventricular fibrillation, tachydysrhythmias, hypovolemia

**BLACK BOX WARNING:** Extravasation

**Precautions:** Pregnancy, breastfeeding, geriatric patients, arterial embolism, peripheral vascular disease, hypertension, hyperthyroidism, cardiac disease, ventricular fibrillation, tachydysrhythmias, pheochromocytoma, hypotension

## DOSAGE AND ROUTES
**Adult: IV INF** 0.5-1 mcg/min titrated to B/P; maintenance 2-4 mcg/min; max 30 mcg/min
**Child: IV INF** 0.1 mcg/kg/min titrated to B/P; max 2 mcg/kg/min

**Available forms:** Inj 1 mg/ml

### Implementation
- Plasma expanders for hypervolemia, correct volume depletion before starting treatment

**CONT IV INF route**
- Dilute with 500-1000 ml $D_5W$ or $D_5$/0.9% NaCl; average dilution 4 mg/1000 ml diluent (4 mcg base/ml); give as inf 2-3 ml/min; titrate to response, discontinue gradually
- Store reconstituted sol in refrigerator <24 hr, protect from light, store unopened product at room temp, do not use discolored sol

**Y-site compatibilities:** Alemtuzumab, alfentanil, amikacin, amiodarone, anidulafungin, argatroban, ascorbic acid, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftobiprole, cefTRIAXone, cefuroxime, cephalothin, chloramphenicol, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cloNIDine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DAPTOmycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, micafungin, miconazole,

midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins injection, mycophenolate, nafcillin, nalbuphine, naloxone, netilmicin, niCARdipine, nitroglycerin, nitroprusside, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanil, ritodrine, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid

## ADVERSE EFFECTS

**CNS:** *Headache,* anxiety, dizziness, insomnia, restlessness, tremor, cerebral hemorrhage
**CV:** *Palpitations, tachycardia, hypertension, ectopic beats, angina*
**GI:** *Nausea, vomiting*
**GU:** Decreased urine output
**INTEG:** Necrosis, tissue sloughing with extravasation, gangrene
**RESP:** Dyspnea
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | Urine |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Immediate |
| **Peak** | Rapid |
| **Duration** | 1 min |

## INTERACTIONS

### Individual drugs

- **Methyldopa:** do not use norepinephrine within 2 wk of using these drugs because hypertensive crisis may result

### Drug classifications

α-blockers: decreased norepinephrine action
- **Antihistamines, ergots, MAOIs, oxytocics, tricyclics:** do not use norepinephrine within 2 wk of using these drugs because hypertensive crisis may result

Oxytocics: Increased B/P
MAOIs, tricyclics: increased pressor effect

## NURSING CONSIDERATIONS

### Assessment

- Assess I&O ratio; notify prescriber if output <30 ml/hr
- Assess B/P, pulse q2-3min after parenteral route, ECG during administration continuously; if B/P increases, product is decreased, CVP or PWP during inf if possible
- Assess paresthesias and coldness of extremities; peripheral blood flow may decrease

**BLACK BOX WARNING: Extravasation:** inj site: tissue sloughing, change injection sites if blanching or vasoconstriction occurs

- Assess for sulfite sensitivity, which may be life-threatening
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding

### Patient/family education

- Teach patient about the reason for product administration
- Advise family to report dyspnea, dizziness, chest pain

### Evaluation

**Positive therapeutic outcome**
- Increased B/P with stabilization
- Adequate tissue perfusion

## TREATMENT OF OVERDOSE:

Administer fluids, electrolyte replacement

## nortriptyline (Rx)

(nor-trip'ti-leen)
**Aventyl, Pamelor**
*Func. class.:* Antidepressant, tricyclic
*Chem. class.:* Dibenzocycloheptene, secondary amine

**Do not confuse:** nortriptyline/amitriptyline Pamelor/Panlor DC/Tambocor

**ACTION:** Blocks reuptake of norepinephrine, serotonin into nerve endings, increasing action of norepinephrine, serotonin in nerve cells; has anticholinergic effects

**Therapeutic outcome:** Decreased symptoms of depression after 2-3 wk

**USES:** Major depression

**Unlabeled uses:** Chronic pain management

## CONTRAINDICATIONS

Hypersensitivity to tricyclics, carBAMazepine, recovery phase of MI

**Precautions:** Breastfeeding, suicidal ideation, severe depression, increased intraocular

pressure, closed-angle glaucoma, urinary retention, cardiac/hepatic disease, hyperthyroidism, electroshock therapy, elective surgery, pregnancy, seizure disorders, prostatic hypertrophy

**BLACK BOX WARNING:** Children, suicidal ideation

## DOSAGE AND ROUTES

**Adult:** PO 25 mg tid or qid; may increase to 150 mg/day; may give daily dose at bedtime
**Adolescent:** PO 1-3 mg/kg/day in 3-4 divided doses or qd at bedtime; max 150 mg/day
**Geriatric:** PO 10-25 mg nightly, increase by 10-25 mg at weekly intervals to desired dose; usual maintenance 75 mg/day, max 150 mg/day

**Available forms:** Caps 10, 25, 50, 75 mg; sol 10 mg/5 ml

### Implementation

- Give with food or milk to decrease GI symptoms; mix conc with water, milk, fruit juice to disguise taste
- Give dose at bedtime if oversedation occurs during day; may take entire dose at bedtime; geriatric may not tolerate once/day dosing
- Store in tight, light-resistant container at room temp; do not freeze

## ADVERSE EFFECTS

**CNS:** *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, stimulation, weakness, insomnia, nightmares, EPS (geriatric), increased psychiatric symptoms, seizures
**CV:** *Orthostatic hypotension,* ECG changes, *tachycardia,* hypertension, palpitations, dysrhythmias
**EENT:** Blurred vision, tinnitus, mydriasis, dry eyes
**ENDO:** SIADH, hyponatremia, hypothyroidism
**GI:** *Constipation, dry mouth,* nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, jaundice, hepatitis, stomatitis, weight gain
**GU:** *Retention,* acute renal failure, sexual dysfunction
**HEMA:** Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia
**INTEG:** Rash, urticaria, sweating, pruritus, photosensitivity
**SYST:** Serotonin syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver, extensively CYP2D6 by genetic polymorphism (≥ 7% are poor metabolizers) |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 18-28 hr; steady state 4-19 days |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
CloNIDine, guanethidine: decreased effects
Smoking (heavy): decreased product effect
Haloperidol, chloroquine, droperidol, pentamidine, arsenic trioxide, levomethadyl: increased QT prolongation

### Drug classifications

Barbiturates, benzodiazepines, CNS depressants: increased effects
MAOIs: hypertensive episode, hyperpyretic crisis, seizures
SSRIs, SNRIs, serotonin-receptor agonists: increased serotonin syndrome, neuroleptic malignant syndrome
Class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation
Sympathomimetics (direct-acting), products increasing QT interval: increased effects
Sympathomimetics (indirect-acting): decreased effects

### Drug/herb

Kava, valerian: increased CNS effect
St. John's wort: decreased nortriptyline level

### Drug/lab test

Increased: serum bilirubin, blood glucose, alkaline phosphatase
Decreased: VMA, 5-HIAA
False increase: urinary catecholamines

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Suicidal thoughts/behaviors in children/young adults:** not approved for children; monitor for suicidal ideation in depression, adolescents, young adults

- Monitor B/P (with patient lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS q4hr of patients with CV disease
- Monitor blood studies: thyroid function tests, LFTs, serum nortriptyline level/target 50-150 ng/ml if patient is receiving long-term therapy
- Monitor liver function tests: AST, ALT, bilirubin
- Check weight weekly; appetite may increase
- **QT prolongation:** assess for chest pain, palpitations, dyspnea
- Assess ECG for flattening of T-wave, bundle branch block, AV block, dysrhythmias in cardiac patients
- Assess for EPS primarily in geriatric: rigidity, dystonia, akathisia
- Assess mental status: mood, sensorium, affect, suicidal tendencies; increase in psychiatric symptoms: depression, panic
- Monitor urinary retention, constipation; constipation is more likely to occur in children or geriatric
- **Assess for withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; do not usually occur unless product was discontinued abruptly
- Monitor for glaucoma exacerbation and paralytic ileus
- Identify alcohol consumption; if alcohol is consumed, hold dose until AM
- **Serotonin syndrome, neuroleptic malignant syndrome:** assess for increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer a serotonin antagonist if needed (rare)
- **Beers:** Avoid in older adults, highly anticholinergic, sedating, and causes orthostatic hypotension

### Patient/family education

- Teach patient that therapeutic effects may take 2-3 wk
- Teach patient to use caution in driving and other activities requiring alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting to standing, especially geriatric
- Teach patient to avoid alcohol ingestion, MAOIs within 14 days, other CNS depressants; teach patient not to discontinue medication quickly after long-term use; may cause nausea, headache, malaise
- Teach patient to wear sunscreen or large hat to avoid burns, because photosensitivity occurs
- Teach patient to increase fluids, bulk in diet if constipation, urinary retention occur, especially geriatric, worsening depression, suicidal thoughts/behavior
- Teach patient to take gum, hard sugarless candy, or frequent sips of water for dry mouth
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Decrease in depression
- Absence of suicidal thoughts

## TREATMENT OF OVERDOSE:

ECG monitoring, lavage, administer anticonvulsant

## nystatin (Rx, OTC)

(nis' ta-tin)

**Mycostatin, Nadostine, Nilstat, Pedi-Dri, PMS-Nystatin**

*Func. class.:* Antifungal

*Chem. class.:* Amphoteric polyene

**ACTION:** Interferes with fungal DNA replication; binds sterols in fungal cell membrane, which increases permeability, resulting in leaking of cell nutrients

**Therapeutic outcome:** Fungistatic/fungicidal against *Candida* organisms

**USES:** *Candida* species causing oral, intestinal infections

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy

## DOSAGE AND ROUTES

### Oral infection

**Adult/adolescent/child:** SUSP 400,000-600,000 units qid, use ½ dose in each side of mouth, swish and swallow, use for at least 48 hr after symptoms are resolved

**Infant:** SUSP 200,000 units qid (100,000 units in each side of mouth)

**Newborn and premature infant:** SUSP 100,000 units qid

**Adult and child:** Troches 200,000-400,000 units qid × up to 2 wk

### GI infection
**Adult:** PO 500,000-1,000,000 units tid

### Cutaneous candidiasis
**Adult/child:**
**Top cream/ointment**
Apply to affected area bid
**Powder**
Apply to affected area bid-tid

**Available forms:** Tabs 500,000 units; oral caps 500,000, 1,000,000 units, bulk powder; susp 1,000,000 unit/ml

### Implementation
• Store oral susp at room temp; store tabs in tight, light-resistant containers at room temp
**PO route**
• Give oral susp dose by placing ½ in each cheek, swish for several min, then swallow; shake susp before use
• Store oral susp at room temp, tab in airtight, light-resistant containers at room temp
**Topical route**
• Administer by moistening lesions with a swab coated with cream or ointment; use enough medication to cover lesions completely; give after cleansing with soap, water before each application; dry well; very moist lesions are best treated with topical powder

## ADVERSE EFFECTS
**GI:** Nausea, vomiting, anorexia, diarrhea, cramps
**INTEG:** Rash, urticaria (rare)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poorly absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Not metabolized |
| **Excretion** | Feces, unchanged |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | Unknown |
| **Duration** | 6-12 hr |

## NURSING CONSIDERATIONS
### Assessment
• **Assess for allergic reaction:** rash, urticaria; product may have to be discontinued
• Assess for predisposing factors for candidal infection: antibiotic therapy, pregnancy, diabetes mellitus, sexual partner infection (vag infections), AIDS
• Obtain culture and histologic tests to confirm organism
• **Pregnancy/breastfeeding:** Use only if clearly needed, may breastfeed

### Patient/family education
• Instruct patient that long-term therapy may be needed to clear infection; to complete entire course of medication
• Teach patient proper hygiene: use no commercial mouthwashes for mouth infection
• Advise patient to avoid getting preparation on hands
• Instruct patient to notify prescriber if irritation occurs; product may have to be discontinued
• Inform patient that relief from itching may occur after 24-72 hr
**Topical route**
• Advise patient to discontinue use and notify prescriber if irritation occurs
• Teach patient to apply with glove to prevent further infection; product may stain
• Caution patient not to use occlusive dressings; to avoid use of OTC creams, ointments, lotions unless directed by prescriber

### Evaluation
**Positive therapeutic outcome**
• Culture negative for *Candida*
• Decrease in size, number of lesions

**nystatin topical**
*See Appendix B*

nadolol (Rx)
naloxone (Rx)
naratriptan (Rx)

**⚠ HIGH ALERT**

## obinutuzumab

(oh'bi-nue-tooz'ue-mab)

**Gazyva**

*Func. class.:* Antineoplastic

*Chem. class.:* Biologic response modifier, monoclonal antibody

**ACTION:** A recombinant human monoclonal antibody that binds to the gastric B-lymphocyte–associated antibody, action is indirect, possible through T-cell–mediated anti-tumor responses

**Therapeutic outcome:** Decreased disease progression

**USES:** Chronic lymphocytic leukemia, non-Hodgkin's lymphoma (follicular lymphoma) in relapse or refractory to riTUXimab-containing regimen, used in combination

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, cardiac disease, children, human antichimeric antibody (HACA), human antimurine antibody (HAMA), infection, infusion-related reactions, neutropenia, pulmonary disease, thrombocytopenia, tumor lysis syndrome, vaccination

**BLACK BOX WARNING:** Hepatitis B exacerbation, progressive multifocal leukoencephalopathy

## DOSAGE AND ROUTES

**Available forms:** Sol for inj 1000 mg/40 ml

### Implementation

**IV intermittent infusion route**

- Due to the risk of hypotension, consider withholding antihypertensive medications for 12 hr before, during, and for the 1st hr after use until B/P is stable
- Give antimicrobial prophylaxis to neutropenic patients throughout treatment; consider antiviral and antifungal prophylaxis as needed
- **Premedication for cycle 1, days 1 and 2:** acetaminophen 650-1000 mg, and diphenhydrAMINE 50 mg at least 30 min prior to infusion, dexamethasone 20 mg IV or methylPREDNISolone 80 mg IV at least 1 hr before infusion
- **Premedication for cycle 1, days 8 and 15 and cycles 2-6, day 1:** acetaminophen 650-1000 mg at least 30 min prior to the infusion; those with any infusion-related reaction with the previous infusion should also receive diphenhydrAMINE 50 mg at least 30 min before the infusion; if the patient had a grade 3 infusion-related reaction with the previous dose or has a lymphocyte count $> 25 \times 10^9$/L, additionally administer dexamethasone 20 mg IV or methylPREDNISolone 80 mg IV at least 1 hr before infusion
- Use in a facility to adequately monitor and treat infusion reactions
- Visually inspect parenteral products for particulate matter and discoloration prior to use
- Prepare all doses in 0.9% NaCl; do not admix; use a final concentration of 0.4-4 mg/ml; give as an IV infusion only

**Reconstitution**

**Cycle 1, day 1 and 2**

- Withdraw 4 ml (100 mg) from the vial and dilute into 100 ml 0.9% NaCl; use on day 1; mix by gentle inversion; do not shake, use immediately
- Withdraw the remaining 36 ml (900 mg) and dilute into 250 ml 0.9% NaCl for use on day 2; mix by gentle inversion; do not shake

**Cycle 1, day 8 and 15; cycles 2-6**

- Withdraw 40 ml (1000 mg) from the vial and dilute into 250 ml 0.9% NaCl mix by gentle inversion; do not shake.
- Storage following reconstitution: Store at 2-8 °C (36-46 °F) for up to 24 hr. Do not freeze. Allow to come to room temperature before administration, use a dedicated line.
- **Day 1 (100-mg dose):** Give at an initial rate of 25 mg/hr over 4 hr. Do not increase the infusion rate.
- **Day 2 (900-mg dose):** Give at an initial rate of 50 mg/hr × 30 min; if no hypersensitivity or infusion-related events occur, increase the infusion rate by 50 mg/hr q30min to a max rate of 400 mg/hr. If a grade 1-2 infusion-related reaction occurs, the infusion should be temporarily interrupted or the rate reduced. The infusion may be resumed or continued at a reduced rate upon improvement of the patient's symptoms; if the reaction does not recur, the rate may be increased as appropriate for the current cycle and dose. If a grade 3 hypersensitivity or infusion-related event develops, the infusion should be temporarily interrupted. Upon improvement of the patient's symptoms, the infusion can be resumed at half the rate being used at the time that the reaction occurred; if the reaction does not recur, the rate may be increased as appropriate for the current cycle and dose. If a grade 4 hypersensitivity or infusion-related event develops, discontinue the infusion and do not resume.

• **Subsequent infusions (1000-mg dose):** Give at an initial rate of 100 mg/hr for 30 min; if no hypersensitivity or infusion-related events occur, increase the infusion rate by 100 mg/hr q30min to a max rate of 400 mg/hr; if a grade 1-2 infusion-related reaction occurs, the infusion should be temporarily interrupted or the rate reduced. The infusion may be resumed or continued at a reduced rate upon improvement of the patient's symptoms; if the reaction does not recur, the rate may be increased as appropriate for the current cycle and dose. If a grade 3 hypersensitivity or infusion-related event develops, the infusion should be temporarily interrupted. Upon improvement of the patient's symptoms, the infusion can be resumed at half the rate being used at the time that the reaction occurred; if the reaction does not recur, the rate may be increased as appropriate for the current cycle and dose. If a grade 4 hypersensitivity or infusion-related event develops, discontinue the infusion and do not resume.

## ADVERSE EFFECTS

**CNS:** Headache, *fever*, chills, flushing
**CV:** Cardiac arrest, MI, sinus tachycardia, hypertension
**GI:** Constipation, decreased appetite, diarrhea, hepatitis/hepatic failure nausea, vomiting
**HEMA:** *Neutropenia, thrombocytopenia, lymphopenia, leukopenia, anemia*
**META:** Lower *potassium*/sodium/calcium, aluminum, higher potassium/uric acid
**RESP:** Wheezing, dyspnea, cough
**SYST:** Tumor lysis syndrome, infection
**MISC:** Arthralgia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Terminal half-life 28.4 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

### Drug/lab

Increase: LFTs

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** HEPATITIS B: reactivation of HBV in those who are HBsAg positive, HBsAg negative, and core antibody anti-HBc positive; may result in fulminant hepatitis, hepatic failure, and death, screen high-risk patients before use, monitor carriers for active HBV infection during and for several months after therapy completion, discontinue treatment of any other antineoplastics if infection is reactivated

• **Bone marrow suppression:** Monitor CBC with differential before infusion and regularly, platelets
• **Infection:** Assess for signs of infection, provide neutropenia precaution

**BLACK BOX WARNING:** **Progressive multifocal leukoencephalopathy (PML):** Notify prescriber of any new or worsening neurologic signs/symptoms (ataxia, visual changes, confusion)

• **Tumor lysis syndrome:** Can occur within 24 hr of 1st infusion, those with high tumor burden or lymphocyte count $>25\times10^9$/L are at increased risk; monitor serum creatinine, potassium, calcium, uric acid, phosphate closely

**BLACK BOX WARNING:** Severe/life-threatening infusion reactions: 2/3 of patients have a reaction to 1st dose; consider withholding antihypertensives for 12 hr prior to, during, and after 1st hr of infusion

• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excretion unknown

### Patient/family education

• Teach patient about the reason for treatment and expected results

**BLACK BOX WARNING:** Hepatitis B: To report yellow skin, eyes, fatigue, dark urine, that continuing follow-up will be needed

**BLACK BOX WARNING:** Progressive multifocal leukoencephalopathy (PML): To report confusion, visual changes, dizziness, difficulty walking or talking

• Teach patient to avoid live virus vaccines, vaccinations should be brought up to date before use

### Evaluation
**Positive therapeutic outcome**
- Decreased disease progression

## octreotide (Rx)
(ok-tree'o-tide)
**SandoSTATIN, Sandostatin LAR Depot**
*Func. class.:* Growth hormone, antidiarrheal
*Chem. class.:* Synthetic analog of somatostatin

**Do not confuse:** SandoSTATIN/SandIMMUNE

**ACTION:** A potent growth hormone similar to somatostatin

**Therapeutic outcome:** Decreased diarrhea; decreased symptoms of acromegaly, carcinoid tumors, vasoactive intestinal peptide tumors (VIPomas)

**USES:** **Sandostatin:** acromegaly, carcinoid tumors, VIPomas; **LAR Depot:** long-term maintenance of acromegaly, carcinoid tumors, VIPomas, short bowel syndrome, insulinoma, hepatorenal syndrome

**Unlabeled uses:** GI fistula, variceal bleeding, diarrheal conditions, pancreatic fistula, IBS, dumping syndrome

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatric, diabetes mellitus, hypothyroidism, renal disease

## DOSAGE AND ROUTES
### Acromegaly
**Adult:** SUBCUT/**IV** 50-100 mcg bid-tid, adjust q2wk based on growth hormone levels (Sandostatin) or IM 20 mg q4wk × 3 mo, adjust by growth hormone levels (Sandostatin LAR)

### VIPomas
**Adult:** SUBCUT/**IV** 200-300 mcg/day in 2-4 doses for 2 wk, max 450 mcg/day; (Sandostatin) or IM 20 mg q2wk × 2 mo, adjust dose (Sandostatin LAR)

### Flushing/diarrhea in carcinoid tumors
**Adult:** SUBCUT/**IV** 100-600 mcg/day in 2-4 doses for 2 wk, titrated to patient response (Sandostatin) or IM 20 mg q4wk × 2 mo, adjust dose (Sandostatin LAR)

### GI fistula
**Adult:** SUBCUT 50-200 mcg q8hr

### Antidiarrheal in AIDS patients (unlabeled)
**Adult:** SUBCUT 50 mcg q8h PRN, increase to 500 mcg q8h

### Irritable bowel syndrome (unlabeled)
**Adult:** SUBCUT 100 mcg single dose to 125 mcg bid

### Dumping syndrome (unlabeled)
**Adult:** SUBCUT 50-150 mcg/day

### Variceal bleeding (unlabeled)
**Adult:** **IV** 25-50 mcg/hr CONT **IV** INF for 18 hr-5 days

**Available forms:** Sandostatin: inj 0.05, 0.1, 0.2, 0.5, 1 mg/ml; LAR Depot: inj powder for susp 10 mg, 20, 30 mg/5 ml

### Implementation
- Store in refrigerator for unopened amps, vials, or at room temp for 2 wk; protect from light; do not use discolored or cloudy sol
- Do not use if discolored or if particulates are present

**IM route**
- Reconstitute with diluent provided; give into gluteal, rotate injection sites

**SUBCUT route**
- Rotate inj sites; use hip, thigh, abdomen
- Avoid using medication that is cold; allow to reach room temperature; do not use LAR Depot, do not use if discolored or if particulates are present

**Direct IV route**
- Give over 3 min; in an emergency carcinoid crisis, give rapid bolus

**Intermittent IV INF route**
- Dilute in 50-200 ml $D_5W$, 0.9% NaCl; give over 15-30 min
- Solution is stable for 24 hr

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, arsenic trioxide, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride/gluconate, capreomycin, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine,

dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, DAUNOrubicin liposome, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium nitrate, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin-tazobactam, polymyxin B, potassium acetate/chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness, fatigue, weakness,* depression, anxiety, tremors, seizures, paranoia

**CV:** *Sinus bradycardia, conduction abnormalities,* dysrhythmias, chest pain, shortness of breath, thrombophlebitis, ischemia, HF, hypertension, palpitations, QT prolongation, ST-T wave changes

**ENDO:** *Hypo/hyperglycemia, ketosis, hypothyroidism,* galactorrhea, diabetes insipidus

**GI:** *Diarrhea, nausea, abdominal pain, vomiting, flatulence, distension, constipation,* hepatitis, elevated liver function tests, GI bleeding, pancreatitis, cholelithiasis, ileus

**GU:** UTI

**HEMA:** Hematoma of inj site, bruise

**INTEG:** Rash, urticaria, pain, inflammation at inj site

**MS:** Joint and muscle pain

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly, completely absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Little |
| **Excretion** | Urine, unchanged |
| **Half-life** | 1.7 hr |

### Pharmacodynamics

| | Subcut/IV | IM |
|---|---|---|
| **Onset** | Unknown | Unknown |
| **Peak** | ½ hr | 2-4 wk |
| **Duration** | 12 hr | Unknown |

## INTERACTIONS

### Individual drugs

Bromocriptine: decreased: effect of bromocriptine

CycloSPORINE: decreased effect of cycloSPORINE

Haloperidol, chloroquine, droperidol, pentamidine, arsenic trioxide, levomethadyl: increased QT prolongation

### Drug classifications

Class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation

Oral antidiabetics: decreased: effect of the oral antidiabetics; monitor blood glucose

CYP3A4 metabolized products: decreased: excretion of these products; reduction of dose may be required

### Drug/food

Decreased: absorption of dietary fat, vit $B_{12}$ levels

### Drug/lab test

Increased: glucose

Decreased: $T_4$, thyroid function tests, vit $B_{12}$, glucose

## NURSING CONSIDERATIONS

### Assessment

- Identify growth hormone antibodies, IGF-1, 1-4 hr intervals for 8-12 hr after dose in acromegaly; 5-HIAA; blood glucose, serotonin levels

(carcinoid tumors), plasma substance P, plasma vasoactive intestinal peptide (VIP) (VIPomas)
• Monitor for fecal fat, serum carotene, somatomedin-C q14 days, glucose; plasma serotonin levels (carcinoid tumors); plasma vasoactive intestinal peptide levels (VIPoma); serum growth hormone, serum IGF-1 baseline and periodically, diabetes to monitor blood glucose
• Monitor thyroid function tests: $T_3$, $T_4$, $T_7$, TSH to identify hypothyroidism
• Assess for allergic reaction: rash, itching, fever, nausea, wheezing
• **Assess for cardiac status:** bradycardia, conduction abnormalities, dysrhythmias; monitor ECG for QT prolongation, low voltage, axis shifts, early repolarization, R/S transition, early wave progression
• **Allergic reaction:** assess for rash, itching, fever, nausea, wheezing
• Gallbladder disease, pancreatitis: monitor closely
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excreted in breast milk
• **Ileus:** Assess character of stools, baseline and throughout treatment

### Patient/family education
• Explain reason for medication and expected results
• Advise patient that routine follow-up is needed
• Instruct parents on procedure for medication preparation and inj use; request demonstration, return demonstration; provide written instructions
• Advise patient that dizziness, drowsiness, weakness may occur; to avoid hazardous activities if these occur; to report abdominal pain immediately
• Teach patient that pregnancy may occur in acromegaly since fertility may be restored
• Teach diabetic patients to monitor glucose regularly

### Evaluation
**Positive therapeutic outcome**
• Decreased symptoms of acromegaly, carcinoid, VIPoma
• Decreased diarrhea in AIDS

## ofloxacin ophthalmic
*See Appendix B*

## OLANZapine (Rx)
(oh-lanz′a-peen)
**ZyPREXA, Zyprexa Intramuscular, Zyprexa Relprevv, Zyprexa Zydis**
*Func. class.:* Antipsychotic (first generation)/neuroleptic
*Chem. class.:* Thienobenzodiazepine

**Do not confuse:** OLANZapine/olsalazine, Zyprexa/Celexa/Zyrtec

**ACTION:** May mediate antipsychotic activity by both DOPamine and serotonin type 2 ($5\text{-}HT_2$) antagonism; also, may antagonize muscarinic, histaminic ($H_1$), and α-adrenergic receptors

**Therapeutic outcome:** Decreased psychotic symptoms

**USES:** Schizophrenia, acute manic episodes in bipolar disorder, acute agitation

**Unlabeled uses:** Dementia related to Alzheimer's disease, OCD, acute psychosis

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, geriatric, hypertension, cardiac/renal/hepatic disease, diabetes, agranulocytosis, abrupt discontinuation, Asian patients, closed-angle glaucoma, coma, leukopenia, QT prolongation, tardive dyskinesia, torsades de pointes, suicidal ideation, stroke history, TIA

**BLACK BOX WARNING:** Dementia, postinjection delirium/sedation syndrome

## DOSAGE AND ROUTES
### Schizophrenia
**Adult:** PO 5-10 mg/day initially, may increase dosage by 5 mg at ≥1 wk intervals; orally disintegrating tabs: open blister pack, place tab on tongue, let disintegrate, swallow; max 20 mg/day; ext rel inj (Zyprexa Relprevv) IM 150-300 mg q2wk or 405 mg q4wk
**Geriatric/debilitated:** PO 5 mg, may increase cautiously at 1 wk intervals, max 20 mg/day
**Adolescent:** PO 2.5 mg or 5 mg/day, target 10 mg/day

### Acute mania or mixed episodes associated with bipolar 1 disorder
**Adult:** PO 10-15 mg/day, may increase dose after 24 hr by 5 mg, max 20 mg/day
**Adolescent:** PO 2.5 or 5 mg/day, target 10 mg/day

### Acute agitation associated with schizophrenia, bipolar I mania
**Adult:** IM (reg rel) 10 mg once
**Geriatric:** IM (reg rel) 2.5-5 mg once

**Available forms:** **Tabs** 2.5, 5, 7.5, 10, 15, 20 mg; **orally disintegrating tabs** 5, 10, 15, 20 mg (Zyprexa Zydis); **powder for injection** 10 mg

### Implementation

- Give antiparkinsonian agent for EPS
- Give decreased dose in geriatric

**PO route**

- Give with full glass of water/milk or with food to decrease GI upset, may give without regard to food
- **Orally disintegrating tabs:** open blister pack; place tab on tongue until dissolved; swallow; no water needed, do not break, crush, chew
- Store in tight, light-resistant container

**IM route (Zyprexa Intramuscular)**

- Inspect for particulate, discoloration before use, if present, do not use
- Dissolve contents of vials with 2.1 ml sterile water for injection (5 mg/ml), use immediately
- Do not use IV or SUBCUT
- Inject slowly, deep into muscle mass

**IM route (Zyprexa Relprevv)**

**BLACK BOX WARNING:** Available only through restricted distribution program (Zyprexa Relprevv Patient Care program 877-772-9390) due to postinjection delirium/sedation syndrome; give at a facility with emergency services, monitor for 3 hr after injection

- Use gloves to prepare, irritating to skin
- Use deep IM gluteal inj only
- Use only diluent provided in kit; give q2-4wk using 19G 1.5-inch needle in kit, in obesity use 19G 2-inch or larger needle
- Provide supervised ambulation until stabilized on medication; do not involve in strenuous exercise program because fainting is possible; patients should not stand still for long periods
- Give increased fluids to prevent constipation
- Give sips of water, candy, gum for dry mouth
- Store in airtight, light-resistant container
- Give orally disintegrating tabs: open blister pack, place tab on tongue until dissolved, swallow; no water needed

## ADVERSE EFFECTS

**CNS:** EPS (pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia), seizures, headache, neuroleptic malignant syndrome (rare), *agitation*, nervousness, hostility, dizziness, hypertonia, tremor, euphoria, confusion, *drowsiness,* fatigue, *abnormal gait, insomnia, fever,* suicidal thoughts

**CV:** Hypotension, tachycardia, chest pain, heart failure, sudden death (geriatric, IM), orthostatic hypotension, peripheral edema

**ENDO:** Increased prolactin levels, hyperglycemia, hypoglycemia

**GI:** Dry mouth, nausea, vomiting, anorexia, constipation, abdominal pain, weight gain, appetite, dyspepsia, jaundice, hepatitis

**GU:** Urinary retention, urinary frequency, enuresis, impotence, amenorrhea, gynecomastia, breast engorgement, premenstrual syndrome

**HEMA:** Neutropenia, agranulocytosis, leukopenia

**INTEG:** Rash

**MISC:** Peripheral edema, accidental injury, hypertonia, hyperlipidemia

**MS:** Joint pain, twitching

**RESP:** *Cough, pharyngitis,* fatal pneumonia (geriatric, IM)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | 93% plasma protein binding |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | PO 6 hr, IM 15-45 min |
| **Duration** | Unknown |

O

## INTERACTIONS

### Individual drugs

Alcohol: increased sedation, hypotension
Bromocriptine, levodopa: decreased antiparkinson activity
CarBAMazepine, omeprazole, rifampin: decreased levels of OLANZapine
Diazepam: increased hypotension
FluvoxaMINE: increased OLANZapine levels

### Drug classifications

Increase: QT prolongation: SSRIs
Anesthetics (barbiturates), antidepressants, antihistamines, CNS depressants, sedative/hypnotics: increased sedation
Anticholinergics: increased anticholinergic effects
Antihypertensives: increased hypotension
DOPamine agonists: decreased antiparkinson activity

### Drug/herb

Kava kava: Increase: toxicity
St. John's wort: Decrease: OLANZapine effect, avoid concurrent use

### Drug/lab test

Increased: liver function tests, prolactin, CPK

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Postinjection delirium/sedation syndrome (Zyprexa Relprevv)**: monitor continuously for ≥3 hr after injection; this patient must be accompanied when leaving: assess for sedation, coma, delirium, EPS, slurred speech, altered gait, aggression, dizziness, weakness, hypertension, seizures; before leaving, confirm the patient is alert, oriented, and free of any other symptoms

- Assess mental status, assess orientation, mood, behavior, presence of hallucinations and type before initial administration and monthly
- **Renal status:** Monitor I&O ratio; palpate bladder if low urinary output occurs, especially in geriatric
- Monitor bilirubin, CBC
- Monitor urinalysis; recommended before, during prolonged therapy
- Assess affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
- Monitor B/P sitting, standing, lying; take pulse and respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; obtain baseline ECG
- **Serotonin syndrome:** assess for increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer a serotonin antagonist if needed
- Assess dizziness, faintness, palpitations, tachycardia on rising
- **Assess for neuroleptic malignant syndrome:** Assess for hyperpyrexia, muscle rigidity, increased CPK, altered mental status, for acute dystonia (cheek chewing, swallowing, eyes, pill rolling)
- **EPS** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait), suicidal thoughts, behaviors
- Monitor constipation, urinary retention daily; increase bulk, water in diet
- **Beers:** Avoid in older adults except for schizophrenia, bipolar disorder, or short-term use as an antiemetic during chemotherapy, increased risk of stroke

### Patient/family education

**BLACK BOX WARNING:** Teach patient about postinjection delirium/sedation syndrome; teach about all symptoms

- Teach patient to use good oral hygiene; frequent rinsing of mouth, candy, ice chips, sugarless gum for dry mouth
- Advise patient to avoid hazardous activities until product response is determined
- Advise patient that orthostatic hypotension occurs often and to rise from sitting or lying position gradually
- Advise patient to avoid hot tubs, hot showers, tub baths, since hypotension may occur
- Advise patient to avoid abrupt withdrawal of this product, or EPS may result; product should be withdrawn slowly
- Advise patient to avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber, since serious product interactions may occur; avoid use with alcohol, CNS depressants, increased drowsiness may occur
- Advise patient that in hot weather, heat stroke may occur; take extra precautions to stay cool
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, may cause EPS in infant if used in third trimester, those pregnant should enroll in the National Pregnancy Registry for Atypical Antipsychotics 866-961-2388, excreted in breast milk, avoid breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Decrease in emotional excitement, hallucinations, delusions, paranoia, reorganization of patterns of thought, speech
- Teach patient to notify prescriber if pregnancy is planned or suspected, not to breastfeed
- Teach patient to take PO without regard to food

## TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; do not induce vomiting or use epinephrine

**⚠ HIGH ALERT**

## olaparib

(oh-lap′a-rib)

**Lynparza**

*Func. class.:* Antineoplastic-PARP

**USES:** Treatment of deleterious or suspected deleterious germline BRCA-mutated advanced ovarian cancer in patients who have not responded successfully to ≥3 prior courses of chemotherapy, as monotherapy

**CONTRAINDICATIONS:** Hypersensitivity, pregnancy

## DOSAGE AND ROUTES

**Adult female: PO** 400 mg bid until disease progression or unacceptable toxicity. Avoid use

of concomitant strong and moderate CYP3A4 inhibitors if possible.

**⚠ HIGH ALERT**

**RARELY USED**

## olaratumab

(oh-lar-atue-mab)

**Lartruvo**

*Func. class.:* Antineoplastic, monoclonal antibody

**USES:** The treatment of soft-tissue sarcoma not amenable to curative treatment with radiotherapy or surgery, in combination with doxorubicin

### CONTRAINDICATIONS

Hypersensitivity, pregnancy

### DOSAGE AND ROUTES

**Adult: IV** INF 15 mg/kg over 60 min on days 1 and 8 repeated q21 days until disease progression or unacceptable toxicity in combination with doxorubicin 75 mg/m$^2$ IV on day 1 repeated q21 days for up to 8 cycles

## olmesartan (Rx)

(ol-meh-sar'tan)

**Benicar, Olmetec**

*Func. class.:* Antihypertensive

*Chem. class.:* Angiotensin II receptor (type $AT_1$) antagonist

**Do not confuse:** Benicar/Mevacor

**ACTION:** Blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the $AT_1$ receptor found in tissues

**Therapeutic outcome:** Decreased B/P

**USES:** Hypertension, alone or in combination with other antihypertensives

### CONTRAINDICATIONS

Hypersensitivity

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Breastfeeding, children, geriatric, hepatic disease, HF, renal artery stenosis, African descent, hyperkalemia

### DOSAGE AND ROUTES

#### Hypertension

**Adult:** PO single agent 20 mg/day initially in patients who are not volume depleted; may be increased to 40 mg/day if needed after 2 wk

**Adolescent ≤16 yr/child ≥6 yr weighing ≥35 kg:** PO 20 mg/day, may increase to max 40 mg/day after 2 wk

**Adolescent ≤16 yr/child ≥6 yr weighing 20-<35 kg:** PO 10 mg/day, may increase to max 20 mg/day after 2 wk

#### Volume depletion

**Adult:** PO start with lower dose

**Available forms:** Tabs 5, 20, 40 mg

#### Implementation

- Give without regard to meals
- Compounded suspension may be made in the pharmacy; refrigerate up to 1 mo; shake well before use

### ADVERSE EFFECTS

**CNS:** *Dizziness,* fatigue, insomnia, syncope
**CV:** Chest pain, peripheral edema, tachycardia, *hypotension*
**EENT:** Sinusitis, rhinitis, pharyngitis
**GI:** *Diarrhea,* abdominal pain
**META:** Hyperkalemia
**MS:** Arthralgia, pain, rhabdomyolysis
**RESP:** *Upper respiratory infection,* bronchitis
**SYST:** Angioedema

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Urine, feces |
| **Half-life** | Unknown |

#### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 hr |
| **Duration** | Unknown |

### INTERACTIONS

#### Individual drugs

Colesevelam: Decreased antihypertensive effect
Lithium, ACE inhibitors: increased effect

#### Drug classifications

Antihypertensives (other), diuretics: increased antihypertensive effects
NSAIDs: decreased antihypertensive effect
Antioxidants: increased effects
Potassium supplements, potassium-sparing diuretics: increased hyperkalemia

#### Drug/herb

Aconite: increased toxicity, death
Astragalus, cola tree: increased or decreased antihypertensive effect
Hawthorn: increased antihypertensive effect
Ephedra: decreased antihypertensive effect

O

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Assess for pregnancy;** this product can cause fetal death when given in pregnancy, assess for pregnancy before starting therapy, do not breastfeed

- Assess response and adverse reactions, especially in renal disease, monitor renal function
- Hypertension: Monitor B/P, pulse q4hr; note rate, rhythm, quality; electrolytes: sodium, potassium, chloride; baselines in renal, liver function tests before therapy begins, may use antihypertensives to control B/P if needed
- Hypotension: place supine; may occur with hyponatremia or in those with volume depletion; more common in those also taking a diuretic
- **Heart failure:** Monitor for edema, weight daily, jugular vein distention, dyspnea

### Patient/family education

- Advise to comply with dosage schedule, even if feeling better
- Advise patient to notify prescriber of mouth sores, fever, swelling of hands or feet, irregular heartbeat, chest pain, severe chronic diarrhea, severe weight loss
- Teach that excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in B/P; to consult prescriber if these occur, maintain adequate hydration
- Teach that product may cause dizziness, fainting; light-headedness may occur, avoid hazardous activities
- Advise to rise slowly to sitting or standing position to minimize orthostatic hypotension

**BLACK BOX WARNING:** Teach to notify prescriber immediately if pregnant; not to use during breastfeeding

- Advise to avoid all OTC medications, unless approved by prescriber, severe chronic diarrhea, severe weight loss
- Teach patient that blood glucose may increase and antidiabetic product may need dosage change
- Advise to inform all health care providers of medication use
- Advise to use proper technique for obtaining B/P and acceptable parameters

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P

## olopatadine ophthalmic

*See Appendix B*

## olsalazine (Rx)

(ohl-sal′ah-zeen)

**Dipentum**

*Func. class.:* GI Antiinflammatory

*Chem. class.:* Salicylate derivative

**Do not confuse:** olsalazine/OLANZapine

**ACTION:** Bioconverted to 5-aminosalicylic acid, which decreases inflammation

**Therapeutic outcome:** Lessening of loose diarrhea stools and cramping

**USES:** Maintenance of remission of ulcerative colitis in patients intolerant to sulfasalazine

## CONTRAINDICATIONS

Hypersensitivity to this product or salicylates

**Precautions:** Pregnancy, breastfeeding, children <14 yr, impaired renal/hepatic function, severe allergy, bronchial asthma

## DOSAGE AND ROUTES

**Adult:** PO 500 mg bid, max 3 g/day

**Available forms:** Caps 250 mg

### Implementation

- Give total daily dose evenly spaced to minimize GI intolerance, give with food
- Store in tight, light-resistant container at room temperature

## ADVERSE EFFECTS

**CNS:** Headache, hallucinations, depression, vertigo, fatigue, dizziness

**GI:** Nausea, vomiting, abdominal pain, diarrhea, bloating, pancreatitis

**INTEG:** Rash, dermatitis, urticaria

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Colon 99% converted to mesalamine |
| **Distribution** | Colon |
| **Metabolism** | Liver |
| **Excretion** | Feces |
| **Half-life** | 0.9 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr |
| **Duration** | 12 hr |

## INTERACTIONS

### Individual drugs

AzaTHIOprine: increased toxicity

Mercaptopurine, thioguanine: increased myelosuppression

Molecular-weight heparins, discontinue before using this product: Increase bleeding risk: low
Varicella vaccine, do not use within 6 wk of olsalazine: Increase Reye's syndrome development
Warfarin: increased pro-time, INR

### Drug/lab test
Increased: AST, ALT

## NURSING CONSIDERATIONS
### Assessment
- **Assess for allergic reaction:** rash, dermatitis, urticaria, pruritus, dyspnea, bronchospasm, sulfonamides
- **Colitis:** assess bowel pattern, number of stools, consistency, frequency, pain, mucus before treatment and periodically
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, avoid breastfeeding, excreted in breast milk

### Patient/family education
- Teach patient that lab work and exams will be needed during treatment
- Advise patient to take as prescribed, take missed dose as soon as remembered
- Inform patient not to operate machinery or drive until effects are known, may cause dizziness
- Advise patient to notify prescriber if symptoms do not improve or if allergic reaction or sore throat occurs
- Teach patient to report diarrhea, rash, bleeding, bruising, fever, hallucinations or if symptoms do not improve after 2 mo of therapy
- BUN, creatinine in those with renal disease; LFTs (liver disease); monitor I&O, output of 1500 ml/day is needed to prevent crystals in urine

### Evaluation
**Positive therapeutic outcome**
- Absence of fever, mucus in stools

## omalizumab (Rx)
(oh-mah-lye-zoo'mab)
**Xolair**
*Func. class.:* Antiasthmatic
*Chem. class.:* Monoclonal antibody

**ACTION:** Recombinant DNA-derived humanized IgG murine monoclonal antibody that selectively binds to IgE to limit the release of mediators in the allergic response

**Therapeutic outcome:** Ability to breathe more easily

**USES:** Moderate to severe persistent asthma, chronic idiopathic urticaria

## CONTRAINDICATIONS
Hypersensitivity to hamster protein

**BLACK BOX WARNING:** Hypersensitivity to this product

**Precautions:** Pregnancy, breastfeeding, children <12 yr, acute attacks of asthma, lymphoma, nephrotic disease, bronchospasm, neoplastic disease, status asthmaticus

## DOSAGE AND ROUTES
**Moderate to severe persistent asthma**
**Adult/adolescent/child ≥12 yr:** SUBCUT 150-300 mg × 2-4 wk, divide inj into 2 sites, if dose is >150 mg; dose is adjusted based on IgE levels and significant changes in body weight

**Chronic idiopathic urticaria in those who are symptomatic with antihistamines**
**Adult/adolescent/child >12 yr:** SUBCUT 150-300 mg q4wk

**Available forms:** Powder for inj, lyophilized 202.5 mg (150 mg/1.2 ml after reconstitution)

### Implementation
**SUBCUT route**
- Reconstitute using 1.4 ml sterile water for inj (150 mg/1.2 ml or 125 mg/ml); gently swirl to dissolve; allow vial to stand and q5min gently swirl for 5-10 sec to dissolve, some vials take ≥20 min, do not use if contents do not dissolve within 40 min, should be clear or slightly opalescent; use large-bore needle to withdraw medication; replace needle with small-bore needle
- Given q2-4wk; product is viscous; if >150 mg is given, divide into two sites; the inj may take 5-10 sec to administer
- Do not give more than 150 mg/inj site

## ADVERSE EFFECTS
**CV:** Heart failure, cardiomyopathy, hypotension, MI, PE, thrombosis
**HEMA:** Serious systemic eosinophilia
**INTEG:** Pruritus, dermatitis, inj site reactions, rash
**MISC:** Earache, dizziness, fatigue, pain, malignancies, viral infections, anaphylaxis, thrombocytopenia, headache
**MS:** Arthralgia, fracture, leg, arm pain
**RESP:** Sinusitis, upper respiratory tract infections, pharyngitis, pulmonary hypertension, bronchospasm

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Slow |
| **Distribution** | Unknown |
| **Metabolism** | Degradation by liver |
| **Excretion** | In bile |
| **Half-life** | 26 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 7-8 days |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Vaccines (live virus): use cautiously

### Drug/lab test

Increased: IgE

## NURSING CONSIDERATIONS

### Assessment

• Monitor respiratory rate, rhythm, depth; auscultate lung fields bilaterally; notify prescriber of abnormalities; monitor pulmonary function tests; serum IgE

**BLACK BOX WARNING: Assess for anaphylaxis, allergic reactions:** rash, urticaria, inability to breathe, edema of throat; observe for 2 hr, reaction can occur up to 24 hr; have emergency equipment available; product should be discontinued

• **Pregnancy/breastfeeding:** Use only if clearly needed, pregnant patients should enroll in EXPECT Pregnancy Registry 866-4XOLAIR, cautious use in breastfeeding, excretion unknown

### Patient/family education

• Advise patient that improvement will not be immediate

• Teach patient not to stop taking or decrease current asthma medications unless instructed by prescriber

**BLACK BOX WARNING:** Instruct patient to report signs of allergic reaction immediately, can be life-threatening

### Evaluation

**Positive therapeutic outcome**

• Ability to breathe more easily

## omeprazole (Rx, OTC)

(oh-mep'ra-zole)

**Losec, PriLOSEC, PriLOSEC OTC**

*Func. class.:* Antiulcer, proton pump inhibitor

*Chem. class.:* Benzimidazole

**Do not confuse:** PriLOSEC/Prinivil/omeprazole/fomepizole predniSONE/PROzac/Pristiq

**ACTION:** Suppresses gastric secretion by inhibiting hydrogen/potassium ATPase enzyme system in the gastric parietal cell; characterized as a gastric acid pump inhibitor, since it blocks the final step of acid production

**Therapeutic outcome:** Absence of duodenal ulcers; decreased gastroesophageal reflux

**USES:** Gastroesophageal reflux disease (GERD), severe erosive esophagitis, poorly responsive systemic GERD, pathologic hypersecretory conditions (Zollinger-Ellison syndrome, systemic mastocytosis, multiple endocrine adenomas); possibly effective for treatment of duodenal ulcers with or without antiinfectives for *Helicobacter pylori*

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children; Asian, Black patients

## DOSAGE AND ROUTES

### Active duodenal ulcers

**Adult:** PO 20 mg/day × 4-8 wk; associated with *H. pylori* 40 mg qAM and clarithromycin 500 mg tid on days 1-14, then 20 mg/day days 15-28

### Severe erosive esophagitis/poorly responsive GERD

**Adult:** PO (DEL REL cap/SUSP) 20 mg/day × 4-8 wk

### Pathologic hypersecretory conditions

**Adult:** PO 60 mg/day; may increase to 120 mg tid; daily doses >80 mg should be divided

### Gastric ulcer

**Adult:** PO 40 mg/day × 4-8 wk

**Geriatric:** PO max 20 mg/day

### Heartburn (OTC)

**Adult:** PO 1 DEL REL tab (20 mg) daily before AM meal with glass of water

**Available forms:** Del rel caps 10, 20, 40 mg, del rel tabs (PriLOSEC OTC) 20 mg; granules for oral susp 2.5, 10 mg (del rel)

### Implementation
• Swallow sus rel caps whole; do not break, crush, chew, or open
• Give before patient eats; may give with antacids

## ADVERSE EFFECTS
**CNS:** *Headache, dizziness, asthenia*
**GI:** *Diarrhea, abdominal pain, vomiting, nausea, constipation, flatulence, acid regurgitation,* abdominal swelling, anorexia, irritable colon, esophageal candidiasis, dry mouth, hepatic failure, CDAD
**INTEG:** Rash, dry skin, urticaria, pruritus, alopecia
**MISC:** *Back pain,* fever, fatigue, malaise
**RESP:** *Upper respiratory tract infections, cough,* epistaxis, pneumonia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Protein binding (95%); gastric parietal cells |
| **Metabolism** | Liver, extensively; by CYP2C19 Genetic Warning some Asians, Blacks, Caucasians are poor metabolizers |
| **Excretion** | Kidneys, feces |
| **Half-life** | ½-1 hr; increased in the geriatric, hepatic disease |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1 hr |
| **Peak** | ½-3½ hr |
| **Duration** | 3-4 days |

## INTERACTIONS
### Individual drugs
Ampicillin: decreased effect of ampicillin
Calcium carbonate: decreased absorption of calcium carbonate
Cyanocobalamin: decreased absorption of cyanocobalamin
CycloSPORINE: increased cycloSPORINE levels
Diazepam: increased serum levels of diazepam
Digoxin: increased serum levels, delayed absorption of digoxin
Disulfiram: increased disulfiram levels
Flurazepam: increased flurazepam level
Gefitinib: decreased effect of gefitinib
Indinavir: decreased effect of indinavir
Iron salts: decreased absorption
Ketoconazole: decreased absorption of ketoconazole
Phenytoin: increased serum levels of phenytoin
Triazolam: increased triazolam level
Warfarin: increased bleeding tendencies

### Drug classifications
Iron products: decreased absorption of iron

### Drug/lab test
Increased: alkaline phosphatase, AST, ALT, bilirubin, gastrin

## NURSING CONSIDERATIONS
### Assessment
• ***Clostridium difficile*-associated diarrhea (CDAD):** Assess for fever, abdominal pain, bloody stool, report to prescriber immediately, may occur up to several weeks after conclusion of therapy
• **Electrolyte imbalances:** hyponatremia, hypomagnesemia in those using this product 3 mo-1 yr; if hypomagnesemia occurs, use of magnesium supplement may be sufficient; if severe, discontinue use
• Assess GI system: bowel sounds q8hr, abdomen for pain and swelling, anorexia
• **Monitor hepatic enzymes:** AST, ALT, increased alkaline phosphatase during treatment; blood studies; CBC, differential during treatment, blood dyscrasias may occur; vitamin $B_{12}$ in long-term treatment
• Teach patient to take as directed, even if feeling better; to take missed dose as soon as remembered; not to double; PriLOSEC OTC can take up to 4 days for full effect
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excreted in breast milk
• **Beers:** Avoid scheduled use >8 wk in those with hypersecretory condition, esophagitis, risk of *Clostridium difficile*, and fractures

### Patient/family education
• Advise patient to report severe diarrhea; black, tarry stools; abdominal cramps/pain, continuing headache; product may have to be discontinued
• Teach patient to report if pregnancy is planned or suspected
• Teach patient not to use OTC, Rx, or herbs without prescriber consent
• Caution patient to avoid driving and other hazardous activities until response to product is known
• Caution patient to avoid alcohol, salicylates, ibuprofen; may cause GI irritation

### Evaluation
#### Positive therapeutic outcome
• Absence of epigastric pain, swelling, fullness

## ondansetron (Rx)

(on-dan′sa-tron)

**Ondissolve, Zofran, Zofran ODT, Zuplenz ODF**

*Func. class.:* Antiemetic

*Chem. class.:* 5-HT receptor antagonist

**Do not confuse:** Zofran/Zantac

**ACTION:** Prevents nausea, vomiting by blocking serotonin (5-HT) peripherally, centrally, and in the small intestine

**Therapeutic outcome:** Control of nausea, vomiting

**USES:** Prevention of nausea, vomiting associated with cancer chemotherapy, radiotherapy, and prevention of postoperative nausea, vomiting

**Unlabeled uses:** Bulimia, pruritus (rectal use), alcoholism, severe vomiting in pregnancy

## CONTRAINDICATIONS

Hypersensitivity; phenylketonuric hypersensitivity (oral disintegrating tab), torsades de pointes

**Precautions:** Pregnancy, breastfeeding, children, geriatric, granisetron hypersensitivity, QT prolongation, torsades de pointes

## DOSAGE AND ROUTES

### Prevention of nausea/vomiting (cancer chemotherapy)

**Adult and child 4-18 yr:** **IV** 0.15 mg/kg infused over 15 min, 30 min before start of cancer chemotherapy, max 16 mg/dose; 0.15 mg/kg is given 4 hr and 8 hr after first dose or 16 mg as a single dose; dilute in 50 ml of $D_5$ or 0.9% NaCl before giving; RECT (unlabeled) 16 mg daily 2 hr before chemotherapy; PO 8 mg ½ hr prior to chemotherapy, repeat 4, 8 hr after 1st dose

**Child ≥4 yr:** PO 4 mg ½ hr prior to chemotherapy

### Prevention of nausea/vomiting (radiotherapy)

**Adult:** PO 8 mg tid, may repeat q8hr

### Prevention of postoperative nausea/vomiting

**Adult:** **IV**/IM 4 mg undiluted over >30 sec prior to induction of anesthesia

**Child 2-12 yr:** **IV** 0.1 mg/kg (≤40 kg); 4 mg (≥40 kg), give ≥30 sec

### Hepatic dose

**Adult:** PO/IM/IV max dose 8 mg daily

### Severe vomiting in pregnancy (unlabeled)

**Adult:** PO/**IV** 4-8 mg bid-tid

### Pruritus (unlabeled)

**Adult:** PO 4 mg bid

### Alcoholism (unlabeled)

**Adult:** PO 4 mcg/kg bid

**Available forms:** Inj 2 mg/ml, 32 mg/50 ml (premixed); tabs 4, 8 mg; oral sol 4 mg/5 ml; oral disintegrating tabs 4, 8 mg; oral dissolving film 4.8 mg

### Implementation

**PO route**

- Regular tab; protect from light (4-mg tab)
- **Oral disintegrating tab:** do not push through foil; gently remove and immediately place on tongue to dissolve, swallow with saliva
- **Oral dissolving film:** fold pouch along dotted line to expose near notch; while folded, tear and remove film, place film on tongue until dissolved, swallow after dissolved; to reach desired dose, administer successive films, allowing each to dissolve before using another
- Check for discoloration or particulate; if particulate is present, shake to dissolve

**Oral solution**

- Protect from light
- Measure in calibrated oral syringe or other calibrated device

**IM route**

- Visually inspect for particulate or discoloration
- May give 4 mg undiluted IM; inject deeply in large muscle mass, aspirate

**Direct IV route**

- Give **IV** after diluting a single dose in 50 ml of 0.9% NaCl or $D_5W$, 0.45% NaCl; give over 15 min
- Store at room temperature for 48 hr after dilution
- Do not use IV 32-mg dose in chemotherapy; nausea/vomiting due to QT prolongation, max 16 mg/dose (adult)

**Y-site compatibilities:** Aldesleukin, amifostine, amikacin, aztreonam, bleomycin, CARBOplatin, carmustine, ceFAZolin, ceforanide, cefotaxme, cefOXitin, cefTAZidime, ceftizoxime, cefuroxime, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, dacarbazine, DACTINomycin, DAUNOrubicin, dexamethasone, diphenhydrAMINE, DOXOrubicin, DOXOrubicin liposome, doxycycline, droperidol, etoposide, famotidine, filgrastim, floxuridine, fluconazole, fludarabine, gentamicin, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem/cilastatin, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna,

methotrexate, metoclopramide, miconazole, mitoMYcin, mitoXANtrone, morphine, PACLitaxel, pentostatin, potassium chloride, prochlorperazine, ranitidine, remifentanil, streptozocin, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, vancomycin, vinBLAStine, vinCRIStine, vinorelbine, zidovudine

**Y-site incompatibilities:** Acyclovir, aminophylline, amphotericin B, ampicillin, ampicillin/sulbactam, cefoperazone, furosemide, ganciclovir, LORazepam, methylPREDNISolone, mezlocillin, piperacillin, sargramostim, sodium bicarbonate

## ADVERSE EFFECTS

**CNS:** *Headache,* dizziness, drowsiness, fatigue, EPS

**GI:** *Diarrhea, constipation, abdominal pain,* dry mouth

**MISC:** Rash, bronchospasm (rare), *musculoskeletal pain, wound problems, shivering, fever, hypoxia, urinary retention*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed (**IV**) |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys |
| **Half-life** | 3.5-4.7 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Apomorphine: increased unconsciousness, hypotension: do not use together

CarBAMazepine, phenytoin, rifampin: decreased ondansetron effect

### Drug classifications

Increased QT prolongation with other products that prolong QT

### Drug/lab test

Increased: LFTs

## NURSING CONSIDERATIONS

### Assessment

- Assess for absence of nausea, vomiting during chemotherapy
- Assess for hypersensitivity reaction: rash, bronchospasm
- **Assess for EPS** shuffling gait, tremors, grimacing, rigidity
- **QT prolongation:** monitor ECG in those with hypokalemia, hypomagnesemia, cardiac disease and those receiving other products that increase QT
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, cardiac malformations, oral clefts may occur
- **Serotonin syndrome:** Occurs when other products are given that increase CNS or peripheral serotonin levels; agitation, confusion, dizziness, diaphoresis, flushing, tremor, seizures, nausea, vomiting, diarrhea, product should be discontinued

### Patient/family education

- Instruct patient to report diarrhea, constipation, rash, changes in respirations, or discomfort at insertion site, serotonin syndrome, EPS symptoms
- Teach patient reason for medication and expected results
- Drink with full glass of water (PO)
- **Oral disintegrating tab:** Remove strip from pouch, place on tongue, and allow to dissolve, drink water

### Evaluation

**Positive therapeutic outcome**

- Absence of nausea

# oritavancin

(or-it'a-van'sin)

**Orbactiv**

*Func. class.:* Antiinfective agent

*Chem. class.:* Glycopeptide

**ACTION:** Inhibits bacterial cell-wall biosynthesis by preventing transglycosylation (polymerization) by binding to precursors, as well as by preventing cross-linking by binding to the peptide bridging segments of the cell wall; also disrupts the bacterial cell membrane integrity, resulting in depolarization, increased permeability, and eventual cell death

**Therapeutic outcome:** Resolution of infection

**USES:** *Enterococcus faecalis, Enterococcus faecium, Staphylococcus aureus* (MRSA), *Staphylococcus aureus* (MSSA), *Streptococcus agalactiae* (group B streptococci), *Streptococcus anginosus, Streptococcus constellatus, Streptococcus dysgalactiae, Streptococcus intermedius, Streptococcus pyogenes* (group A β-hemolytic streptococci); treatment of acute bacterial skin and skin structure infections (ABSSSI) due to gram-positive organisms, including cellulitis/erysipelas, major cutaneous abscesses, and wound infections

**CONTRAINDICATIONS:** Hypersensitivity

**Precautions:** Anticoagulant therapy, antimicrobial resistance, breastfeeding, colitis, diarrhea, inflammatory bowel disease, infusion reactions, pregnancy pseudomembranous colitis, vancomycin hypersensitivity, viral infection

## DOSAGE AND ROUTES

**Adult: IV** 1200 mg as a single dose

**Available forms:** Powder for injection: 400 mg

### Implementation

- Visually inspect for particulate matter and discoloration beforehand; the reconstituted solution is clear, colorless to pale yellow
- Reconstitution: Reconstitute each 400-mg vial with 40 ml sterile water for injection. Three vials are necessary for a single dose; gently swirl until dissolved.
- Dilution: Withdraw and discard 120 ml from a 1000-ml intravenous bag of $D_5W$, transfer 40 ml solution from each of the 3 reconstituted vials to the $D_5W$ IV bag (1.2 mg/ml)
- Storage: Refrigerate or store at room temperature. The combined storage time (from reconstitution to dilution) and 3-hour infusion time should not exceed 6 hr at room temperature or 12 hr if refrigerated.

**Intermittent IV INF**

- Infuse over 3 hr, do not infuse with other medications or electrolytes, do not use saline-based solution

## ADVERSE EFFECTS

**CNS:** Dizziness, flushing, headache
**CV:** Sinus tachycardia, phlebitis
**GI:** Nausea, vomiting, diarrhea
**HEMA:** Anemia, eosinophilia
**INTEG:** Rash, vasculitis, pruritus, angioedema, infusion-related reaction
**MISC:** Wheezing, bronchospasm
**MS:** Myalgia, osteomyelitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 85% protein binding |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Terminal half-life 245 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Products metabolized by CYP2D6 and CYP3A4: Increased toxicity
Increase: Bleeding risk: warfarin, avoid concurrent use

### Drug/lab test

Increased: LFTs, uric acid, INR, aPTT

## NURSING CONSIDERATIONS

### Assessment

- Monitor CBC and differential
- Infusion-related reactions, symptoms of red man's syndrome (flushing, urticaria, pruritus), slow or stop infusion
- Assess for diarrhea, bloody stools, cramping
- Avoid heparin for 5 days after use of this product, a false elevated aPTT and coagulation studies occur
- Assess for fever; report to health care professional, may be *Clostridium difficile*-associated diarrhea (CDAD), may start up to 8 wk after completion of treatment
- C&S before therapy, may give product before receiving results

### Patient/family education

- Teach patient reason for product, expected result
- Advise patient product is used only once to resolve infection
- **Bowel function:** To notify health care professional of diarrhea, bloody stools, cramping, fever, do not self-treat
- Teach patient to notify prescriber of rash, facial swelling, dyspnea
- Teach patient to avoid use of all OTC herbs unless approved by prescriber
- Teach patient to notify prescriber if pregnancy is planned or suspected
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Resolution of infection

## oseltamivir (Rx)

(oh-sell-tam'ih-ver)
**Tamiflu**
*Func. class.:* Antiviral
*Chem. class.:* Neuraminidase inhibitor

**ACTION:** Inhibits influenza virus neuraminidase with possible alteration of virus particle aggregation and release

**Therapeutic outcome:** Decreased symptoms of influenza type A

**USES:** Prevention/treatment of influenza type A or B

**Unlabeled uses:** Avian influenzae (H5N1), swine flu (H1N1), encephalitis

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, geriatric, renal/hepatic/pulmonary/cardiac disease, infants, children, neonates, psychosis, viral infection, breastfeeding

## DOSAGE AND ROUTES

### Treatment

**Adult and child >40 kg:** PO 75 bid mg × 5 days, begin treatment within 2 days of onset of symptoms
**Child 23-40 kg and ≥1 yr:** PO 60 mg bid
**Child 15-23 kg and ≥1 yr:** PO 45 mg bid
**Child ≤15 kg and ≥1 yr:** PO 30 mg bid

### Prevention

**Adult and child ≥13 yr:** PO 75 mg/day × ≥7 days; begin treatment within 2 days of contact, max use 6 wk

### Renal dose

**Adult:** PO CCr 10-30 ml/min 75 mg/day × 5 days (treatment); 75 mg every other day or 30 mg/day (prophylaxis)

### H1N1 influenzae A virus (unlabeled)

**Adult/adolescent/child >40 kg:** PO 75 mg bid × 5 days
**Child/adolescent 24-40 kg:** PO 60 mg bid × 5 days
**Child >1 yr and 15-23 kg:** PO 45 mg bid × 5 days
**Child >1 yr and <15 kg:** PO 30 mg bid × 5 days

**Available forms:** Caps 30, 45, 75 mg; powder for oral susp 6 mg/ml

### Implementation

- Give within 2 days of symptoms of influenza; continue for 5 days
- Give at least 4 hr before bedtime to prevent insomnia
- 12 mg/ml concentration will be available for a limited time, new product is 6 mg/ml concentration, take care to give correct dose
- Give without regard to food, give with food for GI upset, take with full glass of water
- **Oral susp:** loosen powder from side of bottle 55 ml shake well (6 mg/ml); remove child-resistant cap and push bottle adapter into neck of bottle, close tightly with child-resistant cap to ensure sealing; use within 17 days of preparation when refrigerated or 10 days at room temperature, write expiration date on bottle, shake well before use, use oral syringe provided but only with markings for 30, 45, 60 mg, confirm dosing instructions are in same units as syringe provided
- Store in airtight, dry container

## ADVERSE EFFECTS

**CNS:** Headache, fatigue, insomnia, dizziness, delirium, self-injury (children)
**ENDO:** Hyperglycemia
**GI:** *Nausea, vomiting,* diarrhea, abdominal pain
**INTEG:** Toxic epidermal necrolysis, Stevens-Johnson syndrome, erythema multiforme
**RESP:** Cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Protein binding 3% |
| **Metabolism** | Converted to oseltamivir carboxylate (active form) |
| **Excretion** | Eliminated by conversion, urine 99% |
| **Half-life** | 1-3 hr (active form) |

### Pharmacodynamics

Unknown

## INTERACTIONS

Increase: Oseltamivir metabolites probenecid
Avoid use with H1N1 virus vaccine, intranasal influenza vaccine

## NURSING CONSIDERATIONS

### Assessment

- **Influenza:** assess for symptoms of influenza A: increased temperature, malaise, aches and pains
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, may be used for influenza, may breastfeed
- **Behavioral symptoms:** Assess for hallucinations, abnormal behaviors, delirium

### Patient/family education

- Teach patient about aspects of product therapy
- Teach patient to avoid hazardous activities if dizziness occurs
- Advise patient to take as soon as symptoms appear, to take full course, even if feeling better
- Advise patient to take missed dose as soon as remembered if within 2 hr of next dose
- Teach patient to stop product immediately and report to prescriber skin rash, delirium, psychosis, hallucinations (child)
- Advise patient that product is not a substitute for a flu shot
- Inform patient to avoid other products without approval of prescriber

O

## Evaluation

**Positive therapeutic outcome**

• Absence of fever, malaise, cough, dyspnea in influenza A

**⚠ HIGH ALERT**

# oxaliplatin (Rx)

(ox-al-i'plat-in)

**Eloxatin**

*Func. class.:* Antineoplastic

*Chem. class.:* 3rd-generation platinum analog

**ACTION:** Forms cross links, inhibiting DNA replication and transcription, cell-cycle nonspecific

**Therapeutic outcome:** Decreased size of tumor, spread of malignancy

**USES:** Metastatic carcinoma of the colon or rectum in combination with 5-FU/leucovorin

**Unlabeled uses:** Relapsed or refractory non-Hodgkin's lymphoma, advanced ovarian cancer

## CONTRAINDICATIONS

Pregnancy, breastfeeding, radiation therapy or chemotherapy within 1 mo, thrombocytopenia, smallpox vaccination

**BLACK BOX WARNING:** Hypersensitivity to this product or other platinum products

**Precautions:** Children, geriatric, pneumococcus vaccination, renal disease

## DOSAGE AND ROUTES

### First-line treatment for advanced colorectal cancer with 5-FU and leucovorin (5-FU/LV)

Dosage protocols may vary

**Adult: IV** INF *Day 1:* oxaliplatin 85 mg/m$^2$ in 250-500 ml $D_5W$ and leucovorin 200 mg/m$^2$ in $D_5W$, give both over 2 hr at the same time in separate bags using a Y-line, followed by 5-FU 400 mg/m$^2$ **IV** BOL over 2-4 min, then 5-FU 600 mg/m$^2$ **IV** INF in 500 ml $D_5W$ as a 22-hr CONT INF; *Day 2:* leucovorin 200 mg/m$^2$ **IV** INF over 2 hr, then 5-FU 400 mg/m$^2$ **IV** BOL over 2-4 min, then 5-FU 600 mg/m$^2$ **IV** INF in 500 ml $D_5W$ as a 22-hr CONT INF; repeat cycle q2wk

With 5-FU/LV for adjuvant treatment of stage III colon cancer in those who have had complete resection of the primary tumor

### Renal dose

**Adult:** IV CCr <30 ml/min: reduce starting dose to 65 mg/m$^2$

**Available forms:** Powder for inj 50, 100 mg single-use vials (5 mg/ml); solution for inj 50 mg/10 ml, 100 mg/20 ml, 200 mg/40 ml

## Implementation

**Intermittent IV INF route**

• Premedicate with antiemetics including 5-$HT_3$ blockers, with or without dexamethasone, prehydration is not needed

• Do not reconstitute or dilute with sodium chloride or any chloride-containing solutions, do not use aluminum equipment during any preparation or administration, will degrade platinum; do not refrigerate unopened powder or solution; do not freeze; protect from light

• Use cytotoxic handling procedures; prepare in biological cabinet using gown, gloves, mask; do not allow product to come in contact with skin; use soap and water if contact occurs

• EPINEPHrine, antihistamines, corticosteroids for hypersensitivity reaction

• **Lyophilized powder:** reconstitute vial 50 mg/10 ml, or 100 mg/20 ml sterile water for inj or $D_5W$, after reconstitution, solution may be stored for ≤24 hr in refrigerator, after dilution in 250-500 ml $D_5W$, may store ≤24 hr in refrigerator or 6 hr at room temp, infuse over 2 hr

• **Aqueous solution:** dilute in 250-500 ml of $D_5W$, after dilution may store ≤24 hr refrigerator, 6 hr at room temp, infuse over 2 hr

**Y-site compatibilities:** Alfentanil, amifostine, amikacin, aminocaproic acid, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, DOXOrubicin, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular),

irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, metaraminol, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, morphine, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, PACLitaxel, palonosetron, pancuronium, PEMEtrexed, pentamidine, pentazocine, phenylephrine, piperacillin, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, rocuronium, sodium acetate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Peripheral neuropathy, fatigue, headache, dizziness, insomnia, reversible posterior leukoencephalopathy syndrome
**CV:** Cardiac abnormalities, thromboembolism
**EENT:** *Decreased visual acuity, tinnitus, hearing loss*
**GI:** *Severe nausea, vomiting, diarrhea, weight loss,* stomatitis, anorexia, gastroesophageal reflux, constipation, dyspepsia, mucositis, flatulence
**GU:** Hematuria, dysuria, creatinine
**HEMA:** Thrombocytopenia, leukopenia, pancytopenia, neutropenia, anemia, hemolytic uremic syndrome
**INTEG:** *Alopecia,* rash, flushing, extravasation, redness, swelling, pain at inj site
**META:** Hypokalemia
**RESP:** Fibrosis, dyspnea, cough, rhinitis, URI, pharyngitis
**SYST:** Anaphylaxis, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 15% of platinum in systemic circulation; 85% is either in tissues or being eliminated in urine |
| **Metabolism** | Liver |
| **Excretion** | Urine |
| **Half-life** | 40 days |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Alcohol, aspirin: increased risk of bleeding
Radiation: increased myelosuppression

### Drug classifications

Aminoglycosides, diuretics (loop): increased nephrotoxicity
Anticoagulants, NSAIDs, platelet inhibitors, thrombolytics, salicylates: increased risk of bleeding
Live virus vaccines: decreased antibody response
Myelosuppressives: increased myelosuppression
Tannins: increased oxaliplatin toxicity

### Drug/lab test

Increased: ALT, AST, bilirubin, creatinine
Decreased: potassium, neutrophils, WBC, platelets

## NURSING CONSIDERATIONS

### Assessment

- **Bone marrow depression:** monitor CBC, differential, platelet count weekly; withhold product if WBC is <4000 or platelet count is <100,000; notify prescriber of results
- Monitor renal function tests: BUN, creatinine, serum uric acid, urine CCr before, electrolytes during therapy; dose should not be given if BUN >19 mg/dl; creatinine <1.5 mg/dl; I&O ratio; report fall in urine output of <30 ml/hr

**BLACK BOX WARNING: Assess for anaphylaxis:** wheezing, tachycardia, facial swelling, fainting, rash, dyspnea, hives; discontinue product and report to prescriber; resuscitation equipment should be nearby with EPINEPHrine, corticosteroids

- **Reversible posterior leukoencephalopathy syndrome:**
- Monitor temp (may indicate beginning infection)
- Monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly
- **Assess for bleeding:** hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr; obtain prescription for viscous lidocaine (Xylocaine)
- Assess effects of alopecia on body image; discuss feelings about body changes
- Assess for jaundice of skin, sclera; dark urine; clay-colored stools; itchy skin; abdominal pain; fever; diarrhea
- Assess for edema in feet, joint pain, stomach pain, shaking

- **Pulmonary fibrosis:** assess for cough, crackles, dyspnea, pulmonary infiltrate; discontinue immediately; may be fatal
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- **Advise patient to report signs of infection:** increased temp, sore throat, flulike symptoms
- **Advise patient to report signs of anemia:** fatigue, headache, faintness, shortness of breath, irritability
- **Advise patient to report bleeding;** avoid use of razors, commercial mouthwash
- Advise patient to avoid aspirin, ibuprofen, NSAIDs, alcohol; may cause GI bleeding
- Advise patient to report any changes in breathing, coughing
- Advise patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture
- Advise patient to report numbness, tingling in face or extremities, poor hearing or joint pain, swelling
- Advise patient not to receive vaccines during treatment
- Advise patient to use contraception during treatment and 4 mo after; this product may cause infertility, pregnancy D
- Teach patient to avoid contact with cold (air, ice, liquid); causes acute dysesthesias

### Evaluation

**Positive therapeutic outcome**

- Decreased tumor size, spread of malignancy

**⚠ HIGH ALERT**

## oxazepam (Rx)

(ox-az′e-pam)

**Novoxapan, Serax, Zopex**

*Func. class.:* Sedative-hypnotic; antianxiety

*Chem. class.:* Benzodiazepine, short-acting

**Controlled substance schedule IV**

**ACTION:** Depresses subcortical levels of CNS, including limbic system, reticular formation; potentiates GABA

**Therapeutic outcome:** Decreased anxiety, successful alcohol withdrawal, relaxation

**USES:** Anxiety, alcohol withdrawal

**Unlabeled uses:** Insomnia

## CONTRAINDICATIONS

Pregnancy, breastfeeding, children <6 yr, hypersensitivity to benzodiazepines, closed-angle glaucoma, psychosis

**Precautions:** Geriatric, debilitated, renal/hepatic disease, depression, suicidal ideation, dementia, sleep apnea, seizure disorder

**BLACK BOX WARNING:** Depressants, respiratory depression

## DOSAGE AND ROUTES

### Anxiety

**Adult:** PO 15-30 mg tid-qid, max 120 mg/day
**Geriatric:** PO 10 mg daily bid-tid, max 60 mg/day

### Alcohol withdrawal

**Adult:** PO 15-30 mg tid-qid

### Severe anxiety syndrome; agitation; anxiety with depression

**Adult and child >12 yr:** PO 15-30 mg tid-qid

**Available forms:** Caps 10, 15, 30 mg

### Implementation

- Give with food or milk for GI symptoms; tab may be crushed if patient is unable to swallow medication whole
- Taper product (0.5 mg q3day) before discontinuing

## ADVERSE EFFECTS

**CNS:** *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, fatigue, depression, insomnia, hallucinations, paradoxical excitement, transient amnesia
**CV:** *Orthostatic hypotension,* ECG changes, tachycardia, hypotension
**EENT:** *Blurred vision,* tinnitus, mydriasis
**GI:** Nausea, vomiting, anorexia, drug-induced hepatitis
**HEMA:** Leukopenia
**INTEG:** Rash, dermatitis, itching
**SYST:** Dependence

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed; crosses placenta, blood-brain barrier |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 5-15 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½-1½ hr |
| **Peak** | Unknown |
| **Duration** | 6-12 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Disulfiram: increased oxazepam effects
Levodopa: decreased effects of levodopa
Phenytoin, theophylline, valproic acid: decreased oxazepam effects

### Drug classifications

**BLACK BOX WARNING:** CNS depressants: increased oxazepam effects, respiratory depression

**BLACK BOX WARNING:** Oral contraceptives: increased or decreased oxazepam effect

### Drug/herb

Kava, melatonin, valerian: increased CNS depression

### Drug/lab test

Increased: AST, ALT, serum bilirubin
Decreased: WBC

## NURSING CONSIDERATIONS

**BLACK BOX WARNING:** Respiratory depression: Not to be used in preexisting respiratory depression, use cautiously in severe pulmonary disease, monitor respirations

### Assessment

- Monitor CBC and LFTs, periodically
- **Pregnancy:** Assess for pregnancy before use, do not use in pregnancy, do not breastfeed
- **Assess mental status:** mood, sensorium, anxiety, affect, sleeping pattern, drowsiness, dizziness, suicidal thoughts, behavior; physical dependency, withdrawal symptoms: anxiety, panic attacks, agitation, seizures, headache, nausea, vomiting, muscle pain, weakness, sedation suicidal thoughts, behavior; indications of increasing tolerance and abuse
- Monitor B/P with patient lying, standing; pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding
- **Beers:** Avoid in older adults, delirium, cognitive impairment may occur

### Patient/family education

- Teach patient that product may be taken without regard to food or fluids; tab may be crushed or swallowed whole
- Caution patient not to use for everyday stress or longer than 4 mo unless directed by prescriber; not to take more than prescribed amount; not to double doses or skip doses
- Advise patient to avoid OTC preparations unless approved by prescriber; alcohol and CNS depressants will increase CNS depression
- Caution patient to avoid driving and activities that require alertness, since drowsiness may occur; to avoid alcohol and other psychotropic medications; to rise slowly or fainting may occur, especially geriatric; that drowsiness may worsen at beginning of treatment
- Caution patient not to discontinue medication abruptly after long-term use; withdrawal symptoms include vomiting, cramping, tremors, seizures
- Advise patient to use sugarless gum, hard candy, frequent sips of water for dry mouth
- Teach patient that drowsiness may worsen at beginning of treatment
- Teach patient to notify prescriber if pregnancy is planned or suspected, pregnancy

### Evaluation

**Positive therapeutic outcome**

- Decreased anxiety, restlessness, sleeplessness (short-term treatment only)

## TREATMENT OF OVERDOSE:

Lavage, VS, supportive care

## OXcarbazepine (Rx)

(ox′kar-baz′uh-peen)
**Oxtellar XR, Trileptal**
*Func. class.:* Anticonvulsant

**Do not confuse:** OXcarbazepine/carBAMazepine/oxaprozin

**ACTION:** May inhibit nerve impulses by limiting influx of sodium ions across cell membrane in motor cortex

**Therapeutic outcome:** Absence of seizures

**USES:** Partial seizures

**Unlabeled uses:** Trigeminal neuralgia, atypical panic disorder, bipolar disorder

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children <4 yr, hypersensitivity to carbamazepine, renal disease, fluid restriction, hyponatremia,

abrupt discontinuation, suicidal ideation, positive for HLA-B 1502 allele

## DOSAGE AND ROUTES

### Seizures adjunctive therapy

**Adult:** PO 300 mg bid, may be increased by 600 mg/day in divided doses bid at weekly intervals; maintenance 1200 mg/day; ext rel 600 mg/day × 1 wk, increase weekly in 600 mg/day increments to 1200-2400 mg/day

**Child 4-16 yr:** PO 8-10 mg/kg/day divided bid, dose is determined by weight, increase by 5 mg/kg/day q3 days, max doses are weight dependent

### Conversion to monotherapy in partial seizures

**Adult:** PO 300 mg bid with reduction in other anticonvulsants, increase OXcarbazepine by 600 mg/day qwk over 2-4 wk; withdraw other anticonvulsants over 3-6 wk, max 2400 mg/day

### Initiation of monotherapy in partial seizures

**Adult:** PO 300 mg bid, increase by 300 mg/day q3day to 1200 mg divided bid, max 2400 mg/day

### Renal dose

**Adult:** PO CCr <30 ml/min 150 mg bid and increase slowly

**Available forms:** Film-coated tabs 150, 300, 600 mg; oral susp 300 mg/5 ml; ext rel tab 150, 300, 600 mg

### Implementation

- Store product at room temperature
- Provide assistance with ambulation during early part of treatment; dizziness may occur
- Give product with food, milk to decrease GI symptoms
- **Oral susp:** shake well, use calibrated oral syringe provided, use or discard within 7 days of opening
- **Ext rel:** do not crush, break, or chew

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness, confusion, fatigue,* feeling abnormal, ataxia, abnormal gait, tremors, anxiety, agitation, worsening of seizures, suicidal ideation/behavior

**CV:** *Hypotension,* chest pain, edema, bradycardia, syncope

**EENT:** *Blurred vision, diplopia, nystagmus,* rhinitis, sinusitis

**ENDO:** Hypothyroidism, hot flashes

**GI:** *Nausea, constipation, diarrhea,* anorexia, vomiting, abdominal pain, gastritis

**GU:** Urinary frequency, hematuria, menses change

**INTEG:** Purpura, rash, acne

**META:** Hyponatremia

**RESP:** Flulike symptoms

**SYST:** Angioedema, anaphylaxis, Stevens-Johnson syndrome, toxic epidermal necrolysis, drug reaction with eosinophilia and systemic symptoms (DRESS)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver; 95% renal extraction |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4-6 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual products

Alcohol: increased CNS depression
CarBAMazepine: decreased carBAMazepine level, decreased OXcarbazepine levels
Felodipine: decreased effects of felodipine
Nisoldipine, ranolazine: do not use concurrently
PHENobarbital, valproic acid, verapamil: decreased OXcarbazepine level
Phenytoin: decreased OXcarbazepine level

### Drug classifications

Contraceptives (oral): decreased oral contraceptive level
MAOIs: do not use concurrently

### Drug/herb

Ginkgo: increased anticonvulsant effect
Ginseng, santonica: decreased anticonvulsant effect

### Drug/lab test

Decreased: sodium

## NURSING CONSIDERATIONS

### Assessment

- **Assess seizure activity,** including frequency, duration, and aura; provide seizure precautions
- Assess mental status including mood, sensorium, affect, behavioral changes, suicidal thoughts, behavior; if mental status changes, notify prescriber; usually occurs within the first 3 mo of treatment, but may occur ≤1 yr; if this product is being used with other products that decrease sodium, monitor sodium levels
- Assess eye problems: ophthalmic examinations (slit lamp, funduscopy, tonometry) are needed before, during, after treatment
- Assess patient for hypersensitivity to carBAMazepine

- **Assess for serious skin reactions:** angioedema, anaphylaxis, Stevens-Johnson syndrome
- **Pregnancy:** lack of seizure control due to MHD, a metabolite of OXcarbazepine; monitor seizure control, pregnant patients should enroll in Antiepileptic Drug Pregnancy Registry 888-233-2334, do not breastfeed, excreted in breast milk
- May monitor target serum level 12-30 mcg/ml to identify compliance/toxicity
- **Beers:** Avoid in older adults unless safer alternatives are not available, ataxia, impaired psychomotor function may occur

### Patient/family education

- Caution patient to avoid driving, other activities that require alertness
- Instruct patient to take twice a day at same intervals (immediate release)
- Advise patient not to discontinue medication quickly after long-term use, seizures may increase
- Instruct patient to avoid use of alcohol while taking this medication
- Instruct patient to use alternative contraception if using hormonal method, to report if pregnancy is planned or suspected, pregnancy
- Teach patient to report skin rashes immediately; serious skin reactions can occur
- Instruct patient to inform prescriber if allergic to carBAMazepine; multisystem hypersensitivity may occur, to report fever, other allergic symptoms
- Instruct patient to report suicidal thoughts/behavior immediately

### Evaluation

**Positive therapeutic outcome**

- Decreased seizure activity

## TREATMENT OF OVERDOSE:

Give 0.9% NaCl (hypotensive state), atropine (bradycardia); use benzodiazepines, barbiturates for seizures

## oxybutynin (Rx, OTC)

(ox-i-byoo'ti-nin)

**Ditropan, Ditropan XL, Gelnique, Oxytrol ✱, Uromax ✱ Oxybutynin (Transdermal) Oxytrol, Oxytrol for women**

*Func. class.:* Anticholinergic, urinary antispasmatic

*Chem. class.:* Synthetic tertiary amine

**Do not confuse:** Ditropan/diazepam/diprivan

## ACTION:

Relaxes smooth muscles in urinary tract by inhibiting acetylcholine at postganglionic sites

**Therapeutic outcome:** Decreased symptoms of urgency, nocturia, incontinence

## USES:

Antispasmodic for neurogenic bladder, overactive bladder in females (OTC)

## CONTRAINDICATIONS

Hypersensitivity, GI obstruction, urinary retention, glaucoma, severe colitis, myasthenia gravis, unstable CV, infants

**Precautions:** Pregnancy, breastfeeding, children <12 yr, geriatric, suspected glaucoma, cardiac disease, dementia

## DOSAGE AND ROUTES

**Adult:** PO 5 mg bid-tid, max 5 mg qid; ext rel tabs 5-10 mg/day, may increase by 5 mg, max 30 mg/day; transdermal apply one patch to abdomen, hip, buttock 2 ×/wk (q3-4day); GEL apply contents of 1 packet to abdomen, upper arms, shoulders, thighs daily

**Geriatric:** PO 2.5-5 mg bid-tid, increase by 2.5 mg q several days

**Child ≥6 yr:** PO 5 mg bid, not to exceed 5 mg tid; ext rel 5 mg/day, max 20 mg/day

**Child 1-5 yr:** PO 0.2 mg/kg/dose 2-3 ×/day

**Available forms:** Syr 5 mg/5 ml; tabs 5 mg; ext rel tabs 5, 10, 15 mg; transdermal 3.9 mg/day; top gel 10% (Gelnique)

### Implementation

**PO route**

- Do not break, crush, or chew ext rel tabs
- May be given with meals or fluids or on an empty stomach

**Topical route**

- Wash hands, apply to clean, dry, intact skin on abdomen, upper arms/shoulders, thighs, avoid navel, rotate sites
- Squeeze contents in palm of hand or directly on this site, rub gently
- Do not bathe, exercise, swim for 1 hr after application
- Allow to dry before putting on clothing
- Do not be near flame, fire, or smoke until gel has dried
- Delivers 100 mg

**Transdermal route**

- Apply to clean, dry, intact skin on the abdomen, hip, buttock, use firm pressure, not affected by showering/bathing; rotate sites
- Delivers 3.9 mg/day

## ADVERSE EFFECTS

**CNS:** *Anxiety, restlessness, dizziness,* somnolence, insomnia, nervousness, seizures, headache, drowsiness, confusion
**CV:** *Palpitations, sinus tachycardia,* hypertension, peripheral edema, QT prolongation
**EENT:** Blurred vision, increased intraocular tension; dry mouth, throat, dry eyes
**GI:** *Nausea, vomiting, anorexia,* abdominal pain, constipation, *dyspepsia,* diarrhea, taste perversion, GERD
**GU:** Dysuria, impotence, retention, hesitancy
**MISC:** Hyperthermia, anaphylaxis, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½-1 hr |
| **Peak** | 3-4 hr |
| **Duration** | 6-10 hr |

## INTERACTIONS

### Individual drugs

Acetaminophen: decreased levels of acetaminophen
Amantadine: increased anticholinergic effects
Atenolol: increased levels of atenolol
Digoxin: increased levels of digoxin
Haloperidol, chloroquine, droperidol, pentamidine, arsenic trioxide, levomethadyl: increased QT prolongation
Levodopa: decreased levels of levodopa
Nitrofurantoin: increased levels of nitrofurantoin

### Drug classifications

Antihistamines, other anticholinergics: increased anticholinergic effects
Benzodiazepines, sedatives, hypnotics, opioids: increased CNS depression
Class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation

## NURSING CONSIDERATIONS

### Assessment

- **Assess for allergic reactions:** rash, urticaria; if these occur, product should be discontinued, swelling of face, tongue, throat
- **Assess urinary patterns:** distention, nocturia, frequency, urgency, incontinence; catheterization may be required to remove residual urine; urinary tract infections should be treated
- **QT prolongation:** assess ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea
- **Pregnancy/breastfeeding:** Use only if benefits outweigh risks, cautious use in breastfeeding, excretion unknown
- **Beers:** Avoid in older adults, delirium risk is increased

### Patient/family education

- Advise patient to avoid hazardous activities until response to product is known; dizziness, blurred vision may occur
- Caution patient to avoid OTC medication with alcohol or other CNS depressants
- Teach patient to use frequent rinsing of mouth, sips of water for dry mouth
- Teach patient to stay cool; avoid hot weather, strenuous activity since overheating may occur; product decreases perspiration
- Advise patient to report CNS effects: confusion, anxiety, anticholinergic effect in the geriatric

**Transdermal**

- Instruct patient to change patch 2×/wk and not to use same site within 7 days
- Instruct patient to use container that is not accessible to pets/children and to dispose of container after use
- Instruct patient to open patch immediately before using
- Instruct patient to remove patch during MRI

**Topical gel**

- **Instruct patient to rotate sites**
- Instruct patient to apply to clean, dry skin on abdomen, upper arm/shoulders/thighs
- Teach patient that gel is flammable

### Evaluation

**Positive therapeutic outcome**

- Absence of dysuria, frequency, nocturia, incontinence

**⚠ HIGH ALERT—REMS**

## oxyCODONE (Rx)

(ox-i-koe′done)

**Oyado, Oxecta, OxyCONTIN, Oxy IR 🍁, Supeudol, Xampza 🍁**

## oxyCODONE/acetaminophen (Rx)

**Percocet, Roxicet, Xartemis XR**

## oxyCODONE/aspirin (Rx)

**Endodan 🍁, Percodan**

## oxyCODONE/ibuprofen (Rx)

*Func. class.:* Opiate analgesic

*Chem. class.:* Semisynthetic derivative

**Controlled substance schedule II**

**Do not confuse:** oxyCODONE/HYDROcodone/OxyCONTIN

**ACTION:** Inhibits ascending pain pathways in CNS, increases pain threshold, alters pain perception

**Therapeutic outcome:** Decreased pain

**USES:** Moderate to severe pain

**Unlabeled uses:** Postherpetic neuralgia (cont rel)

## CONTRAINDICATIONS

Hypersensitivity, addiction (opiate), asthma, ileus

**BLACK BOX WARNING:** Respiratory depression

**Precautions:** Pregnancy, breastfeeding, children <18 yr, addictive personality, increased ICP, MI (acute), severe heart disease, renal/hepatic disease, bowel impaction

**BLACK BOX WARNING:** Opioid-naïve patients, substance abuse, accidental exposure, potential for overdose/poisoning, status asthmaticus

## DOSAGE AND ROUTES

### Severe pain

**Adult:** PO 10-30 mg q4hr (5-15 mg q4-6hr for opiate naive patients); OxyFast CONC SOL is extremely concentrated, do not use interchangeably; CONT REL 10 mg q12hr in opiate-naïve patients

**Child >5 yr and adolescent (unlabeled):** PO 0.2 mg/kg given 30 min before procedure

**Available forms: OxyCODONE:** cont rel tabs (OxyCONTIN) 10, 15, 20, 30, 40, 80, 160 mg; immediate rel tabs 5, 7.5, 10, 15, 20, 30 mg; immediate rel caps 5 mg; oral sol 5 mg/5 ml, 20 mg/ml; Ext rel cap 13.5, 18, 27, 36 mg **oxyCODONE with acetaminophen:** 2.5 mg/325 mg, 5 mg/325 mg; 7.5 mg/325 mg, 7.5 mg/500 mg, 10 mg/325 mg; oral sol 5 mg/325 mg/5 ml; **oxyCODONE with aspirin:** 4.835 mg/325 mg; **oxyCODONE with ibuprofen:** 5 mg/400 mg

### Implementation

- Clarify all orders, fatalities have occurred
- Regular administration is more effective than PRN, give before pain becomes severe
- Discontinue gradually after long-term use
- OxyCODONE should be titrated from the initial recommended dosage to the dose required to relieve pain
- There is no maximum dose of oxyCODONE; however, careful titration is required until tolerance develops to some of the side effects (drowsiness and respiratory depression)
- Store in light-resistant area at room temp

**Immediate-release tablets**

- May be administered with food or milk to minimize GI irritation
- Oxecta brand tablets: Swallow whole; do not crush or dissolve. Due to the nature of this formulation do not presoak, lick, or otherwise wet tablet prior to dose administration. Administer 1 tablet at a time; allow patient to swallow each tablet separately with sufficient liquid to ensure prompt and complete transit through the esophagus. Do not use this brand for administration via nasogastric, gastric, or other feeding tubes as it may cause obstruction of feeding tubes

**Oxycodone extended-release caps (Xtampza ER) administration**

- Take with food and with approximately the same amount of food in order to ensure consistent plasma concentrations
- The capsule contents may be sprinkled onto soft foods (applesauce, pudding, yogurt, ice cream, or jam) or into a cup and then given directly into the mouth; swallow immediately and rinse mouth to ensure all contents have been swallowed. Discard capsule shells after administration
- The capsule contents may be given through an NG or gastrostomy tube. Flush the tube with water. Open a capsule and pour the contents directly into the tube. Do not premix capsule contents with the liquid that will be used to flush the tube. Draw up 15 ml of water into a syringe, insert the syringe into the tube, and flush the contents through the tube. Repeat flushing twice using 10 ml of water with each flush. Milk or liquid nutritional supplement may be used as

O

an alternative to water when flushing capsule contents through the tube
• Extended-release 36-mg capsules are for use ONLY in opioid-tolerant patients
• Monitor patients closely for respiratory depression, particularly within the first 24 to 72 hr after initiation or dose escalation

**Controlled-release tablets (OxyCONTIN)**
• Administer whole; do not crush, chew, or break in half. Taking chewed, broken, or crushed controlled-release tabs could lead to the rapid release and absorption of a potentially toxic dose of oxyCODONE
• OxyCONTIN brand tablets: Due to hydrogelling nature of the 2010 reformulation, do not presoak, lick, or otherwise wet tab prior to dose administration. Administer 1 tab at a time; allow patient to swallow each tab separately with sufficient liquid to ensure prompt and complete transit through the esophagus
• OxyCODONE controlled-release (OxyCONTIN) 60 mg and 80 mg tablets are for use ONLY in opioid-tolerant patients
• May be administered with or without food

**Oral concentrate solution route**
• As OxyFast is a highly concentrated solution (20 mg oxyCODONE/ml), care should be taken in dispensing and administering this medication. For ease of administration, the solution may be added to 30 ml of a liquid or semisolid food. If the medication is placed in liquid or food, the patient needs to consume immediately; do not store diluted oxyCODONE for future use

**PO route**
• Do not break, crush, or chew cont rel tabs; give q12hr, no more frequently
• May be given with food or milk to lessen GI upset
• Use 80, 160 mg cont rel tabs (oxyCONTIN) only in opioid-tolerant patients

## ADVERSE EFFECTS

**CNS:** *Drowsiness, dizziness, confusion, headache, sedation, euphoria,* fatigue, abnormal dreams, thoughts, hallucinations
**CV:** Palpitations, bradycardia, change in B/P
**EENT:** Tinnitus, blurred vision, miosis, diplopia
**GI:** *Nausea, vomiting, anorexia, constipation, cramps,* gastritis, dyspepsia, biliary spasms
**GU:** Increased urinary output, dysuria, urinary retention
**INTEG:** *Rash,* urticaria, bruising, flushing, diaphoresis, pruritus
**RESP:** Respiratory depression

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed; crosses placenta, protein binding 45% |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 3-5 hr |

### Pharmacodynamics

| | PO | RECT |
|---|---|---|
| **Onset** | 15-30 min | Unknown |
| **Peak** | ½-1 hr | Unknown |
| **Duration** | Reg rel 2-6 hr, cont rel 12 hr | 4-6 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased respiratory depression, hypotension, sedation
Cimetidine: increased toxicity

### Drug classifications

Antipsychotics, CNS depressants, opioids, sedative/hypnotics, skeletal muscle relaxants: increased respiratory depression, hypotension
CYP3A4 inhibitors: increased oxyCODONE level
MAOIs: increased toxicity

### Drug/herb

St. John's wort, valerian: increased sedative effect

### Drug/lab test

Increased: amylase, lipase

## NURSING CONSIDERATIONS

### Assessment

• **Pain:** assess intensity, location, type, characteristics; need for pain medication by pain/sedation scoring; physical dependence
• Monitor I&O ratio; check for decreasing output; may indicate urinary retention
• **CNS changes:** assess for dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
• **Allergic reactions:** assess for rash, urticaria

**BLACK BOX WARNING: Respiratory dysfunction:** assess for respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min; also B/P, pulse take baseline and periodically

• **Bowel status:** assess for constipation; stimulate laxative may be needed with fluids, fiber
• Monitor VS after parenteral route; note muscle rigidity, product history, renal, liver function tests, respiratory dysfunction: respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min

**BLACK BOX WARNING: Substance abuse:** assess for substance abuse in patient/family/friends before prescribing; monitor for abuse, may crush, chew, snort, or inject ex rel product, may be fatal

**BLACK BOX WARNING: Accidental exposure:** dispose of properly away from pets, children

**BLACK BOX WARNING:** Pregnancy/breast-feeding: Use only if benefits outweigh fetal risk, neonatal opioid withdrawal syndrome may occur with extended user, avoid breast-feeding, excreted in breast milk

• **Beers:** Avoid in older adults, ataxia, impaired psychomotor function may occur

### Patient/family education

• Advise patients to avoid CNS depressants: alcohol, sedative/hypnotics
• Discuss with patient that dizziness, drowsiness, and confusion are common; to avoid getting up without assistance
• Discuss in detail all aspects of the product, including purpose and what to expect
• Advise patient to make position changes slowly to lessen orthostatic hypotension
• Advise patient to avoid CNS depressants, alcohol
• Advise patient to avoid operating machinery, driving if drowsiness occurs
• Teach patient that withdrawal symptoms may occur after long-term use: nausea, vomiting, cramps, fever, faintness, anorexia

### Evaluation

**Positive therapeutic outcome**
• Decreased pain

## TREATMENT OF OVERDOSE:

Naloxone 0.2-0.8 **IV,** $O_2$, **IV** fluids, vasopressors; caution with patients physically dependent on opioids

**⚠ HIGH ALERT**

**RARELY USED**

## oxycodone/naltrexone

(ox-i-koe'done/nal-trex'one)

**Troxyca ER**

*Func. class.:* Analgesic combination, opioid

**Controlled Substance Schedule II**

**USES:** For use as the first opioid analgesic in patients who are not opioid tolerant, for conversion from tramadol, for conversion from buprenorphine transdermal patch, for conversion from other oral oxycodone formulations, for conversion from the fentanyl patch, for conversion from other opioid analgesics

## CONTRAINDICATIONS

Hypersensitivity, GI obstruction, ileus, status asthmaticus

**BLACK BOX WARNING:** Respiratory depression

## DOSAGE AND ROUTES

This product should be reserved for those in which nonopioid analgesics or immediate-release opioids are ineffective or not tolerated. Discontinue all other around-the-clock opioid drugs upon initiation of oxycodone/naltrexone

Oxycodone/naltrexone 60 mg/7.2 mg and 80 mg/9.6 mg capsules, a single dose >40 mg/4.8 mg, or a total daily dose >80 mg/9.6 mg are for use in opioid-tolerant patients only

### For use as the first opioid analgesic in patients who are not opioid tolerant, conversion from tramadol, or conversion from buprenorphine transdermal patch

**Adult:** PO 10 mg/1.2 mg PO q12hr. Titrate dose by 20 mg/2.4 mg as needed q2-3 days. To discontinue, gradually taper the dose by 25%-50% q2-4 days

### For conversion from other oral oxycodone formulations

**Adult:** PO Convert to an equivalent total daily oxycodone dose and divide the 24-hour oxycodone requirements into 2 equal doses given q12hr. Titrate dose by 20 mg/2.4 mg as appropriate q2-3 days. To discontinue, gradually taper the dose by 25%-50% q2-4 days

### For conversion from the fentanyl patch

**Adult:** PO 10 mg/1.2 mg q12hr for each 25 mcg/hour fentanyl transdermal patch beginning 18 hr after removal of the fentanyl transdermal patch. Titrate dose by 20 mg/2.4 mg as needed q2-3 days. To discontinue, gradually taper the dose by 25%-50% q2-4 days

### For conversion from other opioid analgesics

**Adult:** Calculate the total daily dose of the opioid and multiply it by the appropriate conversion factor to calculate the total daily oxycodone dose. For patients on more than 1 opioid, calculate the total daily oral oxycodone dose for each opioid and sum the totals. For patients using opioid/nonopioid combination analgesics, use only the opioid component for calculation. Reduce the

O

estimated oxycodone dose by 50% to obtain the total daily dose of oxycodone/naltrexone. Divide the dose and give PO q12 hr. If necessary, always round down to the appropriate capsule strength available. If the total daily oxycodone requirement is 20 mg per day or less, initiate therapy with 10 mg/1.2 mg PO q12hr. Provide immediate-release rescue medication as needed. Titrate dose by 20 mg/2.4 mg as needed q2-3 days. Use extreme caution when converting patients from methadone as the ratio between methadone and other opioid analgesics can vary widely. To discontinue, gradually taper the dose by 25%-50% q2-4 days

## oxymetazoline nasal agent

*See Appendix B*

## oxymetazoline ophthalmic

*See Appendix B*

**⚠ HIGH ALERT—REMS**

## oxymorphone (Rx)

(ox-i-mor′fone)

**Opana, Numorphan**

*Func. class.:* Opiate analgesic

*Chem. class.:* Semisynthetic phenanthrene derivative

**Controlled substance schedule II**

**Do not confuse:** oxymorphone/oxyCODONE

**ACTION:** Depresses pain impulse transmission at the spinal cord level by interacting with opioid receptors, increases pain threshold, alters pain perception

**Therapeutic outcome:** Decreased pain

**USES:** Moderate to severe pain

### CONTRAINDICATIONS

Hypersensitivity, addiction (opioid), asthma, hepatic disease, ileus, intrathecal use, surgery

**BLACK BOX WARNING:** Respiratory depression

**Precautions:** Pregnancy (short-term), breastfeeding, children <18 yr, addictive personality, increased ICP, MI (acute), severe heart disease, respiratory depression, renal/hepatic disease, bowel impaction

**BLACK BOX WARNING:** Alcoholism, opioid-naïve patients, substance abuse

### DOSAGE AND ROUTES

**Adult:** IM/SUBCUT 1 mg q4-6hr prn; **IV** 0.5 mg q4-6hr prn; PO (immediate release only) 5-20 mg q4-6hr prn; PO-ER 5 mg q12hr in those requiring around the clock dosing

#### Labor analgesia

**Adult:** IM 0.5-1 mg

#### Hepatic dose:

**Adult:** Mild hepatic disease PO (ext rel) 5 mg q12hr (opioid naive) or 2.5 mg q12hr those on prior opiate therapy

#### Renal dose

**Adult:** PO (ext rel) 5 mg q12hr (opioid naive) or 2.5 mg q12hr those with prior opiate therapy

**Available forms:** Inj 1 mg/ml; supp 5 mg; ER tab, crush resistant 5, 7.5, 10, 15, 20, 30, 40 mg; tabs 5, 10 mg

#### Implementation

- Give 1 hr before or 2 hr after food (PO)
- Give with antiemetic if nausea, vomiting occur
- Do not break, crush, chew ER product
- Give when pain is beginning to return; determine dosage interval by patient response; continuous dosing of medication is more effective than when given prn
- Medication should be slowly withdrawn after long-term use to prevent withdrawal symptoms
- Store in light-resistant area at room temp

**Direct IV route**

- Give undiluted over 2-3 min, may be diluted in normal saline solution

### ADVERSE EFFECTS

**CNS:** *Drowsiness, dizziness, confusion, headache, sedation, euphoria (geriatric),* seizures, hallucinations, increased ICP

**CV:** Palpitations, bradycardia, change in B/P, hypotension

**EENT:** Tinnitus, blurred vision, miosis, diplopia

**GI:** *Nausea, vomiting, anorexia, constipation, cramps*

**GU:** Dysuria, urinary retention

**INTEG:** *Rash,* urticaria, bruising, flushing, diaphoresis, pruritus

**RESP:** Respiratory depression

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (RECT, IM, SUBCUT); completely absorbed (**IV**) |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys |
| **Half-life** | PO: 7-9 hr, |

### Pharmacodynamics

| | IM/ SUBCUT | IV | RECT |
|---|---|---|---|
| **Onset** | 15 min | 10 min | 30 min |
| **Peak** | 1-1½ hr | 15-30 min | Unknown |
| **Duration** | 3-6 hr | 3-4 hr | 3-6 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased respiratory depression, hypotension, sedation

### Drug classifications

CNS depressants, opiates, antipsychotics, skeletal muscle relaxants, sedative/hypnotics: increased respiratory depression, hypotension

MAOIs: do not use 2 wk before oxymorphone; unpredictable effects

### Drug/herb

Kava, St. John's wort, valerian: increased sedative effect

### Drug/lab test

Increased: amylase

## NURSING CONSIDERATIONS

### Assessment

• **Pain:** assess location, intensity, type, other characteristics, before and 1 hr after (IM) IV 30 min; need for pain medication, physical dependence, give 25%-50% until there is pain reduction of 50% on pain rating scale, repeat dose may be given at time of peak, if previous dose does not control pain, and respiratory depression has not occurred; give short-acting opioids for breakthrough pain if on controlled rel product

**BLACK BOX WARNING: Respiratory dysfunction:** Assess for respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min, dose may need to be decreased by 25%-50%, monitor B/P, pulse also

**BLACK BOX WARNING: Accidental exposure:** Dispose of properly, away from children/pets

**BLACK BOX WARNING: Overdose/poisoning:** Avoid alcohol ingestion; do not crush, chew, snort, or inject tabs, high abuse potential

**BLACK BOX WARNING: Opioid-naive patients:** Ext rel tabs are not to be used immediately post-op (12-24 hr after surgery) in these patients

• **Assess bowel/bladder status:** constipation, may need stimulant laxative; if use ≥ 3 days I&O ratio for decreasing output, may indicate urinary retention

• Monitor VS after parenteral route; note muscle rigidity, product history, liver, kidney function tests

• Monitor CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction

• Monitor allergic reactions: rash, urticaria

**BLACK BOX WARNING:** Pregnancy/breastfeeding: Use only if benefits outweigh fetal risk, neonatal opioid withdrawal syndrome may occur with extended use, avoid breastfeeding

### Patient/family education

• **Advise patient not to use other CNS depressants:** alcohol, sedative/hypnotics

• Discuss with patient that dizziness, drowsiness, and confusion are common; to avoid getting up without assistance

• Discuss in detail all aspects of the product, including purpose and what to expect

• Advise patient to make position changes slowly to lessen orthostatic hypotension

• Advise patient not to drive, operate machinery if drowsiness occurs

• Teach patient to notify health care professional if pregnancy is planned or suspected, not to breastfeed

• Teach patient to notify all prescribers of all OTX, Rx, herbs, supplements being taken, not to take new products unless approved by prescriber

• Teach patient that OxyCONTINtabs may appear in stool

### Evaluation

**Positive therapeutic outcome**

• Decreased pain

## TREATMENT OF OVERDOSE:

Naloxone (Narcan) 0.2-0.8 mg **IV,** $O_2$, **IV** fluids, vasopressors (caution with patients physically dependent on opioids)

O

**⚠ HIGH ALERT**

# oxytocin (Rx)

(ox-i-toe′sin)

**Pitocin, syntocinon**

*Func. class.:* Oxytocic hormone

**ACTION:** Acts directly on myofibrils, producing uterine contraction; stimulates breast milk letdown, vasoactive antidiuretic effect

**Therapeutic outcome:** Stimulation of labor, control of bleeding; stimulation of milk letdown

**USES:** Stimulation, induction of labor; missed or incomplete abortion; postpartum bleeding

## CONTRAINDICATIONS

Hypersensitivity, serum toxemia, cephalopelvic disproportion, fetal distress, hypertonic uterus, prolapsed umbilical cord, active genital herpes

**Precautions:** Cervical/uterine surgery, uterine sepsis, primipara >35 yr, 1st/2nd stage of labor

**BLACK BOX WARNING:** Elective induction of labor

## DOSAGE AND ROUTES

### Labor induction

**Adult: IV** 1-2 milliunit/min, increase by 1-2 milliunit q15-60min until regular contractions occur, then decrease dosage

### Postpartum hemorrhage

**Adult: IV** 10-40 units in 1000 ml nonhydrating diluent infused at 20-40 milliunit/min

**Adult:** IM 3-10 units after placenta delivery

### Incomplete abortion

**Adult: IV** INF 10 units/500 ml $D_5W$ or 0.9% NaCl run at 10-20 milliunit/min; max 30 units/12 hr

### Fetal stress test

**Adult: IV** 0.5 milliunit/min; increase q20min until 3 contractions occur at 10 min

**Available forms:** Inj 10 units/ml

### Implementation

**Oxytocin administration**

- Give by IV infusion or IM
- Before use, an IV infusion of NS should be already running for use in case of adverse reactions. Magnesium sulfate should be readily available if relaxation of the myometrium is needed
- Visually inspect parenteral product for particulate matter and discoloration before use

**IV infusion route**

- ***Induction of labor:*** Dilute 1 ml (10 units) in 1000 ml of a compatible IV infusion solution. Rotate infusion bottle for thorough mixing. The resultant infusion should contain 10 milliunits/ml
- ***Control of postpartum uterine bleeding:*** Dilute 10-40 units in a compatible IV solution or to an already infusing solution. The maximum concentration is 40 units in 1000 ml of solution
- ***Incomplete, inevitable, or elective abortion:*** Dilute 10 units in 500 ml of a compatible IV solution
- Administer using an infusion pump to ensure accurate dosing

**IM route**

- Inject into a large muscle mass, aspirate before injection to avoid injection into a blood vessel

**Y-site compatibilities:** acyclovir, alfentanil, allopurinol, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome (AmBisome), anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, azaTHIOprine, azithromycin, aztreonam, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, capreomycin, caspofungin, cefamandole, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorothiazide, chlorpheniramine, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cloxacillin, colistimethate, cyanocobalamin, cyclophosphamide, cycloSPORINE, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, dilTIAZem, diphenhydramine, dobutamine, dolasetron, dopamine, doxycycline, droperidol, edetate calcium disodium, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, eptifibatide, ergonovine, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, fentaNYL, fluconazole, folic acid (as sodium salt), foscarnet, fosphenytoin, furosemide, gallamine, ganciclovir, gatifloxacin, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone sodium succinate, HYDROmorphone, hydrOXYzine, imipenem-cilastatin, isoproterenol, kanamycin, ketamine, ketorolac, labetalol, lactated Ringer's injection, lansoprazole, lepirudin, leucovorin, levoFLOXacin, lidocaine, lincomycin, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, mephentermine, meropenem, metaraminol, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, minocycline, morphine, moxifloxacin, multiple vitamins injection, mycophenolate mofetil, Nafcillin, nalbuphine, nalorphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin,

palonosetron, pamidronate, papaverine, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin sodium, piperacillin -tazobactam, polymyxin B, potassium acetate/chloride/phosphates, procainamide, prochlorperazine, prochlorperazine, promazine, promethazine, propranolol, protamine, pyridoxine, quinupristin-dalfopristin, raNITIdine, Ringer's injection, sodium acetate/bicarbonate/phosphates, streptomycin, succinylcholine, SUFentanil, tacrolimus, theophylline, thiamine hydrochloride, ticarcillin disodium, ticarcillin disodium-clavulanate potassium, tigecycline, tirofiban hydrochloride, tobramycin sulfate, tolazoline, trimetaphan, tubocurarine, urokinase, vancomycin, vasopressin, verapamil, vitamin B complex with C, voriconazole, warfarin, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Seizures, tetanic contractions
**CV:** Hypo/hypertension, dysrhythmias, increased pulse, bradycardia, tachycardia, premature ventricular contractions
**FETUS:** Dysrhythmias, jaundice, hypoxia, intracranial hemorrhage
**GI:** Anorexia, nausea, vomiting, constipation
**GU:** Abruptio placentae, decreased uterine blood flow
**HEMA:** Increased hyperbilirubinemia
**INTEG:** Rash
**RESP:** Asphyxia
**SYST:** Water intoxication of mother

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (nasal); completely absorbed (**IV**) |
| **Distribution** | Widely distributed (extracellular fluid) |
| **Metabolism** | Liver, rapidly |
| **Excretion** | Kidneys |
| **Half-life** | 3-12 min |

### Pharmacodynamics

| | Nasal | IV | IM |
|---|---|---|---|
| **Onset** | 5 min | Rapid | 3-7 min |
| **Peak** | Unknown | Unknown | Unknown |
| **Duration** | 20 min | 1 hr | 1 hr |

## INTERACTIONS

### Drug classifications

Vasopressors: Increase: increased hypertension

### Drug/herb

Ephedra: Increase: hypertension

## NURSING CONSIDERATIONS

### Assessment

- **Assess labor contractions:** fetal heart tones, frequency, duration, intensity of contractions; if fetal heart tones increase or decrease significantly or if contractions are longer than 1 min, notify prescriber; turn patient on left side to increase oxygen to fetus
- **Assess for water intoxication:** confusion, anuria, drowsiness, headache; monitor I&O notify prescriber
- Watch for fetal distress, acceleration, deceleration, fetal presentation, pelvic dimensions
- Monitor B/P, pulse, respiratory rate, rhythm, depth
- Assess for fetal presentation, pelvic dimensions before use
- Provide an environment conducive to letdown reflex
- Monitor continuously, discontinue immediately if fetal distress occurs or uterine hyperactivity occurs

### Patient/family education

- Teach patient to report increased blood loss, abdominal cramps, increased temp or foul-smelling lochia, nausea, blurred vision, itching, swelling
- Advise patient that contractions will be similar to menstrual cramps, gradually increasing in intensity

**BLACK BOX WARNING:** Elective induction of labor; use only for induction when medically necessary

### Evaluation

**Positive therapeutic outcome**

- Stimulation of milk letdown (nasal)
- Induction of labor
- Decreased postpartum bleeding

**⚠ HIGH ALERT**

# PACLitaxel (Rx)

(pa-kli-tax′el)

**Taxol**

# PACLitaxel protein-bound particles (Rx)

**Abraxane**

*Func. class.:* Antineoplastic—miscellaneous

*Chem. class.:* Taxane

**Do not confuse:** PACLitaxel/PARoxetine/Paxil

**ACTION:** Inhibits the reorganization of the microtubule network needed for interphase and mitotic cellular functions; also causes abnormal bundles of microtubules during cell cycle and multiple esters of microtubules during mitosis

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** PACLitaxel metastatic carcinoma of the ovary, breast carcinoma, AIDS-related Kaposi's sarcoma (second line), non–small cell lung cancer (first line), adjuvant treatment for node-positive breast cancer, prostate, esophageal cancer, melanoma

**Unlabeled uses:** Advanced head, neck, small cell lung cancer; non-Hodgkin's lymphoma, adenocarcinoma of the upper GI tract, hormone-refractory prostate cancer

## CONTRAINDICATIONS

Pregnancy, hypersensitivity to paclitaxel or other products with polyoxyethylated castor oil, albumin

**BLACK BOX WARNING:** Neutropenia (neutrophils $<1500/mm^3$)

**Precautions:** Breastfeeding, children, CV/hepatic disease, CNS disorder, renal disease, bone marrow suppression, dental disease/work, extravasation, females, geriatric patients, herpes, infection, infertility, jaundice, ocular exposure, radiation therapy, thrombocytopenia, vaccination

**BLACK BOX WARNING:** Taxane hypersensitivity, requires a specialized care setting and an experienced clinician, bone marrow supression

## DOSAGE AND ROUTES

### >> PACLitaxel

#### Ovarian carcinoma

**Adult: IV** INF 135 mg/$m^2$ given over 24 hr q3wk, then CISplatin 75 mg/$m^2$ or 175 mg/$m^2$ over 3 hr q3wk (refractory or metastatic) or 175 mg/$m^2$ over 3 hr

#### Advanced ovarian carcinoma

**Adult: IV** INF 175 mg/$m^2$ with CISplatin 75 mg/$m^2$ over 3 hr q3wk

#### Breast carcinoma

**Adult: IV** INF 175 mg/$m^2$ over 3 hr q3wk × 4 courses

#### AIDS-related Kaposi's sarcoma

**Adult: IV** INF 135 mg/$m^2$ over 3 hr q3wk or 100 mg/$m^2$ over 3 hr q2wk

#### 1st line non–small cell lung cancer

**Adult: IV** INF 135 mg/$m^2$/24 hr with CISplatin 75 mg/$m^2$ × 3 wk

### >> PACLitaxel protein-bound particles

#### Breast cancer

#### Pancreatic cancer

**Adult:** IV 125 mg/m2 over 30-40 min on Day 1, 8, 15 of each 28-day cycle

**Adult: IV** 260 mg/$m^2$ q3wk

#### Hepatic dose

Adult, for dose reduction 135 mg/$m^2$ 24 hr IV inf: AST/ALT 2-10 × ULN, total bilirubin ≤1.5 mg/dl: give 100 mg/$m^2$; AST/ALT <10 × ULN, total bilirubin 1.6-7.5 mg/dl: give 50 mg/$m^2$; AST/ALT ≥10 × ULN or total bilirubin >7.5 mg/dl: avoid use

Adult, for dose reduction 175 mg/$m^2$ 3 hr IV inf: AST/ALT <10 × ULN, total bilirubin 1.26-2 × ULN: 135 mg/$m^2$; AST/ALT <10 × ULN, total bilirubin 2.01-5 × ULN: give 90 mg/$m^2$; AST/ALT ≥10 × ULN or total bilirubin >5 × ULN: avoid use

**Available forms:** Inj 6 mg/ml, 30 mg/5-ml vial, 100 mg/16.7-ml vial, 150 mg/25-ml vial, 300 mg/50-ml vials; powder for inj, lyophilized 100 mg in single-use vials (Abraxane)

### Implementation

**BLACK BOX WARNING: Bone marrow suppression** Monitor CBC, differential, platelet count weekly; withhold product if WBC is $<1500/mm^3$ or platelet count is $<100,000/mm^3$, notify prescriber of results

- If CISplatin is given, use after taxane

**Continuous IV INF route**

- After premedicating with dexamethasone 20 mg PO 12 hr and 6 hr before paclitaxel, diphenhydrAMINE 50 mg IV ½-1 hr before PACLitaxel and cimetidine 300 mg or ranitidine 50 mg IV ½-1 hr before PACLitaxel
- For extravasation if given by regular IV, not port

## >> PACLitaxel

### Breast cancer

• After diluting in 0.9% NaCl, $D_5$, $D_5W$ and 0.9% NaCl, $D_5LR$ (0.3-1.2 mg/ml) chemo dispensing pin or similar devices with spikes should not be used in vials of Taxol, use in-line filter ≤0.22 micron, give as 3 hr or 24 hr inf

• Use only glass bottles, polypropylene, polyolefin bags and administration sets; do not use PVC inf bags or sets

**Y-site compatibilities:** Acyclovir, amikacin, aminophylline, ampicillin/sulbactam, bleomycin, butorphanol, calcium chloride, CARBOplatin, cefepime, cefoTEtan, cefTAZidime, cefTRIAXone, cimetidine, CISplatin, cladribine, cyclophosphamide, cytarabine, dacarbazine, dexamethasone, diphenhydrAMINE, DOXOrubicin, droperidol, etoposide, famotidine, floxuridine, fluconazole, fluorouracil, furosemide, ganciclovir, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, ifosfamide, LORazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, metoclopramide, morphine, nalbuphine, ondansetron, pentostatin, potassium chloride, prochlorperazine, propofol, ranitidine, sodium bicarbonate, thiotepa, vancomycin, vinBLAStine, vinCRIStine, zidovudine

## >> Abraxane

**Intermittent IV INF route**

• Reconstitute vial by injecting 20 ml of 0.9% NaCl; slowly inject the 20 ml of 0.9% NaCl over at least 1 min to direct the sol flow on wall of vial; do not inject 0.9% NaCl directly onto lyophilized cake (foaming will occur); allow vial to sit for at least 5 min to ensure proper wetting of lyophilized cake; gently swirl or invert vial slowly for at least 2 min until completely dissolved

• Calculate dosing by dosing vol/ml = total dose (mg) ÷ 5 (mg/ml)

# ADVERSE EFFECTS

**CNS:** Peripheral neuropathy
**CV:** *Bradycardia, hypotension, abnormal ECG,* supraventricular tachycardia (SVT)
**GI:** *Nausea, vomiting, diarrhea, mucositis; increased bilirubin, alkaline phosphatase, AST*
**HEMA:** Neutropenia, leukopenia, thrombocytopenia, anemia, bleeding, infections
**INTEG:** Alopecia, tissue necrosis, generalized urticaria, flushing
**MS:** *Arthralgia, myalgia*
**RESP:** Pulmonary embolism, dyspnea
**SYST:** *Hypersensitivity reactions,* anaphylaxis, Stevens-Johnson syndrome, toxic epidermal necrolysis, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed |
| **Distribution** | 89%-98% protein binding |
| **Metabolism** | Liver, extensively |
| **Excretion** | Unknown |
| **Half-life** | 5-17 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 wk |
| **Duration** | 3 wk |

# INTERACTIONS

### Individual drugs

CycloSPORINE, dexamethasone, diazepam, etoposide, quiNIDine, teniposide, testosterone, verapamil, vinCRIStine: decreased metabolism of PACLitaxel
DOXOrubicin: increased levels of DOXOrubicin
Ketoconazole: increased toxicity, decreased metabolism; avoid concurrent use
Radiation: increased myelosuppression

### Drug classifications

Anticoagulants, NSAIDs: increased bleeding risk
Antineoplastics: increased myelosuppression
CYP2C8, CYP2C9 inducers: decreased PACLitaxel level
Vaccines (live virus): decreased immune response

### Drug/lab test

Increased: AST/ALT, alk phos, triglycerides
Decreased: neutrophils, platelets, WBCs, Hgb

# NURSING CONSIDERATIONS

### Assessment

• Assess CNS changes: confusion, paresthesias, psychosis, tremors, seizures, neuropathies; product should be discontinued
• Check buccal cavity q8hr for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia; obtain prescription for viscous lidocaine (Xylocaine) to use in mouth

**BLACK BOX WARNING:** Requires a specialized care setting such as a hospital or facility capable of managing complications; should be used by a clinician experienced in cytotoxic agents

• **Cardiovascular status:** monitor ECG continuously in CV conditions; monitor for hypotension, sinus bradycardia/tachycardia
• **Peripheral neuropathy:** assess for paresthesias, numbness; during inf use ice packs on extremities to lessen continued neuropathy; use ice on extremities when infusing

• **Arthralgia, myalgia:** may begin 2-3 days after infusion and continue for 4-5 days, may use analgesics
• **Nausea, vomiting:** premedicate with antiemetics, nausea and vomiting occur often
• Monitor renal function tests: BUN, creatinine, serum uric acid, urine CCr before, during therapy; check I&O ratio; report fall in urine output to <30 ml/hr
• Monitor temp q4hr (may indicate beginning of infection)
• Monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; check for jaundice of skin and sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea
• Assess for bleeding: hematuria, stool guaiac, bruising or petechiae, mucosa or orifices q8hr; check for inflammation of mucosa, breaks in skin
• Assess effects of alopecia on body image; discuss feelings about body changes
• VS during 1st hr of inf, check IV site for signs of infiltration

**BLACK BOX WARNING:** Hypersensitive reactions, anaphylaxis, hypotension, dyspnea, angioedema, generalized urticaria; discontinue inf immediately; keep emergency equipment available, monitor continuously during first 30-60 min, then periodically

• **Flush:** for mild to moderate flush, may continue diphenhydrAMINE for up to 48 hr
• Effects of alopecia on body image; discuss feelings about body changes
• **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

• Teach patient to notify prescriber if pregnancy is planned or suspected (D), do not breastfeed
• Teach patient to avoid use of products containing aspirin or ibuprofen, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
• Instruct patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath) and CNS reactions (confusion, psychosis, nightmares, seizures, severe headaches)
• Teach patient to rinse mouth tid-qid with water, club soda; brush teeth bid-qid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss
• Inform patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture
• Inform patient that receiving vaccinations during therapy may cause serious reactions

### Evaluation

**Positive therapeutic outcome**
• Prevention of rapid division of malignant cells

**⚠ HIGH ALERT**

## palbociclib

(pal-boe-sye'klib)
**Ibrance**
*Func. class.:* Antineoplastic
*Chem. class.:* Signal transduction inhibitor

**ACTION:** Inhibits progression of the cell cycle from $G_1$ into S phase, decreased proliferation of ER-positive breast cancer cell lines. When combined with antiestrogen therapy (letrozole), decreases retinoblastoma protein (Rb) phosphorylation, reducing E2F expression and signaling, and increasing growth arrest

**Therapeutic outcome:** Decreased progression of disease

**USES:** Treatment of estrogen receptor (ER)–positive, HER2-negative advanced breast cancer in postmenopausal women, in combination with letrozole as initial endocrine-based therapy

**CONTRAINDICATIONS:** Hypersensitivity

**Precautions:** Breastfeeding, children, fungal/viral infection, infants, infertility, neutropenia, pregnancy, testicular failure, thromboembolic disease

## DOSAGE AND ROUTES

**For the treatment of hormone receptor (HR)-positive, HER2-negative advanced or metastatic breast cancer, with fulvestrant after disease progression following endocrine-based therapy**
**Adult:** females PO 125 mg qday with food for 21 days repeat q28 days with fulvestrant (500 mg IM as two 5 mL injections, one in each buttock, over 1 to 2 min on days 1, 15, 29, and q monthly thereafter)

**Available forms:** Caps 75, 100, 125 mg

### Implementation

**Treatment-related hepatotoxicity:**
• **Grade 1 or 2 hepatotoxicity:** No dosage change
• **Grade ≥3 hepatotoxicity (AST or ALT >5 × ULN or total bilirubin >3 × ULN) that persists despite medical treatment:** Hold until toxicity resolves to grade ≤2 (AST or ALT ≤5 × ULN or total bilirubin ≤3 × ULN), resume treatment at the next lower dose level if not considered a safety risk for the

patient; discontinue if grade ≥3 toxicity occurs at a dose of 75 mg/day

**Treatment-related nephrotoxicity:**

- **Grade 1 or 2 nephrotoxicity:** No change
- **Grade ≥3 nephrotoxicity (CCr >3 × baseline or >4 mg/dl, or requiring hospitalization or dialysis) that persists despite medical treatment:** Hold therapy. When toxicity resolves to grade ≤2 (CCr <3 × baseline or <4 mg/dl), resume at the next lower dose level if not considered a safety risk for the patient, discontinue if grade ≥3 toxicity occurs at a dose of 75 mg/day.

**Other dosage adjustments**

- **Strong CYP3A4 inhibitors:** Avoid concomitant use. If a strong CYP3A4 inhibitor is needed, consider reducing the dose to 75 mg daily; if the strong CYP3A4 inhibitor is discontinued, increase the dose upward to the previously tolerated/recommended dose after a washout period of 3-5 half-lives of the inhibitor.
- **Strong CYP3A4 inducers:** Avoid use

## ADVERSE EFFECTS

**CNS:** Weakness, fever, fatigue
**EENT:** Stomatitis, oral ulceration, glossitis, pharyngitis, sinusitis, epistaxis
**GI:** Vomiting, nausea, anorexia, diarrhea,
**HEMA:** Thrombocytopenia, neutropenia, leukopenia, lymphopenia, anemia
**MISC:** Peripheral neuropathy, alopecia, infection, pulmonary embolism, thromboembolism

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 85% protein bound |
| **Metabolism** | Metabolized by CYP3A |
| **Excretion** | Unknown |
| **Half-life** | Elimination half-life was 24-34 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Peak 6-12 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

CYP3A inhibitors and inducers: avoid concurrent use

### Drug/herb

St. John's wort: Avoid concurrent use

### Drug/food

Avoid use with grapefruit juice

## NURSING CONSIDERATIONS

### Assessment

- **Pregnancy:** Product can cause fetal harm; identify if the patient is pregnant or if pregnancy is planned
- **Pulmonary embolism/thromboembolic events:** Assess for dyspnea/shortness of breath, chest pain, arm or leg swelling, sudden numbness or weakness, severe headache or confusion, or problems with vision, speech, or balance
- **Bone marrow suppression:** Monitor CBC/differential

### Patient/family education

- Identify if pregnancy is planned or suspected. Discuss the need for contraception due to possible fetal harm; avoid breastfeeding
- Advise patient laboratory testing will be needed during treatment
- **Pulmonary/thromboembolic events:** Instruct patient to seek medical attention if dyspnea/shortness of breath, chest pain, arm or leg swelling, sudden numbness or weakness, severe headache or confusion, or problems with vision, speech, or balance develop
- Teach patient to not take with grapefruit juice

### Evaluation

**Positive therapeutic outcome**

- Decreased progression of disease

## paliperidone (Rx)

(pal-ee-per'i-done)
**Invega, Invega Sustenna, Invega Tranza**
*Func. class.:* Antipsychotic (2nd generation)
*Chem. class.:* Benzisoxazole derivative

**Do not confuse:** Invega/Iveegam, paliperidone/risperidone

**ACTION:** Mediated through both dopamine type 2 ($D_2$) and serotonin type 2 ($5\text{-}HT_2$) antagonism

**Therapeutic outcome:** Decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

**USES:** Schizophrenia, schizoaffective disorder

**Unlabeled uses:** Agitation

## CONTRAINDICATIONS

Breastfeeding, seizure disorders, AV block, geriatric, QT prolongation, torsades de pointes, hypersensitivity to this product or risperidone

**Precautions:** Pregnancy, children, renal/hepatic disease, obesity, Parkinson's disease, suicidal ideation, diabetes mellitus, hematologic disease

**BLACK BOX WARNING:** Mortality-related psychosis in dementia

## DOSAGE AND ROUTES

**Adult:** PO 6 mg/day; max 12 mg/day; IM 234 mg on day 1, then 156 mg 1 wk later; after 2nd dose, give 117 mg qmo, range 39-234 mg
**Child/adolescent ≥12 yr and ≥51 kg:** PO 3 mg/day, may increase if needed by 3 mg/day in intervals >5 days up to max 12 mg/day; <51 kg max 6 mg/day

### Renal dose

**Adult:** PO CCr 50-79 ml/min, 3 mg/day, max 6 mg/day; ext rel/IM 156 mg on day 1, 117 mg 1 wk later, then 78 mg each mo CCr 10-49 ml/min, 1.5 mg/day, max 3 mg/day; IM not recommended

**Available forms:** Ext rel tabs 1.5, 3, 6, 9 mg; ext rel susp for inj 39 mg/0.25 ml, 78 mg/0.5 ml, 117 mg/0.75 ml, 156 mg/1 ml, 234 mg/1.5 ml; Invega Trinza extended-release suspension 273, 410, 546, 819 mg

### Implementation

**PO route**

- Do not break, crush, or chew ext rel tabs, use plenty of water
- Give without regard for food
- Give a reduced dose to the geriatric patient
- Give antiparkinsonian agent on order from prescriber; to be used for EPS
- Avoid use with CNS depressants
- Supervise ambulation until patient is stabilized on medication; do not involve in strenuous exercise program, because fainting is possible; patient should not stand still for a long time
- Increase fluids to prevent constipation
- Decrease stimulus by dimming lights, avoiding loud noise
- Provide sips of water, candy, gum for dry mouth
- Store in airtight, light-resistant container

**IM route**

- Use for IM only, do not use IV or SUBCUT, injection kits contain a prefilled syringe and 2 safety needles, for single use only, shake for 10 secs
- **Deltoid injection:** ≥ 90 kg use 1.5 inch, 22 G needle; < 90 kg use 1 inch, 23 G needle, alternate injections between deltoid muscles
- **Gluteal injection:** use 1.5 inch, 22 G needle; attach needle to luer connection in clockwise motion, pull needle sheath away using straight pull, bring syringe with attached needle upright to de-aerate, de-aerate, inject; after injection, use finger, thumb or flat surface to activate needle protection system, until click heard, use deltoid × 2 dosages

## ADVERSE EFFECTS

**CNS:** *EPS, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia; drowsiness, insomnia, agitation, anxiety, headache,* seizures, neuroleptic malignant syndrome, dizziness
**CV:** Orthostatic hypotension, tachycardia, heart failure, QT prolongation, heart block, dysrhythmias
**EENT:** Blurred vision, cough
**ENDO:** Insulin increase, hyperinsulinemia, diabetes mellitus, weight gain, hyperglycemia, dyslipidemia
**GI:** *Nausea,* vomiting, *anorexia, constipation,* weight gain in adolescents, xerostomia
**GU:** Menstrual irregularities
**HEMA:** Agranulocytosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown, protein binding >74% |
| **Metabolism** | Unknown |
| **Excretion** | 80% urine, 11% feces |
| **Half-life** | Elimination 23 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 24 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Abarelix, alfuzosin, amoxapine, apomorphine, chloroquine, dasatinib, dolasetron, droperidol, flecainide, pimozide: increased QT prolongation
Alcohol: increased sedation
Levodopa: decreased levodopa effect
Lithium: increased neurotoxicity
Paliperidone: decreased effect

### Drug classifications

Azole antifungals; β-blockers; class IA, III antidysrhythmics; halogenated anesthetics; some antipsychotics; some phenothiazines; tricyclics (high doses): increased QT prolongation
SSRIs, SNRIs: increased serotonin syndrome, increased neuroleptic malignant syndrome
Other antipsychotics: increased EPS

Other CNS depressants, sedatives/hypnotics, opiates: increased sedation

### Drug/herb

Betel palm, kava: increased EPS
Cola tree, hops, nettle, nutmeg: increased action
Kava: increased CNS depression

### Drug/lab test

Increased: prolactin levels

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess mental status; mood, behavior, confusion, orientation, suicidal thoughts/behaviors; dementia especially in geriatric patients before initial administration and periodically

- **QT prolongation:** monitor ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea
- Assess AIMS assessment, blood glucose, CBC, glycosylated hemoglobulin A1C (HbA1C), LFTs, neurologic function, pregnancy testing, serum creatinine/electrolytes/lipid profile/prolactin, thyroid function tests, weight
- Monitor for swallowing of PO medication; check for hoarding or giving of medication to other patients
- Monitor I&O ratio; palpate bladder if urinary output is low
- Assess affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
- Monitor B/P standing and lying; also pulse, respirations; take these q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; watch for ECG changes
- Assess for dizziness, faintness, palpitations, tachycardia on rising
- **Hyperprolactinemia:** assess for sexual dysfunction, decreased menstruation, breast pain
- **Assess for EPS,** including akathisia, tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)
- Assess for serious reactions in the geriatric patient
- **Serotonin syndrome, neuroleptic malignant syndrome:** assess for increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, monitor for hyperthermia, headache, confusion; if these occur, stop product, administer a serotonin antagonist if needed
- Assess skin turgor daily
- Assess for constipation, urinary retention daily; if these occur, increase bulk and water in diet; monitor for weight gain in adolescents
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, EPS may result in neonate EPS, pregnant patients should enroll in the National Registry for Atypical Antipsychotics 866-961-2388, do not breastfeed
- **Beers:** Avoid in older adults except for schizophrenia, bipolar disorder, or short-term use as an antiemetic in chemotherapy, increases stroke risk

### Patient/family education

- Advise patient that orthostatic hypotension may occur and to rise from sitting or lying position gradually
- Advise patient to avoid hot tubs, hot showers, tub baths; hypotension may occur
- Caution patient to avoid abrupt withdrawal of this product; EPS may result; product should be withdrawn slowly
- Teach patient to avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber; serious product interactions may occur; avoid use of alcohol; increased drowsiness may occur
- Advise patient to avoid hazardous activities if drowsy or dizzy
- Teach patient compliance with product regimen; non-absorbable tab shell is expelled in stool
- Teach patient to avoid abrupt withdrawal of this product, EPS may result; that product should be withdrawn slowly
- Teach patient to report impaired vision, tremors, muscle twitching
- Caution patient that heat stroke may occur in hot weather; take extra precautions to stay cool
- Teach patient to use contraception, inform prescriber if pregnancy is planned or suspected

**BLACK BOX WARNING:** Teach patient to notify prescriber of suicidal thoughts, behaviors, or other changes in behavior; identify dementia in the elderly

### Evaluation

**Positive therapeutic outcome**

- Decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

## TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; *do not induce vomiting*

## palonosetron (Rx)

(pa-lone-o'se-tron)
**Aloxi**
*Func. class.:* Antiemetic
*Chem. class.:* 5-$HT_3$ receptor antagonist

**ACTION:** Prevents nausea, vomiting by blocking serotonin peripherally, centrally, and in the small intestine at the 5-$HT_3$ receptor

**Therapeutic outcome:** Decreased nausea, vomiting during chemotherapy

**USES:** Prevention of nausea, vomiting associated with cancer chemotherapy; postoperative nausea/vomiting

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatric, with hypokalemia, hypomagnesemia, patients taking diuretics

## DOSAGE AND ROUTES

**Adult:** **IV** 0.25 mg as a single dose over 30 sec, 30 min prior to chemotherapy, max 0.25 mg **IV**

### Postoperative nausea/vomiting prophylaxis for up to 24 hr after surgery

**Adult:** **IV** 0.075 mg given over 10 sec immediately before induction

**Available forms:** Inj 0.25 mg/5 ml

### Implementation

**Direct IV route**
- Do not mix with other products; flush **IV** line before, after administration
- Store at room temperature
- **Chemotherapy nausea/vomiting:** give as a single dose over 30 seconds
- **Postoperative nausea/vomiting:** give over 10 seconds immediately prior to anesthesia induction

**Y-site compatibilities:** Alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate/chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, dantrolene, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin hydrochloride, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, inamrinone, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, mitoXANtrone, mivacurium, morphine, nalbuphine, naloxone, neostigmine, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, PACLitaxel, pamidronate, pancuronium, pentazocine, PHENobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate/chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trimethobenzamide, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, zidovudine

**Y-site incompatibilities:** Acyclovir, allopurinol, amphotericin B colloidal, diazepam, doxycycline, ganciclovir, imipenem/cilastatin, methylPREDNISolone, minocycline, nafcillin, pantoprazole, pentamidine, PENTobarbital, phenytoin, thiopental

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness, drowsiness, fatigue, insomnia*
**GI:** *Diarrhea, constipation,* abdominal pain
**MISC:** Weakness, hyperkalemia, anxiety, rash, bronchospasm (rare), arthralgia, *fever, urinary retention*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 62% protein bound |
| **Metabolism** | Liver |
| **Excretion** | Unchanged product and metabolites excreted by kidney |
| **Half-life** | 40 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Chloroquine, clarithromycin, droperidol, erythromycin, grepafloxacin, halofantrine, haloperidol, levomethadyl, methadone, pentamidine: possible QT prolongation

Apomorphine: increased: hypotension, severe

### Drug classifications

Class 1A antidysrhythmics (disopyramide, procainamide, quiNIDine), class III antidysrhythmics (amiodarone, dofetilide, ibutilide), diuretics (except potassium sparing), some phenothiazines: possible QT prolongation

### Drug/lab test

Increase: potassium

## NURSING CONSIDERATIONS

### Assessment

- Monitor for absence of nausea, vomiting during chemotherapy
- **Assess hypersensitivity reaction:** rash, bronchospasm
- Assess for agents that cause QT prolongation, avoid using those products
- Cardiac disease: check ECG, PR, QT interval, QRS duration before use
- Hyperkalemia: monitor potassium baseline and periodically
- **Pregnancy/breastfeeding:** Use only if clearly needed, do not breastfeed

### Patient/family education

- Teach to report diarrhea, constipation, rash, or changes in respirations or discomfort at insertion site
- Advise patient to avoid alcohol, barbiturates
- Teach patient to use other antiemetics if nausea occurs

### Evaluation

**Positive therapeutic outcome**

- Absence of nausea, vomiting during cancer chemotherapy

## pamidronate (Rx)

(pam-i-drone'ate)

**Aredia**

*Func. class.:* Bone resorption inhibitor, electrolyte modifier

*Chem. class.:* Bisphosphonate

**Do not confuse:** Aredia/Adriamycin

**ACTION:** Inhibits bone resorption, apparently without inhibiting bone formation and mineralization; absorbs calcium phosphate crystals in bone and may directly block dissolution of hydroxyapatite crystals of bone

**Therapeutic outcome:** Serum calcium at normal level

**USES:** Moderate to severe Paget's disease, hypercalcemia, osteolytic bone metastases in breast cancer patients, multiple myeloma

**Unlabeled uses:** Postmenopausal osteoporosis, hyperparathyroidism

## CONTRAINDICATIONS

Pregnancy, hypersensitivity to bisphosphonates

**Precautions:** Children, nursing mothers, renal dysfunction, poor dentition

## DOSAGE AND ROUTES

### Hypercalcemia of malignancy

**Adult: IV** INF 60-90 mg as a single dose in moderate hypercalcemia, 90 mg in severe hypercalcemia given over 2-24 hr; dose should be diluted in 1000 ml 0.45% NaCl, 0.9% NaCl, or $D_5W$; wait 7 days before 2nd course

### Osteolytic lesions

**Adult: IV** 90 mg/500 ml of $D_5W$, 0.45% NaCl, or 0.9% NaCl given over 4 hr on a monthly basis (multiple myeloma) or over 2 hr q3-4wk (breast carcinoma)

### Paget's disease

**Adult: IV** INF 30 mg/day given over 4 hr × 3 days

**Available forms:** Powder for inj 30, 90 mg/vial; inj 3, 6, 9 mg/ml

### Implementation

**IV route**

- After reconstituting by adding 10 ml of sterile water for inj to each vial (30 mg/10 ml or 90 mg/10 ml depending on vial used); add to 1000 ml of sterile 0.45%, 0.9% NaCl, $D_5W$, run over 2-24 hr **(hypercalcemia);** dilute reconstituted sol in 500 ml of 0.9% NaCl, 0.45% NaCl, or $D_5W$, give over 4 hr **(multiple myeloma, Paget's disease);** dilute reconstituted sol in 250 ml

of 0.9% NaCl, 0.45% NaCl or $D_5W$, give over 2 hr **(osteolytic bone metastases of breast cancer)**
- Store inf sol for up to 24 hr at room temperature
- Monitor IV site for pain, redness
- Reconstituted sol with sterile water may be stored under refrigeration for up to 24 hr
- Do not mix with calcium-containing inf sol such as Ringer's sol

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, anidulafungin, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, CARBOplatin, carmustine, ceFAZolin, cefepime, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DAPTOmycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, DOXOrubicin, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch 6%, hydrALAZINE, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, inamrinone, insulin (regular), isoproterenol, ketorolac, labetalol, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, mivacurium, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxytocin, PACLitaxel, palonosetron, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, polymyxin B, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRISTine, vinorelbine, voriconazole, zidovudine

## ADVERSE EFFECTS

**CNS:** Fatigue, *fever*
**CV:** *Hypertension,* atrial fibrillation
**EENT:** Ocular pain, inflammation, vision impairment
**GI:** *Abdominal pain, anorexia, constipation, nausea, vomiting,* dyspepsia
**GU:** Renal failure
**HEMA:** Thrombocytopenia, anemia, leukopenia
**INTEG:** Redness, swelling, induration, pain on palpation at site of catheter insertion
**META:** Hypokalemia, hypomagnesemia, hypophosphatemia, hypocalcemia, hypothyroidism
**MS:** *Severe bone pain,* myalgia, osteonecrosis of the jaw
**RESP:** Coughing, dyspnea, URI
**SYST:** Angioedema, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly cleared from circulation |
| **Distribution** | Mainly to bones, primarily in areas of high bone turnover |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys, unchanged (50%) |
| **Half-life** | Biphasic 27 hr; from bone to 300 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1 day |
| **Peak** | 1 wk |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Calcium, vitamin D: decreased pamidronate effect
CycloSPORINE, tacrolimus, vancomycin: increased nephrotoxicity
Entecavir: increased effect of entecavir

### Drug classifications

Aminoglycosides, NSAIDs, radiopaque contrast agents: increased nephrotoxicity
Loop diuretics: increased hypokalemia

### Drug/lab test

Increased: creatinine
Decreased: potassium, magnesium, phosphate, calcium, WBC, platelets

## NURSING CONSIDERATIONS

### Assessment

- **Dental health:** Optimal dental health should be obtained before treatment with this product; give antiinfectives for dental extractions
- Monitor WBCs, platelets, electrolytes, creatinine, BUN, Hgb/Hct prior to beginning treatment
- Temperature may be elevated during the first 3 days after a dose; risk of fever increases as dose increases
- **Renal disease:** max 90 mg single dose, longer infusions >2 hr may increase risk for renal toxicity
- **Hypocalcemia:** assess for nausea, vomiting, constipation, thirst, dysrhythmias, hypocalcemia, paresthesia, twitching, laryngospasm, Chvostek's, Trousseau's signs; **hypercalcemia:** thirst, nausea, vomiting, dysrhythmias
- **Dehydration/hypovolemia:** should be corrected during treatment of hypercalcemia, prior to therapy; maintain adequate urine output
- **Pregnancy/breastfeeding:** Do not use in pregnancy/breastfeeding, use contraception
- Assess for atrial fibrillation
- Assess fluid volume status: check I&O ratio and record, assess for distended red veins, crackles in lung, color, quality, and specific gravity of urine, skin turgor, adequacy of pulses, moist mucous membranes, bilateral lung sounds, peripheral pitting edema
- Monitor electrolytes: phosphorus, potassium, sodium, calcium, magnesium; also include BUN, creatinine, CBC, platelets, hemoglobin, electrolytes (calcium, potassium, magnesium)
- Assess B/P before, during therapy
- Assess for pain: in joints or on exertion, duration and characteristics; analgesics may be ordered
- Assess for phlebitis at **IV** site: swelling, redness, pain, warmth

### Patient/family education

- Advise patient to report hypercalcemic relapse: nausea, vomiting, bone pain, thirst; unusual muscle twitching, muscle spasms, severe diarrhea, constipation, ocular symptoms
- Advise patient to continue with dietary recommendations, including calcium and vit D
- To obtain an analgesic from provider for bone pain
- Advise patient that small, frequent meals may help nausea/vomiting
- Teach patient to notify prescriber if is planned or suspected, to use contraception
- Advise patient to maintain good oral hygiene, have regular dental check-ups
- Teach patient to report dental or jaw pain to prescriber immediately

### Evaluation

**Positive therapeutic outcome**

- Decreased calcium levels to normal

## pancrelipase (Rx)

(pan-kre-li'pase)

**Creon, Cotazym, Pancrease, Pancreaze, Pancrease-V, Pancrecarb MS, Pertyze, Ultrase, Ultrase MT, VioKase, Zenpep**

*Func. class.:* Digestant

*Chem. class.:* Pancreatic enzyme (bovine/porcine)

**ACTION:** Pancreatic enzyme needed for breakdown of substances released from the pancreas

**Therapeutic outcome:** Increases protein, fat, carbohydrate digestion

**USES:** Exocrine pancreatic secretion insufficiency, cystic fibrosis (digestive aid), steatorrhea, pancreatic enzyme deficiency

## CONTRAINDICATIONS

Allergy to pork

**Precautions:** Pregnancy, ileus, pancreatitis, Crohn's disease, diabetes mellitus

## DOSAGE AND ROUTES

Many products listed above are not interchangeable

### Del rel caps—Creon caps, Zenpep caps, Pancreaze caps

**Adult/adolescent/child ≥4 yr:** PO 500 lipase units/kg/meal, titrate based on response, max 2500 lipase units/kg/meal

**Child 1<4 yr:** PO 1000 lipase units/kg/meal, titrate based on response, max 2500 lipase units/kg/meal

**Available forms:** Tabs (VioKase) 10, 20 units; cap, del rel 4, 8, 16 units (Pancrecarb MS), 12, 18, 20 units (Ultrase MT), Ultrase: cap 3000, 4200, 5000, 6000, 8000, 10,500, 12,000, 15,000, 16,000, 16,800, 24,000, 25,000 units

### Implementation

- Give after antacid or cimetidine; decreased pH inactivates product
- Administer low-fat diet to decrease GI symptoms
- Provide adequate hydration
- Store in airtight container at room temperature
- Do not crush, chew del rel products, caps

## ADVERSE EFFECTS

**ENDO:** Hyperglycemia, hypoglycemia
**GI:** Anorexia, nausea, vomiting, diarrhea, cramping, bloating
**GU:** Hyperuricuria, hyperuricemia

### Pharmacokinetics

Unknown

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Acarbose, miglitol: decreased effects of each specific drug
Cimetidine, iron (oral): decreased absorption of pancrelipase

### Drug classifications

Antacids: decreased absorption of pancrelipase

## NURSING CONSIDERATIONS

### Assessment

- Monitor I&O ratio; watch for increasing urinary output
- Monitor fecal fat, nitrogen, pro-time during treatment
- Monitor for polyuria, polydipsia, polyphagia (may indicate diabetes mellitus); monitor glucose level more frequently
- Assess for allergy to pork; patient may also be sensitive to this product
- Assess for appropriate weight, height, development; there may be a developmental lag
- Check stools for steatorrhea, which signifies undigested fat content
- **Pregnancy/breastfeeding:** Use only if clearly needed, can be used in breastfeeding

### Patient/family education

- Teach patient to always take with food, not to crush, chew del rel product, caps
- Instruct patient to store at room temperature, away from moisture
- Teach patient to take tab with 8 oz or more water, not to let tab sit in mouth; have patient take tab sitting up only
- Advise patient to notify prescriber of allergic reactions, abdominal pain, cramping, or hematuria

### Evaluation

**Positive therapeutic outcome**

- Absence of steatorrhea
- Improved digestion of carbohydrates, proteins, fat

**⚠ HIGH ALERT**

## pancuronium (Rx)

(pan-cure-oh'nee-yum)
*Func. class.:* Neuromuscular blocker (nondepolarizing)
*Chem. class.:* Synthetic curariform

**ACTION:** Inhibits transmission of nerve impulses by binding with cholinergic receptor sites, antagonizing action of acetylcholine

**Therapeutic outcome:** Paralysis of all skeletal muscles

**USES:** Facilitation of endotracheal intubation, skeletal muscle relaxation during mechanical ventilation, surgery, or general anesthesia

## CONTRAINDICATIONS

Hypersensitivity to bromide ion

**Precautions:** Pregnancy, breastfeeding, children <2 yr, renal/hepatic/cardiac/neuromuscular disease, electrolyte imbalances, dehydration, previous anaphylactic reactions (other neuromuscular blockers), respiratory insufficiency

**BLACK BOX WARNING:** Requires an experienced clinician

## DOSAGE AND ROUTES

**Adult/child/infant >1 mo: IV** 0.04-0.1 mg/kg initially or 0.05 mg/kg after initial dose of succinylcholine; maintenance 0.01 mg/kg 60-100 min after initial dose, then 0.01 mg/kg q25-60min as needed; in obese patients, use ideal body weight

**Neonate <1 mo: IV** test dose 0.02 mg/kg, then 0.03 mg/kg/dose initially, repeat 2 × as needed at 5-10 min intervals; maintenance 0.03-0.09 mg/kg/dose q30min-4hr as needed

**Available forms:** Inj 1, 2 mg/ml

### Implementation

- Use peripheral nerve stimulator (anesthesiologist) to determine neuromuscular blockade; deep tendon reflexes should be monitored during extended periods

**Direct IV route**

- Give undiluted over 1-2 min (1 mg/ml [10 ml vial], 2 mg/ml [2, 5 ml vial])

**Intermittent IV infusion route**

- Add 100 mg of product to 250 ml $D_5W$, 0.9% NaCl, or LR (0.4 mg/ml)
- Store in light-resistant area
- Give anticholinesterase to reverse neuromuscular blockade

**Y-site compatibilities:** Aminophylline, ceFAZolin, cefuroxime, cimetidine, DOBUTamine, DOPamine, EPINEPHrine, esmolol, fentaNYL, fluconazole, gentamicin, heparin, hydrocortisone, isoproterenol, LORazepam, midazolam, morphine, nitroglycerin, nitroprusside, ranitidine, sulfamethoxazole/trimethoprim, vancomycin

**Y-site incompatibilities:** Diazepam

**Additive compatibilities:** Verapamil

**Additive incompatibilities:** Barbiturates

## ADVERSE EFFECTS

**CV:** Bradycardia, tachycardia, increased, decreased B/P, ventricular extrasystoles, edema, hypotension
**EENT:** Increased secretions
**INTEG:** Rash, flushing, pruritus, urticaria, sweating, salivation
**MS:** Weakness to prolonged skeletal muscle relaxation
**RESP:** Prolonged apnea, bronchospasm, cyanosis, respiratory depression, dyspnea
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability |
| **Distribution** | Extracellular space; crosses placenta |
| **Metabolism** | Plasma |
| **Excretion** | Kidneys, unchanged |
| **Half-life** | 2 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 3-5 min, dose dependent |
| **Peak** | 3-5 min |
| **Duration** | 35-40 min |

## INTERACTIONS

### Individual products

Clindamycin, enflurane, isoflurane, lincomycin, lithium, quiNIDine: increased neuromuscular blockade
Theophylline: dysrhythmias

### Drug classifications

Aminoglycosides, anesthetics (local), analgesics (opioid), polymyxin antiinfectives, thiazides: increased neuromuscular blockade

### Drug/lab test

Decreased: cholinesterase

## NURSING CONSIDERATIONS

### Assessment

- Monitor vital signs (B/P, pulse, respirations, airway) until fully recovered; note rate, depth, pattern of respirations, strength of hand grip; patient should be intubated before use
- Monitor for electrolyte imbalances (potassium, magnesium) before product is used; electrolyte imbalances may lead to increased action of this product
- **Monitor for recovery:** decreased paralysis of face, diaphragm, leg, arm, rest of body; residual weakness and respiratory problems may occur during recovery period
- **Assess for hypersensitive reactions, anaphylaxis:** rash, fever, respiratory distress, pruritus; product should be discontinued
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, breast milk excretion unknown

### Patient/family education

- Provide reassurance if communication is difficult during recovery from neuromuscular blockade
- Provide explanation to patients regarding all procedures or treatments; patient will remain conscious if anesthesia is not given also

### Evaluation

**Positive therapeutic outcome**

- Paralysis of jaw, eyelid, head, neck, rest of body as evaluated by peripheral nerve stimulator

## TREATMENT OF OVERDOSE:

Neostigmine, atropine; monitor VS; may require mechanical ventilation

**⚠ HIGH ALERT**

# panitumumab (Rx)

(pan-i-tue′moo-mab)
**Vectibix**
*Func. class.:* Antineoplastic—miscellaneous
*Chem. class.:* Multikinase inhibitor, signal transduction inhibitor

P

## ACTION:

Decreases growth and survival of cancer cells by competitive inhibition of EGF receptor

**Therapeutic outcome:** Decrease in colon carcinoma progression

## USES:

EGFR expressing metastatic colorectal cancer, not beneficial in *KRAS* mutations in codon 12 or 13

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, hepatic disease, acute bronchospasm, diarrhea, hamster protein allergy, hypomagnesemia, hypotension, pulmonary fibrosis, sepsis, *KRAS* mutations, soft-tissue toxicities infusion-related reactions

**BLACK BOX WARNING:** Exfoliative dermatitis

## DOSAGE AND ROUTES

**Adult: IV** INF 6 mg/kg over 60 min q2wk; doses > 1000 mg over 90 min

**Available forms:** Sol for inj 20 mg/ml (100 mg/5 ml, 400 mg/20 ml)

### Implementation

**Intermittent IV infusion route**

- Give in hospital or clinic setting with full resuscitation equipment
- Give only as IV inf using controlled IV inf pump; do not give **IV** push or bolus; use low-protein binding 0.2 or 0.22 micron in-line filter; flush line with 0.9% NaCl before, after administration
- Give over 60 min through a peripheral line or in-dwelling catheter; inf doses of >1000 mg over 90 min
- Dilute in 100 ml of 0.9% NaCl; dilute doses >1000 mg in 150 ml of 0.9% NaCl; mix by inverting; max 10 mg/ml; use within 6 hr if stored at room temperature; can be stored between 2°-8° C for up to 24 hr
- Store unopened vials in refrigerator; do not shake; protect from direct sunlight; do not freeze

**Dosage adjustment for infusion/dermatologic reaction**

- **Grade 1/2:** reduce infusion by 50%; Grade 3/4: terminate, permanently discontinue depending on severity/resistance

## ADVERSE EFFECTS

**CNS:** Fatigue
**CV:** Peripheral edema
**EENT:** Ocular irritation, ocular toxicity
**GI:** *Nausea, diarrhea, vomiting,* anorexia, mouth ulceration, abdominal pain, constipation
**HEMA:** Thrombophlebitis
**INTEG:** *Rash,* pruritus, exfoliative dermatitis, skin fissure, angioedema, severe/fatal infusion reactions
**META:** Hypocalcemia, hypomagnesemia, antibody formation
**RESP:** Bronchospasm, cough, dyspnea, hypoxia, pulmonary fibrosis/embolism, pneumonitis, wheezing, interstitial lung disease

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 38%-49%, high-fat meal decreases absorption |
| **Distribution** | Protein binding 99.5% |
| **Metabolism** | Liver, oxidative metabolism by CYP3A4, glucuronidation by UGT1A9, some Asian patients (15%-20%) are poor metabolizers |
| **Excretion** | Feces 77% |
| **Half-life** | Elimination 7.5 day |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Antineoplastics, other: do not use with other products

## NURSING CONSIDERATIONS

### Assessment

- **Pulmonary fibrosis:** assess for dyspnea, cough, wheezing, may need to discontinue

**BLACK BOX WARNING: Serious skin disorders:** assess for fever, sore throat, fatigue, then lesions in mouth, lips; withhold product, notify prescriber

- Monitor serum electrolytes periodically (calcium, magnesium)
- Assess for signs of infection: increased temperature
- **Assess for signs of infusion reactions:** bronchospasm, fever, chills, hypotension; may require discontinuation; have emergency equipment available
- **Assess for signs of ocular toxicity:** ocular irritation, hyperemia
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- **Instruct patient to report adverse reactions immediately:** difficulty breathing, mouth sores, skin rash, ocular toxicity
- Teach patient reason for treatment, expected results, adverse reactions
- Teach males/females to use contraception while taking this product and for 6 mo after treatment; do not breastfeed for at least 2 mo after treatment, enroll in Amgen's Pregnancy Surveillance Program (800-772-6436)
- Advise to use sunscreen while taking, 2 mo after

### Evaluation

**Positive therapeutic outcome**

- Decrease in colon carcinoma progression

## pantoprazole (Rx)

(pan-toe-pray'zole)
**Panto, Pantoloc, Protonix, Protonix IV, Tecta**
*Func. class.:* Proton pump inhibitor
*Chem. class.:* Benzimidazole

**Do not confuse:** Protonix/Lotronex/Protamine

**ACTION:** Suppresses gastric secretion by inhibiting hydrogen/potassium ATPase enzyme system in gastric parietal cell; characterized as gastric acid pump inhibitor, since it blocks final step of acid production

**Therapeutic outcome:** Absence of epigastric fullness, pain, swelling

**USES:** Gastroesophageal reflux disease (GERD), severe erosive esophagitis, maintenance, long-term pathological hypersecretory conditions including Zollinger-Ellison syndrome

## CONTRAINDICATIONS

Hypersensitivity to this product or benzimidazole

**Precautions:** Pregnancy, breastfeeding, children, proton pump hypersensitivity

## DOSAGE AND ROUTES

### GERD

**Adult:** PO 40 mg/day × 8 wk, may repeat course

### Erosive esophagitis

**Adult:** **IV** 40 mg/day × 7-10 days; PO 40 mg/day × 8 wk; may repeat PO course

### Pathologic hypersecretory conditions

**Adult:** PO 40 mg bid; **IV** 80 mg q12hr; max 240 mg/day

**Available forms:** Del rel tabs 20, 40 mg; powder for inj 40 mg/vial; del rel granules for susp 40 mg

### Implementation

- Swallow del rel tabs whole; do not break, crush, or chew
- May take with or without food
- **Suspension:** give in apple juice 30 min before a meal or sprinkled on 1 tbsp of applesauce
- **NG tube:** empty contents of packet of granules into barrel of a 60-ml catheter tip syringe (plunger removed) connected to ≥16F NG tube; add 10 ml apple juice and tap or shake barrel of syringe to empty into the tube; add another 10 ml of apple juice; rinse with additional apple juice until syringe is clear

**IV route**

- **Use of Protonix IV vials with spiked IV system adaptors is not recommended**
- Visually inspect for particulate matter and discoloration prior to use
- Give as an IV infusion over 15 min either through a dedicated line or a Y-site; a 2-min slow injection regimen is also approved; do not give fast IV push
- When using a Y-site, immediately stop use if a precipitation or discoloration occurs

**Reconstitution of vial:**

- Use 40 mg vial/10 ml NS; do not freeze

**2-minute slow intravenous (IV) infusion injection:**

- Dilute one or two 40-mg vials with 10 ml NS per vial to 4 mg/ml, store up to 24 hr at room temperature prior to use; infuse slowly over at least 2 min; do not give with other IV fluids or medications; flush line with $D_5W$, NS, or LR before and after each dose

**15-minute intravenous (IV) infusion:**

- Dilute each 40 mg dose with 10 ml NS; the reconstituted vial should be further admixed with 100 ml (for one vial) or 80 ml (for 2 vials) of $D_5W$, NS, or LR (to 0.4 mg/ml or 0.8 mg/ml, respectively), store up to 6 hr at room temperature prior to further dilution; the admixed solution (0.4 mg/ml or 0.8 mg/ml) may be stored at room temperature and must be used within 24 hr from the time of initial reconstitution; infuse over 15 min at 7 ml/min; do not administer with other IV fluids or medications; flush the IV line with $D_5W$, NS, or LR before and after each dose

## ADVERSE EFFECTS

**CNS:** *Headache,* insomnia, asthenia, fatigue, malaise, insomnia, somnolence
**GI:** *Diarrhea, abdominal pain,* flatulence, pancreatitis, weight changes, pseudomembranous colitis
**INTEG:** *Rash*
**META:** Hyperglycemia, weight gain/loss, hyponatremia, hypomagnesemia, vitamin $B_{12}$ deficiency
**MS:** Rhabdomyolysis, myalgia
**RESP:** Pneumonia
**SYST:** Stevens-Johnson syndrome, toxic epidermal necrolysis, anaphylaxis, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 97% |
| **Metabolism** | Unknown |
| **Excretion** | Urine-metabolites, feces, decreased rate in geriatric patients; Genetic Warning some Asian patients (15%-20%) may be poor metabolizers |
| **Half-life** | 1½ hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2.4 hr |
| **Duration** | >24 hr |

## INTERACTIONS

### Individual drugs

Calcium carbonate, sucralfate, vit $B_{12}$, ketoconazole, itraconazole, atazanavir, ampicillin, iron salts: decreased absorption of these products

Clarithromycin, diazepam, flurazepam, phenytoin, triazolam: increased levels of pantoprazole
Clopidogrel: decreased clopidogrel effect
Warfarin: increased risk of bleeding

### Drug/herb
St. John's wort: decreased effect of pantoprazole

## NURSING CONSIDERATIONS
### Assessment
- **Rhabdomyolysis:** muscle pain, increased CPK, weakness, swelling of affected muscles; if these occur and if confirmed by CPK, product should be discontinued
- Assess GI system: bowel sounds q8hr, abdomen for pain, swelling, anorexia
- Monitor hepatic enzymes: AST, ALT, alkaline phosphatase during treatment
- **Serious skin reactions:** assess for toxic epidermal necrolysis, Stevens-Johnson syndrome, exfoliative dermatitis; fever, sore throat, fatigue, thin ulcers, lesions in the mouth, lips
- **Electrolyte imbalances:** hyponatremia; hypomagnesemia in those using this product (3 mo-1 yr) if hypomagnesemia occurs, use of magnesium supplements may be sufficient; if severe, discontinuation of this product may be required
- **Pregnancy/breastfeeding:** Use only if clearly needed, do not breastfeed
- **Beers:** Avoid in older adults for >8 wk unless for high-risk patients, risk of *Clostridium difficile,* fractures

### Patient/family education
- Advise patient to report severe diarrhea; product may have to be discontinued
- Advise patient with diabetes that hyperglycemia may occur
- Advise patient to avoid hazardous activities; dizziness may occur
- Advise patient to avoid alcohol, salicylates, ibuprofen; may cause GI irritation

### Evaluation
**Positive therapeutic outcome**
- Absence of epigastric pain, swelling, fullness

## PARoxetine (Rx)
(par-ox′e-teen)
**Brisdelle, Paxil, Paxil CR, Pexeva, PMS**
*Func. class.:* Antidepressant, selective serotonin reuptake inhibitor (SSRI)
*Chem. class.:* Phenylpiperidine derivative

**Do not confuse:** PARoxetine/FLUoxetine/PACLitaxel, Piroxicam Paxil/PACLitaxel/Doxil/Plavix/Lexiva

**ACTION:** Inhibits CNS neuron reuptake of serotonin but not of norepinephrine or DOPamine

**Therapeutic outcome:** Relief of depression

**USES:** Major depressive disorder, obsessive-compulsive disorder, panic disorder, generalized anxiety disorder, posttraumatic stress disorder, premenstrual disorders, social anxiety disorder

**Unlabeled uses:** Premature ejaculation

## CONTRAINDICATIONS
Pregnancy, hypersensitivity, MAOI use, alcohol use

**Precautions:** Breastfeeding, geriatric, seizure history, patients with history of mania, renal/hepatic disease

**BLACK BOX WARNING:** Children, suicidal ideation

## DOSAGE AND ROUTES
### Depression
**Adult:** PO 20 mg/day in AM; after 4 wk if no clinical improvement is noted, dosage may be increased by 10 mg/day weekly to desired response; max 50 mg/day; or CONT REL 25 mg/day, may increase by 12.5 mg/day weekly up to 62.5 mg/day
**Geriatric:** PO 10 mg/day, increase by 10 mg to desired dose, max 40 mg/day

### Obsessive-compulsive disorder
**Adult:** PO 40 mg/day in AM; start with 20 mg/day, increase 10 mg/day increments, max 60 mg/day

### Panic disorder
**Adult:** Start with 10 mg/day and increase in 10 mg/day increments to 40 mg/day, max 60 mg/day; or CONT REL 12.5 mg/day max 75 mg/day

### Generalized anxiety disorder
**Adult:** PO 20 mg/day in AM, range 20-50 mg/day

### Posttraumatic stress disorder
**Adult:** PO 20 mg/day, range 20-60 mg/day

### Premenstrual disorders
**Adult:** CONT REL 12.5 mg/day in AM

### Renal dose
**Adult:** PO CCr 30-60 ml/min lower doses may be needed, CCr <30 ml/min 10 mg/day in AM, may increase by 10 mg/day qwk, max 40 mg/day; or CONT REL 12.5 mg/day max 50 mg/day

### Hepatic dose
**Adult:** PO 10 mg/day initially, max 40 mg regular release, CONT REL 12.5 mg/day initially, max 50 mg/day

**Available forms:** Tabs 10, 20, 30, 40 mg; oral susp 10 mg/5 ml; cont rel 12.5, 25, 37.5 mg, cap 7.5 mg

### Implementation

- Give with food or milk for GI symptoms; store at room temperature; do not freeze
- Give crushed if patient is unable to swallow whole, regular release only
- Use gum, hard candy, frequent sips of water for dry mouth
- Avoid use with other CNS depressants
- **Oral susp:** shake, measure with oral syringe or calibrated measuring device
- **Cont rel tab:** do not cut, chew, crush; do not give concurrently with antacids

## ADVERSE EFFECTS

**CNS:** *Headache, nervousness, insomnia, drowsiness, anxiety, tremor, dizziness, fatigue, sedation,* abnormal dreams, agitation, apathy, euphoria, hallucinations, delusions, psychosis, seizures, malignant neuroleptic syndrome–like reactions, restless legs syndrome
**CV:** Vasodilatation, postural hypotension, palpitations, bleeding
**EENT:** Visual changes
**GI:** *Nausea, diarrhea, constipation, dry mouth, anorexia,* dyspepsia, vomiting, taste changes, flatulence, decreased appetite, cramps
**GU:** Dysmenorrhea, decreased libido, urinary frequency, UTI, amenorrhea, cystitis, impotence, decreased sperm quality, decreased fertility, *abnormal ejaculation* (male)
**INTEG:** *Sweating,* rash
**MS:** Pain, arthritis, myalgia, myopathy, myasthenia
**RESP:** Infection, pharyngitis, nasal congestion, sinus headache, sinusitis, cough, dyspnea, yawning
**SYST:** Asthenia, fever, abrupt withdrawal syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed; crosses blood-brain barrier, protein-binding 95% |
| **Metabolism** | Liver, mostly by CYP2D6 enzyme system, 7% may be poor metabolizers |
| **Excretion** | Kidneys, unchanged (2%); breast milk |
| **Half-life** | 21 hr (reg rel); 15-20 hr (cont rel) |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 5.2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Methylphenidate, traMADol: increased serotonin syndrome
Cimetidine: increased PARoxetine levels
Digoxin: decreased effect of digoxin
L-tryptophan: increased agitation
PHENobarbital: decreased PARoxetine levels
Phenytoin: decreased effect of PARoxetine
- **Pimozide:** potentially fatal reactions

Theophylline: increased theophylline levels
- **Thioridazine:** do not use with PARoxetine; hypertensive crisis, seizures, potentially fatal reactions can occur

Warfarin: increased bleeding

### Drug classifications

CYP2D6 inhibitors (aprepitant, delavirdine, imatinib, nefazodone): increased toxicity
Highly protein-bound products: increased side effects
- **MAOIs:** hypertensive crisis, seizures; do not use together; potentially fatal reactions can occur

SSRIs, SNRIs, atypical antipsychotics, serotonin-receptor agonists, tricyclics, amphetamines: increased serotonin syndrome
NSAIDs, thrombolytics, salicylates, platelet inhibitors, anticoagulants: increased bleeding

### Drug/herb

Ephedra: hypertensive crisis
Kava: avoid use
St. John's wort: possible serotonin syndrome, avoid use

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Depression/OCD/anxiety/panic attacks:** assess mental status: mood, sensorium, affect, suicidal tendencies (especially in child/young adult), increase in psychiatric symptoms, increasing obsessive thoughts, compulsive behaviors, restrict amount available

- **Postural hypotension:** monitor B/P (lying/standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take vital signs q4hr in patients with CV disease
- **Renal status:** monitor BUN, creatinine, urinary retention

• **Withdrawal symptoms:** assess for headache, nausea, vomiting, muscle pain, weakness; not usual unless product discontinued abruptly, taper over 1-2 wk
• **Serotonin, neuroleptic malignant syndrome:** assess for hallucinations, coma, headache, agitation, shivering/sweating, tachycardia, diarrhea, tremor, hypertension, hyperthermia, rigidity, delirium, coma, myoclonus, agitation, nausea, vomiting
• Monitor blood studies: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy
• Monitor hepatic studies: AST, ALT, bilirubin
• Check weight weekly; appetite may increase with product
• Assess ECG for flattening of T-wave, bundle branch block, AV block, dysrhythmias in cardiac patients
• Assess for EPS primarily in geriatric: rigidity, dystonia, akathisia
• Monitor urinary retention, constipation; constipation is more likely to occur in children or geriatric
• Identify alcohol consumption; if alcohol is consumed, hold dose until AM
• **Pregnancy/breastfeeding:** Do not use in pregnancy/breastfeeding

### Patient/family education

• Advise patient that therapeutic effects may take 1-4 wk
• Teach patient to use caution in driving and other activities requiring alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting to standing, especially geriatric
• Caution patient to avoid alcohol ingestion, other CNS depressants, and OTC medication unless prescribed
• Caution patient not to discontinue medication quickly after long-term use; may cause nausea, anxiety, headache, malaise; do not double doses if one is missed
• Advise patient to use gum, hard sugarless candy, or frequent sips of water for dry mouth; if dry mouth continues an artificial saliva product may be used

**BLACK BOX WARNING:** Advise patient that depression may worsen, suicidal thoughts/behavior may occur (especially in child/young adult), to notify prescriber immediately

• Advise patient to discuss sexual side effects: impotence, possible male infertility while taking this product

### Evaluation

**Positive therapeutic outcome**
• Decrease in depression
• Absence of suicidal thoughts

## TREATMENT OF OVERDOSE:

Gastric lavage, maintain airway; for seizures give diazepam, symptomatic treatment

**⚠ HIGH ALERT**

## pazopanib

(paz-oh′pa-nib)
**Votrient**
*Func. class.:* Antineoplastic biologic response modifier/multikinase angiogenesis inhibitor
*Chem. class.:* Kinase inhibitor

## ACTION:

Targets vascular endothelial growth factor receptors; a multikinase angiogenesis inhibitor

**Therapeutic outcome:** Decrease in size, spread of tumor

## USES:

Advanced renal cell carcinoma; soft-tissue sarcoma patients who have received prior chemotherapy

## CONTRAINDICATIONS

Pregnancy, hypothyroidism, QT prolongation, MI, wound dehiscence, hypertension

**Precautions:** Breastfeeding, children, cardiac/renal/hepatic/dental disease, GI bleeding

**BLACK BOX WARNING:** Hepatic disease

## DOSAGE AND ROUTES

**Adult: PO** 800 mg/day without food (1 hr before, 2 hr after a meal), may decrease to 400 mg/day if not tolerated (renal cell cancer); or adjust in 200-mg increments based on toxicity (soft-tissue sarcoma)

**Available forms:** Tabs 200 mg

### Implementation

• Give on an empty stomach (1 hr before or 2 hr after a meal); separate doses by 24 hr
• Do not crush tablets, can lead to an increased rate of absorption, which can affect systemic exposure; only intact, whole tablets should be used
• If a dose is missed, it should not be taken if it is ≤12 hr until the next dose
• Store at 77°F (25°C)

## ADVERSE EFFECTS

**CNS:** Intracranial bleeding, headache

**CV:** Heart failure, hypertension, hypertensive crisis, chest pain, MI, QT prolongation, torsades de pointes
**GI:** Nausea, hepatotoxicity, vomiting, dyspepsia, GI hemorrhage, anorexia, abdominal pain, GI perforation, pancreatitis, diarrhea; hepatotoxicity (geriatric)
**HEMA:** Neutropenia, thrombocytopenia, bleeding
**INTEG:** Rash, alopecia
**MISC:** Fatigue, epistaxis, pyrexia, hot sweats, increased weight, flulike symptoms, hypothyroidism, hand–foot syndrome, retinal tear/detachment

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 99% |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 31 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-4 hr |
| **Duration** | 24 hr |

## INTERACTIONS

### Individual drugs

Arsenic trioxide, levomethadyl, haloperidol, chloroquine, droperidol, pentamidine: increased QT prolongation, pazopanib concentrations
Simvastatin: increased plasma concentrations of this agent
Warfarin: avoid use with warfarin; use low-molecular-weight anticoagulants instead; increased plasma concentration of warfarin

### Drug classifications

Class IA/III antidysrhythmics, some phenothiazines, Beta-agonists, local anesthetics, tricyclics; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, ketoconazole, troleandomycin); CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation, increased pazopanib concentrations
Calcium-channel blockers, ergots: increased plasma concentrations of these agents
CYP3A4 inducers (dexamethasone, phenytoin, carBAMazepine, rifampin, PHENobarbital): decreased pazopanib concentrations

### Drug/food

Grapefruit juice: avoid use; increased pazopanib effect

### Drug/herb

St. John's wort: decreased pazopanib concentration

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Hepatic disease: fatal hepatotoxicity can occur; obtain LFTs baseline and at least every 2 wk × 2 mo, then monthly

**BLACK BOX WARNING:** Fatal bleeding: from GI, respiratory, GU tracts, permanently discontinue in those with severe bleeding

- **Palmar-plantar erythrodysesthesia (hand–foot syndrome):** more common in those previously treated; assess for swelling, numbness, desquamation on palms and soles
- **GI perforation/fistula:** discontinue if this occurs, assess for pain in epigastric area, dyspepsia, flatulence, fever, chills
- **Hypertension/hypertensive crisis:** hypertension usually occurs in the first cycle; in those with preexisting hypertension, do not start treatment until B/P is controlled; monitor B/P every wk × 6 wk, then at start of each cycle or more often if needed, temporarily or permanently discontinue for severe uncontrolled hypertension
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Advise patient to report adverse reactions immediately: bleeding
- Teach patient about reason for treatment, expected results
- Inform patient that effect on male fertility is unknown
- Do not crush or chew tabs, take on empty stomach 1 hr before or 2 hr after meals, avoid grapefruit juice

### Evaluation

**Positive therapeutic outcome**

- Decrease in size, spread of tumor

## pegaptanib (Rx)

(peg-ap'ta-nib)
**Macugen**
*Func. class:* Ophthalmic agent—miscellaneous

**Do not confuse:** Neulasta/Lunesta/Neomega/Nuedexta

**ACTION:** Binds to vascular endothelial growth factor (VEGF), thereby inhibiting angiogenesis

**Therapeutic outcome:** Stabilization of vision in macular degeneration

**USES:** Treatment of neovascular (wet) age-related macular degeneration; may be used alone or with photodynamic therapy (PDT)

## CONTRAINDICATIONS

Hypersensitivity, ocular or periocular infections

**Precautions:** Pregnancy, inflammatory eye disease, ocular hypertension

## DOSAGE AND ROUTES

**Adult:** Intravitreal inj 0.3 mg inj q6wk

**Available forms:** Inj 0.3 mg, single glass syringes

### Implementation

- Administer anesthesia and a broad-spectrum antiinfective prior to injection
- The inj should be done under aseptic conditions
- Remove all air bubbles prior to use
- Store at 36°-46° F, do not freeze or shake vigorously

## ADVERSE EFFECTS

**EENT:** *Anterior chamber inflammation, blurred vision, conjunctival hemorrhage, corneal edema, cataract, eye discharge, eye pain, increased intraocular pressure, punctate keratitis, reduced visual acuity, vitreous floaters, vitreous opacities, blepharitis, conjunctivitis, photophobia,* retinal detachment, iatrogenic traumatic cataract

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 87-100 hr in vitreous humor of the monkey |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | May remain fully active in the eye for 7-28 days |

## NURSING CONSIDERATIONS

### Assessment

- Test visual acuity periodically
- Assess treated eye for increased intraocular pressure, infection, endophthalmitis
- Monitor perfusion of the optic nerve head immediately after injection, tonometry ½ hr after inj, biomicroscopy 2-7 days after inj

### Patient/family education

- Instruct patient to report any inflammation, bleeding, eye discharge, opacities to prescriber
- Instruct patient to continue with follow-up care during treatment

### Evaluation

**Positive therapeutic outcome**

- Macular degeneration stabilized

**⚠ HIGH ALERT**

# pegfilgrastim (Rx)

(peg-fill-grass'stim)

**Neulasta**

*Func. class.:* Hematopoietic agent

**ACTION:** Stimulates proliferation and differentiation of neutrophils

**Therapeutic outcome:** Absence of infection

**USES:** To decrease infection in patients receiving antineoplastics that are myelosuppressive; to increase WBC in patients with product-induced neutropenia

## CONTRAINDICATIONS

Hypersensitivity to proteins of *E. coli,* filgrastim

**Precautions:** Pregnancy, breastfeeding, child <45 kg, adolescents, myeloid malignancies, sickle cell disease, leukocytosis, splenic rupture, allergic-type reactions, ARDS, peripheral blood stem cell mobilization (PBSC)

## DOSAGE AND ROUTES

**Adult:** SUBCUT 6 mg per chemotherapy cycle

**Available forms:** Sol for inj 10 mg/0.6 ml

### Implementation

**SUBCUT route**

- Give using single-use vials; after dose is withdrawn, do not reenter vial
- Do not use 6-mg fixed dose in infants, children, or others <45 kg
- Inspect sol for discoloration, particulates; if present, do not use
- Do not administer in the period 14 days before and 24 hr after cytotoxic chemotherapy
- Store in refrigerator; do not freeze; may store at room temp up to 6 hr, avoid shaking, protect from light

## ADVERSE EFFECTS

**CNS:** Fever, fatigue, headache, dizziness, insomnia, peripheral edema

**GI:** *Nausea,* vomiting, diarrhea, mucositis, anorexia, constipation, dyspepsia, abdominal pain, stomatitis, splenic rupture

**HEMA:** Leukocytosis, granulocytopenia, sickle cell crisis, hemoglobin S disease with crisis
**INTEG:** Alopecia
**MISC:** Chest pain, hyperuricemia, anaphylaxis, flulike syndrome, angioedema, antibody formation
**MS:** Skeletal pain
**RESP:** Respiratory distress syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 15-80 hr; 20-38 hr (child) |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drug

Lithium: increased release of neutrophils

### Drug classifications

Cytotoxic chemotherapy agents: do not use this product concomitantly or 2 wk before or 24 hr after administration of cytotoxics

### Drug/lab test

Increased: uric acid, LDH, alkaline phosphatase

## NURSING CONSIDERATIONS

### Assessment

- **Assess for allergic reactions, anaphylaxis:** rash, urticaria; discontinue this product, have emergency equipment nearby
- Monitor blood studies: CBC, platelet count before treatment and twice weekly; neutrophil counts may be increased for 2 days after therapy
- **ARDS:** assess for dyspnea, fever, tachypnea, occasional confusion; obtain ABGs, chest x-ray, product may need to be discontinued
- Monitor B/P, respirations, pulse before, during therapy
- **Assess for bone pain,** give mild analgesics
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, pregnant patient should enroll in Amgen's Pregnancy Surveillance Program 800-772-6436, cautious use in breastfeeding, excretion unknown

### Patient/family education

- Teach the technique for self-administration: dose, side effects, disposal of containers and needles; provide instruction sheet
- Teach patient to notify prescriber immediately of allergic reaction, trouble breathing, abdominal pain

### Evaluation

**Positive therapeutic outcome**

- Absence of infection

**⚠ HIGH ALERT**

## PEMEtrexed (Rx)

(pem-ah-trex'ed)
**Alimta**
*Func. class.:* Antineoplastic-antimetabolite
*Chem. class.:* Folic acid antagonist

**ACTION:** Inhibits multiple enzymes that reduce folic acid, which is needed for cell replication

**Therapeutic outcome:** Decreased spread of mesothelioma, decreased tumor size

**USES:** Malignant pleural mesothelioma in combination with CISplatin; non–small cell lung cancer as a single agent; non-squamous non–small cell lung cancer (first-line treatment)

## CONTRAINDICATIONS

Pregnancy, hypersensitivity, ANC <1500 cells/mm$^3$, CCr <45 ml/min, thrombocytopenia (<100,000/mm$^3$), anemia

**Precautions:** Breastfeeding, children, renal/hepatic disease

## DOSAGE AND ROUTES

**Adult: IV** INF 500-600 mg/m$^2$ given over 10 min on day 1 of a 21-day cycle with CISplatin 75 mg/m$^2$ INF over 2 hr beginning ½ hr after end of PEMEtrexed INF

### Renal dose

**Adult:** IV infusion CCr <45 ml/min, not recommended

**Available forms:** Inj, single-use vials, 100, 500 mg

### Implementation

- Administer vit $B_{12}$ and low-dose folic acid as a prophylactic measure to treat related hematologic, GI toxicity; at least 5 daily doses of folic acid must be taken in the 7 days preceding first dose
- Premedicate with a corticosteroid (dexamethasone) given PO bid the day before, day of, and day after administration of PEMEtrexed
- **Neurotoxicity:** assess for CTC grade 2: withhold until resolution to at least pretherapy value/condition, reduce CISplatin by 50%; CTC grade 3/4; immediately discontinue this product and CISplatin if given in combination
- **Mucositis:** assess for CTC 3-4; withhold until resolution to at least pretherapy value/condition, reduce dose by 50%, if grade

3-4 occurs after 2 dosage reductions, discontinue this product and CISplatin
• **Bleeding:** assess for bleeding time, coagulation time during treatment; bleeding; hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr
• Use a liquid diet: carbonated beverage, gelatin; dry toast, crackers may be added when patient is not nauseated or vomiting
• Assist patient with rinsing of mouth tid-qid with water, club soda; brushing of teeth bid-tid with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss

**IV route**
• Use cytotoxic handling procedures
• Reconstitute 500-mg vial/20 ml 0.9% NaCl inj (preservative free) = 25 mg/ml, swirl until dissolved, further dilute with 100 ml 0.9% NaCl inj (preservative free), give as IV inf over 10 min
• Use only 0.9% NaCl inj (preservative free) for reconstitution, dilution
• Store at 77° F, excursions permitted 59°-86°F, not light sensitive, discard unused portions

**Dosage adjustments**
Do not begin a new cycle unless neutrophils (ANC) ≥1500 cells/mm$^3$, platelets ≥100,000 cells/mm$^3$, CCr is ≥45 ml/min
• **Platelet nadir <50,000/mm$^3$ regardless of the ANC:** If necessary, delay until platelet count recovery, reduce PEMEtrexed and CISplatin, by 50%; if grade 3/4 toxicity occurs after 2 reductions, discontinue both products
• **ANC nadir <500/mm$^3$ when platelet nadir is ≥50,000/mm$^3$:** If necessary, delay until ANC recovery, reduce PEMEtrexed and CISplatin, by 75%; if grade 3/4 toxicity occurs after 2 reductions, discontinue both products
• **CTC Grade 3/4 nonhematologic toxicity including diarrhea requiring hospitalization and excluding neurotoxicity, mucositis, and grade 3 transaminase elevations:** Withhold therapy until pre-therapy value or condition, reduce by 75% both products, if grade 3 or 4 toxicity occurs after 2 reductions, discontinue both products
• **CTC grade 3/4 mucositis:** Withhold therapy until pre-therapy condition, reduce 50% of PEMEtrexed, if grade 3 or 4 mucositis occurs after 2 dosage reductions, discontinue both products
• **CTC grade 2 neurotoxicity:** Withhold therapy until pre-therapy value or condition, reduce dose of CISplatin by 50%
• **CTC grade 3/4 neurotoxicity:** discontinue both products

**Y-site compatibilities:** Acyclovir sodium, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin-sulbactam, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, CARBOplatin, carmustine, ceftizoxime, cefTRIAXone, cefuroxime, cimetidine, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOCEtaxel, dolasetron, DOPamine, doxacurium, enalaprilat, ePHEDrine, EPINEPHrine, eptifibatide, ertapenem, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gatifloxacin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, insulin (regular), isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium, mannitol, meperidine, meropenem, mesna, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, midazolam, milrinone, mitoMYcin, mivacurium, morphine, moxifloxacin, nafcillin, naloxone, nesiritide, nitroglycerin, norepinephrine, octreotide, oxaliplatin, PACLitaxel, pamidronate, pancuronium, PENTobarbital, PHENobarbital, piperacillin-tazobactam, polymyxin B, potassium chloride/phosphates, procainamide, promethazine, propranolol, ranitidine, remifentanil, rocuronium, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, trimethobenzamide, vancomycin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** *Fatigue, fever, mood alteration, neuropathy*
**CV:** Thrombosis/embolism, *chest pain*, arrhythmia exacerbation
**GI:** *Nausea, vomiting, anorexia, diarrhea, ulcerative stomatitis, constipation, dysphagia, dehydration*
**GU:** Renal failure, *creatinine elevation*
**HEMA:** Neutropenia, leukopenia, thrombocytopenia, myelosuppression, anemia
**INTEG:** *Rash, desquamation*
**RESP:** *Dyspnea*
**SYST:** Infection with/without neutropenia, radiation recall reaction

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 81% protein binding |
| **Metabolism** | Not metabolized |
| **Excretion** | Excreted in urine (unchanged 70%-90%)Not known if it is excreted in breast milk |
| **Half-life** | 3.5 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug classifications

Anticoagulants, NSAIDs, platelet inhibitors, salicylates, thrombolytics: increased bleeding risk

Nephrotoxic products (NSAIDs): decreased PEMEtrexed clearance

## NURSING CONSIDERATIONS

### Assessment

- **Bone marrow depression:** monitor CBC, differential, platelet count; monitor for nadir and recovery; a new cycle should not begin if ANC < 1500 cells/mm$^3$, platelets are < 100,000 cells/mm$^3$, creatinine clearance < 45 ml/min
- Monitor renal tests: BUN, serum uric acid, urine CCr, electrolytes before, during therapy
- For previous radiation treatments; radiation recall reactions have occurred (erythema, exfoliative dermatitis, pain, burning)
- Monitor I&O ratio; report fall in urine output to <30 ml/hr
- Monitor temp q4hr; fever may indicate beginning infection; no rectal temps
- Assess bleeding time, coagulation time during treatment; bleeding: hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr
- Assess buccal cavity q8hr for dryness, sores, ulceration, white patches, oral pain, bleeding, dysphagia
- **Assess for symptoms indicating severe allergic reaction/toxic epidermal necrolysis:** rash, urticaria, itching, flushing
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Instruct patient to report any complaints, side effects to nurse or prescriber: black tarry stools, chills, fever, sore throat, bleeding, bruising, cough, shortness of breath, dark or bloody urine
- Instruct patient to avoid foods with citric acid, hot or rough texture if stomatitis is present
- Instruct patient to report stomatitis: any bleeding, white spots, ulcerations in mouth to prescriber; tell patient to examine mouth daily, report symptoms to nurse, use good oral hygiene
- Advise patient that contraceptive measures are recommended during therapy and for at least 8 wk following cessation of therapy, to discontinue breastfeeding; toxicity to infant may occur
- Advise patient to avoid alcohol, salicylates, live vaccines
- Advise patient to avoid use of razors, commercial mouthwash
- Teach to eat foods high in folic acid and take supplements as prescribed

### Evaluation

**Positive therapeutic outcome**

- Decreased spread of malignancy

**⚠ HIGH ALERT**

## pembrolizumab

(pem'broe-liz'ue-mab)

**Keytruda**

*Func. class.:* Antineoplastic, biologic response modifier

*Chem. class.:* Monoclonal antibody

**ACTION:** A human monoclonal antibody that binds to the programmed death receptor-1 (PD-1) found on T cells and blocks the interaction of PD-1 with its ligands, PD-L1 and PD-L2, on the tumor cell

**Therapeutic outcome:** Decreased progression of multiple myeloma

**USES:** Treatment of unresectable or metastatic malignant melanoma in those who have disease progression after ipilimumab or in BRAF V600 mutation–positive patients who have disease progression after ipilimumab and a BRAF inhibitor

**CONTRAINDICATIONS:** Hypersensitivity, pregnancy, breastfeeding

**Precautions:** Immune-mediated colitis, immune-mediated hepatitis, immune-mediated hyperthyroidism/hypothyroidism; immune-mediated nephritis, acute interstitial nephritis, and renal failure; immune-mediated pneumonitis, adrenocortical insufficiency, arthritis, exfoliative dermatitis, hemolytic anemia, hypophysitis, myasthenia syndrome, myositis, optic neuritis, pancreatitis, partial seizures after inflammatory foci identified in brain parenchyma, rhabdomyolysis, uveitis, incidence of abortion/stillbirths

P

## DOSAGE AND ROUTES

**Adult: IV** INF: 200mg over 30 min q3wk until disease progression

**Available forms:** Powder for injection 50 mg

### Implementation

**IV INF route**

- Add 2.3 ml of sterile water for injection, 50-mg vial (25 mg/ml); inject sterile water along the walls of the vial and not directly on the powder
- Gently swirl and allow up to 5 min for bubbles to clear, do not shake, solution will be clear to slightly opalescent, colorless to slightly yellow
- Add the required amount of product to a bag of normal saline (0.9% sodium chloride injection) to a final diluted concentration between 1 and 10 mg/ml; mix by gentle inversion
- Discard any unused solution left in the vial
- Storage after reconstitution and dilution: Store at room temperature up to 4 hr or refrigerate up to 24 hr (includes reconstitution, dilution, and administration time). If refrigerated, allow the diluted solution to warm to room temperature before use, give over 30 min.
- Use a sterile, nonpyrogenic, low-protein binding 0.2- to 5-micron in-line or add-on filter
- Do not use with other drugs through the same infusion line
- **Grade 2 or 3 toxicity:** Withhold and give corticosteroids; resume when the adverse event recovers to grade ≤1. Permanently discontinue if there is no recovery within 12 wk, if the corticosteroid dose cannot be reduced to ≤10 mg/day of predniSONE (or equivalent) within 12 wk, or for recurrent severe or grade 3 colitis.
- **Grade 4 toxicity:** Permanently discontinue, give corticosteroids

**Hepatitis:**

- **Grade 2 toxicity (AST or ALT >3-5 × upper limit of normal [ULN] or total bilirubin >1.5-3 × ULN):** Withhold and give corticosteroids; resume when adverse event recovers to grade 1 or less. Permanently discontinue if there is no recovery within 12 wks or if the corticosteroid dose cannot be reduced to ≤10 mg/day of predniSONE (or equivalent) within 12 wks.
- **Grade 3 or 4 toxicity (AST or ALT >5 × ULN or total bilirubin >3 × ULN):** Permanently discontinue, give corticosteroids
- **Liver metastases and grade 2 elevated transaminase levels at baseline:** Permanently discontinue if AST/ALT levels increase by ≥50% over baseline and transaminase level elevations persist for at least 1 wk

## ADVERSE EFFECTS

**CNS:** Seizures, myasthenia gravis, headache, fever, insomnia, chills, dizziness, fatigue
**EENT:** Optic neuritis
**ENDO:** Hyponatremia, hypothyroidism/hyperthyroidism, hyperglycemia, hypocalcemia immune-mediated hypophysitis
**GI:** Nausea, vomiting, abdominal pain, pancreatitis, colitis, diarrhea, hepatitis, constipation
**GU:** Interstitial nephritis, renal failure
**INTEG:** Rash, pruritus, skin discoloration
**MS:** Myalgia, immune-mediated rhabdomyolysis
**RESP:** Cough, dyspnea, pneumonitis
**SYST:** Exfoliative dermatitis

### Pharmacokinetics

| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Drug/lab test

Increased: LFTs, renal function studies

## NURSING CONSIDERATIONS

### Assessment

- **Hyperglycemia:** May cause diabetes mellitus type 1 or diabetic ketoacidosis
- For hyperthyroidism/hypothyroidism, renal function studies baseline, periodically during therapy, CCr, BUN, monitor for nephritis
- For pneumonitis (new or worsening cough, chest pain, shortness of breath), confirm with radiographic imaging
- **Immune-mediated hepatitis:** Liver function tests and hepatitis (e.g., jaundice, severe nausea/vomiting, easy bleeding or bruising; withhold and give corticosteroids if grade 2 hepatitis (AST or ALT >3-5 × ULN or total bilirubin >1.5-3 × ULN)
- **Pregnancy:** Assess if pregnancy is planned or suspected, if breastfeeding

### Patient/family education

- Instruct patient to use highly effective contraceptive methods during and for 4 months after treatment, to contact their health care provider if pregnancy is suspected or confirmed

- Teach patient to notify prescriber immediately of signs of colitis, pneumonitis, hepatitis, hypophysitis
- **Hyperglycemia:** Teach about signs and symptoms of hyperglycemia, diabetes, ensure right glucose control, report
- Teach patient that prophylactic folic acid and $B_{12}$ injections may be necessary 1 wk before therapy to prevent bone marrow suppression and GI symptoms
- **Immune-mediated hypophysitis:** Headache, weakness, fainting, dizziness, blurred vision, use corticosteroid if >grade 2, discontinue if >grade 3

### Evaluation

**Positive therapeutic outcome**
- Decreased progression of multiple myeloma

## penciclovir topical

*See Appendix B*

## PENICILLINS

## penicillin G benzathine (Rx)

(pen-i-sill'in)
**Bicillin L-A**

## penicillin G Potassium (Rx)

**Pfizerpen**

## penicillin G procaine (Rx)

## penicillin V (Rx)

**Apo-Pen-VK** 🍁, **Penicillin VK**

*Func. class.:* Broad-spectrum antiinfective
*Chem. class.:* Natural penicillin

**ACTION:** Interferes with cell wall replication of susceptible organisms; osmotically unstable cell wall swells and bursts from osmotic pressure, resulting in cell death

**Therapeutic outcome:** Bactericidal effects on the gram-positive cocci *Staphylococcus, Streptococcus pyogenes, Streptococcus viridans, Streptococcus faecalis, Streptococcus bovis, Streptococcus pneumoniae;* gram-negative cocci *Neisseria gonorrhoeae;* gram-positive bacilli *Actinomyces, Bacillus anthracis, Clostridium perfringens, Clostridium tetani, Corynebacterium diphtheriae, Listeria monocytogenes;* gram-negative bacilli *Escherichia coli, Proteus mirabilis, Salmonella, Shigella, Enterobacter, Streptobacillus moniliformis;* spirochete *Treponema pallidum*

**USES:** Respiratory tract infections, scarlet fever, erysipelas, otitis media, pneumonia, skin and soft tissue infections, gonorrhea

## CONTRAINDICATIONS

Hypersensitivity to penicillins, corn

**Precautions:** Pregnancy, breastfeeding, hypersensitivity to cephalosporins/carbapenem/sulfite, severe renal disease, GI disease, asthma

**BLACK BOX WARNING:** Penicillin G benzathine: IV use

## DOSAGE AND ROUTES

### >> Penicillin G benzathine

**Early syphilis**
**Adult:** IM 2.4 million units in single dose

**Congenital syphilis**
**Child <2 yr:** IM 50,000 units/kg in single dose, max 2.4 million units as a single inj

**Prophylaxis of rheumatic fever, glomerulonephritis**
**Adult and child:** IM 1.2 million units in single dose

**Upper respiratory tract infections (group A streptococcal)**
**Adult:** IM 1.2 million units in single dose
**Child >27 kg:** IM 900,000 units in single dose
**Child <27 kg:** IM 300,000-600,000 units in single dose

**Available forms:** Inj 300,000 units/ml; 600,000 units/ml

### >> Penicillin G

**Pneumococcal/streptococcal infections (serious)**
**Adult:** IM/IV 5-24 million units in divided doses q4-6hr
**Child <12 yr:** IV 150,000-300,000 units/kg/day in 4-6 divided doses; max 24 million units/day

**Renal dose**
CCr <10 ml/min, give full loading dose, then ½ of loading dose q8-10hr

**Available forms:** Inj 1, 2, 3 million units/50 ml; powder for inj 1, 5, 20 million units/vial

### >> Penicillin G procaine

**Moderate to severe pneumococcal infections**
**Adult and child:** IM 600,000-1.2 million units in 1 or 2 doses/day for 10 days to 2 wk
**Newborn:** Avoid use in newborns

**Pneumococcal pneumonia**
**Adult and child >12 yr:** IM 600,000-1.2 million units/day × 7-10 days

**Available forms:** Inj 600,000, 1,200,000 units/dose

### Moderately severe group A streptococcal/staphylococcal pneumonia

**Adult, adolescent, child ≥60 lb:** IM 600,000-1 million units/day

**Adolescent and child <60 lb:** IM 300,000 units/day

## >> Penicillin V

### Pneumococcal/staphylococcal infections

**Adult:** PO 250-500 mg q6hr

**Child <12 yr/adolescent/child >12 yr:** PO 25-50 mg/kg/day in divided doses q6-8hr, max 3 g/day

### Streptococcal infections

**Adult/adolescent/child >12 yr:** PO 125 mg q6-8hr × 10 days

**Child <12 yr and >27 kg:** PO 500 mg q8hr or 12hr × 10 days

**Child <12 yr and ≤27 kg:** PO 250 mg q8hr or q12hr or 40 mg/kg/day in 3 divided doses × 10 days

### Prevention of recurrence of rheumatic fever/chorea

**Adult:** PO 125-250 mg bid continuously

### Vincent's gingivitis/pharyngitis

**Adult:** PO 250 mg q6-8hr

## Renal dose

CCr <50 ml/min dosage reduction indicated based on clinical response, degree of impairment

**Available forms:** Tabs 250, 500 mg; powder for oral sol 125, 250 mg/5 ml

## Implementation

## >> Penicillin G benzathine

**IM route**

- No dilution needed, shake well, give deeply IM in large muscle mass, avoid intravascular inj; aspirate; do not give **IV**

## >> Penicillin G

- Penicillin G sodium or potassium can be given IM or IV, vials containing 10 or 20 million units are not for IM use

**Intermittent IV infusion route**

- Vials/bulk packages; dilute according to manufacturer's directions
- Frozen bags: thaw at room temp, do not force thaw, no reconstitution needed
- Final conc (100,000-500,000 units/ml, adults; 50,000 units/ml, neonate/infant)
- Total daily dose divided q4-6hr and given over 1-2 hr (adult), 15 min (infant/neonate)

## >> Penicillin G potassium

**Y-site compatibilities:** Acyclovir, amiodarone, aztreonam, atropine, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, ceFAZolin, cefTRIAXone, cefuroxime, chloramphenicol, clindamycin, cyclophosphamide, diltiazem, enalaprilat, esmolol, fluconazole, foscarnet, heparin, HYDROmorphone, labetalol, magnesium sulfate, meperidine, morphine, perphenazine, potassium chloride, tacrolimus, theophylline, verapamil, vit B/C

## >> Penicillin G procaine

- No dilution needed, give deep IM inj; avoid intravascular inj; aspirate; do not give IV
- Do not give **IV**
- Give deeply in large muscle mass
- Reconstitute with 0.9% NaCl, sterile water for inj, $D_5W$; refrigerate unused portion
- Shake medication before administering
- IM route may include procaine reactions: fear of death, depression, seizures, anxiety, confusion, hallucinations

## >> Penicillin V

- Orally on empty stomach for best absorption
- Oral susp: tap bottle to loosen, add ½ total amount of water, shake, add remaining water, shake; final conc (125 or 250); store in refrigerator after reconstitution, discard after 14 days
- Give in even doses around the clock; if GI upset occurs, give with food; product must be given for 10-14 days to ensure organism death and prevent superinfection; store in tight container
- Shake susp; store in refrigerator for 2 wk or for 1 wk at room temperature

## ADVERSE EFFECTS

**CNS:** Lethargy, hallucinations, anxiety, depression, twitching, coma, seizures, hyperreflexia

**GI:** *Nausea, vomiting, diarrhea,* increased AST, ALT, abdominal pain, glossitis, colitis, pseudomembranous colitis

**GU:** Oliguria, proteinuria, hematuria, *vaginitis, moniliasis,* glomerulonephritis, renal tubular damage

**HEMA:** Anemia, increased bleeding time, bone marrow depression, granulocytopenia, hemolytic anemia

**META:** Hyperkalemia, hypokalemia, alkalosis, hypernatremia

**MISC:** Local pain, tenderness and fever with IM inj, anaphylaxis serum sickness, Stevens-Johnson syndrome

## INTERACTIONS

### Individual drugs

Aspirin, probenecid: increased penicillin levels
Heparin: increased effect of heparin
Methotrexate: increased effect of methotrexate
Typhoid vaccine: decreased effect of toxoid vaccine

### Drug classifications

Contraceptives (oral): decreased contraceptive effectiveness
Tetracyclines: decreased antimicrobial effectiveness of penicillin

### Drug/lab test

False positive: urine glucose, urine protein

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction to penicillins or cephalosporins; cross-sensitivity between penicillins and cephalosporins is common
- **Assess patient for signs and symptoms of infection** including characteristics of wounds, sputum, urine, stool, WBC >10,000/mm$^3$, earache, fever; obtain information baseline, during treatment
- Obtain C&S before beginning drug therapy to identify if correct treatment has been initiated
- **Assess for allergic reactions:** rash, urticaria, pruritus, chills, fever, joint pain; angioedema may occur a few days after therapy begins; EPINEPHrine, resuscitation equipment should be available for anaphylactic reaction
- **Pseudomembranous colitis:** Assess for diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC and low serum albumin; stop product and usually give either vancomycin or IV metroNIDAZOLE

• Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also check for increased BUN, creatinine
• Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
• Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
• Assess bowel pattern daily; if severe diarrhea occurs, product should be discontinued; may indicate pseudomembranous colitis
• Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
• **Assess for overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

### Patient/family education

• Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate **blood dyscrasias (rare)**; CNS effects: depression, hallucinations, seizures
• Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate **superinfection**
• Instruct patient to take all medication prescribed for the length of time ordered
• Advise patient to notify prescriber of diarrhea with blood or pus, which may indicate pseudomembranous colitis
• **Pregnancy:** May decrease effect of hormonal contraceptives, advise another form of contraception
• **Sexually transmitted infection:** All partners must be notified and treated
• **Suspension:** Teach patient to shake suspension well before each dose, store in refrigerator for up to 2 wk

### Evaluation

**Positive therapeutic outcome**
• Absence of signs/symptoms of infection (WBC $<10{,}000/mm^3$, temp WNL, absence of red, draining wounds, earache)
• Reported improvement in symptoms of infection

**TREATMENT OF ANAPHYLAXIS:** Withdraw product, maintain airway, administer EPINEPHrine, SUBCUT × 3 doses, followed by an epinephrine drip, $O_2$, **IV** corticosteroids, inhaled bronchodilator

## pentamidine (Rx)

(pen-tam'i-deen)
**Nebupent, Pentam**
*Func. class.:* Antiprotozoal
*Chem. class.:* Aromatic diamide derivative

**ACTION:** Interferes with DNA/RNA synthesis in protozoa; has direct effect on islet cells in the pancreas

**Therapeutic outcome:** Protozoa death

**USES:** Treatment/prevention of *Pneumocystis jiroveci* infections

**Unlabeled uses:** Leishmaniasis, African trypanosomiasis

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, blood dyscrasias, cardiac/renal/hepatic disease, diabetes mellitus, hypocalcemia, hyper/hypotension, anemia

## DOSAGE AND ROUTES

**Adult and child ≥4 mo: IV/IM** 4 mg/kg/day × 2-3 wk; NEB 300 mg via specific nebulizer given q4wk for prevention

**Available forms:** Inj; aerosol 300 mg/vial; sol for aerosol 60 mg/vial

### Implementation

**Inhalation route**
• Through nebulizer, using Respirgard II jet nebulizer; mix contents in 6 ml of sterile water; do not use low pressure (<20 psi); flow rate should be 5-7 L/min (40-50 psi) air or $O_2$ source over 30-45 min until chamber is empty

**IM route**
• 300 mg diluted in 3 ml sterile water; give deep IM by Z-track; painful by this route, rotate inj site

**Intermittent IV infusion route**
• 300 mg/3-5 ml of sterile water for inj, $D_5W$; withdraw dose and further dilute in 50-250 ml of $D_5W$; diluted sol is stable for 48 hr; discard unused sol; give over 1 hr or more

**Y-site compatibilities:** alemtuzumab Alfentanil, aminocaproic acid, anidulafungin, argatroban atracurium, atropine, benztropine, buprenorphine, calcium gluconate, CARBOplatin, caspofungin, chlorpromazine, cimetidine, CISplatin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, diltiazem, gatifloxacin, zidovudine

**Y-site incompatibilities:** Foscarnet, fluconazole

## ADVERSE EFFECTS

**CNS:** Disorientation, hallucinations, dizziness, confusion, drowsiness
**CV:** Hypotension, ventricular tachycardia, QT prolongation, dysrhythmias
**GI:** *Nausea, vomiting, anorexia,* increased AST, ALT, acute pancreatitis, metallic taste
**GU:** Acute renal failure, increased serum creatinine, renal toxicity, decreased urination
**HEMA:** Anemia, leukopenia, thrombocytopenia
**INTEG:** Sterile abscess, pain at inj site, pruritus, urticaria, rash
**META:** Hyperkalemia, hypocalcemia, *hypoglycemia,* hypomagnesemia
**MISC:** Fatigue, fever, chills, night sweats, anaphylaxis, Stevens-Johnson syndrome
**RESP:** Cough, shortness of breath, bronchospasm (with aerosol), sore throat

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM); minimally absorbed (INH); completely absorbed (**IV**) |
| **Distribution** | Widely distributed; does not appear in CSF |
| **Metabolism** | Not known |
| **Excretion** | Kidneys, unchanged (up to 30%) |
| **Half-life** | 6½-9½ hr; increased in renal disease |

### Pharmacodynamics

| | IM | IV | INH |
|---|---|---|---|
| **Onset** | Unknown | Unknown | Unknown |
| **Peak** | ½-1 hr | Inf end | Unknown |
| **Duration** | Unknown | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Amphotericin B, CISplatin, vancomycin: increased nephrotoxicity
Erythromycin IV: fatal dysrhythmias
Haloperidol, chloroquine, droperidol, pentamidine; arsenic trioxide, levomethadyl: increased QT prolongation
Radiation: bone marrow suppression

### Drug classifications

Aminoglycosides NSAIDs: increased nephrotoxicity
Antineoplastics: increased bone marrow depression
Class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation

### Drug/lab test

Decrease: WBC, platelets, Hbg, Hct
Increase: BUN, creatinine potassium, LFTs

## NURSING CONSIDERATIONS

### Assessment

- **Assess any patient with compromised renal system:** product is excreted slowly in poor renal system function; toxicity may occur rapidly
- **QT prolongation:** ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea
- **Assess patient for infection,** including increased temp, thick sputum, WBC >10,000/mm$^3$; monitor these signs of infection throughout treatment; obtain C&S before beginning therapy; treatment may begin after culture is obtained
- Assess respiratory system including rate, rhythm, bilateral lung sounds, SOB, wheezing, dyspnea
- **Serious skin reactions:** Assess for rash, fever, fatigue, muscle/joint aches, oral lesions, blisters, discontinue product immediately if these occur
- **Pancreatitis:** Assess for nausea, vomiting, severe abdominal pain, monitor the lab values of lipase/amylase that will be elevated, if these occur product may need to be discontinued
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding
- Monitor ECG for cardiac dysrhythmias; ECG and pulse should be checked frequently during treatment, since cardiotoxicity can occur
- Assess for hypoglycemia including nausea, tremors, anxiety, chills, diaphoresis, headache, hunger, cold, pale skin; this side effect can last for several mo after treatment is completed
- Monitor for hyperglycemia including flushed, dry skin, acetone breath, thirst, anorexia, drowsiness, polyuria; this side effect can last for several mo after treatment is completed
- Monitor renal function tests including BUN, urinalysis, creatinine; obtain at baseline and frequently during treatment; nephrotoxicity may occur; check I&O, report hematuria, oliguria

P

• Monitor blood studies including blood glucose, CBC, platelets; blood glucose fluctuations are common; anemia, leukopenia, thrombocytopenia can occur
• Monitor liver function studies including AST, ALT, alkaline phosphatase, bilirubin before beginning treatment and every 3 days during therapy
• Monitor calcium and magnesium before beginning treatment and every 3 days during therapy; hypocalcemia may occur

### Patient/family education

• Teach patient to report sore throat, fever, fatigue; could indicate superinfection
• Advise patient not to drink alcohol or take aspirin, since gastric bleeding may occur
• Teach patient to make position changes slowly to prevent orthostatic hypotension
• Advise patient to maintain adequate fluid intake
• Teach patient to complete entire course of medication

### Evaluation

**Positive therapeutic outcome**
• Decreased signs and symptoms of protozoan infections
• Decreased signs and symptoms of *P. jiroveci* pneumonia in HIV infections

**RARELY USED**

## pentazocine (Rx)

(pen-taz′oh-seen)
**Talwin, Talwin NX**
*Func. class.:* Opiate analgesic
*Chem. class.:* Synthetic benzomorphan (agonist/antagonist)
**Controlled substance schedule IV**

**USES:** Moderate to severe pain

### CONTRAINDICATIONS

Hypersensitivity to this product or sulfites, addiction (opioid)

### DOSAGE AND ROUTES

**Adult: IV**/IM/SUBCUT 30 mg q3-4hr prn, max 360 mg/day

#### Labor

**Adult:** IM 30 mg as a single dose; **IV** 20 mg q2-3hr when contractions are regular, max 2-3 times

#### Renal dose

**Adult:** CCr 10-50 ml/min reduce dose by 25%; CCr <10 ml/min reduce dose by 50%

## peramivir

(per-am′i-vir)
**Rapivab**
*Func. class.:* Antiviral

**ACTION:** Competitively binds to the active site of the influenza virus, inhibits the activity of strains of influenza A and B viruses

**Therapeutic outcome:** Absence of developing influenza A or B

**USES:** Treatment of uncomplicated acute influenza (seasonal influenza A virus infection or seasonal influenza B virus infection)

**Unlabeled uses:** Treatment of H1N1 influenza A virus (swine influenza) infection in pediatric patients requiring hospitalization

### CONTRAINDICATIONS:

Hypersensitivity

**Precautions:** Breastfeeding, children, dialysis, infants, infection, pregnancy, psychosis, renal impairment

### DOSAGE AND ROUTES

#### Influenza

**Adult: IV** 600 mg as a single dose infused over 15-30 min, give within 48 hr of onset of influenza symptoms

**Available forms:** Solution for injection 200 mg/20 ml

#### Implementation

• For IV use only, do not give IM, visually inspect parenteral products for particulate matter and discoloration
• Dilute the 10 mg/ml to a max volume of 100 ml, use only 0.9% or 0.45% NaCl, 5% dextrose, or LR
• Storage of diluted solution: Use immediately or refrigerate up to 24 hr. Refrigerated solution should be allowed to reach room temperature before administration. Discard any unused diluted solution after 24 hr.
• Give over 15-30 min, do not mix or coadminister with other IV products

### ADVERSE EFFECTS

**CNS:** Delirium, psychosis, hallucinations, insomnia
**GI:** Constipation, diarrhea, vomiting
**MISC:** Rash, Stevens-Johnson syndrome

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding <30% |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications:

Intranasal influenza vaccines, H1N1 vaccines: avoid concurrent use

## NURSING CONSIDERATIONS

### Assessment

- Assess for hypersensitivity reactions/Stevens-Johnson syndrome
- Neuropsychiatric reactions: Assess for delirium, psychosis, hallucinations
- **Pregnancy/breastfeeding:** Use only if clearly needed

### Patient/family education

- Teach patient that product is only for use within 48 hr of symptoms

### Evaluation

**Therapeutic response**

Absence of developing influenza A or B

**⚠ HIGH ALERT**

# pertuzumab

(per-too′zoo-mab)

**Perjeta**

*Func. class.:* Antineoplastic biologic response modifier

*Chem. class.:* Monoclonal antibody, antineoplastic

**ACTION:** Blocks liquid-dependent action of human epidermal growth factor-2 (HER2), inhibiting signal pathways

**Therapeutic outcome:** Decreased size, spread of tumor

**USES:** First-line treatment of (HER2) positive metastatic breast cancer with trastuzumab and DOCEtaxel

## CONTRAINDICATIONS

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Breastfeeding, children, infants, neonates, cardiac arrhythmias, MI, cardiac disease, heart failure, hypertension, infusion-related reactions, Asian patients

**BLACK BOX WARNING:** Heart failure, ventricular dysfunction

## DOSAGE AND ROUTES

**Adult: IV** 840 mg over 60 min, then after 3 wk 420 mg over 30–60 min every 3 wk; give with trastuzumab 8 mg/kg IV over 90 min, then after 3 wk 6 mg/kg over 30–90 min every 3 wk and DOCEtaxel 75 mg/m 2 IV every 3 wk; dosage may be escalated to 100 mg/m$^2$

**Available forms:** Solution for inj 420 mg/14 ml (single-use vials)

### Implementation

- Visually inspect for particulate matter and discoloration

**Dilution and preparation**

- Withdraw the calculated dose from the vial and add to a 250 ml 0.9% sodium chloride to PVC or non-PVC polyolefin infusion bag; do not dilute with dextrose 5% solution
- Dilute in normal saline only; do not mix or dilute with other drugs or dextrose solutions
- Mix the diluted solution by gentle inversion; do not shake

**IV infusion**

- Administer the diluted solution immediately
- Do not administer as an IV push or bolus
- Give the first dose of 840 mg over 60 min and subsequent 420-mg doses over 30–60 min
- If the diluted solution is not used immediately, store at 2°–8° C for up to 24 hr

**Delayed or missed doses**

- If time since previous dose is 6 wk, give 420 mg IV (do not wait for next scheduled dose)
- If time since previous dose is 6 wk, give 840 mg IV over 60 min, followed 3 wk later by 420 mg IV over 30–60 min repeated every 3 wk
- If DOCEtaxel is discontinued, this product and trastuzumab may continue

## ADVERSE EFFECTS

**CNS: Headache, fever, peripheral neuropathy,** chills, **fatigue, asthenia, dizziness**
**CV:** Heart failure
**EENT:** Lacrimation, **stomatitis**
**GI: Nausea, vomiting, diarrhea,** dysgeusia, anorexia, constipation
**HEMA:** Anemia, neutropenia, arthralgia
**RESP:** Upper respiratory infection, cough
**SYST:** Anaphylaxis, antibody formation
**INTEG:** *Alopecia*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Median 18 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## NURSING CONSIDERATIONS

### Assessment

• **HER2 overexpression**: Testing should be done to identify HER2 overexpression before using this product

• **Decreased left ventricular ejection fraction (LVEF):** Can occur and is increased in those with a history of prior anthracycline use or radiotherapy to the chest; evaluate LVEF at baseline and every 3 mo; withhold therapy × 3 wk if LVEF is <40% or LVEF is 40%–45% with a 10% or greater absolute decrease from baseline; resume therapy if the LVEF is recovered to >45% or to 40%–45% with <10% absolute decrease at reassessment; if the LVEF has not improved or has declined further, consider permanently discontinuing pertuzumab and trastuzumab after a risk/benefit assessment

• **Infusion-related reactions/hypersensitivity:** Assess anaphylactoid reaction, acute infusion reaction, cytokine-release syndrome 60 min after the first infusion, 30 min after other infusions; monitor for pyrexia, chills, fatigue, headache, asthenia, hypersensitivity, and vomiting; if a significant reaction occurs, slow or interrupt the infusion; permanent discontinuation may be needed in severe reactions

**BLACK BOX WARNING: Pregnancy:** Determine if pregnancy is planned or suspected; patients who become pregnant during therapy should report exposure to the Genentech Adverse Event line at 888-835-2555 and enroll in the MOTHER pregnancy registry at 800-690-6720

• **Neutropenia:** Can occur, but occurs more commonly when trastuzumab is also used and in Asian patients

• Upper respiratory infection: Monitor for dyspnea, shortness of breath, fever

### Patient/family education

**BLACK BOX WARNING:** Counsel women of childbearing age on the need for contraception during and for 6 mo after therapy; advise patients who suspect pregnancy to contact their health care provider immediately; discontinue breastfeeding

• Teach patient to notify prescriber immediately of infection: cough, fever, chills, sore throat

• Teach patient to avoid all OTC, Rx, herbals, supplements unless approved by prescriber, not to use aspirin, NSAIDs, alcohol

• Teach patient to notify prescriber of peripheral neuropathy

• Hair loss is common

### Evaluation

**Positive therapeutic outcome**

• Decreased size, spread of tumor

## phenylephrine nasal agent

*See Appendix B*

## phenylephrine ophthalmic

*See Appendix B*

## phenytoin (Rx)

(fen′i-toyn)

**Dilantin, Dilantin Infatabs, Mebroin, Phenytek, Tremytoine**

*Func. class.:* Anticonvulsant/antidysrhythmic (class IB)

*Chem. class.:* Hydantoin

**ACTION:** Inhibits spread of seizure activity in motor cortex by altering ion transport; increases AV conduction to decrease dysrhythmias

**Therapeutic outcome:** Decreased seizures, absence of dysrhythmias

**USES:** Generalized tonic-clonic seizures, status epilepticus, nonepileptic seizures associated with Reye's syndrome or after head trauma, complex/partial seizures

## CONTRAINDICATIONS

Pregnancy, hypersensitivity, psychiatric condition, bradycardia, SA and AV block, Stokes-Adams syndrome

**Precautions:** Geriatric, allergies, renal/hepatic disease, petit mal seizures, hypotension, myocardial insufficiency, Asian patients positive for HLA-B 1502, hepatic failure, acute intermittent porphyria

**BLACK BOX WARNING:** IV use

## DOSAGE AND ROUTES

### Seizures

**Adult:** PO 15-20 mg/kg (EXT REL) in 3-4 divided doses given q2hr or 400 mg, then 300 mg q2hr × 2 doses, maintenance 4-7 mg/kg/day; max 600 mg/day; **IV** 15-20 mg/kg, max 25-50 mg/min then 100 mg q6-8hr

**Child:** PO 5 mg/kg/day in 2-3 divided doses, maintenance 4-8 mg/kg/day in 2-3 divided

doses, max 300 mg/day; **IV** 15-20 mg/kg at 1-3 mg/kg/min

### Status epilepticus

**Adult:** **IV** 15-20 mg/kg, max 25-50 mg/min; may give 100 mg q6-8hr thereafter
**Child:** **IV** 15-20 mg/kg, max in divided doses 1-3 mg/kg/min

### Ventricular dysrhythmias

**Adult:** PO loading dose 1 g divided over 24 hr, then 500 mg/day × 2 days; **IV** 250 mg given over 5 min until dysrhythmias subside or 1 g is given, or 100 mg q15min until dysrhythmias subside or 1 g is given
**Child:** PO 3-8 mg/kg or 250 mg/m$^2$/day as single dose or divided in 2 doses; **IV** 3-8 mg/kg given over several min, or 250 mg/m$^2$/day as single dose or divided in 2 doses

### Renal dose

**Adult:** Do not use loading dose if CCr <10 ml/min or hepatic failure

**Available forms:** Susp 25 mg/5 ml; chew tabs 50 mg; inj 50 mg/ml; ext rel caps 100, 200, 300 mg; prompt rel caps 100 mg

### Implementation

**PO route**

- Do not interchange chewable product with caps, not equivalent; only ext rel caps are to be used for once-a-day dosing
- Give with meals to decrease GI upset
- Chew tab can be crushed or chewed; cap can be opened and mixed with foods or fluids; cap and tab are not interchangeable, only ext rel cap is to be used for once a day dosing
- Do not take antacids or antidiarrheals within 2-3 hr of taking phenytoin
- **Oral suspension:** shake well before each dose G tube/NG tube; dilute susp prior to administration; flush tube with 20 ml water after dose; hold tube feedings 1 hr before and 1 hr after dose
- Allow 7-10 days between dosage changes
- Divided PO doses with or after meals to decrease adverse effects
- 2 hr before or after antacid, enteral feeding
- Shake oral susp well; use measuring device for correct dose

**Direct IV route**

**BLACK BOX WARNING:** Give undiluted at ≤50 mg/min (adult) 1-3 mg/kg/min (neonates); 0.5-1 mg/kg/min

**Intermittent IV INF route**

**BLACK BOX WARNING:** Dilute dose in NS to ≤6.7 mg/ml, complete inf within 1 hr of preparation, use 0.22 or 0.55 micron in-line particulate final filter between **IV** catheter and tubing, flush the **IV** line or catheter with NS before and after use, give at ≤50 mg/min (adult), 0.5-1 mg/kg/min (child, infant, neonate)

## ADVERSE EFFECTS

**CNS:** Dizziness, insomnia, paresthesias, depression, suicidal tendencies, aggression, headache, confusion, slurred speech, peripheral neuropathy
**CV:** Hypotension, ventricular fibrillation, bradycardia, cardiac arrest
**EENT:** Nystagmus, diplopia, blurred vision
**ENDO:** Diabetes insipidus
**GI:** Nausea, vomiting, constipation, anorexia, weight loss, hepatitis, jaundice, gingival hyperplasia, abdominal pain
**GU:** Nephritis, urine discoloration, sexual dysfunction
**HEMA:** Agranulocytosis, leukopenia, aplastic anemia, thrombocytopenia, megaloblastic anemia
**INTEG:** Rash, lupus erythematosus, Stevens-Johnson syndrome, hirsutism, toxic epidermal necrolysis
**SYST:** Hypocalcemia, purple glove syndrome (IV), exacerbation of myasthenia gravis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Slowly absorbed from GI tract; erratic (IM) |
| **Distribution** | Crosses placenta, 90%-95% protein binding |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, minimally; enters breast milk |
| **Half-life** | 7-42 hr, dose dependent |

### Pharmacodynamics

| | PO | PO-EXT REL | IM | IV |
|---|---|---|---|---|
| **Onset** | 2-24 hr | 2-24 hr | Erratic | 1-2 hr |
| **Peak** | 1½-3 hr | 4-12 hr | Erratic | Unknown |
| **Duration** | 6-12 hr | 12-36 hr | 12-24 hr | 12-24 hr |

## INTERACTIONS

### Individual drugs

Alcohol (chronic use), calcium (high dose), carBAMazepine, folic acid, rifampin: decreased effects of phenytoin

Chloramphenicol, cimetidine, cycloSERINE, disulfiram, alcohol, amiodarone, FLUoxetine, gabapentin, methylphenidate, felbamate, traZODone, diazepam, valproate: increased phenytoin effect

Delavirdine: decreased response, resistance, do not use together

### Drug classifications

Antacids, barbiturates: decreased effect of phenytoin

Antidepressants (tricyclics), benzodiazepines, sulfonamides, $H_2$ antagonists, azole antifungals, estrogens, succinimides, phenothiazines, salicylates: increased phenytoin level

### Drug/food

Enteral tube feeding: may decrease absorption of oral product, do not use enteral feedings 2 hr before and after dose

### Drug/lab test

Increased: glucose, alkaline phosphatase, BSP

Decreased: dexamethasone, metyrapone test serum, urinary steroids

## NURSING CONSIDERATIONS

### Assessment

- Assess product level: toxic level 30-50 mcg/ml; therapeutic level 7.5-20 mcg/ml, wait ≥1 wk to determine level
- **Assess mental status:** mood, sensorium, affect, memory (long, short), especially geriatric; suicidal thoughts/behaviors
- **Phenytoin hypersensitivity syndrome:** assess 3-12 wk after start of treatment: rash, temp, lymphadenopathy; may cause hepatotoxicity, renal failure, rhabdomyolysis
- **Serious skin disorders:** assess for beginning rash that may lead to Stevens-Johnson syndrome or toxic epidermal necrolysis; phenytoin should not be used again, may occur more often in Asian patients with HLA-B 1502
- **Purple glove syndrome:** with IV use
- **Phenytoin level:** toxic level 30-50 mcg/ml, therapeutic level: 7.5-20 mcg/ml, wait ≥1 wk to draw levels
- **Seizures:** assess for duration, type, intensity precipitating factors, obtain EEG periodically, monitor therapeutic level
- Blood studies: CBC, platelets q2wk until stabilized, then qmo × 12, then q3mo; discontinue product if neutrophils $<1600/m^3$; renal function: albumin conc; folic acid levels, LFTs
- **Blood dyscrasias:** assess fever, sore throat, bruising, rash, jaundice, epistaxis (long-term treatment only)
- Assess renal studies: urinalysis, BUN, urine creatinine
- Monitor blood studies: RBC, Hct, Hgb, reticulocyte counts weekly for 4 wk then monthly; also check thyroid function tests, serum calcium
- Monitor ECG, B/P, respiratory function during IV loading dose; verify potency of IV access port prior to IV infusion
- Monitor EEG function and serum levels periodically
- Monitor liver function tests for renal failure: ALT, AST, bilirubin, creatinine
- Assess for signs of physical withdrawal if medication suddenly discontinued
- Assess eye problems: need for ophth exam before, during, after treatment (slit lamp, funduscopy, tonometry)
- **Monitor for toxicity:** bone marrow depression, nausea, vomiting, ataxia, diplopia, CV collapse, slurred speech, confusion
- **Beers:** Avoid use in older adults unless safer alternatives are not available, ataxia, impaired psychomotor function may occur
- **Pregnancy/breastfeeding:** Pregnant patient should enroll in the Antiepileptic Drug Pregnancy Registry 888-233-2334, may cause fetal malformations, use other options when possible, breastfeeding is not recommended

### Patient/family education

- Teach patient to carry/wear emergency ID stating name, products taken, condition, prescriber's name and phone number
- Advise patient to avoid driving and other activities that require alertness until product response is known; dizziness, drowsiness can occur
- Advise patient to avoid alcohol ingestion and CNS depressants unless approved by prescriber; increased sedation may occur
- Teach patient not to discontinue medication quickly after long-term use; taper off over several wk
- Advise patient that urine may turn pink, red, or brown
- Caution patient to avoid antacids or antidiarrheals within 2-3 hr of taking phenytoin
- Instruct patient in proper oral hygiene to prevent gingival hyperplasia; to visit dentist routinely
- Teach patient to use nonhormonal contraception, to notify prescriber if pregnancy is planned or suspected

- Teach patient to notify prescriber of unusual bleeding, bruising, petechiae (bleeding), clay-colored stools, abdominal pain, dark urine, yellowing of skin/eyes (hepatotoxicity); slurred speech, headache, drowsiness
- Teach patient to report suicidal thoughts/behaviors immediately

### Evaluation

**Positive therapeutic outcome**
- Decreased seizure activity
- Decreased dysrhythmias
- Relief of pain

## physostigmine ophthalmic

*See Appendix B*

## phytonadione (vit $K_1$) (Rx)

(fye-toe-na-dye′one)
**Konakion ✱ Mephyton**
*Func. class.:* Vitamin $K_1$, fat-soluble vitamin

**Do not confuse:** Mephyton/methadone

**ACTION:** Needed for adequate blood clotting (factors II, VII, IX, X)

**Therapeutic outcome:** Prevention of bleeding

**USES:** Vitamin K malabsorption, hypoprothrombinemia, prevention of hypoprothrombinemia caused by oral anticoagulants, prevention of hemorrhagic disease of the newborn

### CONTRAINDICATIONS

Hypersensitivity, severe hepatic disease, last few wk of pregnancy

**Precautions:** Pregnancy, neonates, hepatic disease, IV use

**BLACK BOX WARNING:** Risk of anaphylaxis

### DOSAGE AND ROUTES

#### Hypoprothrombinemia caused by vitamin K malabsorption

**Adult:** PO/IM 2.5-25 mg; may repeat or increase to 50 mg
**Child:** PO 2.5-5 mg
**Infant:** PO/IM 2 mg

#### Prevention of hemorrhagic disease of the newborn

**Neonate:** IM 0.5-1 mg within 1 hr after birth; repeat in 2-3 wk if required

#### Hypoprothrombinemia caused by oral anticoagulants

**Adult and child:** PO/SUBCUT/IM 1-10 mg, may repeat 12-48 hr after PO dose or 6-8 hr after SUBCUT/IM dose, based on INR

**Available forms:** Tabs 5 mg; inj 10 mg/ml, 1 mg/0.5 ml

### Implementation

**IM route**
- Only use when other routes are not possible (deaths have occurred from allergic reactions)

**Intermittent IV infusion route**
- Give **IV** after diluting with $D_5$ NS 10 ml or more; give max 1 mg/min
- Give **IV** only when other routes not possible (deaths have occurred)
- Store in airtight, light-resistant container

**Y-site compatibilities:** Alfentanil, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azaTHIOprine, aztreonam, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, ceFAZolin, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, ceftAZidime, ceftizoxime, ceftRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, clindamycin, cyanocobalamin, cycloSPORINE, dexamethasone, digoxin, diphenhydrAMINE, DOPamine, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, erythromycin, esmolol, famotidine, fentaNYL, fluconazole, folic acid, furosemide, ganciclovir, gentamicin, glycopyrrolate, heparin, hydrocortisone, imipenem-cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, lidocaine, mannitol, meperidine, metaraminol, methoxamine, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, papaverine, penicillin G potassium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, potassium chloride, procainamide, prochlorperazine, propranolol, pyridoxine, ranitidine, sodium bicarbonate, succinylcholine, SUFentanil, theophylline, thiamine, ticarcillin/clavulanate, tobramycin, tolazoline, trimethaphan, urokinase, vancomycin, vasopressin, verapamil, vitamin B with C

**Y-site incompatibilities:** Dantrolene, diazepam, diazoxide, magnesium sulfate, phenytoin, trimethoprim/sulfamethoxazole

### ADVERSE EFFECTS

**CNS:** Headache, brain damage (large doses)
**GI:** Nausea, decreased liver function tests

**HEMA:** Hemolytic anemia, hemoglobinuria, hyperbilirubinemia
**INTEG:** Rash, urticaria
**RESP:** Bronchospasm, dyspnea, chest constriction, respiratory arrest

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, IM, SUBCUT) |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver, rapidly |
| **Excretion** | Breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics

| | PO | SUBCUT/IM |
|---|---|---|
| **Onset** | 6-12 hr | 1-2 hr |
| **Peak** | Unknown | 6 hr |
| **Duration** | Unknown | 14 hr |

## INTERACTIONS

### Individual drugs

Sucralfate, mineral oil: decreased action of phytonadione
Warfarin: decreased action of warfarin (large dose of this product)

### Drug classifications

Oral anticoagulants: decreased anticoagulant effect
Bile acid sequestrants, antiinfectives, salicylates: decreased action of phytonadione

### Drug/food

Olestra: decreased vit K levels

## NURSING CONSIDERATIONS

### Assessment

- Monitor pro-time during treatment (2-sec deviation from control time, bleeding time, and clotting time), INR
- Monitor for bleeding, INR pulse, and B/P
- Assess nutritional status: liver (beef), spinach, tomatoes, coffee, asparagus, broccoli, cabbage, lettuce, greens
- Assess for bleeding or bruising: hematuria, black tarry stools, hematemesis
- **Pregnancy/breastfeeding:** Usually not needed in pregnancy, may breastfeed

### Patient/family education

- Teach patient not to take other supplements unless directed by prescriber; to take this medication as directed
- Teach patient necessary foods high in vit K to be included in diet
- Advise patient to avoid IM inj, hard toothbrush, flossing; use electric razor until treatment is terminated
- Instruct patient to report symptoms of bleeding: bruising, nosebleeds, blood in urine, heavy menstruation, black tarry stools
- Caution patient not to use OTC medications unless approved by prescriber
- Stress the need for periodic lab tests to monitor coagulation levels
- Stress the need for patient to carry/wear emergency ID with condition, treatment, and medications taken

### Evaluation

**Positive therapeutic outcome**

- Decreased bleeding tendencies
- Decreased pro-time
- Decreased clotting time

## pilocarpine ophthalmic

*See Appendix B*

## pimavanserin

(pam-a-vans'er-in)
**Nuplazid**
*Func. class.:* Atypical antipsychotic

**ACTION:** The exact mechanism of action is unknown; may be mediated through inverse agonist and antagonist activity at serotonin 5-HT2A receptors, and to a lesser extent at 5-HT2C receptors

**Therapeutic outcome:** Decrease in hallucinations, delusions, paranoia; reorganization of patterns of thought and speech

**USES:** The treatment of hallucinations and delusions associated with Parkinson's disease psychosis

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Alcoholism, bradycardia, breastfeeding, cardiac arrhythmias, cardiac disease, children, coronary artery disease, diabetes mellitus, females, geriatric patients, heart failure, hepatic disease, hypertension, hypocalcemia, hypokalemia, hypomagnesemia, long QT syndrome, malnutrition, myocardial infarction, pregnancy, QT prolongation, renal failure, renal impairment, stroke, thyroid disease

**BLACK BOX WARNING:** Dementia-related psychosis

## DOSAGE AND ROUTES

**Adult: PO** 34 mg (taken as two 17-mg tablets) qday, without titration

**Hepatic dose**
**Adult:** PO Not recommended

### Renal dose
**Adult:** PO CCr 30 ml/min or more: No dosage adjustment needed; CCr <30 ml/min: Not recommended

### Other dosage adjustments
- **Patients receiving a strong CYP3A4 inhibitor:** 17 mg qday
- **Patients receiving a strong CYP3A4 inducer:** Monitor for reduced effect, increase dose if needed

**Available forms:** Tab 17 mg

### Implementation:
- Give without regard to food

## ADVERSE EFFECTS
**CNS:** Confusion, hallucinations, fatigue, stroke, dizziness

**GI:** Nausea, constipation

**Misc:** Peripheral edema, infection, QT prolongation

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding |
| **Metabolism** | Hepatic metabolism occurs through CYP3A4 and CYP3A5, and to a lesser extent CYP2J2, CYP2D6 with a major active metabolite |
| **Excretion** | 0.55% eliminated unchanged in the urine and 1.53% was eliminated in feces after 10 days |
| **Half-life** | Plasma half-lives of drug and metabolite are 57 hr and 200 hr, respectively |

### Pharmacodynamics

| | |
|---|---|
| Onset | Unknown |
| Peak | 6 hr |
| Duration | Unknown |

## INTERACTIONS
### Drug classifications
CYP2D6 inhibitors (fluoxetine, paroxetine, quinidine), CYP3A4 inhibitors (erythromycin, ketoconazole); reduce dose of pimavanserin: increased effects of pimavanserin

Other CNS depressants: increased sedation

Products that cause QT prolongation: Increase: QT prolongation, CYP3A4 inducers (carbamazepine): decreased pimavanserin effects

### Drug/herb
St. John's wort: decreased pimavanserin effect

## NURSING CONSIDERATIONS
### Assessment
**BLACK BOX WARNING:** Dementia-related psychosis: At increased risk of death, avoid using

- Swallowing of medication, check for hoarding, giving product to other patients
- AIMS assessment, neurologic function, LFTs, serum electrolytes, creatinine monthly
- Constipation daily, if this occurs, increase bulk, water in diet, stool softeners, laxatives may be needed
- **QT prolongation:** Avoid in those with cardiac disease or other risk factors for QT prolongation, torsades de pointes (TdP), and/or sudden death such as cardiac arrhythmias, congenital long QT syndrome, heart failure, bradycardia, myocardial infarction, hypertension, coronary artery disease, hypomagnesemia, hypokalemia, hypocalcemia, or in patients receiving medications known to prolong the QT interval. Females, elderly patients, patients with diabetes mellitus, thyroid disease, malnutrition, alcoholism, or hepatic impairment may also be at increased risk for QT prolongation
- **Renal disease:** Product is not recommended for patients with severe renal impairment (CCr <30 ml/min)
- **Hepatic disease:** Product is extensively metabolized in the liver, use is not recommended in patients with mild, moderate, or severe hepatic disease
- Stroke: Avoid antipsychotics to treat delirium or dementia-related behavioral problems unless nonpharmacologic options have failed or are not possible and the patient is a substantial threat to self or others, avoid use in those with a history of falls or fractures
- Hyponatremia: Product can cause hyponatremia and SIADH, and the elderly are at increased risk of developing these conditions, sodium levels should be closely monitored when starting or changing dosages of antipsychotics in older adults

## PATIENT/FAMILY EDUCATION
- To avoid hazardous activities until response is known, dizziness may occur
- That compliance with dose is needed
- To avoid OTC products unless approved by prescriber

**Evaluation:** Decrease in hallucinations, delusions, paranoia; reorganization of patterns of thought and speech

## pimecrolimus topical

*See Appendix B*

**⚠ HIGH ALERT**

## pioglitazone (Rx)

(pie-oh-glye'ta-zone)

**Actos**

*Func. class.:* Antidiabetic, oral

*Chem. class.:* Thiazolidinedione

**Do not confuse:** Actos/Actonel

**ACTION:** Specifically targets insulin resistance, an insulin sensitizer; regulates the transcription of a number of insulin-responsive genes

**Therapeutic outcome:** Decreased symptoms of diabetes mellitus

**USES:** Type 2 diabetes mellitus

## CONTRAINDICATIONS

Breastfeeding, children, hypersensitivity to thiazolidinediones, diabetic ketoacidosis

**BLACK BOX WARNING:** NYHA Class III/IV heart failure

**Precautions:** Pregnancy, thyroid/renal/hepatic disease, edema, geriatric patients with CV disease, polycystic ovary syndrome, bladder cancer, osteoporosis, pulmonary disease, secondary malignancy

## DOSAGE AND ROUTES

### Monotherapy

**Adult:** PO 15-30 mg/day, may increase to 45 mg/day; with strong CYP2C8 max 15 mg/day; those with NYHA class I/II heart failure max 15 mg/day

### Combination therapy

**Adult:** PO 15-30 mg/day with a sulfonylurea, metformin, or insulin; decrease sulfonylurea dose if hypoglycemia occurs; decrease insulin dose by 10%-25% if hypoglycemia occurs or if plasma glucose is <100 mg/dl; max 45 mg/day

### Hepatic dose

Do not use in active liver disease or if ALT >2.5 × ULN

**Available forms:** Tabs 15, 30, 45 mg

### Implementation

- Convert from other oral hypoglycemic agents; change may be made with gradual dosage change; monitor serum glucose during conversion
- Give once a day without regard to meals
- Give tabs crushed and mixed with meal or fluids for patients with difficulty swallowing
- Store in airtight container in cool environment

## ADVERSE EFFECTS

**CNS:** *Headache*

**CV:** MI, heart failure, death (geriatric patients)

**ENDO:** Hyper/hypoglycemia

**MISC:** *Myalgia, sinusitis, upper respiratory tract infection, pharyngitis,* hepatotoxicity, edema, weight gain, anemia, macular edema; risk of bladder cancer (use >1 yr), peripheral/pulmonary edema

**MS:** Fractures (females), rhabdomyolysis, myalgia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding >99% |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys |
| **Half-life** | 3-7 hr, terminal 16-24 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 6-12 wk |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Atorvastatin: decreased effect of this product

Fluconazole, itraconazole, ketoconazole, miconazole, voriconazole: decreased pioglitazone effect

### Drug classifications

CYP2C8 inducers: decreased pioglitazone effect

Oral contraceptives: decreased effect, use an alternative contraceptive method

### Drug/herb

Garlic, green tea, horse chestnut: increased hypoglycemia

### Drug/lab test

Increased: CPK, LFTs, HDL, cholesterol

Decreased: glucose, Hct/Hgb

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Heart failure:** do not use in NYHA Class III/IV; excessive/rapid weight gain > 5 lb, dyspnea, edema; may need to be reduced or discontinued, monitor daily weights

• **Hypoglycemic reactions:** assess for hypoglycemic reactions (sweating, weakness, dizziness, anxiety, tremors, hunger), hyperglycemic reactions soon after meals (rare)
• **Bladder cancer:** Avoid use in patients with history of bladder cancer; use of pioglitazone >1 yr has been correlated with an increase in bladder cancer; may occur more often with insulin or other antidiabetics
• **Hepatic disease:** check LFTs periodically: AST, LDH; do not start treatment in active heart disease or if ALT >2.5× upper limit of normal; if treatment has already begun, follow closely with continuing ALT levels; if ALT increases to >3× upper limit of normal, recheck ALT as soon as possible, if ALT remains >3× upper limit of normal, discontinue
• Monitor FBS, glycosylated HbA1c, plasma lipids/lipoproteins, B/P, body weight during treatment
• Monitor CBC with differential prior to and during therapy, more necessary in those with anemia, Hct/Hgb (may be decreased in first few months of treatment)
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, usually insulin is used in pregnancy, do not breastfeed, excretion unknown
• **Beers:** Avoid use in older adults, may promote fluid retention and/or exacerbate heart failure

### Patient/family education

• Teach patient to self-monitor using a blood glucose meter
• Teach patient symptoms of hypo/hyperglycemia, what to do about each (rare)
• Advise patient that product must be continued on daily basis; explain consequence of discontinuing product abruptly
• Advise patient to avoid OTC medications or herbal preparations unless approved by prescriber; to report weight gain, edema
• Advise patient that diabetes is lifelong illness; that this product is not a cure, only controls symptoms
• Instruct patient to notify prescriber if oral contraceptives are used, effect may be decreased
• Teach patient not to use if breastfeeding
• Teach patient that lab work, eye exams will be needed periodically

### Evaluation

**Positive therapeutic outcome**

• Decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; blood glucose, A1c improvement

## piperacillin/tazobactam (Rx)

(pip′er-ah-sill′in/ta-zoe-bak′tam)
**Tazocin, Zosyn**
*Func. class.:* Broad-spectrum antiinfective
*Chem. class.:* Extended-spectrum penicillin

**ACTION:** Interferes with cell wall replication of susceptible organisms; tazobactam is a β-lactamase inhibitor, protects piperacillin from enzymatic degradation

**Therapeutic outcome:** Bactericidal effects for piperacillin-resistant β-lactamase, *Escherichia coli, Staphylococcus aureus, Bacteroides fragilis, Bacteroides ovatus, Bacteroides thetaiotaomicron, Bacteroides vulgatus, Haemophilus influenzae*

**USES:** Moderate to severe infections: piperacillin-resistant, β-lactamase strains causing infections in respiratory tract, skin, skin structure, urinary tract, bone, and joint; gonorrhea, pneumonia, infections from penicillinase-producing staphylococci, streptococci

**Unlabeled uses:** Endocarditis

### CONTRAINDICATIONS

Hypersensitivity to penicillins; neonates, carbapenem allergy

**Precautions:** Pregnancy, breastfeeding, HF, seizures, hypersensitivity to cephalosporins, renal insufficiency in neonates, GI disease, electrolyte imbalances, biliary obstruction

### DOSAGE AND ROUTES

**Nosocomial pneumonia**

**Adult: IV** 4.5 g q6hr or 3.375 g q4hr with an aminoglycoside or antipseudomonal fluoroquinolone × 1-2 wk

**Appendicitis/peritonitis**

**Child ≥40 kg (88 lb): IV** 3.375 g q6hr × 7-10 days
**Child ≥9 mo and <40 g: IV** 100 mg (piperacillin)/q8hr × 7-10 days
**Infant 2 mo to <9 mo: IV** 80 mg/kg (piperacillin) q8hr × 7-10 days

**Renal dose**

**Adult:** IV CCr 20-40 ml/min give 3.375 g q6hr (nosocomial pneumonia); give 2.25 g q6hr (all other indications); CCr <20 ml/min, give 2.25 g q6hr (nosocomial pneumonia); give 2.25 g q8hr (all other indications)

**Available forms:** Powder for inj 2 g piperacillin/0.25 g tazobactam, 3 g piperacillin/0.375 g tazobactam, 4 g piperacillin/0.5 g tazobactam, 36 g piperacillin/4.5 g tazobactam

## Implementation

• Separate aminoglycoside from piperacillin to avoid inactivation
• Product after C&S is complete

**Intermittent IV infusion route**

• Reconstitute each 1 g of product/5 ml 0.9% NaCl for inj or sterile water for inj, dextrose 5%; shake well; further dilute in at least 50 ml compatible IV sol and run as int inf over at least 30 min

**ADD-Vantage IV solution: reconstitution**

• Reconstitute with 0.9% NaCl or $D_5W$ in the appropriate flexible diluent container provided; for 500 mg vials, use at least a 100 ml diluent container and for 750 mg and 1 g vials, use only the 250 ml diluent container
• Remove the protective covers from the top of the vial and vial port. Remove vial cap (do not access with a syringe) and vial port cover. Screw the vial into the vial port until it will go no further to assure a seal. Once vial is sealed to the port, do not remove. To activate the contents of the vial, squeeze the bottom of the diluent container gently to inflate the portion of the container surrounding the end of the drug vial. With the other hand, push the drug vial down into the container telescoping walls of the container and grasp the inner cap of the vial through the walls of the container. Pull the inner cap from the drug vial. Verify the rubber stopper has been pulled out, allowing the drug and diluent to mix. Mix the container contents thoroughly
• *Storage after reconstitution:* The admixture solution may be stored for up to 24 hr at room temperature. Do not refrigerate or freeze after reconstitution
• Do not use in series connections with flexible containers

**Pre-mixed Galaxy IV solution**

• Thaw frozen containers at room temperature (20-25° C or 68-77° F) or under refrigeration (2-8° C or 36-46° F). Do not force thaw by immersion in water baths or by microwaving. Check for leaks by squeezing bag firmly
• Do not admix
• Contents of the solution may precipitate in the frozen state and should dissolve with little or no agitation once the solution has reached room temperature
• *Storage:* The thawed solution is stable for 24 hours at room temperature or for 14 days under refrigeration. Do not refreeze thawed product
• Do not use plastic containers in series connections as this could result in an embolism due to residual air being drawn from the primary container before administration of the fluid from the secondary container is complete

**IV infusion**

• Infuse IV over at least 30 min. Ambulatory intravenous infusion pumps can be used; the solution is stable for up to 12 hr at room temperature

**Y-site compatibilities:** Alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, atenolol, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate/chloride/gluconate, CARBOplatin, carmustine, cefepime, chloramphenicol, cimetidine, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexrazoxane, diazepam, digoxin, diphenhydrAMINE, DOCEtaxel, DOPamine, doxacurium, enalaprilat, ePHEDrine, EPINEPHrine, eptifibatide, erythromycin, esmolol, etoposide, fenoldopam, fentaNYL, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gallium, granisetron, heparin, hydrocortisone, HYDROmorphone, ifosfamide, isoproterenol, ketorolac, lansoprazole, lepirudin, leucovorin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, metaraminol, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, milrinone, morphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, plicamycin, potassium chloride/phosphates, procainamide, ranitidine, remifentanil, riTUXimab, sargramostim, sodium acetate/bicarbonate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, telavancin, teniposide, theophylline, thiotepa, tigecycline, tirofiban, trimethobenzamide, vasopressin, vinBLAStine, vinCRIStine, voriconazole, zidovudine, zoledronic acid

**Y-site incompatibilities:** Fluconazole, ondansetron, sargramostim, vinorelbine

## ADVERSE EFFECTS

**CNS:** Headache, insomnia, dizziness, fever, lethargy, hallucinations, anxiety, depression, twitching, seizures, vertigo
**CV:** Cardiac toxicity, edema
**GI:** *Nausea, vomiting, diarrhea,* increased AST, ALT, abdominal pain, glossitis, constipation, pseudomembranous colitis, pancreatitis
**GU:** Oliguria, proteinuria, hematuria, *vaginitis, moniliasis,* glomerulonephritis, renal failure

**HEMA:** Anemia, increased bleeding time, bone marrow depression, agranulocytosis, hemolytic anemia
**INTEG:** Rash, pruritus, exfoliative dermatitis
**META:** Hypokalemia, hypernatremia
**SYST:** Serum sickness, anaphylaxis, Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (80%) |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys, unchanged (90%); bile (10%); breast milk |
| **Half-life** | 0.7-1.3 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | Inf end |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Aspirin, probenecid: increased piperacillin levels
Methotrexate: increased effect of methotrexate

### Drug classifications

Aminoglycosides (**IV**): decreased piperacillin effect
Anticoagulants (oral): increased effect of anticoagulants
Contraceptives (oral): decreased contraceptive effectiveness
Neuromuscular blockers: increased effects
Tetracyclines: decreased antimicrobial effectiveness of piperacillin

### Drug/lab test

Increased: eosinophilia, neutropenia, leucopenia, serum creatinine, PTT, AST, ALT, alkaline phosphatase, bilirubin, BUN, electrolytes
Decreased: Hct, Hgb, electrolytes
False positive: urine glucose, urine protein, Coombs' test

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction to penicillins or other cephalosporins; cross-sensitivity between penicillins and cephalosporins is common
- Assess patient for signs and symptoms of infection, including characteristics of wounds, sputum, urine, stool, WBC >10,000/mm$^3$, fever; obtain information baseline, during treatment
- Obtain C&S before beginning product therapy to identify if correct treatment has been initiated
- **Assess for allergic reactions:** rash, urticaria, pruritus, chills, fever, joint pain; angioedema may occur a few days after therapy begins; EPINEPHrine, resuscitation equipment should be available for anaphylactic reaction
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also check for increased BUN, creatinine
- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride monthly if patient is on long-term therapy
- **Pseudomembranous colitis:** assess for diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC and low serum albumin; stop product and usually give either vancomycin or IV metroNIDAZOLE
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if on long-term therapy
- **Assess for overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate **superinfection**
- Advise patient to notify prescriber of diarrhea with blood or pus, which may indicate pseudomembranous colitis

### Evaluation

**Positive therapeutic outcome**

- Absence of signs/symptoms of infection (WBC <10,000/mm$^3$, temp WNL, absence of red, draining wounds)
- Reported improvement in symptoms of infection

**TREATMENT OF ANAPHYLAXIS:** Withdraw product, maintain airway, administer EPINEPHrine, aminophylline, $O_2$, **IV** corticosteroids

P

## RARELY USED

## pirfenidone

(pir-fen'i-done)
**Esbriet**
*Func. class.:* Respiratory agent

**USES:** Pulmonary fibrosis

**CONTRAINDICATIONS:** Hypersensitivity

## DOSAGE AND ROUTES

**Adult: PO** Titrate over 2 wk to a maintenance dose of 801 mg tid. Give 267 mg tid on days 1-7, 534 mg tid on days 8-14, and 801 mg tid from day 15 onward

**Available forms:** Cap 267 mg

## pitavastatin (Rx)

(pit'a-va-stat'in)
**Livalo**
*Func. class.:* Antilipidemic
*Chem. class.:* HMG-CoA reductase inhibitor

**Do not confuse:** pitavastatin/pravastatin

**ACTION:** Inhibits HMG-CoA reductase enzyme, which reduces cholesterol synthesis, high doses lead to plaque regression

**Therapeutic outcome:** Decreased cholesterol levels and LDLs, increased HDLs

**USES:** As an adjunct in primary hypercholesterolemia (types Ia, Ib), dysbetalipoproteinemia, elevated triglyceride levels; prevention of cardiovascular disease by reduction of heart risk in those with mildly elevated cholesterol

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, active liver disease, cholestasis

**Precautions:** Past liver disease, alcoholism, severe acute infections, trauma, severe metabolic disorders, electrolyte imbalance, seizures, surgery, organ transplant, endocrine disease, females, hypotension, renal disease

## DOSAGE AND ROUTES

**Adult:** PO 2 mg/day, usual range 1-4, max 4 mg/day

### Renal dose

**Adult:** PO CCr 30-60 ml/min 1 mg qd, max 2 mg qd; CCr <30 ml/min on hemodialysis 1 mg qd, max 2 mg qd; CCr <30 ml/min not on hemodialysis—not recommended

**Available forms:** Tabs 1, 2, 4 mg

### Implementation

- Administer total daily dose at any time of day
- Store in cool environment in tight container protected from light

## ADVERSE EFFECTS

**CNS:** Headache
**GI:** Constipation, diarrhea
**INTEG:** Rash, pruritus, alopecia
**MS:** Myalgia, rhabdomyolysis, arthralgia
**RESP:** Pharyngitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Concentrations are lower in healthy African Americans |
| **Metabolism** | Liver |
| **Excretion** | Urine, feces |
| **Half-life** | 12 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Clofibrate, cycloSPORINE, erythromycin, gemfibrozil, niacin: increased risk of rhabdomyolysis
Colestipol: decreased action of atorvastatin
Erythromycin: increased levels of atorvastatin

### Drug classifications

Antifungals (azole): possible rhabdomyolysis

### Drug/herb

Red yeast rice: increased pitavastatin effect

### Drug/lab test

Increased: bilirubin, alkaline phosphatase, ALT, AST
Interference: thyroid function tests

## NURSING CONSIDERATIONS

### Assessment

- Assess nutrition: fat, protein, carbohydrates; nutritional analysis should be completed by dietitian before treatment
- **Rhabdomyolysis:** assess for muscle pain, tenderness; obtain CPK if these occur; product may need to be discontinued
- Monitor bowel pattern daily; diarrhea may be a problem
- Monitor triglycerides, cholesterol at baseline, throughout treatment; LDL and VLDL should be watched closely; if increased, product should be discontinued
- Monitor liver function studies q1-2mo during the first 1½ yr of treatment; AST, ALT, liver function tests may be increased
- Monitor renal studies in patients with compromised renal system: BUN, I&O ratio, creatinine

• Assess eyes via ophthalmic exam 1 mo after treatment begins, annually
• **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

• Inform patient that compliance is needed for positive results to occur, not to double doses
• Teach patient that risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
• Advise patient to notify prescriber if the GI symptoms of diarrhea, abdominal or epigastric pain, nausea, vomiting; chills, fever, sore throat; muscle pain, weakness occur
• Advise patient that treatment will take several years
• Advise patient that blood work will be necessary during treatment
• Teach patient that product may increase blood glucose level
• Advise patient not to take if pregnant, pregnancy, avoid breastfeeding

### Evaluation

**Positive therapeutic outcome**
• Decreased cholesterol levels, serum triglyceride
• Improved ratio of HDLs

## posaconazole (Rx)

(poe'sa-kon'a-zole)
**Noxafil, Posanol**
*Func. class.:* Antifungal, systemic
*Chem. class.:* Triazole derivative

**ACTION:** Inhibits a portion of cell wall synthesis; alters cell membranes and inhibits several fungal enzymes

**Therapeutic outcome:** Decreased fever, malaise, rash; negative C&S for infecting organism

**USES:** Prevention of aspergillus, candida infection, oropharyngeal candidiasis in the immunocompromised, chemotherapy-induced neutropenia, mucocutaneous candidiasis

## CONTRAINDICATIONS

Hypersensitivity to this product or other systemic antifungal or azoles, fungal meningitis, onchomycosis or dermatomycosis in cardiac dysfunction, use with ergots, sirolimus, CYP3A4 substrates

**Precautions:** Pregnancy, breastfeeding, children, hepatic/cardiac/renal disease

## DOSAGE AND ROUTES

**Adult/adolescent:** PO 600 mg/day in 2-4 divided doses

### Oropharyngeal candidiasis

**Adult:** PO 100 mg bid × 1 day, then 100 mg/day × 13 days

### Oropharyngeal candidiasis resistant to fluconazole or itraconazole

**Adult/Child ≥13 yr:** PO 400 mg bid

**Available forms:** Oral susp 200 mg/5 ml; delayed release tab 100 mg; solution for injection 300 mg/16.7 ml

### Implementation

**PO route**
• **Oral susp:** give after shaking well; use calibrated measuring device; take only with a full meal or liquid nutritional supplements such as Ensure; rinse measuring device after each use
• Store in a tight container in refrigerator; do not freeze
• **Delayed-release tab:** Do not divide, chew, or crush; give with food

**IV route**
**Intermittent IV infusion:**
• Use 0.22 micron PES or PVDF filter, give slowly over 90 min through central line, if central line is not available may give a single dose through a peripheral line over 30 min, do not give multiple doses by this method

**Dilution:**
• Bring to room temperature, transfer 16.7 ml of posaconazole to IV solution that is sufficient for final concentration of 1-2 mg/ml, use immediately (diluted solution)
• Store up to 2 hr refrigerated

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness,* insomnia, fever, rigors, weakness, anxiety
**CV:** Hypo/hypertension, tachycardia, anemia, QT prolongation, torsades de pointes
**GI:** *Nausea, vomiting, anorexia, diarrhea,* cramps, abdominal pain, flatulence, GI bleeding, hepatotoxicity
**GU:** Gynecomastia, impotence, decreased libido
**INTEG:** *Pruritus,* fever, *rash,* toxic epidermal necrolysis
**MISC:** *Edema, fatigue,* malaise, hypokalemia, tinnitus, rhabdomyolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed, enhanced by food |
| **Distribution** | Protein binding 98%-99% |
| **Metabolism** | Liver |
| **Excretion** | Feces, 77% unchanged |
| **Half-life** | 19-35 hr |

P

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3-5 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Atorvastatin, lovastatin: do not use concurrently

BusPIRone, busulfan, clarithromycin, cycloSPORINE, diazepam, digoxin, felodipine, indinavir, isradipine, midazolam, niCARdipine, NIFEdipine, niMODipine, phenytoin, quiNIDine, ritonavir, saquinavir, tacrolimus, warfarin: increased levels, toxicity

Haloperidol, chloroquine, droperidol, pentamidine; arsenic trioxide, levomethadyl: increased QT prolongation

Cimetidine, phenytoin: decreased posaconazole level

Didanosine, rifamycin: decreased posaconazole action

Dofetilide, pimozide, quiNIDine, halofantrine: life-threatening reactions, increased QT prolongation

Midazolam (oral), triazolam: increased sedation

QuiNIDine: increased tinnitus, hearing loss

### Drug classifications

Antacids, $H_2$-receptor antagonists, rifamycins: decreased posaconazole action

Class IA/III antidysrhythmics, some phenothiazines, beta agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation

Ergots: life-threatening reactions, increased QT prolongation

Other hepatotoxic products: increased hepatotoxicity

Calcium channel blockers, HMG-CoA reductase inhibitors, vinca alkaloids: increased levels, toxicity

Oral hypoglycemics: increased severe hypoglycemia

### Drug/food

Food: increased absorption

## NURSING CONSIDERATIONS

### Assessment

- **Rhabdomyolysis:** assess for muscle pain, increased CPK, weakness, swelling of affected muscles; if these occur and if confirmed by CPK, product should be discontinued
- **QT prolongation:** monitor ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea
- Assess for type of infection; may begin treatment before obtaining results
- Assess for infection: temp, WBC, sputum, baseline, periodically, breakthrough infections may occur when used with fosamprenavir
- Monitor I&O ratio, potassium levels
- Monitor liver function tests (ALT, AST, bilirubin) if on long-term therapy
- Assess for allergic reaction: rash, photosensitivity, urticaria, dermatitis
- **Assess for hepatotoxicity:** nausea, vomiting, jaundice, clay-colored stools, fatigue
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, may cause malformations, breastfeeding isn't recommended

### Patient/family education

- Teach patient that long-term therapy may be needed to clear infection (1 wk-6 mo depending on infection)
- Advise patient to avoid hazardous activities if dizziness occurs
- Advise patient to take 2 hr before administration of other products that increase gastric pH (antacids, $H_2$-blockers, omeprazole, sucralfate, anticholinergics); to notify health care provider of all medications taken (many interactions)
- Teach the patient the importance of compliance with product regimen; to use alternative method of contraception
- Teach patient to notify prescriber of GI symptoms, signs of hepatic dysfunction (fatigue, nausea, anorexia, vomiting, dark urine, pale stools)
- Teach patient to take during meal or within 20 min of eating

### Evaluation

**Positive therapeutic outcome**

- Decreased fever, malaise, rash, negative C&S for infecting organism

**potassium acetate/potassium bicarbonate (Rx, OTC)**
**K-Effervescent, Klor-Con EF, K-Vescent**
**potassium bicarbonate potassium chloride (Rx, OTC)**
**Neo-K**

## potassium bicarbonate/ potassium citrate (Rx, OTC)

**⚠ HIGH ALERT**

## potassium chloride (Rx, OTC)

**Epiklor, Klor-Con, K-Tab, Micro-K, Odan K-20** 🍁

## potassium gluconate (Rx, OTC)

**Kaon, Kaylixir, K-G Elixir, Potassium-Rougier** 🍁

*Func. class.:* Electrolyte, mineral replacement

*Chem. class.:* Potassium

**ACTION:** Needed for adequate transmission of nerve impulses and cardiac contraction, renal function, intracellular ion maintenance

**Therapeutic outcome:** Potassium level 3.0-5.0 mg/dl

**USES:** Prevention and treatment of hypokalemia

## CONTRAINDICATIONS

Renal disease (severe), severe hemolytic disease, Addison's disease, hyperkalemia, acute dehydration, extensive tissue breakdown

**Precautions:** Pregnancy, cardiac disease, potassium-sparing diuretic therapy, systemic acidosis

## DOSAGE AND ROUTES

### Hypokalemia (prevention) (bicarbonate, chloride, gluconate)

**Adult:** **PO** 20 mEq/day in 1-2 divided doses

**Child:** **PO** 1-2 mEq/day in 1-2 divided doses

### Hypokalemia, digoxin toxicity (acetate, chloride)

**Adult:** serum potassium conc > 2.5 mEq/L: **IV** max 10 mEq/l hr, with 24 hr dose max 200 mEq, initial dose of 20-40 mEq has been recommended; **PO** 40-100 mEq/day in 2-4 divided doses

**Child:** **IV** 0.25-0.5 mEq/g/dose, at 0.25-0.5 mEq/kg/hr; **PO** 2-5 mEq/day in divided doses

**Available forms:** Tabs for sol 6.5, 25 mEq; ext rel caps 8, 10 mEq; powder for sol 3.3, 5, 6.7, 10, 13.3 mEq/5 ml; tabs 2, 4, 5, 13.4 mEq; ext rel tabs 6.7, 8, 10 mEq; elix 6.7 mEq/5 ml; oral sol 2.375 mEq/5 ml; inj for prep of IV 1.5, 2, 2.4, 3, 3.2, 4.4, 4.7 mEq/ml

### Implementation

**PO route**

- Do not break, crush, or chew ext rel tabs/caps or enteric-coated products
- Give with meal or after meal; take cap with full glass of liquid; dissolve effervescent tab, powder in 8 oz of cold water or juice; do not give IM, SUBCUT
- Store at room temperature

**IV route**

- Give through large-bore needle to decrease vein inflammation; check for extravasation; administer in large vein, avoiding scalp vein in child
- After diluting in large volume of **IV** sol give as an **IV** inf slowly to prevent toxicity; never give **IV** bol or IM

**>> Potassium acetate**

**Additive compatibilities:** Metoclopramide

- **Potassium chloride** must be diluted, concentrated potassium injections are fatal

**Continuous IV infusion route**

- Conc max 80 mEq/L for peripheral line, 120 mEq/L central line
- Dehydrated patients should receive 1 L of potassium-free hydration sol; then infuse 10 mEq/hr; in severe hypokalemia rate may be 40 mEq/hr

**Y-site compatibilities:** Acyclovir, aldesleukin, allopurinol, amifostine, aminophylline, amiodarone, ampicillin, atropine, aztreonam, betamethasone, calcium gluconate, cefmetazole, cephalothin, cephapirin, chlordiazePOXIDE, chlorproMAZINE, ciprofloxacin, cladribine, cyanocobalamin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOPAmine, droperidol, edrophonium, enalaprilat, EPINEPHrine, esmolol, estrogens, ethacrynate, famotidine, fentaNYL, filgrastim, fludarabine, fluorouracil, furosemide, gallium, granisetron, heparin, hydrALAZINE, IDArubicin, indomethacin, inamrinone, regular insulin, isoproterenol, kanamycin, labetalol, lidocaine, LORazepam, magnesium sulfate, melphalan, meperidine, methicillin, methoxamine, methylergonovine, midazolam, minocycline, morphine, neostigmine, norepinephrine, ondansetron, oxacillin, oxytocin, PACLitaxel, penicillin G potassium, pentazocine, phytonadione, piperacillin/tazobactam, prednisoLONE, procainamide, prochlorperazine, propofol, propranolol, pyridostigmine, sargramostim, scopolamine, sodium bicarbonate, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, trimethaphan, trimethobenzamide, vinorelbine, zidovudine

### >> Potassium chloride

**Y-site compatibilities:** Aldesleukin, amifostine, granisetron, LORazepam, midazolam, thiotepa

## ADVERSE EFFECTS

**CNS:** Confusion
**CV:** Bradycardia, *cardiac depression,* dysrhythmias, arrest, peaking T waves, lowered R and depressed RST, prolonged P–R interval, widened QRS complex
**GI:** *Nausea, vomiting, cramps,* pain, *diarrhea,* ulceration of small bowel
**GU:** Oliguria
**INTEG:** Cold extremities, rash

| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Drug classifications

Angiotensin-converting enzyme inhibitors, calcium, diuretics (potassium-sparing), magnesium, potassium phosphate, **IV,** other potassium products: increased hyperkalemia

## NURSING CONSIDERATIONS

### Assessment

- Assess ECG for peaking T-waves, lowered R, depressed RST, prolonged PR interval, widening QRS complex, hyperkalemia; product should be reduced or discontinued
- Monitor potassium level during treatment (3.5-5.0 mg/dl is normal level)
- Monitor hydration status, I&O ratio; watch for decreased urinary output; notify prescriber immediately; check urinary pH in patients receiving the product as a urinary acidifier
- Assess cardiac status: rate, rhythm, CVP, PWP, PAWP if being monitored directly
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding

### Patient/family education

- Teach patient to eat foods rich in potassium after medication is discontinued
- Advise patient to avoid OTC products: antacids, salt substitutes, analgesics, vit preparations, unless specifically directed by prescriber; avoid licorice in large amounts, may cause hypokalemia, sodium retention
- Advise patient to report hyperkalemia symptoms or continued hypokalemia symptoms
- Tell patient to take cap with full glass of liquid; to dissolve powder or tab completely in at least 120 ml of water or juice; not to crush, chew caps or tabs
- Emphasize importance of regular follow-up and periodic potassium levels

### Evaluation

**Positive therapeutic outcome**

- Absence of fatigue, muscle weakness, and decreased thirst and urinary output, cardiac changes
- Potassium level normal

## pramipexole (Rx)

(pra-mi-pex′ol)
**Mirapex, Mirapex ER**
*Func. class.:* Antiparkinsonian agent
*Chem. class.:* Dopamine receptor agonist, nonergot

**ACTION:** Selective agonist for $D_2$ receptors (presynaptic/postsynaptic sites); binding at $D_3$ receptor contributes to antiparkinson effects

**Therapeutic outcome:** Decreased symptoms of Parkinson's disease (involuntary movements)

**USES:** Idiopathic Parkinson's disease, restless leg syndrome

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy renal/cardiac disease, MI with dysrhythmias, affective disorders, psychosis, preexisting dyskinesias, history of falling asleep during daily activities, rapid dose reduction

## DOSAGE AND ROUTES

### Initial treatment

**Adult:** PO from a starting dose of 0.375 mg/day given in 3 divided doses, increase gradually by 0.125 mg/dose at 5-7–day intervals until total daily dose of 4.5 mg is reached; ER 0.375 mg qd, may increase up to 0.75 mg/day, then increments of 0.75 mg/day ≤5-7 days, max 4.5 mg/day

### Restless leg syndrome

**Adult:** PO 0.125 mg 2-3 hr before bedtime, increase gradually, max 0.5 mg/day

### Renal dose
**Adult:** PO CCr 35-59 ml/min 0.125 mg bid, may increase q5-7day to 1.5 mg bid; CCr 15-34 ml/min 0.125 mg/day, may increase q5-7day to 1.5 mg/day

**Available forms:** Tabs 0.125, 0.25, 0.5, 0.75, 1, 1.5 mg; cap ER 0.375, 0.75, 1.5, 2.25, 3.0, 3.75, 4.5 mg

### Implementation
- Adjust dosage to patient's response
- Give with meals to decrease GI upset

## ADVERSE EFFECTS
**CNS:** *Agitation, insomnia,* psychosis, hallucinations, depression, dizziness, headache, confusion, amnesia, dream disorder, asthenia, dyskinesia, hypersomnolence, sudden sleep onset, impulse-control disorders
**CV:** *Orthostatic hypotension,* edema, syncope, tachycardia, increased B/P, heart rate
**EENT:** Blurred vision
**ENDO:** Antidiuretic hormone secretion (SIADH)
**GI:** *Nausea, anorexia,* constipation, dysphagia, dry mouth
**GU:** Impotence, urinary frequency
**HEMA:** Hemolytic anemia, leukopenia, agranulocytosis
**INTEG:** Pruritus

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver, minimally |
| **Excretion** | Kidneys, unchanged |
| **Half-life** | 8 hr; 12 hr in geriatric |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Cimetidine, diltiazem, levodopa, quiNIDine, ranitidine, triamterene, verapamil: increased pramipexole levels
Metoclopramide: decreased pramipexole levels

### Drug classifications
Butyrophenones, DOPamine agonists, phenothiazines: decreased pramipexole effect

## NURSING CONSIDERATIONS
### Assessment
- Monitor B/P, ECG, respiration during initial treatment; hypo/hypertension should be reported
- Assess mental status: affect, mood, behavioral changes, depression; complete suicide assessment
- Assess for involuntary movements in parkinsonism: akinesia, tremors, staggering gait, muscle rigidity, drooling; these symptoms should improve with therapy
- **Assess for sleep attacks:** may fall asleep during activities, without warning; may need to discontinue medication
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, may cause fetal harm, do not breastfeed

### Patient/family education
- Advise patient that therapeutic effects may take several wk to a few mo
- Caution patient to change positions slowly to prevent orthostatic hypotension
- Instruct patient to use product exactly as prescribed; if product is discontinued abruptly, parkinsonian crisis may occur; if treatment is to be discontinued, taper over 1 wk; avoid alcohol, OTC sleeping products
- Advise patient to notify prescriber if pregnancy is planned or suspected
- Teach patient to notify prescriber of impulse control disorders: shopping

### Evaluation
**Positive therapeutic outcome**
- Decreased akathisia, other involuntary movements
- Improved mood

**⚠ HIGH ALERT**

## pramlintide (Rx)
(pram′lin-tide)
**SymlinPen**
*Func. class.:* Antidiabetic
*Chem. class.:* Synthetic human amylin analog

**ACTION:** Modulates and slows stomach emptying, prevents postprandial rise in plasma glucagon, decreases appetite, leads to decreased caloric intake and weight loss

**Therapeutic outcome:** Decreased polyuria, polydipsia, polyphagia; improved A1C

**USES:** As an adjunct to insulin therapy with uncontrolled type 1 or type 2 diabetes mellitus

## CONTRAINDICATIONS
Hypersensitivity to this product or cresol, gastroparesis

**BLACK BOX WARNING:** Hypoglycemia

**Precautions:** Pregnancy, breastfeeding, osteoporosis, thyroid disease, trauma, vomiting, renal failure, fever, diarrhea

## DOSAGE AND ROUTES

### Type 1 diabetes

**Adult:** SUBCUT prior to each meal (≥30 g carbohydrate), titrate up from 15 mcg to target dose of 60 mcg/dose, each dose titration should occur after no nausea for 3 days

### Type 2 diabetes

**Adult:** SUBCUT 60 mcg prior to each meal (≥30 g CHO), titrate up to 120 mcg SUBCUT with each meal after no nausea for 3-7 days

**Available forms:** PEN 60, 120 (1000 mcg/ml sol for injection)

### Implementation

- Pre-meal insulin should be decreased by 50% when starting and adjusted to therapeutic dose to prevent hypoglycemia

**SUBCUT route**

- Rotate inj sites, allow sol to warm to room temp before use
- Give immediately before mealtime or if 30 g of carbohydrates will be consumed
- Do not use if a meal is skipped
- Do not use if discolored; do not give in arm; absorption is variable
- Store at room temperature for up to 30 days; keep away from heat and sunlight; refrigerate all other supply

## ADVERSE EFFECTS

**CNS:** *Headache,* fatigue, dizziness, confusion
**EENT:** Blurred vision
**GI:** *Nausea, vomiting, anorexia,* abdominal pain
**INTEG:** Inj site reactions, diaphoresis
**META:** Hypoglycemia
**MS:** Arthralgia
**RESP:** *Cough,* pharyngitis
**SYST:** *Systemic allergy*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 30%-40% |
| **Distribution** | Not bound to blood cells or albumin, 40% bound in plasma |
| **Metabolism** | Kidneys |
| **Excretion** | Unknown |
| **Half-life** | 48 min |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 20 min |
| **Duration** | 3 hr |

## INTERACTIONS

### Individual drugs

Acetaminophen: may increase effect of acetaminophen
Alcohol, disopyramide, insulin: increased hypoglycemia
Dextrothyroxine, niacin, triamterene: decreased hypoglycemia
Diphenoxylate, loperamide, octreotide: increased pramlintide action
Erythromycin, metoclopramide: do not use

### Drug classifications

ACE inhibitors, anabolic steroids, androgens, corticosteroids, fibric acid derivatives: increased hypoglycemia
α-Glucosidase inhibitors, antimuscarinics, opiate agonist, tricyclics: increased pramlintide action
Estrogens, MAOIs, oral contraceptives, progestins, thiazide diuretics: decreased hypoglycemia
Phenothiazines: increased hyperglycemia

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Monitor fasting blood glucose, 2 hr postprandial (80-150 mg/dl, normal fasting level; 70-130 mg/dl, normal 2 hr level); A1c may also be drawn to identify treatment effectiveness; also monitor weight, appetite

**BLACK BOX WARNING:** **Assess for hypoglycemic reaction** (sweating, weakness, dizziness, chills, confusion, headache, nausea, rapid weak pulse, fatigue, tachycardia, memory lapses, slurred speech, staggering gait, anxiety, tremors, hunger)

- **Assess for hyperglycemia:** acetone breath, polyuria, fatigue, polydipsia, flushed, dry skin, lethargy
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, usually insulin is used in pregnancy, avoid breastfeeding

### Patient/family education

- Advise patient that product does not cure diabetes but controls symptoms
- Advise patient to carry emergency ID as diabetic
- Teach patient to recognize hypoglycemia reaction: headache, fatigue, weakness, fast pulse
- Teach patient the dosage, route, mixing instructions, if any diet restrictions, disease process

**BLACK BOX WARNING:** Advise patient to carry a glucose source (candy or lump sugar, glucose tabs) to treat hypoglycemia

• Teach patient symptoms of ketoacidosis: nausea, thirst, polyuria, dry mouth, decreased B/P, dry, flushed skin, acetone breath, drowsiness, Kussmaul respirations
• Advise patient that a plan is necessary for diet, exercise; all food on diet should be eaten; exercise routine should not vary
• Teach patient about blood glucose testing; make sure patient is able to determine glucose level
• Advise patient to avoid OTC products unless directed by prescriber, avoid alcohol
• Advise patient not to operate machinery or drive until effect is known
• Teach patient how to use pen

### Evaluation

**Positive therapeutic outcome**
• Decrease in polyuria, polydipsia, polyphagia, clear sensorium; improved A1c, blood glucose; absence of dizziness; stable gait

## TREATMENT OF OVERDOSE:
Glucose 25 g **IV,** via dextrose 50% sol, 50 ml or glucagon 1 mg SUBCUT

## pramoxine topical
*See Appendix B*

**⚠ HIGH ALERT**

## prasugrel (Rx)
(pra′soo-grel)
**Effient**
*Func. class.:* Platelet aggregation inhibitor
*Chem. class.:* ADP receptor antagonist

## ACTION:
Inhibits ADP-induced platelet aggregation

**Therapeutic outcome:** Absence of MI, stroke

## USES:
Reducing the risk of stroke, MI, vascular death, peripheral arterial disease in high-risk patients

## CONTRAINDICATIONS
Hypersensitivity, stroke, TIA

**BLACK BOX WARNING:** Active bleeding

**Precautions:** Pregnancy, breastfeeding, children, hepatic disease, increased bleeding risk, neutropenia, agranulocytosis, renal disease, surgery, trauma, thrombotic thrombocytopenia purpura, Asian patients, weight <60 kg, CABG, geriatric, abrupt discontinuation

## DOSAGE AND ROUTES
**Adult/geriatric <75 yr and ≥60 kg:** PO 60 mg loading dose, then 10 mg qd with aspirin (75-325 mg/day)
**Adult/geriatric <75 yr and <60 kg:** PO 60 mg loading dose, then 5 mg qd
**Geriatric >75 yr:** Not recommended

**Available forms:** Tabs 5, 10 mg

### Implementation
• Give with food to decrease gastric symptoms
• Do not break tablets
• Do not discontinue therapy abruptly

## ADVERSE EFFECTS
**CNS:** Headache, dizziness
**CV:** Edema, atrial fibrillation, bradycardia, chest pain, hyper/hypotension
**GI:** Nausea, vomiting, diarrhea
**HEMA:** Epistaxis, leukopenia, thrombocytopenia, neutropenia, anaphylaxis, angioedema, anemia
**INTEG:** Rash, hypercholesterolemia
**MISC:** Fatigue, intracranial hemorrhage, secondary malignancy, angioedema
**MS:** Back pain

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver CYP3A4, CYP2B6 |
| **Excretion** | Urine, feces |
| **Half-life** | 7-8 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 30 min |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Abciximab, aspirin, eptifibatide, rifampin, tirofiban, ticlopidine, treprostinil: increased bleeding risk

### Drug classifications
Anticoagulants, thrombolytics, NSAIDs, SSRIs: increased bleeding risk

## NURSING CONSIDERATIONS
### Assessment
• **Assess for thrombotic/thrombocytic purpura:** fever, thrombocytopenia, neurolytic anemia
• Monitor hepatic studies: AST, ALT, bilirubin, creatinine (long-term therapy)
• Monitor blood studies: CBC, differential, Hct, Hgb, PT, cholesterol (long-term therapy)

**BLACK BOX WARNING: Bleeding:** may be fatal, decreased B/P in those who have had CABG may be the first indication; bleeding should be controlled while continuing product; may use transfusion; do not use within 1 wk of CABG; may use lower doses in those <60 kg

- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk
- **Beers:** Avoid use in those ≥ 75 yr old, increased bleeding risk

### Patient/family education

- Advise that blood work will be necessary during treatment
- Teach to report any unusual bruising, bleeding to prescriber; that it may take longer to stop bleeding
- Advise to take with food or just after eating to minimize GI discomfort
- Advise to report diarrhea, skin rashes, subcutaneous bleeding, chills, fever, sore throat
- Teach to tell all health care providers that prasugrel is used; may be withheld before surgery

### Evaluation

**Positive therapeutic outcome**
- Absence of stroke, MI

## pravastatin (Rx)

(pra′va-sta-tin)
**Pravachol, PravASA**
Func. class.: Antilipidemic

**Do not confuse:** Pravachol/Prevacid

**ACTION:** Inhibits biosynthesis of VLDL, LDL, which are responsible for cholesterol development, by inhibiting the enzyme HMG-CoA reductase

**Therapeutic outcome:** Decreasing cholesterol levels and LDL, increased HDL

**USES:** As an adjunct in primary hypercholesterolemia types IIa, IIb, III, IV, arthero-sclerosis; to reduce the risk of recurrent MI, primary/secondary CV events; reduce stroke, TIAs

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, active liver disease

**Precautions:** Past liver disease, alcoholism, severe acute infections, trauma, severe metabolic disorders, electrolyte imbalances, renal disease

## DOSAGE AND ROUTES

**Adult:** PO 40-80 mg/day at bedtime (range 20-80 mg/day), start at 10 mg/day if also on immunosuppressants

**Adolescent 14-18 yr:** PO 40 mg/day
**Child 8-13 yr:** PO 20 mg/day
**Geriatric:** PO 10 mg/day, initially

### Renal dose

**Adult:** PO 10-20 mg daily at bedtime, increase at 4-wk intervals

**Available forms:** Tabs 10, 20, 40, 80 mg

### Implementation

- Give at bedtime only; give 1 hr before or 2 hr after bile acid sequestrants
- Store in cool environment in airtight, light-resistant container

## ADVERSE EFFECTS

**CNS:** Headache, dizziness, fatigue, confusion
**CV:** Chest pain
**EENT:** Lens opacities
**GI:** Nausea, constipation, diarrhea, flatus, abdominal pain, heartburn, liver dysfunction, pancreatitis, hepatitis
**GU:** Renal failure (myoglobinuria)
**INTEG:** Rash, pruritus
**MS:** Muscle cramps, myalgia, myositis, rhabdomyolysis
**RESP:** Common cold, rhinitis, cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poorly absorbed, erratic |
| **Distribution** | Protein binding 80% |
| **Metabolism** | Liver, extensively |
| **Excretion** | Feces (70%-75%); kidneys, unchanged (20%); breast milk (minimal) |
| **Half-life** | 2 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-1½ hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Clarithromycin, clofibrate, cycloSPORINE, erythromycin, gemfibrozil, itraconazole, niacin: increased risk for myopathy

### Drug classifications

Bile acid sequestrants: decreased pravastatin bioavailability
Protease inhibitors: increased risk of myopathy

### Drug/herb

St. John's wort: decreased effect
Red yeast rice: increased adverse reactions
Eucalyptus: increased hepatotoxicity

### Drug/lab test
Increased: CPK, liver function tests
Altered: thyroid function tests

## NURSING CONSIDERATIONS
### Assessment
- Assess nutrition: fat, protein, carbohydrates; nutritional analysis should be completed by dietitian before treatment
- Monitor triglycerides, esterol, cholesterol at baseline, throughout treatment; LDL and HDL should be watched closely; if increased, product should be discontinued
- Rhabdomyolysis: assess for muscle tenderness, pain; obtain CPK; therapy should be discontinued
- Monitor ophth status yearly
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding
- **Renal failure (rare):** Renal studies of patients with compromised renal systems: BUN, I&O ratio, creatinine, that if taking a product like cholestyramine to take this product at least 1 hr before or 4 hr after the bile acid resin

### Patient/family education
- Inform patient that compliance is needed for positive results to occur; not to double doses or skip doses
- Teach patient that risk factors should be decreased: high-fat diet, smoking, alcohol consumption, absence of exercise
- Advise patient to notify prescriber of weakness, tenderness, or limited mobility, blurred vision, severe GI symptoms, dizziness, headache, muscle pain, fever
- Explain to patient that contraception is necessary, since product produces teratogenic effects, pregnancy X, not to breastfeed
- Advise patient to use sunscreen, protective clothing to prevent burns
- **Hepatic disease:** Instruct patient to notify prescriber of lack of appetite, yellow sclera and skin, dark urine, abdominal pain, weakness

### Evaluation
#### Positive therapeutic outcome
- Decreased cholesterol, serum triglyceride levels and improved ratio with HDL

## prazosin (Rx)
(pra′zoe-sin)
**Minipress**
*Func. class.:* Antihypertensive
*Chem. class.:* $\alpha_1$-Adrenergic blocker, peripheral

**ACTION:** Blocks α-mediated vasoconstriction of adrenergic receptors, inducing peripheral vasodilatation

**Therapeutic outcome:** Decreased B/P in hypertension; decreased cardiac preload, afterload

**USES:** Hypertension

**Unlabeled uses:** Benign prostatic hypertrophy to decrease urine outflow obstruction, posttraumatic stress disorder (PTSD), scorpion venom poisoning

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatric patients, prostate cancer, ocular surgery, orthostatic hypotension

## DOSAGE AND ROUTES
### Post-traumatic stress disorder (unlabeled)
**Adult:** PO up to 15 mg/day
**Adolescents ≥ 15 yr:** PO 1 mg at bedtime, then titrated to 1.5-4 mg at bedtime to relieve nightmares

### Hypertension (unlabeled)
**Adult:** PO 1 mg bid or tid, increasing to 20 mg/day in divided doses if required, usual range 6-15 mg/day; max 1 mg initially, max 20-40 mg/day
**Child:** PO 5 mcg/kg q6hr; max 400 mcg/kg/day or 15 mg/day

### Benign prostatic hyperplasia (unlabeled)
**Adult:** PO 2 mg bid

**Available forms:** Caps 1, 2, 5 mg

### Implementation
- Severe hypotension may occur after first dose of this medication; hypotension may be prevented by reducing or discontinuing diuretic therapy 3 days before beginning prazosin therapy
- Give same time each day
- Store in airtight container at 86° F (30° C) or less
- Give without regard to meals
- Store at room temperature

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache, drowsiness,* anxiety, depression, vertigo, *weakness,* fatigue, syncope
**CV:** *Palpitations, orthostatic hypotension,* tachycardia, edema, rebound hypertension
**EENT:** Blurred vision, epistaxis, tinnitus, dry mouth, red sclera
**GI:** *Nausea,* vomiting, diarrhea, constipation, abdominal pain, pancreatitis
**GU:** Urinary frequency, incontinence, impotence, priapism, water and sodium retention

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 60% |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver, extensively; protein binding 97% |
| **Excretion** | Kidneys, unchanged (10%); bile (90%) |
| **Half-life** | 2-3 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 2 hr |
| **Peak** | 1-3 hr |
| **Duration** | 6-12 hr |

## INTERACTIONS

### Individual drugs

Alcohol, nitroglycerin: increased hypotension
CloNIDine: decreased antihypertensive effect

### Drug classifications

Antihypertensives, β-adrenergic blockers, phosphodiesterase inhibitors (vardenafil, tadalafil, sildenafil), diuretics, MAOIs: increased hypotension
NSAIDs: decreased antihypertensive effect

### Drug/herb

Hawthorn: increased antihypertensive effect

### Drug/lab test

Increased: urinary norepinephrine, BUN, uric acid, LFTs
Positive: ANA titer

## NURSING CONSIDERATIONS

### Assessment

- **Hypertension/HF:** Monitor B/P, orthostatic hypotension, syncope; check for edema in feet, legs daily; monitor I&O, weight daily; notify prescriber of changes
- Assess for allergic reactions: rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help
- Assess for orthostatic hypotension; tell patient to rise slowly from sitting or lying position
- **Beers:** Avoid use as an antihypertensive in older adults, high risk of orthostatic hypotension
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excreted in breast milk

### Patient/family education

- Instruct patient not to discontinue product abruptly; stress the importance of complying with dosage schedule, even if feeling better; if dose is missed, take as soon as remembered; take at same time each day
- Advise patient not to use OTC products (cough, cold, allergy) unless directed by prescriber; also to avoid large amounts of caffeine, alcohol, do not crush, chew caps
- Emphasize the need to rise slowly to sitting or standing position to minimize orthostatic hypotension
- Teach patient to notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain
- Caution patient to report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P
- Caution patient that product may cause dizziness, fainting, light-headedness; may occur during 1st few days of therapy; to avoid hazardous activities
- Teach patient how to take B/P and normal readings for age group; instruct to take B/P q7day

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P in hypertension

## TREATMENT OF OVERDOSE:

Administer volume expanders or vasopressors, discontinue product, place patient in supine position

## prednisoLONE (Rx)

(pred-niss'oh-lone)
**Orapred, Prelone Millipred, Pred-Forte, Prednoral, Veripred**
*Func. class.:* Corticosteroid, synthetic
*Chem. class.:* Intermediate-acting glucocorticoid

**Do not confuse:** prednisoLONE/predniSONE

**ACTION:** Decreases inflammation by suppressing migration of polymorphonuclear leukocytes, fibroblasts; reversal to increase capillary permeability and lysosomal stabilization

**Therapeutic outcome:** Decreased inflammation, decreased adrenal insufficiency

**USES:** Severe inflammation, immunosuppression, neoplasms, asthma

## CONTRAINDICATIONS

Hypersensitivity, fungal infections, varicella, viral infection

**Precautions:** Pregnancy, breastfeeding, children, diabetes mellitus, glaucoma, osteoporosis, seizure disorders, ulcerative colitis, HF, myasthenia gravis, thromboembolism, peptic ulcer disease, renal disease, Cushing syndrome, abrupt discontinuation, children, acute MI, GI ulcers, hypertension, hepatitis, psychosis

## DOSAGE AND ROUTES

### Primary (Addison's disease)/secondary adrenocortical insufficiency or for the treatment of congenital adrenal hyperplasia

**Adult:** PO 5-60 mg/day as a single dose or in divided doses

**Adolescent/child/infant:** PO 0.14-2 mg/kg or 4-60 mg/m$^2$/day in 3-4 divided doses

### Nonsuppurative thyroiditis

**Adult:** PO 5-60 mg/day as a single dose or in divided doses

**Adolescent/child/infant:** PO 0.14-2 mg/kg or 4-60 mg/m$^2$/day in 3-4 divided doses

### Management of symptomatic sarcoidosis; or treatment of hypercalcemia associated with sarcoidosis or with various cancers

**Adult:** PO 5-60 mg/day as a single dose or divided doses

**Adolescent/child/infant:** PO 0.14-2 mg/kg or 4-60 mg/m$^2$/day in 3-4 divided doses

### Adjunct in rheumatic disorders (ankylosing spondylitis, gout with gouty arthritis, juvenile rheumatoid arthritis (JRA)/juvenile idiopathic arthritis (JIA), post-traumatic osteoarthritis psoriatic arthritis, rheumatoid arthritis) or acute episodes or exacerbation of nonrheumatic inflammation (acute and subacute bursitis, epicondylitis, and acute nonspecific tenosynovitis)

**Adult:** PO 5-60 mg/day as a single dose or in divided doses

**Adolescent/child/infant:** PO 0.14-2 mg/kg or 4-60 mg/m$^2$/day in 3-4 divided doses

### Adjunct in carpal tunnel syndrome (unlabeled)

**Adult:** PO 20 mg/day × 2 wk, then 10 mg/day for an additional 2 wk relief

### Maintenance of acute rheumatic carditis, systemic dermatomyositis (polymyositis), systemic lupus erythematosus (SLE); (unlabeled): temporal arteritis, Churg-Strauss syndrome, mixed connective tissue disease, polyarteritis nodosa, relapsing polychondritis, polymyalgia rheumatica, vasculitis, or Wegener's granulomatosis

**Adult:** PO 5-60 mg/day as a single dose or in divided doses

**Adolescent/child/infant:** PO 0.14-2 mg/kg or 4-60 mg/m$^2$/day given in 3-4 divided doses

### Corticosteroid-responsive respiratory disorders (airway-obstructing hemangioma in infant) (unlabeled), aspiration pneumonitis, berylliosis, chronic obstructive pulmonary disease (COPD), laryngotracheobronchitis (croup), Loeffler's syndrome, noncardiogenic pulmonary edema (unlabeled)

**Adult:** PO 5-60 mg/day as a single dose or in divided doses

**Adolescent/child/infant:** PO 0.14-2 mg/kg or 4-60 mg/m$^2$/day in 3-4 divided doses

### Asthma; bronchospasm prophylaxis (unlabeled)

**Adult/adolescent:** PO 40-80 mg/day in 1-2 divided doses until the peak expiratory flow (PEF) reaches 70% of predicted or personal best; total course of treatment is 3-10 days

**Child:** PO 1 mg/kg/day (up to 60 mg) in 2 divided doses until PEF reaches 70% of predicted or personal best; if a patient is given systemic corticosteroids, continue PO corticosteroids for a total course of 3-10 days; tapering is not necessary for courses <1 wk

### Acute asthma exacerbation on an outpatient basis

**Adult/adolescent:** PO 40-60 mg/day as a single dose or in 2 divided doses for 3-10 days

**Child 5-12 yr:** PO 1-2 mg/kg/day (up to 60 mg) in 2 divided doses for 3-10 days

**Infant/child ≤4 yr:** PO 1-2 mg/kg/day (up to 30 mg) in 2 divided doses for 3-10 days

### Long-term prevention of symptoms in severe persistent asthma

**Adult, adolescent, and child ≥12 yr:** PO 7.5-60 mg once daily in the morning or every other day

**Infant and child ≤11 yr:** PO 0.25-2 mg/kg PO daily given as a single dose each morning or every other day

### Thrombocytopenia (immune thrombocytopenia/idiopathic thrombocytopenic purpura (ITP), or secondary thrombocytopenia)

**Adult:** PO 5-60 mg/day as a single dose or in divided doses

**Adolescent/child:** PO 0.14-2 mg/kg or 4-60 mg/m$^2$/day in 3-4 divided doses

**Available forms:** Tabs 5 mg; oral sol 5 mg/5 ml, 10 mg/5 ml, 15 mg/5 ml, 25 mg/5 ml; syrup 5 mg/5 ml; oral dissolving tab 10, 15, 30 mg

### Implementation

- **Oral sol:** use calibrated measuring devices
- **Orally disintegrating tabs:** place on tongue, allow to dissolve, swallow; or swallow whole; do not cut, split

## ADVERSE EFFECTS

**CNS:** *Depression,* flushing, sweating, headache, mood changes

**CV:** *Hypertension,* circulatory collapse, thrombophlebitis, embolism, tachycardia

**EENT:** Fungal infections, increased intraocular pressure, blurred vision

**GI:** *Diarrhea, nausea, abdominal distention,* GI hemorrhage, increased appetite, pancreatitis

**INTEG:** Acne, poor wound healing, ecchymosis, petechiae

**MS:** Fractures, osteoporosis, weakness, arthralgia, myopathy, tendon rupture

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, IM), completely absorbed (**IV**) |
| **Distribution** | Widely distributed, crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidney, breast milk |
| **Half-life** | 2-4 hr |

### Pharmacodynamics

| | PO | IM (phosphate) | IV | IA/IL |
|---|---|---|---|---|
| **Onset** | 1 hr | Rapid | Rapid | Slow |
| **Peak** | 2 hr | 1 hr | Unknown | Unknown |
| **Duration** | 1½ days | Unknown | Unknown | Up to 1 mo |

## INTERACTIONS

### Individual drugs

Alcohol, amphotericin B, cycloSPORINE, digitalis, indomethacin, NSAIDs: increased side effects

Ambenonium, isoniazid, neostigmine, somatrem: decreased effects of each specific product

Cholestyramine, colestipol, ePHEDrine, phenytoin, rifampin, theophylline: decreased action of prednisoLONE

Indomethacin, ketoconazole: increased action of prednisoLONE

### Drug classifications

Antibiotics (macrolide), contraceptives (oral), estrogens, salicylates: increased action of prednisoLONE

Anticholinesterases, anticoagulants, anticonvulsants, antidiabetics, salicylates, toxoids, vaccines: decreased effects of each specific product

Azole antifungals, cycloSPORINE: increased toxicity

Barbiturates: decreased action of prednisoLONE

CYP3A4 inducers: decreased prednisoLONE effect

CYP3A4 inhibitors: increased prednisoLONE effect

Diuretics, salicylates: increased side effects

Quinolones: increased tendon rupture

### Drug/lab test

Increased: cholesterol, sodium, blood glucose, uric acid, calcium, urine glucose

Decreased: calcium, potassium, $T_4$, $T_3$, thyroid $^{131}I$ uptake test, urine 17-OHCS, 17-KS, PBI

False negative: skin allergy tests

## NURSING CONSIDERATIONS

### Assessment

- Monitor potassium, blood glucose, urine glucose while patient is on long-term therapy; hypokalemia and hyperglycemia may occur
- Monitor weight daily; notify prescriber of weekly gain >5 lb; monitor I&O ratio; be alert for decreasing urinary output and increasing edema
- Monitor B/P q4hr, pulse; notify prescriber if chest pain occurs
- Monitor plasma cortisol levels during long-term therapy (normal level 138-635 nmol/L [SI units] when measured at 8 AM)
- Assess adrenal function periodically for hypothalamic-pituitary-adrenal axis suppression
- **Assess infection:** increased temp, WBC even after withdrawal of medication; product masks infection symptoms
- **Assess for potassium depletion:** paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness, edema, hypertension, cardiac symptoms
- **Adrenal insufficiency:** assess for nausea, vomiting, lethargy, restlessness, confusion

• Assess mental status: affect, mood, behavioral changes, aggression
• Monitor temp; if fever develops, product should be discontinued
• Assess for systemic absorption: increased temp, inflammation, irritation (topical)
• **Pregnancy/breastfeeding:** Not recommended in pregnancy, cautious use in breastfeeding
• **Beers:** Avoid in older adults with or at high risk of delirium

### Patient/family education

• Advise patient to carry/wear emergency ID as steroid user
• Advise patient to notify prescriber if therapeutic response decreases; dosage adjustment may be needed
• Caution patient not to discontinue abruptly; adrenal crisis can result; take exactly as prescribed
• Caution patient to avoid OTC products: salicylates, cough products with alcohol, cold preparations unless directed by prescriber
• Teach patient all aspects of product usage including cushingoid symptoms (moon face, buffalo hump, rapid weight gain, excessive sweating, stretch marks)
• **Teach patient symptoms of adrenal insufficiency:** nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain
• Advise patient that long-term therapy may be needed to clear infection (1-2 mo depending on type of infection)

### Evaluation

**Positive therapeutic outcome**
• Decreased inflammation

## prednisoLONE ophthalmic

*See Appendix B*

## predniSONE (Rx)

(pred′ni-sone)
**Rayos, Winpreo** 🍁
*Func. class.:* Corticosteroid
*Chem. class.:* Intermediate-acting glucocorticoid

**Do not confuse:** predniSONE/methylPREDNISolone/prednisoLONE/PriLOSEC

**ACTION:** Decreases inflammation by increasing capillary permeability and lysosomal stabilization, minimal mineralocorticoid activity

**Therapeutic outcome:** Decreased inflammation, decreased adrenal insufficiency

**USES:** Severe inflammation, neoplasms, multiple sclerosis, collagen disorders, dermatologic disorders

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, diabetes mellitus, glaucoma, osteoporosis, seizure disorders, ulcerative colitis, HF, myasthenia gravis, renal disease, esophagitis, peptic ulcer, cataracts, coagulopathy, abrupt discontinuation, children, corticosteroid hypersensitivity, Cushing syndrome, thromboembolism, geriatrics, acute MI

## DOSAGE AND ROUTES

**Adult:** PO 5-60 mg/day or divided bid-qid
**Child:** PO 0.05-2 mg/kg/day divided 1-4 ×/day

### Nephrotic syndrome

**Child:** PO 2 mg/kg/day in divided doses until urine is protein-free for 3 consecutive days, then 1-1.5 mg/kg/day every other day × 4 wk

### Multiple sclerosis

**Adult:** PO 200 mg/day × 1 wk, then 80 mg every other day × 1 mo

### Asthma

**Adult/adolescent:** PO 40-80 mg/day in 1-2 divided doses until PEF is 70% of predicted or personal best
**Child:** PO 1 mg/kg (max 60 mg)/day in 2 divided doses until PEF is 70% of predicted or personal best

**Available forms:** Tabs 1, 2.5, 5, 10, 20, 50 mg; oral sol 5 mg/5 ml; syr 5 mg/5 ml; del rel tab 1, 2, 5 mg

### Implementation

• Give with food or milk to decrease GI symptoms; use measuring device for liquid route
• For long-term use, alternative product therapy is recommended, to decrease adverse reactions
• **Del rel tab:** swallow whole, do not break, crush, or chew; give once daily

## ADVERSE EFFECTS

**CNS:** Depression, flushing, sweating, headache, mood changes
**CV:** Hypertension, thrombophlebitis, embolism, tachycardia, fluid retention
**EENT:** Fungal infections, increased intraocular pressure, blurred vision
**GI:** Diarrhea, nausea, abdominal distention, GI hemorrhage, increased appetite, pancreatitis
**INTEG:** Acne, poor wound healing, ecchymosis, petechiae
**META:** Hyperglycemia
**MS:** Fractures, osteoporosis, weakness

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed, crosses placenta |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidney, breast milk |
| **Half-life** | 3-4 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 hr; del rel 6-6½ hr |
| **Duration** | 1½ days |

## INTERACTIONS

### Individual drugs

Alcohol, amphotericin B, cycloSPORINE, digoxin: increased side effects

Ambenonium, isoniazid, neostigmine, somatrem: decreased effects of each specific product

Cholestyramine, colestipol, phenytoin, rifampin, theophylline: decreased action of predniSONE

Ketoconazole: increased action of predniSONE

NSAIDs: increased side effects, increased action of predniSONE

### Drug classifications

Anticholinesterases, anticoagulants, anticonvulsants, antidiabetics, toxoids, vaccines: decreased effects of each specific product

Antiinfectives (macrolide), contraceptives (oral), estrogens: increased action of predniSONE

Barbiturates: decreased action of predniSONE

CYP3A4 inducers: decreased predniSONE effect

CYP3A4 inhibitors: increased predniSONE effect

Diuretics: increased side effects

Quinolones: increased tendon rupture

Salicylates: increased side effects, increased action of predniSONE, decreased effects of salicylates

### Drug/herb

Ephedra (ma huang): decreased predniSONE effect

### Drug/lab test

Increased: cholesterol, sodium, blood glucose, uric acid, calcium, urine glucose

Decreased: calcium, potassium, $T_4$, $T_3$, thyroid $^{131}I$ uptake test, urine 17-OHCS, 17-KS, PBI

False negative: skin allergy tests

## NURSING CONSIDERATIONS

### Assessment

- **Adrenal insufficiency:** assess for nausea, vomiting, anorexia, confusion, hypotension, weight loss before and during treatment; HPA suppression may be precipitated by abrupt withdrawal
- Monitor potassium, blood glucose, urine glucose while on long-term therapy; hypokalemia and hyperglycemia may occur
- Monitor weight daily; notify prescriber of weekly gain >5 lb; monitor I&O ratio; be alert for decreasing urinary output and increasing edema, rales/crackles, notify provider if present
- Monitor B/P, pulse; notify prescriber if chest pain occurs
- Monitor plasma cortisol levels during long-term therapy (normal level 138-635 nmol/L when measured at 8 AM)
- Assess adrenal function periodically for hypothalamic-pituitary-adrenal axis suppression
- Assess infection: increased temp, WBC even after withdrawal of medication; product masks infection symptoms
- **Assess for potassium depletion:** paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness, edema, hypertension, cardiac symptoms
- Assess mental status: affect, mood, behavioral changes, aggression
- Monitor temp; if fever develops, product should be discontinued
- Assess for systemic absorption: increased temp, inflammation, irritation (topical)
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed
- **Beers:** Avoid in older adults with a high risk of delirium

### Patient/family education

- Advise patient that emergency ID as corticosteroid user should be carried or worn
- Advise patient to notify prescriber if therapeutic response decreases; dosage adjustment may be needed
- Caution patient not to discontinue abruptly; adrenal crisis can result
- Caution patient to avoid OTC products: salicylates, cough products with alcohol, cold preparations unless directed by prescriber
- Teach patient all aspects of product use including cushingoid symptoms
- Teach patient symptoms of adrenal insufficiency: nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain
- Advise patient that long-term therapy may be needed to clear infection (1-2 mo depending on type of infection)
- **Pregnancy:** Teach patient to notify prescriber if pregnancy is planned or suspected; cleft palate, stillbirth, abortion reported

### Evaluation

**Positive therapeutic outcome**
- Decreased inflammation

## pregabalin (Rx)

(pre-gab'a-lin)
**Lyrica**
*Func. class.:* Anticonvulsant
**Controlled substance schedule V**

**ACTION:** Binds to high-voltage–gated calcium channels in CNS tissues; this may lead to anticonvulsant action, similar to the inhibitory neurotransmitter GABA; anxiolytic, analgesic, and antiepileptic properties

**Therapeutic outcome:** Decreased seizure activity, decreased neuropathic pain

**USES:** Neuropathic pain associated with spinal cord injury, diabetic peripheral neuropathy, partial-onset seizures, postherpetic neuralgia, fibromyalgia

**Unlabeled uses:** Moderate pain, social anxiety disorder, generalized anxiety disorder

## CONTRAINDICATIONS

Hypersensitivity to this product or gabapentin, abrupt discontinuation

**Precautions:** Pregnancy, breastfeeding, children <12 yr, geriatric, renal disease, PR interval prolongation, creatine kinase elevations, HF (class III, IV), decreased platelets, drug abuse, dependence, glaucoma, myopathy, angioedema history, suicidal behavior

## DOSAGE AND ROUTES

### Diabetic peripheral neuropathic pain

**Adult:** PO/oral sol 50 mg tid, may increase to 300 mg/day (max) within 1 wk, adjust in renal disease

### Partial onset seizures

**Adult:** PO/oral sol 75 mg bid or 50 mg tid; may increase to 600 mg/day (max)

### Postherpetic neuralgia

**Adult:** PO/oral sol 150 mg/day in 2-3 doses, may increase to 300 mg/day in 2-3 divided doses, if higher dose is needed in 2-4 wk, may increase to 600 mg/day in 2-3 divided doses

### Fibromyalgia, spinal cord injury/pain

**Adult:** PO/oral sol 75 mg bid, may increase to 150 mg bid within 1 wk and 225 mg bid after 1 wk

### Renal dose

PO CCr 30-60 ml/min 75-300 mg/day in 2-3 divided doses; CCr 15-30 ml/min 25-150 mg/day in 1-2 divided doses, CCr <15 ml/min 25-75 mg/day in a single dose

**Available forms:** Caps 25, 50, 75, 100, 150, 200, 225, 300 mg; oral sol 20 mg/ml

### Implementation

- Do not crush or chew caps; caps may be opened and contents put in applesauce or dissolved in juice
- Give without regard to meals
- Gradually withdraw over 7 days; abrupt withdrawal may precipitate seizures
- Store at room temperature away from heat and light
- Give hard candy, frequent rinsing of mouth, gum for dry mouth
- Provide assistance with ambulation during early part of treatment; dizziness occurs
- Provide seizure precautions: padded side rails; move objects that may harm patient
- Provide increased fluids, bulk in diet for constipation
- **Oral sol:** should be written in mg and calculated to mL

## ADVERSE EFFECTS

**CNS:** *Drowsiness, dizziness,* abnormal thinking
**EENT:** *Dry mouth,* blurred vision, sinusitis
**GI:** Constipation, abdominal pain, weight gain, nausea, vomiting, increased appetite
**HEMA:** thrombocytopenia
**MS:** Back pain, rhabdomyolysis, myopathy
**MISC:** Pruritus, *peripheral edema*, angioedema, suicidal ideation, drowsiness

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Not bound to plasma proteins |
| **Metabolism** | Negligible |
| **Excretion** | 90% unchanged, urine |
| **Half-life** | 6 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1.5 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression

### Drug classifications

Anxiolytics, barbiturates, general anesthetics, hypnotics, opiate agonists, phenothiazines,

sedating $H_1$ blockers, sedatives, thiazolidinediones, tricyclics: increased CNS depression
Thiazolidinediones: increased weight gain/fluid retention; avoid use if possible

### Drug/lab test
Increased: creatine kinase
Decreased: platelets

## NURSING CONSIDERATIONS
### Assessment
- **Assess for seizures:** aura, location, duration, activity at onset, use seizure precaution
- **Assess for pain:** location, duration, characteristics if using for diabetic neuropathy, spinal cord injury, neuralgia
- Monitor renal function tests: urinalysis, BUN, urine creatinine q3mo, creatine kinase; if markedly increased, discontinue
- **Assess mental status:** mood, sensorium, affect, behavioral changes, suicidal thoughts, behavior; if mental status changes, notify prescriber
- **Angioedema/hypersensitivity:** monitor for blisters, hives, rash, dyspnea, wheezing; angioedema; if these occur discontinue: cross-hypersensitivity with this product and gabapentin may occur
- **Rhabdomyolysis and creatinine kinase elevations (rare):** monitor for muscle pain, tenderness, weakness accompanied by malaise or fever; product should be discontinued
- Hemolytic anemia may be severe in Asian, Mediterranean individuals
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, may cause fetal toxicity, pregnant patients should enroll in the Antiepileptic Drug Pregnancy Registry 888-233-2334, do not breastfeed
- **Beers:** Avoid in older adults unless safer alternative is not available, may cause ataxia, impaired psychomotor function

### Patient/family education
- Advise patient to carry emergency ID stating patient's name, products taken, condition, prescriber's name and phone number
- Advise patient to avoid driving, other activities that require alertness: dizziness, drowsiness may occur
- Teach patient not to discontinue medication quickly after long-term use, taper over ≥1 wk; withdrawal-precipitated seizures may occur, not to double doses if dose is missed, take if 2 hr or more before next dose
- Teach patient to notify prescriber if pregnancy is planned or suspected; avoid breastfeeding
- Teach patient to report muscle pain, tenderness, weakness, when accompanied by fever, malaise
- Advise patient to avoid alcohol, live virus vaccines

### Evaluation
**Positive therapeutic outcome**
- Decreased seizure activity; decrease in neuropathic pain

## TREATMENT OF OVERDOSE:
Lavage, VS, hemodialysis

**RARELY USED**

## primidone (Rx)
(pri′mi-done)
**Mysoline, Sertan**
*Func. class.:* Anticonvulsant
*Chem. class.:* Barbiturate derivative

**Therapeutic outcome:** Reduction in seizure activity

**USES:** Generalized tonic-clonic (grand mal), complex

## CONTRAINDICATIONS
Pregnancy, hypersensitivity to this product or barbiturates, porphyria, breastfeeding

## DOSAGE AND ROUTES
**Adult and child >8 yr:** PO 125-250 mg at bedtime, increase by 125-250 mg/day q3-7day, usual dose 750-1500 mg/day in 3-4 divided doses, max 2 g/day in divided doses
**Child <8 yr:** PO 50-125 mg at bedtime, increase by 50-125 mg/day q3-7day, usual dose 10-25 mg/kg/day in 3-4 divided doses

**Neonate:** PO 12-20 mg/kg/day in 2-4 divided doses, start at lower dose and titrate

### Renal dose
**Adult:** CCr 10-15 ml/min: increase interval between doses to 8-12 hr; CCr <10 ml/min: increase interval to 12-24 hr

**⚠ HIGH ALERT**

## procainamide (Rx)
(proe′kane-ah-mide)
**Procan SR**
*Func. class.:* Antidysrhythmic (class IA)
*Chem. class.:* Procaine HCl amide analog

**ACTION:** Depresses excitability of cardiac muscle to electrical stimulation and slows conduction velocity in atrium, bundle of His, ventricle; increases refractory period

**Therapeutic outcome:** Prevention of dysrhythmias

## USES:
Life-threatening ventricular dysrhythmias, paroxysmal atrial tachycardia, PSVT, Wolff-Parkinson-White (WPW) syndrome

## CONTRAINDICATIONS
Hypersensitivity, severe heart block, torsades de pointes

**BLACK BOX WARNING:** Lupus erythromatosis

**Precautions:** Pregnancy, breastfeeding, children, renal/hepatic disease, HF, respiratory depression, cytopenia, dysrhythmia associated with digoxin toxicity, myasthenia gravis, digoxin toxicity

**BLACK BOX WARNING:** Bone marrow failure, cardiac arrhythmias

## DOSAGE AND ROUTES
### Ventricular tachycardia during CPR
**Adult:** IV loading dose 20 mg/min; either ventricular tachycardia resolves or patient becomes hypotensive; the QRS complex is widened by 50% of original width or total is 17 mg/kg (1.2 g for a 70 kg patient); may give up to 50 mg/min in urgent situations; maintenance 1-4 mg/min CONT IV INF; IM 50 mg/kg/day in divided doses q3-6hr
**Child:** IV PALS 15 mg/kg over 30-60 min

### Renal dose
**Adult:** IV CCr 35-59 ml/min give 70% of maintenance dose; CCr 15-34 ml/min give 40%-60% maintenance dose; CCr <15 ml/min individualized

**Available forms:** inj 100, 500 mg/ml

### Implementation
**IM route**
- IM inj in deltoid; aspirate to avoid intravascular administration, use only when unable to use IV

**Direct IV route**
- Dilute each 100 mg/10 ml of 0.9% NaCl, give at max 50 mg/min

**Intermittent INF route**
- Dilute 0.2-1 g/50-500 ml of $D_5W$ (2-4 mg/ml) give over 30-60 min at max 25-50 mg/min, use inf pump

**Y-site compatibilities:** Alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, ascorbic acid, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, caspofungin, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, cefTRIAXone, cefuroxime, cephalothin, chlorproMAZINE, cimetidine, cisatracurium, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, indomethacin, insulin (regular), irinotecan, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, mezlocillin, miconazole, midazolam, mitoXANtrone, morphine, moxalactam, multiple vitamins, mycophenolate, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, piperacillin-tazobactam, polymyxin B, potassium chloride, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, ritodrine, rocuronium, sodium bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zoledronic acid

**Y-site incompatibilities:** Milrinone

## ADVERSE EFFECTS
**CNS:** *Headache, dizziness,* confusion, psychosis, restlessness, irritability, weakness, depression
**CV:** *Hypotension,* heart block, cardiovascular collapse, arrest, torsades de pointes
**GI:** Nausea, vomiting, anorexia, diarrhea, hepatomegaly, pain, bitter taste
**HEMA:** Systemic lupus erythematosus syndrome, agranulocytosis, thrombocytopenia, neutropenia, hemolytic anemia

P

**INTEG:** Rash, urticaria, edema, swelling (rare), pruritus, flushing, angioedema
**SYST:** SLE

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Rapidly distributed, protein binding 15% |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, unchanged (50%-70%) |
| **Half-life** | 2½-4½ hr; increased in renal disease |

### Pharmacodynamics

| | IV |
|---|---|
| **Onset** | Rapid |
| **Peak** | ½-1 hr |
| **Duration** | 3-4 hr |

## INTERACTIONS

### Individual drugs

Cimetidine, quiNIDine, ranitidine, trimethoprim: increased procainamide effect
Thioridazine: increased toxicity

### Drug classifications

Antidysrhythmics, quinolones: increased toxicity
β-Adrenergic blockers: increased procainamide effects
Neuromuscular blockers: increased neuromuscular blocking effect

### Drug/lab test

Increased: ALT, AST, alkaline phosphatase, LDH, bilirubin

## NURSING CONSIDERATIONS

### Assessment

- Assess for oxygenation or perfusion deficit: decreased B/P, chest pain, dizziness, loss of consciousness
- Assess respiratory status: auscultate lung fields for bibasilar crackles in patients with advanced HF
- Monitor I&O ratio; electrolytes: potassium, sodium, chloride; watch for decreasing urinary output, possible retention
- Monitor liver function tests: AST, ALT, bilirubin, alkaline phosphatase

**BLACK BOX WARNING: Cardiac dysrhythmias:** Monitor ECG continuously to determine product effectiveness; measure PR, QRS, QT intervals; check for PVCs, other dysrhythmias; check B/P continuously for hypo/hypertension; for rebound hypertension after 1-2 hr; prolonged PR/QT intervals, QRS complex; if QT or QRS increases by 50% or more, withhold next dose, notify prescriber

- Monitor ANA titer; during long-term treatment, watch for lupuslike symptoms
- Monitor for dehydration or hypovolemia
- **Monitor for CNS symptoms:** confusion, seizures, psychosis, numbness, depression, involuntary movements; if these occur, product should be discontinued

**BLACK BOX WARNING: Bone marrow suppression:** CBC q2wk × 3 mo; leukocyte, neutrophil, platelet counts may be decreased, treatment may need to be discontinued

- Monitor blood levels (therapeutic level 4-10 mcg/ml), ANA titer or *N*-acetylprocainamide levels 10-20 mcg/ml; notify prescriber of abnormal results; assess for toxicity: confusion, drowsiness, nausea, vomiting, tachydysrhythmias, oliguria
- Assess cardiac rate, respiration: rate, rhythm, character, chest pain, ventricular tachycardia, supraventricular tachycardia or fibrillation
- **Pregnancy/breastfeeding:** Use only if clearly needed, do not breastfeed

### Patient/family education

- Advise patient to report side effects immediately to prescriber; to take exactly as prescribed; if dose is missed take when remembered if within 3-4 hr of next dose, do not double doses
- Caution patient that dark glasses may be needed for photophobia; to use sunscreen or stay out of sun to prevent burns; avoid temperature extremes; impairment of heat-regulating mechanism can occur
- Advise patient to complete follow-up appointment with prescriber, including pulmonary function tests, chest x-ray
- Instruct patient that dry mouth may be relieved by frequent sips of water, hard candy, sugarless gum
- Caution patient to make position changes from lying to standing slowly to prevent orthostatic hypotension

**BLACK BOX WARNING:** Advise prescriber immediately if lupuslike symptoms (joint pain, butterfly rash, fever, chills, dyspnea), leukopenia symptoms (sore mouth, gums, throat), or thrombocytopenia symptoms (bleeding, bruising) occur

- Teach patient how to take pulse and when to report to prescriber

### Evaluation

**Positive therapeutic outcome**

- Decreased PVCs, ventricular tachycardia

## TREATMENT OF OVERDOSE:
$O_2$, artificial ventilation, ECG, administer DOPamine for circulatory depression, diazepam or thiopental for seizures, isoproterenol

**⚠ HIGH ALERT**

# procarbazine (Rx)
(proe-kar'ba-zeen)
**Matulane, Natulan** 🍁
*Func. class.:* Antineoplastic, alkylating agent
*Chem. class.:* Hydrazine derivative

**Do not confuse:** Matulane/Materna

**ACTION:** Inhibits DNA, RNA, protein synthesis; has multiple sites of action; a nonvesicant

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Lymphoma, Hodgkin's disease, cancers resistant to other therapy

**Unlabeled uses:** Brain, lung malignancies, other lymphomas, multiple myeloma, malignant melanoma, polycythemia vera

## CONTRAINDICATIONS
Pregnancy, breastfeeding, hypersensitivity, thrombocytopenia, bone marrow depression

**Precautions:** Cardiac/renal/hepatic disease, radiation therapy, seizure disorder, anemia, bipolar disorder, Parkinson's disease

**BLACK BOX WARNING:** Requires a specialized care setting and an experienced clinician

## DOSAGE AND ROUTES
**Adult:** PO 2-4 mg/kg/day for first wk; maintain dosage of 4-6 mg/kg/day until platelets and WBC fall; after recovery, 1-2 mg/kg/day
**Child:** PO 50 mg/m$^2$/day for 7 days, then 100 mg/m$^2$ until desired response, leukopenia, or thrombocytopenia occurs; 50 mg/m$^2$/day is maintenance after bone marrow recovery

**Available forms:** Caps 50 mg

### Implementation
• Give with foods, fluids for GI upset; open cap and give with food/fluids for swallowing difficulty; administer as directed

## ADVERSE EFFECTS
**CNS:** Headache, dizziness, seizures, insomnia, hallucinations, confusion, coma, pain, chills, fever, sweating, paresthesias, peripheral neuropathy
**EENT:** Retinal hemorrhage, nystagmus, photophobia, diplopia, dry eyes
**GI:** *Nausea, vomiting,* anorexia, diarrhea, constipation, dry mouth, stomatitis, elevated hepatic enzymes
**GU:** Azoospermia, cessation of menses
**HEMA:** Thrombocytopenia, anemia, leukopenia, myelosuppression, bleeding tendencies, purpura, petechiae, epistaxis, hemolysis
**INTEG:** *Rash,* pruritus, dermatitis, alopecia, herpes, hyperpigmentation
**MS:** Arthralgias, myalgias
**RESP:** Cough, pneumonitis, hemoptysis
**SYST:** Secondary malignancy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed, crosses blood-brain barrier |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 1 hr |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Individual drugs
Alcohol: increased CNS depression
Caffeine, guanethidine, levodopa, methyldopa, reserpine: increased hypertension
Meperidine: hypotension; do not use together

### Drug classifications
Anticoagulants, NSAIDs, platelet inhibitors, thrombolytics: increased bleeding risk
Antidepressants (tricyclics), MAOIs, SSRIs, SNRIs: confusion, seizures, hypertension
Antihistamines, barbiturates, hypotensive agents, opiates, phenothiazines: increased CNS depression
Sympathomimetics: disulfiram-like reaction, life-threatening hypertensive crisis

### Drug/food
Tyramine-containing foods: increased disulfiram-like reaction, hypertensive crisis

## NURSING CONSIDERATIONS
### Assessment
• **Bone marrow suppression:** monitor CBC, differential, platelet count weekly; withhold product if WBC is <4000/mm$^3$ or platelet count is <75,000/mm$^3$; notify prescriber of results if WBC <20,000/mm$^3$, platelets <150,000/mm$^3$
• Monitor pulmonary function tests, chest x-ray films before, during therapy; chest film should be obtained q2wk during treatment; check for dyspnea, crackles, unproductive cough, chest pain, tachypnea

• **Hepatic/renal disease:** can cause accumulation of drug, increased toxicity; monitor renal function tests: BUN, serum uric acid, urine CCr before, during therapy; I&O ratio; report fall in urine output of 30 ml/hr; check for decreased hyperuricemia; monitor hepatic studies before, during therapy: bilirubin, AST, ALT, ALK phos, LDH, PRN or qmo

**BLACK BOX WARNING:** To be used only in a specialized care setting with emergency equipment

**BLACK BOX WARNING:** To be given only by an experienced clinician knowledgeable in cytotoxic products

• Monitor for cold, fever, sore throat (may indicate beginning of infection); identify edema in feet, joint and stomach pain, shaking; prescriber should be notified
• **Assess for bleeding:** hematuria, guaiac, bruising or petechiae, mucosa or orifices; no rectal temp
• Assess for tyramine-containing foods in the diet; hypertensive crisis can occur
• **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

• Teach patient to avoid use of products containing aspirin or NSAIDs, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
• Caution patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath); CNS changes, diarrhea
• Advise patient to report any changes in breathing or coughing even several mo after treatment; to avoid crowds and persons with respiratory tract or other infections
• Inform patient hair loss is common; discuss the use of wigs or hairpieces
• Caution patient not to have any vaccinations without the advice of the prescriber; serious reactions can occur
• Advise patient that contraception is needed during treatment and for several mo after the completion of therapy; may cause infertility; do not breastfeed
• Teach patient to avoid sunlight, UV exposure; wear sunscreen or protective clothing

### Evaluation

**Positive therapeutic outcome**
• Absence of swelling at night
• Increased appetite, increased weight
• Decreasing malignancy

## prochlorperazine (Rx)

(proe-klor-pair'a-zeen)
**Compro, Prochlorazine**
*Func. class.:* Antiemetic/antipsychotic
*Chem. class.:* Phenothiazine, piperazine derivative

**Do not confuse:** prochlorperazine/chlorproMAZINE

**ACTION:** Decreases DOPamine neurotransmission by increasing DOPamine turnover through blockade of the $D_2$ somatodendritic autoreceptor in the meso-limbic system

**Therapeutic outcome:** Decreased nausea, vomiting, decreased signs and symptoms of psychosis

**USES:** Nausea, vomiting, psychosis

## CONTRAINDICATIONS

Hypersensitivity to phenothiazines, coma, infants/neonates/child <2 yr or <20 lb, surgery

**Precautions:** Pregnancy, breastfeeding, geriatric, seizure, encephalopathy, glaucoma, hepatic disease, Parkinson's disease, BPH

**BLACK BOX WARNING:** Increased mortality in elderly patients with dementia-related psychosis

## DOSAGE AND ROUTES

### Postoperative nausea/vomiting

**Adult:** IM 5-10 mg 1-2 hr before anesthesia; may repeat in 30 min; **IV** 5-10 mg 15-30 min before anesthesia; **IV** INF 20 mg/L $D_5W$ or 0.9% NaCl 15-30 min before anesthesia, max 40 mg/day

### Severe nausea/vomiting

**Adult:** PO 5-10 mg tid-qid; SUS REL 15 mg/day in AM or 10 mg q12hr; RECT 25 mg/bid; IM 5-10 mg; may repeat q3-4hr prn, max 40 mg/day
**Child 18-39 kg:** PO 2.5 mg tid or 5 mg bid; IM 0.132 mg/kg, q3-4hr prn, max 15 mg/day
**Child 14-17 kg:** PO/RECT 2.5 mg bid-tid; IM 0.132 mg/kg, q3-4hr prn, max 10 mg/day
**Child 9-13 kg:** PO/RECT 2.5 mg daily-bid; IM 0.132 mg/kg, q3-4hr prn, max 7.5 mg/day

### Antipsychotic

**Adult and child ≥12 yr:** PO 5-10 mg tid-qid; may increase q2-3day, max 150 mg/day; IM 10-20 mg q2-4hr up to 4 doses, then 10-20 mg q4-6hr, max 200 mg/day; RECT 10 mg tid-qid, may increase by 5-10 mg q2-3day as needed
**Child 2-12 yr:** PO 2.5 mg bid-tid; IM 0.132 mg/kg, change to oral ASAP

### Antianxiety

**Adult and child ≥12 yr:** PO 5 mg tid-qid, max 20 mg/day or >12 wk; IM 5-10 mg q3-4hr, max 40 mg/day; **IV** 2.5-10 mg; max 40 mg/day
**Child 2-12 yr:** IM 0.132 mg/kg, change to oral ASAP

**Available forms:** Syr 5 mg/ml; inj 5 mg/ml; tabs 5, 10, 25 mg; sus rel caps 10, 15 mg; supp 2.5, 5, 25 mg; solution for injection 5 mg/ml

### Implementation

**IM route**

- Inject slowly in deep muscle mass; do not give SUBCUT; aspirate to avoid **IV** administration; do not administer sol with a precipitate; have patient lie down afterward for at least 30 min

**Direct IV route**

- No dilution needed, inject directly in a vein ≤5 mg/min, do not give as bolus

**Intermittent IV infusion route**

- May dilute 20 mg/L NaCl and give as inf 15-30 min prior to anesthesia induction

**Y-site compatibilities:** Amsacrine, calcium gluconate, CISplatin, cladribine, cyclophosphamide, cytarabine, DOXOrubicin, fluconazole, granisetron, heparin, hydrocortisone, melphalan, methotrexate, ondansetron, PACLitaxel, potassium chloride, propofol, sargramostim, SUFentanil, teniposide, thiotepa, vinorelbine, vit B/C

**Y-site incompatibilities:** Foscarnet

## ADVERSE EFFECTS

**CNS:** Tardive dyskinesia, *euphoria,* depression, EPS, restlessness, tremor, dizziness, neuroleptic malignant syndrome, drowsiness, headache
**CV:** Circulatory failure, tachycardia, hypotension, ECG changes
**EENT:** Blurred vision
**GI:** Nausea, vomiting, anorexia, dry mouth, diarrhea, constipation, weight loss, metallic taste, cramps
**HEMA:** Agranulocytosis
**MISC:** Impotence
**RESP:** Respiratory depression

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Variably absorbed (PO); well absorbed (IM) |
| **Distribution** | Widely distributed, high concentration in CNS, crosses placenta |
| **Metabolism** | Liver, extensively; GI mucosa |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics

| | PO | PO-SUS REL | RECT | IM | IV |
|---|---|---|---|---|---|
| **Onset** | ½ hr | Unkn | 1 hr | 10-20 min | 4-5 min |
| **Peak** | Unkn | Unkn | Unkn | Unkn | Unkn |
| **Duration** | 3-4 hr | 10-12 hr | 3-4 hr | 4-6 hr; children: 12 hr | 3-4 hr |

## INTERACTIONS

### Individual drugs

Lithium: decreased prochlorperazine effect

### Drug classifications

Antacids, barbiturates: decreased prochlorperazine effect
Anticholinergics, antidepressants, antiparkinson products: increased anticholinergic effects
SSRIs, SNRIs: increased serotonin syndrome, increased neuroleptic malignant syndrome
CNS depressants: increased CNS depression

### Drug/herb

Betel palm, kava: increased EPS
Dong quai: avoid use

### Drug/lab test

Increased: liver function tests, cardiac enzymes, cholesterol, blood glucose, prolactin, bilirubin, PBI, $^{131}I$, alkaline phosphatase, leukocytes, granulocytes, platelets
Decreased: hormones (blood and urine)
False positive: pregnancy tests, urine bilirubin
False negative: urinary steroids, 17-OHCS, pregnancy tests

## NURSING CONSIDERATIONS

### Assessment

- Assess mental status: orientation, mood, behavior, presence and type of hallucinations before initial administration and monthly; this product should significantly reduce psychotic behavior
- Check for swallowing of PO medication; check for hoarding or giving of medication to other patients
- Monitor I&O ratio; palpate bladder if low urinary output occurs, especially in geriatric; urinalysis recommended before, during prolonged therapy
- Monitor bilirubin, CBC, liver function tests monthly; blood dyscrasias, hepatotoxicity may occur
- Assess affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances

• Monitor B/P with patient sitting, standing, and lying; take pulse and respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; obtain baseline ECG, Q-wave and T-wave changes
• Check for dizziness, faintness, palpitations, tachycardia on rising; severe orthostatic hypotension is common
• **Identify neuroleptic malignant syndrome:** hyperpyrexia, muscle rigidity, increased CPK, altered mental status, seizures, fever, tachycardia, dyspnea, fatigue, loss of bladder control; notify prescriber immediately; product should be discontinued
• Assess for EPS including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (ragged tremors, pill rolling, shuffling gait); an antiparkinsonism product should be prescribed
• Assess for constipation, urinary retention daily; if these occur, increase bulk, water in diet
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, EPS may result, cautious use in breastfeeding, excreted in breast milk
• **Beers:** Avoid in older adults with a high risk of delirium

### Patient/family education

• Teach patient to use good oral hygiene; frequent rinsing of mouth, sugarless gum for dry mouth since oral candidiasis may occur
• Caution patient to avoid hazardous activities until product response is determined; dizziness, blurred vision may occur
• Inform patient that orthostatic hypotension occurs often and to rise from sitting or lying position gradually; to remain lying down after IM inj for at least 30 min; tell patient to avoid hot tubs, hot showers, tub baths, since hypotension may occur; tell patient that in hot weather heat stroke may occur; take extra precautions to stay cool
• Advise patient to avoid abrupt withdrawal of this product, or EPS may result; product should be withdrawn slowly
• Teach patient to avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber, since serious product interactions may occur; avoid use with alcohol, CNS depressants; increased drowsiness may occur; avoid activities requiring mental alertness
• Instruct patient to avoid sun or use sunscreen, sunglasses, and protective clothing to prevent burns
• Advise patient to take antacids 2 hr before or after taking this product
• Advise patient to report sore throat, malaise, fever, bleeding, mouth sores; if these occur, CBC should be done and product discontinued
• Teach patient not to double or skip doses
• Inform patient that urine may turn pink to reddish brown
• Instruct patient to report dark urine, clay-colored stools, bleeding, bruising, rash, blurred vision
• Advise patient that suppositories may contain coconut/palm oil

### Evaluation

**Positive therapeutic outcome**
• Relief of nausea and vomiting
• Decrease in emotional excitement, hallucinations, delusions, paranoia
• Reorganization of patterns of thought, speech

**TREATMENT OF OVERDOSE:** Lavage if orally ingested; provide airway; *do not induce vomiting or use EPINEPHrine*

## progesterone (Rx)

(proe-jess'ter-one)
**Crinone, Endometrin, Prometrium**
*Func. class.:* Progestogen
*Chem. class.:* Progesterone derivative

**ACTION:** Inhibits secretion of pituitary gonadotropins, which prevents follicular maturation, ovulation; stimulates growth of mammary tissue; antineoplastic action against endometrial cancer

**Therapeutic outcome:** Decreased abnormal uterine bleeding, absence of amenorrhea

**USES:** Contraception, amenorrhea, premenstrual syndrome, abnormal uterine bleeding, endometrial hyperplasia prevention, assisted reproductive technology (ART) gel

**Unlabeled uses:** Corpus luteum insufficiency

**CONTRAINDICATIONS**
Pregnancy, thromboembolic disorders, reproductive cancer, genital bleeding (abnormal, undiagnosed), cerebral hemorrhage, ectopic pregnancy, PID, STDs, thrombophlebitis, hypersensitivity to this product, peanuts, or peanut oil

**BLACK BOX WARNING:** Breast cancer

**Precautions:** Breastfeeding, hypertension, asthma, blood dyscrasias, gallbladder disease, HF, diabetes mellitus, bone disease, depression, migraine headache, seizure disorders, renal/hepatic disease, family history of breast or reproductive tract cancer

**BLACK BOX WARNING:** Cardiac disease, dementia

## DOSAGE AND ROUTES

### Infertility
**Adult:** Vag 90 mg/day (micronized gel); 100 mg 2-3 times/day, starting day after oocyte retrieval and up to 10 wk total

### Amenorrhea/functional uterine bleeding
**Adult:** IM 5-10 mg/day × 6-8 doses

### Endometrial hyperplasia prevention
**Adult:** PO 200 mg/day × 12 days

### Assisted reproductive technology
**Adult:** GEL 90 mg (8%) vaginally daily, for supplementation; 90 mg (8%) vaginally bid for replacement; if pregnancy occurs, continue × 10-12 wk

### Corpus luteum insufficiency (unlabeled)
**Adult:** VAG insert 90-100 mg bid-tid starting at oocyte retrieval and continuing up to 10-12 wk of gestation

**Available forms:** Caps 100, 200 mg; inj 50 mg/ml; powder micronized; vag gel 4%, 8%; vag insert 100 mg; supp 25, 100, 200, 500 mg, compounding kit 25, 50, 100, 200, 400 mg

### Implementation
**PO route**
- Do not crush, break, chew caps, give one dose in AM
- With food or milk to decrease GI symptoms
- Start progesterone 14 days after estrogen dose, if given concomitantly

**Vaginal route**
- Wait at least 6 hr after any vaginal treatment before using vaginal gel

**IM route**
- Store in dark area
- Give titrated dose; use lowest effective dosage; give oil sol deep in large muscle mass; rotate sites; use after warming to dissolve crystals
- Check for particulate matter and discoloration prior to injecting

## ADVERSE EFFECTS
**CNS:** *Dizziness, headache,* migraines, depression, *fatigue,* mood swings, dementia, drowsiness
**CV:** Hypotension, thrombophlebitis, edema, thromboembolism, stroke, pulmonary embolism, MI
**EENT:** Diplopia, retinal thrombosis
**GI:** *Nausea,* vomiting, anorexia, cramps, increased weight, cholestatic jaundice, *constipation,* abdominal pain
**GU:** Amenorrhea, cervical erosion, breakthrough bleeding, dysmenorrhea, vaginal candidiasis, nocturia, breast changes, *gynecomastia, testicular atrophy, impotence,* endometriosis, spontaneous abortion, breast pain, ectopic pregnancy
**INTEG:** Rash, urticaria, acne, hirsutism, alopecia, oily skin, seborrhea, purpura, melasma
**META:** Hyperglycemia
**SYST:** Angioedema, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics

| | IM | RECT | VAG |
|---|---|---|---|
| **Onset** | Unknown | Unknown | Unknown |
| **Peak** | Unknown | Unknown | Unknown |
| **Duration** | 24 hr | 24 hr | 24 hr |

## INTERACTIONS
### Drug classifications
Barbiturates, phenytoins: decreased progesterone effect
CYP3A4 inhibitors (cimetidine, clarithromycin, danazol, diltiazem, erythromycin, fluconazole, itraconazole, ketoconazole, troleandomycin, verapamil, voriconazole): increased progesterone effect

### Drug/lab test
Increased: alkaline phosphatase, nitrogen (urine), pregnanediol, amino acids, factors VII, VIII, IX, X
Decreased: GTT, HDL

## NURSING CONSIDERATIONS
### Assessment
- Monitor B/P at beginning of treatment and periodically; check weight daily; notify prescriber of weekly weight gain >5 lb
- Monitor I&O ratio: be alert for decreasing urinary output, increasing edema, hypertension
- Assess liver function tests: ALT, AST, bilirubin periodically during long-term therapy
- Assess edema, hypertension, cardiac symptoms, jaundice
- Assess mental status: affect, mood, behavioral changes, depression
- Assess for hypercalcemia
- Assess cervical cytology
- Conduct breast exam
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

P

### Patient/family education

- Teach patient to avoid activities requiring mental alertness until effects are realized; can cause dizziness
- Teach patient to report breast lumps, vaginal bleeding, edema, jaundice, dark urine, clay-colored stools, dyspnea, headache, blurred vision, abdominal pain, numbness or stiffness in legs, chest pain
- Teach patient to report suspected pregnancy
- Teach patient to avoid gel with other vaginal products; if to be used together, to separate by 6 hr; for vaginal route, teach patient proper insertion technique

### Evaluation

**Positive therapeutic outcome**

- Decreased abnormal uterine bleeding
- Absence of amenorrhea
- Prevented pregnancy

**⚠ HIGH ALERT**

## promethazine (Rx)

(proe-meth'a-zeen)

**Histamil, Phenergan, Promethagan**

*Func. class.:* Antihistamine, $H_1$-receptor antagonist; antiemetic; sedative/hypnotic

*Chem. class.:* Phenothiazine derivative

**ACTION:** Acts on blood vessels, GI, respiratory system by competing with histamine for $H_1$-receptor site; decreases allergic response by blocking histamine

**Therapeutic outcome:** Absence of allergy symptoms and rhinitis, absence of nausea/vomiting, sedation

**USES:** Motion sickness, rhinitis, allergy symptoms, sedation, nausea, preoperative and postoperative sedation

## CONTRAINDICATIONS

Hypersensitivity to $H_1$-receptor antagonist, agranulocytosis, bone marrow suppression, breastfeeding, coma, jaundice, Reye's syndrome

**BLACK BOX WARNING:** Infants, intraarterial/SUBCUT use, neonates, children, extravasation

**Precautions:** Pregnancy, renal/cardiac/hepatic disease, asthma, seizure disorder, prostatic hypertrophy, bladder obstruction, glaucoma, COPD, GI obstruction, ileus, CNS depression, diabetes, sleep apnea, urinary retention

**BLACK BOX WARNING: IV** use, tissue necrosis

## DOSAGE AND ROUTES

### Nausea/vomiting

**Adult:** PO/IM/**IV**/RECT 12.5-25 mg; q4-6hr prn
**Child >2 yr:** PO/IM/**IV**/RECT 0.25-0.5 mg/kg q4-6hr prn

### Motion sickness

**Adult:** PO 25 mg bid; give 30-60 min before departure and q8-12hr prn
**Child >2 yr:** PO/IM/RECT 12.5-25 mg bid; give 30-60 min before departure and q8-12hr prn

### Allergy/rhinitis (unlabeled)

**Adult:** PO 12.5 mg qid, or 25 mg at bedtime
**Child ≥2 yr:** PO 6.25-12.5 mg tid or 25 mg at bedtime

### Sedation

**Adult:** PO/IM 25-50 mg at bedtime
**Child ≥2 yr:** PO/IM/RECT 12.5-25 mg at bedtime

### Sedation (preoperative/postoperative)

**Adult:** PO/IM/**IV** 25-50 mg
**Child ≥2 yr:** PO/IM/**IV** 0.5-1.1 mg/kg

**Available forms:** Tabs 12.5, 25, 50 mg; supp 12.5, 25, 50 mg; inj 25, 50 mg/ml

### Implementation

**PO route**

- With meals for GI symptoms; absorption may slightly decrease
- When used for motion sickness, 30 min-1 hr before travel

**IM route**

- IM inj in deep in large muscle; rotate site

**Direct IV route**

**BLACK BOX WARNING:** Check for extravasation: burning, pain, swelling at **IV** site, can cause tissue necrosis

- Do not use if precipitate is present
- Rapid administration may cause transient decrease in B/P
- After diluting each 25-50 mg/9 ml of NaCl for inj; give 25 mg or less/2 min

**Y-site compatibilities:** Alfentanil, amifostine, amikacin, aminocaproic acid, amsacrine, anidulafungin, ascorbic acid, atenolol, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium,

DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin, eptifibatide, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, gemcitabine, gentamicin, glycopyrrolate, granisetron, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, insulin (regular), irinotecan, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, LR, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methoxamine, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, mitoXANtrone, morphine, mycophenolate, nalbuphine, naloxone, netilmicin, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, phenylephrine, polymyxin B, procainamide, prochlorperazine, propranolol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, remifentanil, Ringer's, ritodrine, riTUXimab, rocuronium, sargramostim, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, TNA, tobramycin, tolazoline, trastuzumab, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole

## ADVERSE EFFECTS

**CNS:** *Dizziness, drowsiness,* poor coordination, fatigue, anxiety, euphoria, confusion, paresthesia, neuritis, EPS, neuroleptic malignant syndrome

**CV:** Hyper/hypotension, palpitations, tachycardia

**EENT:** Blurred vision, dilated pupils, tinnitus, nasal stuffiness, dry nose, throat, mouth, photosensitivity

**GI:** *Constipation,* dry mouth, nausea, vomiting, anorexia, diarrhea

**GU:** *Retention,* dysuria, frequency

**HEMA:** Thrombocytopenia, agranulocytosis, hemolytic anemia

**INTEG:** Rash, urticaria, photosensitivity

**RESP:** Increased thick secretions, wheezing, chest tightness, apnea in pediatric patients

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, IM); erratically absorbed (RECT) |
| **Distribution** | Widely distributed; crosses the blood-brain barrier, placenta |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics

| | PO/IM/RECT | IV |
|---|---|---|
| **Onset** | 20 min | 3-5 min |
| **Peak** | Unknown | Unknown |
| **Duration** | 4-12 hr | 4-6 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression

Heparin: decreased oral anticoagulants effect

### Drug classifications

Antidepressants (tricyclics), barbiturates, CNS depressants, opiates, sedative/hypnotics: increased CNS depression

MAOIs: increased promethazine effect

### Drug/lab test

False negative: skin allergy tests (discontinue antihistamines 3 days before testing)

False positive: urine pregnancy test

Interference: blood grouping (ABO), GTT

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Child:** Not to be used in children <2 yr: fatal respiratory depression may occur; use cautiously in children >2 yr: seizures, paradoxical CNS stimulation may occur

- **Neuroleptic malignant syndrome:** assess for fever, confusion, diaphoresis, rigid muscles, elevated CPK, encephalopathy, discontinue product, notify prescriber
- Assess respiratory status: rate, rhythm, increase in bronchial secretions, wheezing, chest tightness; provide fluids to 2 L/day to decrease secretion thickness
- Monitor I&O ratio: be alert for urinary retention, frequency, dysuria, especially geriatric; product should be discontinued if these occur
- Monitor CBC during long-term therapy; blood dyscrasias may occur but are rare
- Monitor cardiac status: VS, palpitations, increased pulse, hypo/hypertension
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed

### Patient/family education

- Inform patient that a false-negative result may occur with skin testing; these procedures should not be scheduled until 3 days after discontinuing use
- Advise patient to take 30 min before departure to prevent motion sickness
- Caution patient to avoid hazardous activities, activities requiring alertness, since dizziness may

P

occur; instruct patient to request assistance with ambulation
• Advise patient to avoid alcohol, other depressants; serious CNS depression may occur
• Teach patient all aspects of product use; to notify prescriber if confusion, sedation, hypotension, jaundice, fever occur; to avoid driving and other hazardous activity if drowsiness occurs
• Advise patient to take 1 hr before or 2 hr after meals to facilitate absorption
• Caution patient not to exceed recommended dosage; dysrhythmias may occur
• Inform patient hard candy, gum, frequent rinsing of mouth may be used for dryness
• Advise that product may reduce sweating (heat stroke)

### Evaluation

**Positive therapeutic outcome**
• Absence of motion sickness
• Absence of nausea, vomiting

**⚠ HIGH ALERT**

## propafenone (Rx)

(pro-paff'e-nown)
**Rythmol, Rythmol SR**
*Func. class.:* Antidysrhythmic (Class IC)

**ACTION:** Slows conduction velocity; reduces membrane responsiveness; inhibits automaticity; increases ratio of effective refractory period to action potential duration; β-blocking activity

**Therapeutic outcome:** Absence of arrhythmias

**USES:** Atrial fibrillation (single dose), sustained ventricular tachycardia, paroxysmal supraventricular tachycardia (PSVT) prophylaxis, supraventricular dysrhythmias

## CONTRAINDICATIONS

2nd-, 3rd-degree AV block, right bundle branch block, cardiogenic shock, hypersensitivity, bradycardia, uncontrolled HF, sick sinus syndrome, marked hypotension, bronchospastic disorders, electrolyte imbalance, Brugada syndrome

**Precautions:** Pregnancy, breastfeeding, children, geriatric, HF, hypo/hyperkalemia, nonallergic bronchospasm, renal/hepatic disease, hematologic disorders, myasthenia gravis, COPD, cardiac arrhythmias, QT prolongation, torsades de pointes

**BLACK BOX WARNING:** Recent MI

## DOSAGE AND ROUTES

### PSVT

**Adult:** PO 150 mg q8hr; allow a 3-4 day interval before increasing dose, max 900 mg/day

### Atrial fibrillation

**Adult:** PO 450 or 600 mg as a single dose; SR 225 mg q12hr, may increase to 325 mg q12hr, max 425 mg q12hr

**Available forms:** Tabs 150, 225, 300 mg, SR cap 225, 325, 425 mg

### Implementation

• Begin treatment in hospital
• Remove other antiarrhythmics before starting propafenone
• Adjust dosage q3-4day, no sooner

## ADVERSE EFFECTS

**CNS:** Headache, dizziness, abnormal dreams, syncope, confusion, seizures, insomnia, tremor, anxiety, fatigue
**CV:** Supraventricular dysrhythmia, ventricular dysrhythmia, bradycardia, prodysrhythmia, palpitations, AV block, intraventricular conduction delay, AV dissociation, hypotension, chest pain, asystole
**EENT:** Blurred vision, altered taste, tinnitus
**GI:** *Nausea, vomiting*, constipation, dyspepsia, cholestasis, abnormal hepatic studies, dry mouth, diarrhea, anorexia
**HEMA:** Leukopenia, agranulocytosis, granulocytopenia, thrombocytopenia, anemia, bruising
**INTEG:** Rash
**RESP:** Dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely, crosses placenta |
| **Metabolism** | Rapid, liver, CYP1A2, CYP2D6, CYP3A4 |
| **Excretion** | Kidneys |
| **Half-life** | 2-32 hr, poor metabolizers 10-32 hr |

### Pharmacodynamics (antiarrhythmic)

| | |
|---|---|
| **Onset** | Hours to several days |
| **Peak** | 4-5 days |
| **Duration** | Several hr |

## INTERACTIONS

### Individual products

Arsenic trioxide, chloroquine, clarithromycin, droperidol, erythromycin, haloperidol, levomethadyl, methadone, pentamidine, chlorproMAZINE, mesoridazine, thioridazine: increased QT prolongation
Cimetidine, quiNIDine, rifampin: decreased propafenone effect
CycloSPORINE, digoxin: increased serum levels
Metoprolol, propranolol: increased β-blocker effect
Warfarin: increased anticoagulation

### Drug classifications
Local anesthetics: increased CNS effects
CYP1A2, CYP2D6, CYP3A4 inhibitors (protease inhibitors, quiNINE, PARoxetine, saquinavir, erythromycin, azole antifungals, sertraline, tricyclics): increased propafenone effects

### Drug/food
Grapefruit juice: increased propafenone effect

### Drug/herb
St. John's wort: decreased propafenone effect

### Drug/lab test
Increased: CPK, Hct, Hgb
Decrease: WBC, platelets

## NURSING CONSIDERATIONS
### Assessment
- Monitor GI status: bowel pattern, number of stools
- **Assess cardiac status:** rate, rhythm, quality; ECG or Holter monitor prior to, during therapy; watch for PR, QT prolongation
- Monitor chest x-ray film, pulmonary function test during treatment
- Monitor I&O ratio; check for decreasing output; daily weight
- Monitor B/P for fluctuations
- Assess lung fields; bilateral crackles, dyspnea, peripheral edema, weight gain, jugular venous distention may occur in HF patient
- **Assess toxicity:** fine tremors, dizziness, hypotension, drowsiness, abnormal heart rate
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excreted in breast milk

### Patient/family education
- Advise patient to avoid hazardous activities until response is known
- Advise patient to report fever, chills, sore throat, bleeding, shortness of breath, chest pain, palpitations, blurred vision
- Advise patient to take medication with food
- Advise patient to carry emergency ID identifying medication and prescriber
- Instruct patient not to use with grapefruit juice or St. John's wort
- **Pregnancy:** Notify prescriber if pregnancy is planned or suspected, do not breastfeed

### Evaluation
**Positive therapeutic outcome**
- Absence of dysrhythmias

## TREATMENT OF OVERDOSE:
$O_2$, artificial ventilation, defibrillation ECG; administer DOPamine for circulatory depression, diazepam or thiopental for seizures, isoproterenol

## proparacaine ophthalmic
*See Appendix B*

**⚠ HIGH ALERT**

## propofol (Rx)
(pro′poh-fole)
**Diprivan**
*Func. class.:* Hypnotic

**Do not confuse:** Diprivan/Diflucan/Ditropan

**ACTION:** Produces dose-dependent CNS depression by activation of GABA receptor

**Therapeutic outcome:** Induction of anesthesia

**USES:** Induction or maintenance of anesthesia as part of balanced anesthetic technique; sedation in mechanically ventilated patients

## CONTRAINDICATIONS
Hypersensitivity to product or soybean oil, egg, benzyl alcohol (some products)

**Precautions:** Pregnancy, breastfeeding, children, geriatric, respiratory depression, severe respiratory disorders, cardiac dysrhythmias, labor and delivery, renal disease, hyperlipidemia

## DOSAGE AND ROUTES
### Anesthesia
**Adult <55 yr and ASA I/II IV (Diprivan or generic): IV** 40 mg q10sec until induction onset; maintenance: 100-200 mcg/kg/min or **IV BOL** 20-50 mg prn, allow 3-5 min between adjustments
**Child ≥3 yr or ASA I or II: IV Induction:** 2.5-3.5 mg/kg over 20-30 sec when not premedicated or lightly premedicated
**Child 2 mo-16 yr maintenance: IV** 125-300 mcg/kg/min, lower dose for ASA III or IV

### ICU sedation
**Adult: IV** 5 mcg/kg/min over 5 min; may increase by 5-10 mcg/kg/min over 5-10 min until desired response (Diprivan or generic)

**Available forms:** Inj 10 mg/ml in 20 ml ampule, vials, syringes

### Implementation
**IV route**
- Shake well before use; dilution is not necessary but if diluted, use only $D_5W$ to ≥2 mg/ml; give over 3-5 min, titrate to needed level of sedation; use only glass containers when mixing, not stable in plastic; use aseptic technique when transferring from original container

• Only with resuscitative equipment available, only by qualified persons trained in anesthesia

**Y-site compatibilities:** Acyclovir, alfentanil, aminophylline, ampicillin, aztreonam, bumetanide, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, ceFAZolin, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dexamethasone, diphenhydrAMINE, DOBUTamine, DOPamine, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, esmolol, famotidine, fentaNYL, fluconazole, fluorouracil, furosemide, ganciclovir, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem/cilastatin, inamrinone, regular insulin, isoproterenol, ketamine, labetalol, levorphanol, lidocaine, LORazepam, magnesium sulfate, mannitol, meperidine, mezlocillin, miconazole, morphine, nafcillin, nalbuphine, naloxone, nitroglycerin, norepinephrine, ofloxacin, PACLitaxel, PENTobarbital, PHENobarbital, piperacillin, potassium chloride, prochlorperazine, propranolol, ranitidine, scopolamine, sodium bicarbonate, sodium nitroprusside, succinylcholine, SUFentanil, thiopental, ticarcillin, ticarcillin/clavulanate, vecuronium, verapamil

**Solution compatibilities:** (If given together via Y-site) $D_5W$, $D_5LR$, LR, $D_5/0.45\%$ NaCl, $D_5/0.2\%$ NaCl

## ADVERSE EFFECTS

**CNS:** Involuntary movement, headache, jerking, fever, dizziness, shivering, tremor, confusion, somnolence, paresthesia, agitation, abnormal dreams, euphoria, fatigue, increased ICP, impaired cerebral flow, seizures

**CV:** *Bradycardia, hypotension,* hypertension, PVC, PAC, tachycardia, abnormal ECG, ST segment depression, asystole, bradydysrhythmias

**EENT:** Blurred vision, tinnitus, eye pain, strange taste, diplopia

**GI:** *Nausea, vomiting, abdominal cramping,* dry mouth, swallowing, hypersalivation, pancreatitis

**GU:** Urine retention, green urine, cloudy urine, oliguria

**INTEG:** *Flushing, phlebitis, hives, burning/stinging at inj site,* rash, pain of extremities

**MS:** Myalgia

**RESP:** Apnea, *cough, hiccups*, dyspnea, hypoventilation, sneezing, wheezing, tachypnea, hypoxia, respiratory acidosis

**SYST:** Propofol infusion syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed |
| **Distribution** | Rapid |
| **Metabolism** | Liver, conjugation to active metabolites; 95%-99% protein binding |
| **Excretion** | Urine |
| **Half-life** | 3-12 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 15-30 sec |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression

### Drug classifications

Antipsychotics, CNS depressants (sedative-hypnotics, opioid analgesics), inhalational anesthetics, skeletal muscle relaxants: increased CNS depression

MAOIs: do not use within 10 days

### Drug/herb

St. John's wort: increased propofol effect

## NURSING CONSIDERATIONS

### Assessment

- Assess inj site: phlebitis, burning, stinging
- **Monitor ECG for changes:** PVC, PAC, ST segment changes; monitor VS
- Assess CNS changes: movement, jerking, tremors, dizziness, LOC, pupil reaction
- Avoid general anesthetic use in child <3 yr, may negatively affect the brain
- Assess allergic reactions: hives
- **Assess respiratory dysfunction:** respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min
- **Propofol infusion syndrome:** assess for rhabdomyolysis, renal failure, hyperkalemia, metabolic acidosis, cardiac dysrhythmias, heart failure, usually between 35 and 93 hr after inf began, at >5 mg/kg/hr for >58 hr
- **Pregnancy/breastfeeding:** Use only if clearly needed, avoid breastfeeding, excreted in breast milk

### Patient/family education

- Teach patient that this medication will cause dizziness, drowsiness, sedation; to avoid hazardous activities until drug effect wears off, may cause burning sensation during administration

## Evaluation

**Positive therapeutic outcome**
- Induction of anesthesia

## TREATMENT OF OVERDOSE:
Discontinue product; administer vasopressor agents or anticholinergics, artificial ventilation

**⚠ HIGH ALERT**

## propranolol (Rx)
(proe-pran′oh-lole)
**Hemanegeol, Inderal XL Inderal, Inderal LA, InnoPran XL**
*Func. class.:* Antihypertensive, antianginal, antidysrhythmic (class III)
*Chem. class.:* β-Adrenergic blocker

**Do not confuse:** Inderal/Adderall, propranolol/Pravachol

**ACTION:** Nonselective β-blocker with negative inotropic, chronotropic, dromotropic properties

**Therapeutic outcome:** Decreased B/P, heart rate

**USES:** Chronic stable angina pectoris, hypertension, supraventricular dysrhythmias, migraine prophylaxis, pheochromocytoma, cyanotic spells related to hypertrophic subaortic stenosis, essential tremor, acute MI

**Unlabeled uses:** Prevention of variceal bleeding caused by portal hypertension, akathisia induced by antipsychotics, lithium-induced tremor

## CONTRAINDICATIONS
Hypersensitivity to this product, cardiogenic shock, AV heart block, bronchospastic disease, sinus bradycardia, bronchospasm, asthma

**Precautions:** Pregnancy, breastfeeding, children, diabetes mellitus, renal/hepatic disease, hyperthyroidism, COPD, myasthenia gravis, peripheral vascular disease, hypotension, cardiac failure, Raynaud's disease, sick sinus syndrome, vasospastic angina, smoking, Wolff-Parkinson-White syndrome, thyrotoxicosis

**BLACK BOX WARNING:** Abrupt discontinuation

## DOSAGE AND ROUTES
### Dysrhythmias
**Adult:** PO 10-30 mg tid-qid; **IV** BOL 1-3 mg given 1 mg/min; may repeat in 2 min; may repeat q4hr thereafter
**Child:** PO 1 mg/kg/day divided in 2 doses, **IV** 0.01-0.1 mg/kg over 5 min

### Hypertension
**Adult:** PO 40 mg bid or 80 mg/day (EXT REL) initially; usual dosage 120-240 mg/day bid-tid or 120-160 mg/day (EXT REL)
**Child:** PO 0.5-1 mg/kg/day divided q6-12hr

### Angina
**Adult:** PO 10-20 mg bid-qid, increase at 3-7 day intervals up to 160-320 mg/day, or ext rel 80 mg/day, increase at 3-7 day intervals up to 160-320 mg/day

### MI prophylaxis
**Adult:** PO 180-240 mg/day tid-qid starting 5 days to 2 wk after MI

### Pheochromocytoma
**Adult:** PO 60 mg/day × 3 days preoperatively in divided doses or 30 mg/day in divided doses (inoperable tumor)

### Migraine
**Adult:** PO 80 mg/day (EXT REL) or in divided doses; may increase to 160-240 mg/day in divided doses
**Child:** PO 0.6-1.5 mg/kg/day divided q8hr
**Child ≤35 kg (unlabeled):** PO 10-20 mg tid

### Essential tremor
**Adult:** PO 40 mg bid; usual dosage 120 mg/day

**Available forms:** Ext rel caps 60, 80, 120, 160 mg; tabs 10, 20, 40, 60, 80, 90 mg; inj 1 mg/ml; oral sol 4 mg, 8 mg/ml

### Implementation
**PO route**
- Do not break, crush, chew, or open ext rel cap
- Do not use ext rel cap for essential tremor, MI, cardiac dysrhythmias; do not use InnoPran XL in hypertropic subaortic stenosis, migraine, angina pectoris
- Ext rel caps should be taken daily; InnoPran XL should be taken at bedtime
- May mix oral sol with liquid or semisolid food; rinse container to get entire dose
- Give with 8 oz water with food; food enhances bioavailability
- Do not give with aluminum-containing antacid; may decrease GI absorption

**Direct IV route**
- IV undiluted or diluted 10 ml $D_5W$ for inj; give 1 mg or less/min

**Intermittent IV infusion route**
- May be diluted in 50 ml NaCl and run 1 mg over 10-15 min

**Y-site compatibilities:** Acyclovir, alfentanil, alteplase, amikacin, aminocaproic acid, aminophylline, anidulafungin, ascorbic acid, atracurium, atropine, azaTHIOprine, aztreonam,

benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, cefamandole, ceFAZolin, cefmetazole, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cephalothin, cephapirin, chloramphenicol, chlorproMAZINE, cimetidine, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gatifloxacin, gemcitabine, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, ifosfamide, imipenem-cilastatin, inamrinone, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, phytonadione, piperacillin, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, protamine, pyridoxine, quiNIDine, quinupristin-dalfopristin, ranitidine, ritodrine, rocuronium, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, vitamin B complex/C, voriconazole, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Depression, hallucinations, *dizziness, fatigue,* lethargy, paresthesia, bizarre dreams, disorientation

**CV:** Bradycardia, *hypotension,* HF, palpitations, AV block, peripheral vascular insufficiency, vasodilatation, pulmonary edema, dysrhythmias, cold extremities

**EENT:** Sore throat, laryngospasm, blurred vision, dry eyes

**GI:** Nausea, vomiting, diarrhea, colitis, constipation, cramps, dry mouth, hepatomegaly, gastric pain, acute pancreatitis

**GU:** Impotence, decreased libido, UTIs

**HEMA:** Agranulocytosis, thrombocytopenia

**INTEG:** Rash, pruritus, fever, Stevens-Johnson syndrome, toxic epidermal necrolysis

**META:** Hyperglycemia, hypoglycemia

**MISC:** Facial swelling, weight change, Raynaud's phenomenon

**MS:** Joint pain, arthralgia, muscle cramps, pain

**RESP:** Dyspnea, respiratory dysfunction, bronchospasm, cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO); slowly absorbed (ext rel); completely absorbed (**IV**) |
| **Distribution** | Widely distributed, crosses blood-brain barrier, protein binding 90% |
| **Metabolism** | Liver, extensively by CYP2D6 enzyme system, ☠ 7% of population are poor metabolizers |
| **Excretion** | Kidneys |
| **Half-life** | 3-8 hr; ext rel 8-11 hr |

### Pharmacodynamics

| | PO | PO-EXT REL | IV |
|---|---|---|---|
| **Onset** | ½ hr | Unknown | Rapid |
| **Peak** | 1-1½ hr | 6 hr | 1 min |
| **Duration** | 6-12 hr | 24 hr | 2-4 hr |

## INTERACTIONS

### Individual drugs

Cimetidine: increased β-blocking effect

Disopyramide: increased negative inotropic effects

Haloperidol, prazosin, quiNIDine: increased hypotension

Propafenone: increased propranolol levels

Smoking: decreased propranolol levels

### Drug classifications

Barbiturates: decreased β-blocking effect

Calcium channel blockers, neuromuscular blockers: increased effects

Phenothiazines: increased toxicity

### Drug/herb

Hawthorn: increased antihypertensive effect
Avoid use with feverfew, ma huang: decreased antihypertensive effect

### Drug/lab test

Increased: serum potassium, serum uric acid, AST, ALT, alkaline phosphatase, LDH
Decreased: blood glucose
Interference: glaucoma testing

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P during beginning treatment, periodically thereafter; pulse q4hr; note rate, rhythm, quality; check apical/radial pulse before administration; notify prescriber of any significant changes (pulse <50 bpm or systolic B/P <90 mm Hg)

**BLACK BOX WARNING:** Abrupt withdrawal: taper over 1-2 weeks; do not discontinue abruptly; dysrhythmias, angina, myocardial ischemia, or MI may recur

- Monitor ECG continuously if using an antidysrhythmic IV, PCWP (pulmonary capillary wedge pressure), CVP (central venous pressure)
- Assess for edema in feet, legs daily; monitor; check for jugular vein distention, crackles bilaterally; dyspnea (HF)
- Monitor skin turgor, dryness of mucous membranes for hydration status, especially geriatric
- Assess for headache, light-headedness, decreased B/P; may indicate need for decreased dose; may aggravate symptoms of arterial insufficiency
- Monitor hepatic enzymes: AST, ALT, bilirubin; blood glucose (diabetes mellitus)
- Angina pain: Assess duration, time started, activity being performed, character
- Assess for tolerance with long-term use
- Fluid overload: Monitor weight daily; report gain of >5 lb
- Monitor I&O ratio, CCr if kidney damage is diagnosed; fatigue, weight gain, jugular distention, dyspnea, peripheral edema, crackles
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding

### Patient/family education

- Teach patient not to discontinue product abruptly (life-threatening dysrhythmias, exacerbation of angina, MI); to take at same time of day either with or without food consistently; taper over at least a few wk
- Teach patient not to use OTC products containing α-adrenergic stimulants (such as nasal decongestants, cold preparations); to avoid alcohol, smoking and to limit sodium intake as prescribed; blood glucose (diabetes mellitus)
- Teach patient how to take pulse and B/P at home; advise when to notify prescriber
- Instruct patient to comply with weight control, dietary adjustments, modified exercise program
- Instruct patient to carry/wear emergency ID to identify product being taken, allergies; tell patient product controls symptoms but does not cure
- Caution patient to avoid hazardous activities if dizziness, drowsiness are present
- **Teach patient to report symptoms of HF:** difficulty breathing, especially on exertion or when lying down, night cough, swelling of extremities or bradycardia, dizziness, confusion, depression, fever
- Advise patient that sensitivity to cold may occur
- Teach patient to monitor blood glucose; may mask symptoms of hypoglycemia
- Teach patient how to take pulse, B/P; withhold if <50 bpm or systolic B/P <90 mm Hg

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P in hypertension (after 1-2 wk)
- Decreased tremors
- Absence of dysrhythmias
- Decreased migraine headaches

## TREATMENT OF OVERDOSE:

Lavage, **IV** atropine for bradycardia, **IV** theophylline for bronchospasm, digoxin, $O_2$, diuretic for cardiac failure, hemodialysis, **IV** glucose for hyperglycemia, **IV** diazepam (or phenytoin) for seizures

**⚠ HIGH ALERT**

## propylthiouracil (Rx)

(proe-pill-thye-oh-yoor'a-sill)
**Propyl-Thyracil** 🍁
*Func. class.:* Thyroid hormone antagonist (antithyroid)
*Chem. class.:* Thioamide

**ACTION:** Blocks synthesis peripherally of $T_3$, $T_4$, inhibits organification of iodine

**Therapeutic outcome:** Decreased $T_3$, $T_4$ levels, hyperthyroid symptoms

**USES:** Preparation for thyroidectomy, thyrotoxic crisis, hyperthyroidism, thyroid storm

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, agranulocytosis, hepatitis, jaundice

**Precautions:** Infection, bone marrow depression, hepatic disease, fever

**BLACK BOX WARNING:** Hepatic disease

## DOSAGE AND ROUTES

### Thyrotoxic crisis

**Adult and child:** PO 200-400 mg q4h for 1st 24 hr

### Preparation for thyroidectomy

**Adult:** PO 600-1200 mg/day
**Child:** PO 10 mg/kg/day in divided doses

### Hyperthyroidism

**Adult:** PO 100 mg tid increasing to 300 mg q8hr if condition is severe; continue to euthyroid state, then 100 mg daily-tid
**Child >6 yr:** PO 50 mg/day divided doses q8hr, titrate based on TSH/free $T_4$ levels
**Neonate (unlabeled):** PO 10 mg/kg/day in divided doses

### Available forms: Tabs 50 mg

### Implementation

- Give with meals to decrease GI upset
- Give at same time each day to maintain product level
- Give lowest dosage that relieves symptoms
- Store in light-resistant container
- Increase fluids to 3-4 L/day, unless contraindicated

## ADVERSE EFFECTS

**CNS:** *Drowsiness, headache, vertigo, fever,* paresthesias, neuritis
**GI:** *Nausea, diarrhea, vomiting,* jaundice, hepatitis, loss of taste, liver failure, death
**GU:** Nephritis
**HEMA:** Agranulocytosis, leukopenia, thrombocytopenia, hypothrombinemia, lymphadenopathy, bleeding, vasculitis, periarteritis
**INTEG:** *Rash, urticaria, pruritus, alopecia, hyperpigmentation,* lupuslike syndrome
**MS:** Myalgia, arthralgia, nocturnal muscle cramps, osteoporosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Crosses placenta, concentration in thyroid gland |
| **Metabolism** | Liver |
| **Excretion** | Urine, bile, breast milk |
| **Half-life** | 1-2 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 30-40 min |
| **Peak** | Unknown |
| **Duration** | 2-4 hr |

## INTERACTIONS

### Individual drugs

Heparin: decreased anticoagulant effect
Lithium: increased antithyroid effect
Potassium/sodium iodide: increased effects
Radiation: increased bone marrow depression

### Drug classifications

Anticoagulants (oral): decreased anticoagulant effect
Antineoplastics: increased bone marrow depression
Phenothiazines: increased agranulocytosis

### Drug/lab test

Increased: pro-time, AST, ALT, alkaline phosphatase

## NURSING CONSIDERATIONS

### Assessment

- Monitor pulse, B/P, temp; I&O ratio; check for edema (puffy hands, feet, periorbits); indicates hypothyroidism
- Check weight daily with same clothing, scale, time of day
- Hyperthyroidism: weight loss, nervousness, insomnia, fever, diaphoresis, tremors
- Hypothyroidism: constipation, dry skin, weakness, headache
- Monitor $T_3$, $T_4$, which are increased; check serum TSH, which is decreased; assess free thyroxine index, which is increased if dosage is too low; discontinue product 3-4 wk before radioactive iodine uptake test
- **Blood dyscrasias:** Monitor CBC with differential; leukopenia, thrombocytopenia, agranulocytosis, monitor periodically; agranulocytosis may develop in first 2 mo of treatment, discontinue treatment
- **Overdose:** Assess for peripheral edema, heat intolerance, diaphoresis, palpitations, dysrhythmias, severe tachycardia, increased temp, delirium, CNS irritability
- **Hypersensitivity:** Assess for rash, enlarged cervical lymph nodes; product may have to be discontinued
- **Hypoprothrombinemia:** assess for bleeding, petechiae, ecchymosis
- **Bone marrow depression:** assess for sore throat, fever, fatigue

**BLACK BOX WARNING: Hepatotoxicity:** monitor LFTs before and during treatment; jaundice, nausea, vomiting, abdominal pain, anorexia, diarrhea, fatigue

- Monitor clinical response: after 3 wk should include increased weight, decreased pulse, decreased $T_4$
- **Pregnancy/benefits:** Do not use in pregnancy, breastfeeding

### Patient/family education

- product appears in breast milk
- Teach patient to take pulse daily and to keep graph of weight, pulse, mood
- Advise patient to report redness, swelling, sore throat, mouth lesions, which indicate blood dyscrasias (yellow skin/eyes, clay-colored stools, dark urine)
- Caution patient to avoid OTC products that contain iodine; that seafood, other iodine-containing foods may be restricted by prescriber
- Teach patient that response may take several mo if thyroid is large
- **Teach patient symptoms/signs of overdose:** periorbital edema, cold intolerance, mental depression; notify prescriber at once
- **Pregnancy:** Notify prescriber immediately if pregnancy is planned or suspected, do not breastfeed
- Teach patient symptoms of inadequate dose: tachycardia, diarrhea, fever, irritability; prescriber should be notified to adjust dosage
- Teach patient to take medication exactly as prescribed, not to skip or double doses; missed doses should be taken when remembered up to 1 hr before next dose
- Instruct patient to carry/wear emergency identification indicating medication taken and condition being treated

### Evaluation

**Positive therapeutic outcome**

- Weight gain
- Decreased pulse
- Decreased $T_4$
- Decreased B/P

## protamine (Rx)

(proe′ta-meen)

*Func. class.:* Heparin antagonist

*Chem. class.:* Low-molecular-weight protein

**Do not confuse:** Protamine/Protonix

**ACTION:** Binds heparin, making it ineffective

**Therapeutic outcome:** Prevention of heparin overdose

**USES:** Heparin overdose; neutralizes heparin in procedures, hemorrhage

## CONTRAINDICATION

**BLACK BOX WARNING:** Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, fish allergy, diabetes, previous exposure to protamine, insulins, heparin rebound or bleeding

**BLACK BOX WARNING:** Requires a specialized care setting

## DOSAGE AND ROUTES

### Heparin overdose

**Adult and child: IV** 1 mg of protamine/100 units of heparin given; administer slowly over 1-3 min; max 50 mg/10 min

### Enoxaparin overdose

**Adult: IV** 1 mg of protamine/1 mg enoxaparin

### Dalteparin/tinzaparin overdose

**Adult: IV** 1 mg of protamine/100 anti-Xa unit

**Available forms:** Inj 10 mg/ml

### Implementation

**Direct IV route**

- After reconstituting 50 mg/5 ml sterile bacteriostatic water for inj, shake; give 20 mg or less over 1-3 min

**Y-site compatibilities:** Alfentanil, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azaTHIOprine, aztreonam, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, ceftazidime, chlorproMAZINE, cimetidine, clindamycin, cyanocobalamin, cycloSPORINE, digoxin, diphenhydrAMINE, DOBUTamine, DOPamine, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, erythromycin, esmolol, famotidine, fentaNYL, fluconazole, ganciclovir, gentamicin, glycopyrrolate, hydrOXYzine, imipenem-cilastatin, inamrinone, iohexol, iopamidol, isoproterenol, labetalol, lidocaine, magnesium, mannitol, meperidine, metaraminol, methoxamine, methyldopate, metoclopramide, metoprolol, miconazole, midazolam, minocycline, morphine, multiple vitamins, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxytocin, papaverine, pentazocine, phenylephrine, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, pyridoxine, quiNIDine, ranitidine, Ringer's, ritodrine, sodium bicarbonate, succinylcholine, SUFentanil, theophylline, thiamine, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, verapamil

## ADVERSE EFFECTS

**CV:** Hypotension, bradycardia, circulatory collapse, capillary leak
**GI:** Nausea, vomiting
**HEMA:** Bleeding
**INTEG:** *Rash,* dermatitis, urticaria
**RESP:** Dyspnea, pulmonary edema, severe respiratory distress, bronchospasm
**SYST:** Anaphylaxis, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 5 min |
| **Peak** | Unknown |
| **Duration** | 2 hr |

## NURSING CONSIDERATIONS

### Assessment

- Monitor blood studies (Hct, platelets, occult blood stools) q3mo
- Monitor coagulation tests (aPTT, ACT) 15 min after dose, then in several hr
- Monitor VS, B/P, pulse q30min, plus 3 hr after dose

**BLACK BOX WARNING:** Assess for hypersensitivity: skin rash, urticaria, dermatitis, cough, wheezing, have emergency equipment nearby; men who have had a vasectomy may be more prone to hypersensitivity

- Assess for allergy to salmon; use with caution in these patients
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding

### Patient/family education

- Explain reason for medication and expected results; not to take if allergic to fish
- Caution patient to avoid contact activities that may result in bleeding
- Inform the patient about the purpose of product, expected result
- Teach patient to avoid activities where bleeding may occur such as shaving, use of hard bristle toothbrush, injections, rectal temperatures, until risk of bleeding has past

### Evaluation

**Positive therapeutic outcome**

- Reversal of heparin overdose

## pseudoephedrine (OTC)

(soo-doe-e-fed′rin)

**ElixSure Cold, Eltor, Nasofed, Sudafed, Sudafed 24 hour, Sudogest**

*Func. class.:* Adrenergic

*Chem. class.:* Substituted phenylethylamine

**Controlled Substance V**

**Do not confuse:** Sudafed/Sotalol

**ACTION:** Primary activity through α-adrenergic effects on respiratory mucosal membranes reducing congestion, hyperemia, edema; minimal bronchodilatation secondary to β-adrenergic effects

**Therapeutic outcome:** Decreased nasal congestion, swelling

**USES:** Nasal decongestant, otitis media adjunct, adjunct with antihistamines

## CONTRAINDICATIONS

Hypersensitivity to sympathomimetics, closed-angle glaucoma

**Precautions:** Pregnancy, breastfeeding, cardiac disorders, hyperthyroidism, diabetes mellitus, prostatic hypertrophy, hypertension

## DOSAGE AND ROUTES

**Adult and child >12 yr:** PO 60 mg q6hr; EXT REL 120 mg q12hr or 240 mg q24hr
**Geriatric:** PO 30-60 mg q6hr prn
**Child 6-12 yr:** PO 30 mg q6hr, max 120 mg/day
**Child 2-6 yr:** PO 15 mg q6hr, max 60 mg/day

**Available forms:** Ext rel caps 120, 240 mg; oral sol 15 mg, 30 mg/5 ml; tabs 30, 60 mg; ext rel tabs 120, 240 mg

### Implementation

- Swallow tab and ext rel cap whole; do not break, crush, or chew
- Avoid taking at or near bedtime if insomnia occurs
- Store at room temperature
- OTC preparations require an ID, tracked, Schedule V

## ADVERSE EFFECTS

**CNS:** *Tremors, anxiety,* stimulation, insomnia, headache, dizziness, hallucinations, seizures (geriatric)
**CV:** Palpitations, tachycardia, hypertension, chest pain, dysrhythmias, CV collapse
**EENT:** Dry nose, irritation of nose and throat
**GI:** *Anorexia, nausea, vomiting,* dry mouth, ischemic colitis
**GU:** Dysuria

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Enters CSF, crosses placenta |
| **Metabolism** | Liver, partially |
| **Excretion** | Kidneys, unchanged (75%); breast milk |
| **Half-life** | 7 hr |

### Pharmacodynamics

| | PO | PO-EXT REL |
|---|---|---|
| **Onset** | 15-30 min | 1 hr |
| **Peak** | Unknown | Unknown |
| **Duration** | 4-6 hr | 12 hr |

## INTERACTIONS

### Drug classifications

Antidepressants (tricyclics), MAOIs: hypertensive crisis, do not use together

Urinary acidifiers: decreased effect of pseudoephedrine

Urinary alkalizers, adrenergics, β-blockers, phenothiazines, tricyclics: increased effect of pseudoephedrine

## NURSING CONSIDERATIONS

### Assessment

- Monitor for nasal congestion; auscultate lung sounds; check for tenacious bronchial secretions; children with otitis media should be assessed for eustachian tube congestion
- Monitor B/P and pulse throughout treatment
- **Pregnancy/breastfeeding:** Avoid in pregnancy, cautious use in breastfeeding

### Patient/family education

- Teach patient reason for product administration and expected results
- Instruct patient not to use continuously, or more than recommended dose; rebound congestion may occur
- Advise patient to check with prescriber before using other products, as product interactions may occur
- Advise patient to avoid taking near bedtime; stimulation can occur
- Caution patient not to use if stimulation, restlessness, tremors occur
- Notify parents of possible excessive agitation in children
- Advise patient to notify prescriber of anxiety, slow or fast heart rate, dyspnea, seizures
- Ext rel: do not divide, crush, chew, or dissolve
- Do not use within 14 days of MAOIs
- **Beers:** Avoid in older adults, CNS stimulant effects, seizures, hallucinations, excitation

### Evaluation

**Positive therapeutic outcome**

- Decreased nasal congestion

# psyllium (OTC)

(sill'i-um)

**Hydrocil, Karacil, Konsyl Leader Fiber Laxative, Metamucil, Natural Fiber, Natural Vegetable Fiber, Reguloid, Wal-Mucil**

*Func. class.:* Laxative, bulk-forming

*Chem. class.:* Psyllium colloid

## ACTION: Bulk-forming laxative

**Therapeutic outcome:** Decreased constipation, decreased diarrhea in colitis

## USES: Chronic constipation, ulcerative colitis, irritable bowel syndrome

## CONTRAINDICATIONS

Hypersensitivity, intestinal obstruction, abdominal pain, nausea/vomiting, fecal impaction

**Precautions:** Pregnancy

## DOSAGE AND ROUTES

**Adult:** PO 1-2 tsp in 8 oz of water bid or tid, then 8 oz of water; or 1 premeasured packet in 8 oz of water bid or tid, then 8 oz of water

**Child >6 yr:** 1 tsp in 4 oz of water at bedtime

**Available forms:** Chew pieces 1.7, 3.4 g/piece; powder effervescent 3.4, 3.7 g/packet; powder 3.3, 3.4, 3.5, 4.94 g/tsp; wafers 3.4 g/wafer

### Implementation

- Give alone for better absorption; give after mixing with water immediately before use; administer with 8 oz of water or juice followed by another 8 oz of fluid
- Administer in AM or PM (oral dose)
- Shake susp well

## ADVERSE EFFECTS

**GI:** *Nausea, vomiting, anorexia, diarrhea,* cramps, intestinal/esophageal blockage

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | None |
| **Distribution** | None |
| **Metabolism** | Unknown |
| **Excretion** | Feces |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 12-24 hr |
| **Peak** | 2-4 days |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Cardiac glycosides, oral anticoagulants, salicylates: decreased absorption of each specific product

### Drug/herb

Flax, senna: increased laxative

## NURSING CONSIDERATIONS

### Assessment

- Monitor blood, urine electrolytes if used often by patient; check I&O ratio to identify fluid loss
- Assess for cramping, rectal bleeding, nausea, vomiting; if these symptoms occur, product should be discontinued; identify cause of constipation; identify whether fluids, bulk, or exercise is missing from lifestyle, assess stool for color, consistency, amount, presence of flatulence
- Assess stool for color, consistency, amount, presence of flatulence
- **Pregnancy/breastfeeding:** Generally considered safe in pregnancy, breastfeeding

### Patient/family education

- Discuss with patient that adequate fluid consumption is necessary
- Teach patient that normal bowel movements do not always occur daily
- Caution patient not to use in presence of abdominal pain, nausea, vomiting; tell patient to notify prescriber if constipation is unrelieved or if symptoms of electrolyte imbalance occur (muscle cramps, pain, weakness, dizziness, excessive thirst)
- Teach patient not to use laxatives for long-term therapy; bowel tone will be lost and will decrease
- Teach patient not to take at bedtime as a laxative; may interfere with sleep; also problems with lipid pneumonia
- Teach patient not to use with food or vitamin preparations; delays digestion and absorption of fat-soluble vitamins

### Evaluation

**Positive therapeutic outcome**

- Decreased constipation in 12-24 hr

## pyridostigmine (Rx)

(peer-id-oh-stig′meen)

**Mestinon, Mestinon SR, Regonol**

*Func. class.:* Cholinergic, anticholinesterase

*Chem. class.:* Tertiary amine carbamate

**ACTION:** Inhibits destruction of acetylcholine, which increases concentration at sites where acetylcholine is released; this facilitates transmission of impulses across myoneural junction

**Therapeutic outcome:** Decreased action of nondepolarizing muscle relaxant; increased muscle strength in myasthenia gravis

**USES:** Nondepolarizing muscle relaxant antagonist, myasthenia gravis, pretreatment in nerve gas exposure (military only)

## CONTRAINDICATIONS

Bradycardia, hypotension, obstruction of intestine, renal system, bromide, benzyl alcohol sensitivity, cholinesterase inhibitor toxicity

**Precautions:** Pregnancy seizure disorders, bronchial asthma, coronary occlusion, hyperthyroidism, dysrhythmias, peptic ulcer, megacolon, poor GI motility

## DOSAGE AND ROUTES

### Myasthenia gravis

**Adult:** PO 600 mg/day in 5-6 divided doses, max 1.5 g/day; IM/**IV** 2 mg; SUS REL 180-540 mg/day or bid at intervals of at least 6 hr

**Child:** PO 7 mg/kg/day in 5-6 divided doses; IM/**IV** 0.05-0.15 mg/kg/dose

### Nondepolarizing neuromuscular blocker antagonist

**Adult:** 0.6-1.2 mg **IV** atropine, then 0.1-0.25 mg/kg/dose

**Child:** **IV** 0.1-0.25 mg/kg/dose

### Nerve gas exposure prophylaxis (military)

**Adult:** PO 30 mg q8hr if threat of exposure to Soman gas is anticipated, start several hours before exposure and discontinue upon exposure; after this product is discontinued, give antidotes (atropine, pralidoxime)

**Available forms:** Tabs 60 mg; ext rel tabs 180 mg; syr 60 mg/5 ml; inj 5 mg/ml

### Implementation

- Only with atropine sulfate available for cholinergic crisis
- Only after all other cholinergics have been discontinued
- Increased doses for tolerance, as ordered
- Larger doses after exercise or fatigue, as ordered
- Do not break, crush, or chew sus rel tabs

**PO route**

- On empty stomach for better absorption

**IV route**

- Undiluted (5 mg/ml), give through Y-tube or 3-way stopcock, give 0.5 mg or less/min (myasthenia gravis); 5 mg/min (reversal of nondepolarizing neuromuscular blockers)

**Y-site compatibilities:** Heparin, hydrocortisone, potassium chloride, vit B/C
• Storage at room temperature

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, sweating, weakness, seizures, uncoordination, paralysis, drowsiness, LOC
**CV:** Tachycardia, dysrhythmias, bradycardia, AV block, hypotension, ECG changes, cardiac arrest, syncope
**EENT:** Miosis, blurred vision, lacrimation, vision changes
**GI:** *Nausea, diarrhea, vomiting, cramps, increased salivary and gastric secretions, peristalsis*
**GU:** Frequency, incontinence, urgency
**INTEG:** Rash, urticaria, flushing
**RESP:** Respiratory depression, bronchospasm, constriction, laryngospasm, respiratory arrest
**SYST:** Cholinergic crisis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poorly absorbed (PO) |
| **Distribution** | Widely distributed, crosses placenta |
| **Metabolism** | Liver, plasma cholinesterase |
| **Excretion** | Kidneys |
| **Half-life** | 2 hr (**IV**); 4 hr (PO) |

### Pharmacodynamics

| | PO | PO-EXT REL | IM/IV |
|---|---|---|---|
| **Onset** | 20-30 min | ½-1 hr | 2-15 min |
| **Peak** | Unknown | Unknown | Unknown |
| **Duration** | 3-6 hr | 3-6 hr | 2-4 hr |

## INTERACTIONS

### Individual drugs

Atropine, gallamine, metocurine, pancuronium, tubocurarine: decreased action
Succinylcholine: increased action of pyridostigmine
Magnesium, mecamylamine, polymyxin, procainamide, quiNIDine: decreased action of pyridostigmine

### Drug classifications

Aminoglycosides, anesthetics, antidysrhythmics, corticosteroids, quinolones: decreased action of pyridostigmine

## NURSING CONSIDERATIONS

### Assessment

• **Myasthenia gravis:** assess for fatigue, ptosis, diplopia, difficulty swallowing, SOB, hand/gait before and after product, improvement should be seen after 1 hr
• Monitor I&O ratio; check for urinary retention or incontinence
• **Toxicity:** assess for bradycardia, hypotension, bronchospasm, headache, dizziness, seizures, respiratory depression; product should be discontinued if toxicity occurs
• Monitor VS, respiration; increased B/P during test and at baseline
• Monitor diabetic patient carefully, since this product lowers blood glucose
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding

### Patient/family education

• Advise patient to carry/wear emergency ID specifying myasthenia gravis, products taken
• Teach patient that product doesn't cure but relieves symptoms
• Teach patient to avoid driving, other hazardous activities until effect is known
• Advise patient not to drink alcohol
• Advise patient to take with food to decrease gastric side effects
• Teach patient to report weakness (cholinergic crisis, or overdose), bradycardia

### Evaluation

**Positive therapeutic outcome**
• Increased muscle strength, hand grasp, improved gait, absence of labored breathing (if severe); reversal of nondepolarizing neuromuscular blockers; prevention of nerve gas toxicity

## TREATMENT OF OVERDOSE:

Discontinue product, atropine 1-4 mg **IV**

## pyridoxine (vitamin $B_6$) (OTC, Rx)

(peer-i-dox'een)
**Equaline Vitamin $B_6$, Neuro-K, Walgreens Finest B-6, Walgreens Gold Seal Vitamin $B_6$**
*Func. class.:* Vitamin $B_6$, water soluble

**ACTION:** Needed for fat, protein, carbohydrate metabolism; enhances glycogen release from liver and muscle tissue; needed as coenzyme for metabolic transformations of a variety of amino acids

**Therapeutic outcome:** Absence of vit $B_6$ deficiency

**USES:** Vitamin $B_6$ deficiency associated with the following: inborn errors of metabolism, seizures, isoniazid therapy, oral contraceptives, alcoholism, polyneuritis

**Unlabeled uses:** Palmar-plantar erythrodysesthesia syndrome

## CONTRAINDICATION

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, Parkinson's disease, patients taking levodopa should avoid supplemental vitamins with >5 mg pyridoxine

## DOSAGE AND ROUTES

### RDA

**Adult:** PO (male) 1.7-2 mg; (female) 1.4-1.6 mg
**Child 9-13 yr:** PO 1 mg/day
**Child 4-8 yr:** PO 0.6 mg/day
**Child 1-3 yr:** PO 0.5 mg/day
**Infant 7-12 mo:** PO 0.3 mg/day

### Vitamin $B_6$ deficiency

**Adult:** PO 5-25 mg/day × 3 wk
**Child:** PO 10 mg until desired response

### Pyridoxine deficiency neuritis/seizure (not drug induced)

**Adult:** PO without neuritis 2.5-10 mg/day, after corrected 2-5 mg/day; with neuritis 100-200 mg/day × 3 wk, then 2-5 mg/day
**Child:** PO without neuritis 5-25 mg/day × 3 wk, then 1.5-2.5 mg/day in a multivitamin; with neuritis 10-50 mg/day × 3 wk, then 1-2 mg/day
**Neonate with seizures:** IM/IV 50-100 mg as a single dose

### Deficiency caused by isoniazid, cycloSERINE, hydrALAZINE, penicillamine

**Adult:** PO 100-300 mg/day
**Child:** PO 10-50 mg/day

### Prevention of deficiency caused by isoniazid, cycloSERINE, hydrALAZINE, penicillamine

**Adult:** PO 25-100 mg/day
**Child:** PO 1.2 mg/kg/day

### Palmar-plantar erythrodysesthesia syndrome (unlabeled)

**Adult:** PO 50-150 mg/day

**Available forms:** Tabs 10, 25, 50, 100 mg; ext rel tabs 100 mg; inj 100 mg/ml; ext rel caps 150 mg

### Implementation

**PO route**

- Swallow ext rel cap and ext rel tabs whole; do not break, crush, or chew

**IM route**

- Rotate sites to avoid pain; burning or stinging at site may occur; give by Z-track to minimize pain
- Store in airtight, light-resistant container

**IV route**

- Give **IV** undiluted or added to most **IV** sol; give 50 mg or less/1 min if undiluted

**Syringe compatibilities:** Doxapram

**Additive incompatibilities:** Erythromycin, iron salts, kanamycin, riboflavin, streptomycin

## ADVERSE EFFECTS

**CNS:** Paresthesia, flushing, warmth, lethargy (rare with normal renal function)
**INTEG:** Pain at inj site

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO) |
| **Distribution** | Stored in liver, muscle, brain; crosses placenta |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys, unchanged (not used) |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Chloramphenicol, cycloSERINE, hydrALAZINE, isoniazid, penicillamine: decreased effects of pyridoxine
Levodopa: decreased effects of levodopa

### Drug classifications

Contraceptives (oral), immunosuppressants: decreased effects of pyridoxine

## NURSING CONSIDERATIONS

### Assessment

- Monitor pyridoxine levels throughout treatment
- Assess nutritional status: yeast, liver, legumes, bananas, green vegetables, whole grains
- Assess for pyridoxine ($B_6$) deficiency: nausea, vomiting, dermatitis, cheilosis, seizures, irritability, dermatitis before, during treatment
- Assess neurological status: paresthesia, lethargy
- Monitor blood tests: Hct, Hgb
- **Malabsorption:** Assess for malabsorption, may require injection if abnormal GI motility or absorption is present
- **Pregnancy/breastfeeding:** Safe in pregnancy, breastfeeding

### Patient/family education

- Teach patient to avoid other vitamin supplements unless directed by prescriber
- Advise patient to increase meat, bananas, potatoes, lima beans, whole grain cereals in diet which are high in vit $B_6$
- Caution patient not to increase dosage, since serious reactions may occur

### Evaluation

**Positive therapeutic outcome**

- Absence of nausea, vomiting, anorexia, skin lesions, glossitis, stomatitis, edema, seizures, restlessness, paresthesia

## QUEtiapine (Rx)

(kwe-tie'a-peen)
**SEROquel, Seroquel XR**
*Func. class.:* Antipsychotic
*Chem. class.:* Dibenzodiazepine

**Do not confuse:** QUEtiapine/OLANZapine SEROquel/Serzone/SINEquan

**ACTION:** Functions as an antagonist at multiple neurotransmitter receptors in the brain including 5-$HT_{1A}$, 5-$HT_2$, DOPamine $D_1$, $D_2$, $H_1$, adrenergic $\alpha_1$, $\alpha_2$ receptors

**Therapeutic outcome:** Decreased hallucinations and disorganized thought

**USES:** Bipolar disorder, bipolar I disorder, depression, mania, schizophrenia

## CONTRAINDICATIONS

Hypersensitivity, breastfeeding

**Precautions:** Pregnancy, geriatric, long-term use, seizures, hepatic disease, breast cancer, QT prolongation, CV disease, Parkinson's, brain tumor, hematological disease, torsades de pointes, cataracts, dehydration

**BLACK BOX WARNING:** Children, suicide, dementia

## DOSAGE AND ROUTES

### Schizophrenia

**Adult:** PO (not at risk for hypotension) 25 mg bid on day 1, increase by 25-50 mg divided two to three times on day 2 and day 3 to a target of 300-400 mg/day in divided doses on day 4; make further dosage adjustments in 25-50 mg bid increments, max 800 mg/day
**Adolescents 13-17 yr:** PO 25 mg bid on day 1, 50 mg bid on day 2, 100 mg bid on day 3, 150 mg bid on day 4, 200 mg on day 5; ext rel 50 mg on day 1, then 100 mg on day 2 , 200 mg on day 3, 300 mg on day 4, 400 mg on day 5
**Geriatric:** PO ext rel 50 mg/day; may increase in 50 mg/day increments

### Bipolar I disorder

**Adult:** PO (monotherapy or as adjunct to lithium or divalproex) 50 mg bid on day 1, 100 mg on day 2 in 2 divided doses as tolerated to 400 mg on day 4; range 400-800 mg/day; ext rel give in evening 300 mg qday day 1, then 600 mg qday day 2, then adjusted as tolerated

### Psychotic disorders

**Adult:** PO 25 mg bid, titrate upward; XR: 300 mg/day in PM, range 400-800 mg/day

### Depressive disorder (inadequate response to antidepressants alone)

**Adult:** PO EXT REL 50 mg/day in the PM on day 1, 2; on day 3 give 150 mg in the PM, max 600 mg/day
**Geriatric:** PO EXT REL 50 mg; may increase by 50 mg/day based on response; ext rel 50 mg in evening, max 800 mg/day

**Available forms:** Tabs 25, 50, 100, 200, 300, 400 mg; ext rel tab 50, 150, 200, 300, 400 mg

### Implementation

- Give reduced dosage in geriatric patients
- Avoid use of CNS depressants
- Give **immediate release** without regard to meals
- Give **extended release** without food or with light meal, swallow whole, do not split, crush, chew
- Supervise ambulation until patient is stabilized on medication; do not involve in strenuous exercise program because fainting is possible; patient should not stand still for a long time
- If there is a week of absence of therapy, initiate at beginning dose
- Sips of water, sugarless candy, gum for dry mouth
- Store in airtight, light-resistant container

## ADVERSE EFFECTS

**CNS:** EPS, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia, drowsiness, insomnia, agitation, anxiety, *headache*, seizures, neuroleptic malignant syndrome, dizziness, dystonia, restless legs syndrome
**CV:** Orthostatic hypotension, tachycardia, QT prolongation, CV disease, Parkinson's disease, cardiomyopathy, myocarditis
**ENDO:** SIADH, hyperglycemia
**GI:** Nausea, anorexia, constipation, abdominal pain, dry mouth, pancreatitis
**HEMA:** Leukopenia, agranulocytosis
**INTEG:** Rash
**META:** Hyponatremia
**MISC:** Asthenia, back pain, fever, ear pain
**MS:** Rhabdomyolysis
**RESP:** Rhinitis
**SYST:** Stevens-Johnson syndrome, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver, extensively; inhibits P450 CYP3A4 enzyme system; 83% protein |
| **Excretion** | Excretion <1% unchanged urine |
| **Half-life** | ≥6 hr |

Q

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1.5 hr |
| **Duration** | Up to 12 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
CarBAMazepine, phenytoin, rifampin, thioridazine: increased QUEtiapine clearance
Chloroquine, clarithromycin, droperidol, erythromycin, haloperidol, methadone, pentamidine: increased QT prolongation
Cimetidine: decreased QUEtiapine clearance
Erythromycin: increased effects of erythromycin
Fluconazole, itraconazole, ketoconazole: increased action of QUEtiapine
Levodopa: decreased effect of levodopa
Lithium: increased neurotoxicity
LORazepam: decreased effect of LORazepam

### Drug classifications

Analgesics (opioid), antihistamines, sedatives-hypnotics: increased CNS depression
Antihypertensives: increased hypotension
Barbiturates, glucocorticoids: increased clearance of quetiapine, decreased quetiapine effect
β-agonists, class IA/III antidysrhythmics, local anesthetics, phenothiazines (some), tricyclics: increased QT prolongation
DOPamine agonists: decreased effects of DOPamine agonists

## NURSING CONSIDERATIONS

### Assessment

- Assess CV status: QT prolongation, tachycardia, orthostatic B/P

**BLACK BOX WARNING:** Mental status before initial administration, AIMS assessment; affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances; suicidal thoughts/behavior (child/young adult); dementia (geriatric patients)

**BLACK BOX WARNING:** Not to be used in child <10 yr (immediate release) or <18 yr (extended release)

**BLACK BOX WARNING:** **Suicide:** restrict amount of product given, usually suicidal thoughts, behavior occur early in treatment and in children/adolescents/young adults

- Check that patient swallows all PO medication; check for hoarding or giving of medication to other patients
- Obtain baselines in blood glucose, liver function tests, neurologic status, ophthalmologic exam, weight, thyroid function tests, serum electrolytes/creatinine/lipid profile/prolactin
- Monitor B/P with patient in sitting, standing, and lying positions; take pulse and respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; obtain baseline ECG and monitor Q- and T-wave changes
- Check for dizziness, faintness, palpitations, tachycardia on rising; severe orthostatic hypotension is common
- **Serious rash:** Stevens-Johnson syndrome, discontinue product, may cause rash, fever, joint pain, lesions
- **Pancreatitis:** Assess for nausea, vomiting, severe abdominal pain
- **Identify for neuroleptic malignant syndrome:** hyperpyrexia, muscle rigidity, increased CPK, altered mental status, seizures, tachycardia, diaphoresis, hyper/hypotension, fatigue; product should be discontinued and prescriber notified immediately
- **Assess for EPS** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait); an antiparkinson product should be prescribed
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, pregnant patients should enroll in the National Pregnancy Registry for Atypical Antipsychotics 866-961-2388, EPS may develop in the infant, breastfeeding isn't recommended, excreted in breast milk
- **Beers:** Avoid in older adults except for schizophrenia, bipolar disorder, or short-term use as an antiemetic for chemotherapy, increased risk of stroke

### Patient/family education

- Teach patient to use good oral hygiene; frequent rinsing of mouth, sugarless gum for dry mouth
- Caution patient to avoid hazardous activities until product response is determined; dizziness, blurred vision may occur
- Inform patient that orthostatic hypotension occurs often; patient should rise from sitting

or lying position gradually; avoid hot tubs, hot showers, and tub baths because hypotension may occur; inform patient that heat stroke may occur in hot weather, to take extra precautions to stay cool, drink plenty of fluids
• Advise patient to avoid abrupt withdrawal of this product or EPS may result; product should be withdrawn slowly
• Teach patient to avoid OTC preparations (cough, hayfever, cold) unless approved by prescriber; serious product interactions may occur; avoid use with alcohol, CNS depressants because increased drowsiness may occur
• Advise patient to take medication only as prescribed, not to use other products unless approved by prescriber; not to stop abruptly
• Advise patient that follow-up is necessary including LFTs, blood glucose, neurologic/ophthalmic function, cholesterol profile, weight
• If drowsiness occurs, avoid hazardous activities such as driving
• Advise patient to notify prescriber if pregnancy is planned, suspected; do not breastfeed
• Advise patient to notify prescriber immediately of fever, difficulty breathing, fatigue, sore throat, rash, bleeding

**BLACK BOX WARNING:** Suicide: To notify provider of thoughts, behavior, primarily in children/adolescents/young adults or worsening depression, severe anxiety, panic attacks, insomnia

### Evaluation
**Positive therapeutic outcome**
• Decrease in emotional excitement, hallucinations, delusions, paranoia
• Reorganization of patterns of thought, speech

## TREATMENT OF OVERDOSE:
Lavage, provide airway

## quinapril (Rx)
(kwin'a-pril)
**Accuretic, Accupril**
*Func. class.:* Antihypertensive
*Chem. class.:* Angiotensin-converting enzyme (ACE) inhibitor

**Do not confuse:** Accupril/Aciphex

**ACTION:** Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE, prevents conversion of angiotensin I to angiotensin II; results in dilatation of arterial, venous vessels

**Therapeutic outcome:** Decreased B/P in hypertension

## USES:
Hypertension, alone or in combination with thiazide diuretics, systolic HF

## CONTRAINDICATIONS
Children, hypersensitivity to ACE inhibitors, angioedema

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Breastfeeding, geriatric, impaired renal/liver function, dialysis patients, hypovolemia, blood dyscrasias, bilateral renal stenosis, cough, pregnancy 1st trimester, hyperkalemia, aortic stenosis, African descent

## DOSAGE AND ROUTES
### Hypertension
**Adult:** PO 10-20 mg/day initially, then 20-80 mg/day divided bid or daily (monotherapy), start at 2.5 mg/day (with diuretics)
**Geriatric:** PO 10 mg/day, titrate to desired response (monotherapy), start at 2.5 mg/day (with diuretics), titrate ≥ 2 wk

### Congestive heart failure
**Adult:** PO 5 mg bid, may increase qwk until 20-40 mg/day in 2 divided doses

### Renal dose
**Adult:** PO CCr 61-89 ml/min start or 10 mg/day (hypertension), 5 mg bid (heart failure); CCr 30-60 ml/min 5 mg/day initially; CCr 10-29 ml/min 2.5 mg/day initially

**Available forms:** Tabs 5, 10, 20, 40 mg

### Implementation
• Tabs may be crushed if necessary, without regard to food
• Store in airtight container at 86° F (30° C) or less
• Do not use with high-fat meal, decreases absorption
• Severe hypotension may occur after 1st dose of this medication; may be prevented by reducing or discontinuing diuretic therapy 3 days before beginning quinapril therapy

## ADVERSE EFFECTS
**CNS:** Headache, dizziness, fatigue, somnolence, depression, malaise, nervousness, vertigo, syncope
**CV:** Hypotension, postural hypotension, syncope, palpitations, *angina pectoris,* MI, tachycardia, vasodilatation, chest pain
**GI:** Nausea, diarrhea, constipation, vomiting, gastritis, GI hemorrhage, dry mouth

**GU:** Increased BUN, creatinine, decreased libido, impotence
**INTEG:** Angioedema, rash, sweating, photosensitivity, pruritus
**META:** Hyperkalemia
**MISC:** Back pain, amblyopia
**MS:** Myalgia
**RESP:** *Cough*, pharyngitis, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | ≥60% |
| **Distribution** | Protein binding 97%, crosses placenta |
| **Metabolism** | Liver (active metabolites quinaprilat) |
| **Excretion** | Metabolites urine (60%), feces (37%) |
| **Half-life** | 2 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½-1 hr |
| **Peak** | 1-2 hr |
| **Duration** | 24 hr |

## INTERACTIONS

### Individual drugs

Aliskiren (diabetic patients): increased hyperkalemia
Alcohol: increased hypotension (large amounts)
Lithium: increased toxicity
HydrALAZINE, prazosin: use caution
Tetracycline: decreased absorption of tetracycline

### Drug classifications

Adrenergic blockers, antihypertensives, diuretics, ganglionic blockers, nitrates, phenothiazines: increased hypotension
Diuretics (potassium sparing), potassium supplements, sympathomimetics, ACE/angiotensin II receptor antagonists, vasodilators: use caution
NSAIDs: decreased hypotensive effect of quinapril

### Drug/herb

Cough: capsaicin
Decrease antihypertensive effect: ma huang

### Drug/food

Hyperkalemia: do not use with potassium-containing salt substitutes; read label carefully

### Drug/lab test

Increased: Potassium, creatinine, BUN, LFTs

## NURSING CONSIDERATIONS

### Assessment

- **Collagen vascular disease:** monitor blood studies: neutrophils, decreased platelets; WBC with differential baseline, periodically q3mo; if neutrophils <1000/mm$^3$ discontinue treatment
- **Hypertension:** monitor B/P, check for orthostatic hypotension, syncope; if changes occur, dosage change may be required
- Monitor renal function tests (protein, BUN, creatinine) and periodically liver function tests, uric acid; glucose may be elevated; watch for increased levels that may indicate nephrotic syndrome and renal failure; monitor renal symptoms: polyuria, oliguria, frequency, dysuria
- Check potassium levels throughout treatment, although hyperkalemia rarely occurs
- **HF:** check for edema in feet, legs daily, weight daily
- **Allergic reactions:** Angioedema, rash, fever, pruritus, swelling of eyes/face/neck/throat, difficulty breathing; product should be discontinued, angioedema is more common in Black patients

**BLACK BOX WARNING:** Assess for pregnancy; pregnancy; if pregnancy is suspected, discontinue product

### Patient/family education

- Advise patient not to discontinue product abruptly; advise patient to tell all persons associated with care
- Teach patient not to use OTC products (cough, cold, allergy) unless directed by physician; serious side effects can occur; avoid high-fat meal at time of dose
- Inform patient that xanthines such as coffee, tea, chocolate, cola can prevent action of product
- Caution patient on the importance of complying with dosage schedule, even if feeling better; to continue with medical regimen to decrease B/P: exercise, cessation of smoking, decreasing stress, diet modifications
- Emphasize the need to rise slowly to sitting or standing position to minimize orthostatic hypotension; not to exercise in hot weather or increased hypotension can occur
- **Allergic reactions:** assess for allergic reactions: rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help
- Teach patient to notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, coughing, shortness of breath
- Caution patient to report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P, maintain adequate hydration

• Caution patient that product may cause dizziness, fainting, light-headedness; may occur during 1st few days of therapy; to avoid activities that may be hazardous
• Teach patient how to take B/P, and normal readings for age group
• Teach patient product may cause skin rash or impaired taste perception

**BLACK BOX WARNING:** Pregnancy, to report if pregnancy is planned or suspected, do not use in pregnancy, breastfeeding do not breastfeed

### Evaluation
**Positive therapeutic outcome**
• Decreased B/P in hypertension

## TREATMENT OF OVERDOSE:
0.9% NaCl **IV** inf, hemodialysis

**⚠ HIGH ALERT**

## quiNIDine gluconate (Rx)
(kwin'i-deen)
## quiNIDine sulfate (Rx)
*Func. class.:* Antidysrhythmic (class IA)
*Chem. class.:* QuiNINE dextro isomer

**Do not confuse:** quiNIDine/quiNINE

**ACTION:** Prolongs action potential duration and effective refractory period, thus decreasing myocardial excitability; anticholinergic properties

**Therapeutic outcome:** Treatment of dysrhythmias

**USES:** Wolff-Parkinson-White syndrome, PVST, atrial fibrillation, flutter; paroxysmal atrial tachycardia, ventricular tachycardia, malaria (**IV** quiNIDine gluconate)

**Unlabeled uses:** Singultus (hiccups)

## CONTRAINDICATIONS
Hypersensitivity or idiosyncratic response, digoxin toxicity, blood dyscrasias, myasthenia gravis, AV block

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal/hepatic disease, electrolyte imbalance, HF, respiratory depression, bradycardia, hypotension, syncope

**BLACK BOX WARNING:** Cardiac arrhythmias, MI

## DOSAGE AND ROUTES
### >> QuiNIDine sulfate
**Atrial fibrillation/flutter/PVST/WPW**
**Adult:** PO 200 mg q6-8hr × 5-8 doses; may increase daily until sinus rhythm is restored; max 4 g/day given only after digitalization; maintenance 200-300 mg tid-qid or 300-600 mg q8-12hr (EXT REL)

**Hiccups (unlabeled)**
**Adult:** PO 200 mg qid

### >> QuiNIDine gluconate
**Adult:** PO 324-648 mg q8-12hr (EXT REL); IM 600 mg, then 400 mg q2hr; **IV** give 16 mg/min

**Severe malaria**
**Adult, adolescent, child, infant:** IV INF (Regimen 1) 10 mg/kg/dose (6.25 mg/kg/dose base) over 1-2 hr, then CONT IV INF 0.02 mg/kg/min (0.0125 mg/kg/min base) × at least 24 hr, use quiNINE as step-down
(Regimen 2) 24 mg/kg/dose (15 mg/kg/dose) base IV INF over 4 hr, then 12 mg/kg/dose (7.5 mg/kg/dose base) IV INF over 4 hr q8hr after beginning of loading dose

**Available forms: Gluconate:** ext rel tabs 324, 330 mg; inj gluconate 80 mg/ml; **sulfate:** tabs 200, 300 mg; ext rel tabs 300 mg

### Implementation
• Give AV node blocker (digoxin) before starting quiNIDine to avoid increased ventricular rate
**PO route**
• Do not break, crush, or chew ext rel tab
• Give with a full glass of water with food for GI upset; may be given with meals if GI irritation occurs, absorption will be decreased
• Ext rel forms not interchangeable
• Tab may be crushed and mixed with fluid or foods for patients with swallowing difficulties
**IM route**
• Give IM injection in deltoid, aspirate to avoid intravascular administration

**Intermittent IV infusion route**
• Give after diluting 800 mg/50 ml or more $D_5W$ (16 mg/ml); give max 0.25 mg/kg/min, quiNIDine is absorbed by PVC tubing, minimize length; use inf pump

**Y-site compatibilities:** Alfentanil, amikacin, anidulafungin, argatroban, arsenic trioxide ascorbic acid, asparaginase, atenolol, atracurium, atropine, benztropine, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, caspofungin, chlorproMAZINE, cimetidine, CISplatin, cyanocobalamin, cycloSPORINE, DACTINomycin, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epoetin alfa, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, HYDROmorphone, IDArubicin, imipenem-cilastatin,

Q

irinotecan, isoproterenol, labetalol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methoxamine, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, milrinone, mitoXANtrone, morphine, multiple vitamins, mycophenolate, nalbuphine, naloxone, nesiritide, netilmicin, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, PACLitaxel, palonosetron, pamidronate, pancuronium, papaverine, pentamidine, pentazocine, phenylephrine, phytonadione, polymyxin B, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, ranitidine, ritodrine, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tirofiban, tobramycin, tolazoline, trimethoprim, urokinase, vancomycin, vasopressin, verapamil, vinorelbine, voriconazole, zoledronic acid

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness,* involuntary movement, confusion, psychosis, restlessness, irritability, syncope, excitement, depression, ataxia
**CV:** Hypotension, *bradycardia, PVCs,* heart block, cardiovascular collapse, arrest, torsades de pointes, widening QRS complex, ventricular tachycardia
**GI:** Nausea, vomiting, anorexia, *diarrhea,* hepatotoxicity, abdominal pain
**HEMA:** Thrombocytopenia, hemolytic anemia, agranulocytosis, hypoprothrombinemia
**INTEG:** Rash, urticaria, angioedema, swelling, photosensitivity, flushing with severe pruritus
**RESP:** Dyspnea, respiratory depression

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, IM), slowly absorbed (sus rel) |
| **Distribution** | Widely distributed, crosses placenta, protein binding 80%-90% |
| **Metabolism** | Liver |
| **Excretion** | Kidney unchanged, 10%-50% breast milk |
| **Half-life** | 6-7 hr (prolonged in geriatrics, cirrhosis, HF) |

## INTERACTIONS

### Individual drugs

Amiodarone, cimetidine, NIFEdipine: increased quiNIDine level
Digoxin: increased digoxin level
NIFEdipine, sodium bicarbonate, verapamil: increased quiNIDine effect
Phenytoin, rifampin, sucralfate: decreased effects of quiNIDine
Propranolol: increased effect of propranolol
Reserpine: increased cardiac depression
Warfarin: increased levels of warfarin

### Drug classifications

Antacids, carbonic anhydrase inhibitors, hydroxide suspensions: increased effects of quiNIDine
Anticholinergic blockers: increased vagolytic effects
Anticoagulants (oral): increased levels of anticoagulant
Antidepressants (tricyclics): increased effect of antidepressant
Antidysrhythmics: increased cardiac depression
Barbiturates, cholinergics: decreased effects of quiNIDine
Neuromuscular blockers: increased neuromuscular blocking
Phenothiazines: increased cardiac depression

### Drug/herb

Hawthorn: increased quiNIDine effect, licorice

### Drug/food

Grapefruit juice: decreased absorption, decreased metabolism

### Drug/lab test

Increased: CPK
Interference: triamterene therapy interferes with quiNIDine test levels
Decrease: platelets, Hgb, granulocytes

## NURSING CONSIDERATIONS

### Assessment

• Monitor ECG continuously to determine product effectiveness, measure PR, QRS, QT intervals, check for PVCs, other dysrhythmias; monitor B/P continuously for hypo/hypertension; for

### Pharmacodynamics

| | PO (SULFATE) | (SULFATE ER) | (GLUCONATE PO) | IM | IV |
|---|---|---|---|---|---|
| **Onset** | ½ hr | | | ½ hr | 5 min |
| **Peak** | 1-6 hr | 4 hr | 3-4 hr | ½-1½ hr | Unknown |
| **Duration** | 6-8 hr | 8-12 hr | 6-8 hr | 6-8 hr | 6-8 hr |

rebound hypertension after 1-2 hr; check for dehydration or hypovolemia
• Monitor blood levels (therapeutic level 2-7 mcg/ml)
• Monitor I&O ratio, electrolytes (potassium, sodium, chloride); check weight daily; check for signs of HF or pulmonary toxicity: dyspnea, fatigue, cough, fever, chest pain; if these occur, product should be discontinued
• Monitor liver function tests: AST, ALT, bilirubin, alkaline phosphatase
• Assess for CNS symptoms: confusion, psychosis, numbness, depression, involuntary movements; if these occur, product should be discontinued
• **Monitor cardiac rate, respiration:** rate, rhythm, character, chest pain; watch for ventricular tachycardia, supraventricular tachycardia, or fibrillation that indicates toxicity
• **Pregnancy/breastfeeding:** Use only if clearly needed, avoid use in breastfeeding, excreted in breast milk

## Patient/family education

• Instruct patient to report adverse effects immediately to prescriber
• Instruct patient to complete follow-up appointments with health care provider including pulmonary function tests, chest x-ray, ophth and otoscopic exams
• Avoid grapefruit

## Evaluation

### Positive therapeutic outcome

• Resolution of dysrhythmias

QUEtiapine (Rx)
quinapril (Rx)
quiNIDine gluconate (Rx)
quiNIDine sulfate (Rx)

## RABEprazole (Rx)

(rab-ee-pray′zole)

**Aciphex, Aciphex Sprinkle, Pariet**

*Func. class.:* Proton pump inhibitor

*Chem. class.:* Benzimidazole

**Do not confuse:** Aciphex/Aricept/Accupril RABEprazole/ARIPiprazole

**ACTION:** Suppresses gastric secretion by inhibiting hydrogen/potassium ATPase enzyme system in the gastric parietal cell; characterized as a gastric acid pump inhibitor, since it blocks the final step of acid production

**Therapeutic outcome:** Absence of duodenal ulcers; decreased gastroesophageal reflux

**USES:** Gastroesophageal reflux disease (GERD), severe erosive esophagitis, poorly responsive systemic GERD, pathologic hypersecretory conditions (Zollinger-Ellison syndrome, systemic mastocytosis, multiple endocrine adenomas); treatment of duodenal ulcers with or without antiinfectives for *Helicobacter pylori;* daytime, nighttime heartburn

## CONTRAINDICATIONS

Hypersensitivity to this product or proton pump inhibitors (PPIs)

**Precautions:** Pregnancy, breastfeeding, children, Asian patients, diarrhea, geriatric patients, gastric cancer, hepatic/GI disease, IBS, osteoporosis, pseudomembranous colitis, ulcerative colitis, vit $B_{12}$ deficiency

## DOSAGE AND ROUTES

### Healing of duodenal ulcers

**Adult:** PO 20 mg/day × ≤4 wk, to be taken after breakfast

### Erosive esophagitis/GERD

**Adult:** PO Delayed release tabs 20 mg/day × 4-8 wk

**Adolescent and child ≥12 yr:** PO Delayed release tabs 20 mg/day up to 8 wk, may use an additional course

**Child 1-11 yr (≥ 15 kg):** PO (sprinkle) 10 mg qday up to 12 wk; (<15 kg) 5 mg qday up to 12 wk; may increase to 10 mg qday if needed

### *H. pylori* eradication

**Adult:** PO 20 mg bid × 7 days with amoxicillin 1 g bid × 7 days with clarithromycin 500 mg bid × 7 days

**Available forms:** Del rel tabs 20 mg; delayed release caps 5, 10 mg

### Implementation

**PO route**

- Do not break, crush, or chew del rel tab
- Give after breakfast daily with a full glass of water, without regard to food
- **Delayed-release capsule:** Open, use on a spoonful of applesauce or liquid, give immediately, (within 15 min) 2h before a meal, do not crush, chew delayed-release product

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness*

**EENT:** Tinnitus, taste perversion

**GI:** *Diarrhea, abdominal pain, vomiting, nausea, constipation, flatulence, acid regurgitation,* abdominal swelling, anorexia, CDAD, hepatitis, hepatic encephalopathy

**MISC:** *Back pain*, infection, arthralgia, myalgia, osteoporosis, fractures, Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 96.3% |
| **Metabolism** | Liver, extensively by CYP2C19 |
| **Excretion** | Kidneys, feces, metabolites |
| **Half-life** | 1-2 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Digoxin, methotrexate, nelfinavir/omeprazole: increased levels

Ketoconazole, itraconazole, iron salts, atazanavir/ritonavir, ampicillin, cycloSPORINE: decreased levels

Calcium carbonate, sucralfate, vitamin $B_{12}$: decreased rabeprazole levels

Clarithromycin, phenytoin: increased levels of rabeprazole

Warfarin, clopidogrel: increased bleeding risk

### Drug classifications

Benzodiazepines, antacids, other proton pump inhibitors, $H_2$ blockers: increased levels of rabeprazole

Protease inhibitors: Decreased level of protease inhibitors

### Drug/herb

St. John's wort: decreased levels of rabeprazole

### Drug/lab test

Decreased: magnesium

## NURSING CONSIDERATIONS

### Assessment

- Assess GI system: bowel sounds q8hr, abdomen for pain and swelling, anorexia
- CDAD may occur with most antibiotic therapy; assess for watery diarrhea, abdominal pain, fever, may occur several weeks after treatment concludes
- **Vitamin $B_{12}$ deficiency/cyanocobalamin/hypomagnesemia:** may occur several weeks after treatment concludes; use magnesium, vit $B_{12}$, cyanocobalamin supplement, if severe, discontinuing of product may be needed
- Monitor hepatic enzymes: AST, ALT, increased alkaline phosphatase during treatment
- Assess for low magnesium level: tremors, muscle soreness, spasms, anxiety, change in heart rate, palpitations, obtain magnesium level
- **Blood dyscrasias (rare):** CBC with differential before and periodically during treatment
- Obtain susceptibility testing if *H. pylori* treatment is ineffective; another antiinfective may be needed
- **Osteoporosis/fractures:** May occur with prolonged high-dose use, usually in those 50 yr, make sure adequate vitamin D and calcium are taken
- **Beers:** Avoid scheduled use >8 wk in older adults unless for high-risk patients

### Patient/family education

- Advise patient to report severe diarrhea; product may have to be discontinued
- Advise patient to notify prescriber if pregnancy is planned or suspected
- Teach patient to report diarrhea, black, tarry stools, product may need to be discontinued
- Inform diabetic patient that hypoglycemia can occur
- Caution patient to avoid driving and other hazardous activities until response to product is known, take delayed release tab whole, do not cut, break; that cap should be opened and sprinkled on food (applesauce), to take within 15 min and 30 min before a meal
- Caution patient to avoid alcohol, salicylates, NSAIDs; may cause GI irritation
- Advise patient to wear sunscreen, protective clothing to prevent burns

### Evaluation

**Positive therapeutic outcome**

- Absence of epigastric pain, swelling, fullness; decreased symptoms of GERD after 4-8 wk

## raloxifene (Rx)

(ral-ox'ih-feen)

**Evista**

*Func. class.:* Bone resorption inhibitor

*Chem. class.:* Hormone modifier, selective estrogen receptor modulator (SERM)

**ACTION:** Tissue-selective estrogen agonist/antagonist; agonist activity in bone and lipid metabolism, antagonistic activity on breast and uterus, reduces resorption of bone and decreases bone turnover

**Therapeutic outcome:** Absence or decrease of osteoporosis in postmenopausal women

**USES:** Prevention, treatment of osteoporosis in postmenopausal women, breast cancer prophylaxis in postmenopausal women with osteoporosis or in postmenopausal women at high risk for developing the disease, invasive breast cancer risk reduction

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity

**BLACK BOX WARNING:** Women with active or history of venous thromboembolic events

**Precautions:** Hepatic/CV disease, cervical/uterine cancer, elevated triglycerides, pulmonary embolism

**BLACK BOX WARNING:** Stroke

## DOSAGE AND ROUTES

### Hormone replacement

**Postmenopausal women:** PO 60 mg/day, max 60 mg/day

**Available forms:** Tabs 60 mg

### Implementation

- Administer without regard to meals
- Add calcium supplement, vit D if lacking
- Do not use during prolonged bed rest

## ADVERSE EFFECTS

**CNS:** Insomnia, depression, migraines, fever

**CV:** Hot flashes, peripheral edema, thromboembolism, stroke, chest pain

**EENT:** pharyngitis, sinusitis, laryngitis

**GI:** *Nausea,* vomiting, diarrhea, dyspepsia, abdominal pain

**GU:** Vaginitis, leukorrhea, *hot flashes,* cystitis, vaginal bleeding

**INTEG:** Rash, sweating

**META:** Weight gain, peripheral edema

**MS:** Arthralgia, myalgia, *leg cramps,* arthritis

**RESP:** Sinusitis, pharyngitis, increased cough, pneumonia, laryngitis, rhinitis, bronchitis, pulmonary embolism, flulike symptoms

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Highly protein bound |
| **Metabolism** | Unknown |
| **Excretion** | Feces, breast milk |
| **Half-life** | 28-32 hr (elimination) |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | 24 hr |

## INTERACTIONS

### Individual drugs

Ampicillin, cholestyramine: decreased action of raloxifene

Desiccated thyroid, levothyroxine, liotrix: decreased action

### Drug classifications

Anticoagulants: decreased action of anticoagulants

Highly protein-bound products, systemic estrogens: administer cautiously ibuprofen, diazepam, naproxen

### Drug/food

Soy: decreased effect of raloxifene

### Drug/lab test

Increased: apolipoprotein, corticosteroid-binding globulin, thyroxine-binding globulin (TBG)

Decreased: lipoprotein, LDL cholesterol, total cholesterol, calcium, total protein, albumin

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** For history of stroke, TIA, thrombosis, atrial fibrillation, hypertension, smoking; venous thrombosis may occur; avoid prolonged sitting, discontinue 3 days before surgery or other immobilization

- Obtain bone density test baseline, periodically throughout treatment; bone-specific alkaline phosphatase; osteocalcin, collagen breakdown
- Monitor B/P q4hr, watch for increase caused by $H_2O$ and sodium retention

### Patient/family education

**BLACK BOX WARNING:** Teach patients to discontinue product 72 hr before prolonged bedrest, to report possible blood clots immediately, usually during first few months of therapy

- **Teach patient not to use in pregnancy, breastfeeding**
- Advise patient to avoid maintaining one position for long periods
- Advise patient to take calcium supplements, vit D if intake is inadequate
- Advise patient to increase exercise using weights
- Advise patient to stop smoking and to decrease alcohol consumption
- Inform patient that this product does not help control hot flashes
- Instruct patient to report fever, acute migraine, insomnia, emotional distress, UTI, or vaginal itching, uterine bleeding (abnormal), breast lumps
- **Pregnancy:** To notify prescriber if pregnancy is planned or suspected, not to use in pregnancy or breastfeeding
- Provide product package insert and discuss with patient

**BLACK BOX WARNING:** Teach patient to report swelling, warmth, or pain in calves

### Evaluation

**Positive therapeutic outcome**

- Prevention, treatment of osteoporosis

## raltegravir (Rx)

(ral-teg′ra-vir)

**Isentress**

*Func. class.:* Antiretroviral

*Chem. class.:* HIV integrase strand transfer inhibitor (ISTIs)

**ACTION:** Inhibits catalytic activity of HIV integrase, which is an HIV-encoded enzyme needed for replication

**Therapeutic outcome:** Improvement in CD4, T-cell counts

**USES:** HIV in combination with other antiretrovirals

## CONTRAINDICATIONS

Hypersensitivity, breastfeeding

**Precautions:** Pregnancy, children, geriatric, hepatic disease, immune reconstitution syndrome, hepatitis, antimicrobial resistance, lactase deficiency

## DOSAGE AND ROUTES

**Adult and adolescent ≥16 yr:** PO 400 mg bid, if using with rifampin give 800 mg bid

**Available forms:** Tabs 400 mg; chew tabs 25, 100 mg; granules for oral suspension 100 mg

### Implementation

**PO route**

- Tablets and chew tablets are not interchangeable
- Chew tabs should be chewed or swallowed whole
- Do not break, crush, or chew tabs
- May give without regard to meals, with 8 oz of water
- Store at room temperature

**Oral suspension**

- Open foil; use 5 ml of water in provided measuring cup; close, then swirl; don't turn upside down; use oral syringe to administer; use within 30 min; discard any remaining suspension

## ADVERSE EFFECTS

**CNS:** *Fatigue,* fever, *dizziness, headache,* asthenia, suicidal ideation
**CV:** MI
**GI:** *Nausea,* vomiting, diarrhea, abdominal pain, gastritis, hepatitis
**GU:** Oliguria, proteinuria, hematuria, glomerulonephritis, acute renal failure, renal tubular necrosis
**HEMA:** Anemia, neutropenia
**INTEG:** Rash, urticaria, pruritus, pain or phlebitis at IV site, unusual sweating, alopecia
**META:** Hyperamylasemia, hyperglycemia
**MS:** Myopathy, rhabdomyolysis
**SYST:** Immune reconstitution syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Max 3 hr if taken on empty stomach |
| **Distribution** | Unknown |
| **Metabolism** | Liver by uridine diphosphate glucuronosyltransferase (Genetic Warning UGT1A1 enzyme system) |
| **Excretion** | 51% feces, 32% urine |
| **Half-life** | Terminal 9 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Rifampin, efavirenz, tenofovir, tipranavir/ritonavir: decreased raltegravir levels

### Drug classifications

Fibric acid derivatives, HMG-CoA reductase inhibitors: increased rhabdomyolysis, myopathy, elevated CPK
$H_2$ blockers, protein pump inhibitors, UGT1A1 inhibitors (atazanavir): increased raltegravir effect

### Drug/lab test

Increased: total/HDL/LDL cholesterol

## NURSING CONSIDERATIONS

### Assessment

- **Rhabdomyolysis:** Assess for muscle pain, dark urine, increased CPK; product should be discontinued
- **HIV infection:** monitor CD4, T-cell count, plasma HIV RNA, viral load; resistance testing prior to therapy and at treatment failure
- **Suicidal thoughts, behavior:** monitor for depression, more common in those with mental illness
- **Immune reconstitution syndrome:** usually during initial phase of treatment, may give antiinfective before starting, opportunistic infections or autoimmune disorders
- Monitor total HDL/LDL cholesterol baseline and periodically; all may be elevated; pregnancy test, CBC with differential, hepatitis B serology, plasma hepatitis C RNA, urinalysis, blood glucose, LFTs serum bilirubin (total and direct)
- Assess skin eruptions: rash, urticaria, itching
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, pregnant patients need to enroll in the Antiretroviral Pregnancy Registry 800-258-4263, do not breastfeed

### Patient/family education

- Teach patient to take as prescribed; if dose is missed, take as soon as remembered up to 1 hr before next dose; do not double dose, do not share with others
- Teach patient to report rash, muscle pain
- Teach patient that sexual partners need to be told that patient has HIV
- Advise patient that product does not cure infection, just controls symptoms, does not prevent infecting others
- Teach patient to report sore throat, fever, fatigue (may indicate immune reconstitution syndrome)
- Advise patient that product must be taken in equal intervals 2×/day to maintain blood levels for duration of therapy
- Advise patient to notify prescriber immediately of suicidal thoughts, behavior
- **Pregnancy:** Advise patient to notify prescriber if pregnancy is planned or suspected, not to breastfeed

### Evaluation

**Positive therapeutic outcome**

- Improvement in CD4, T-cell counts

R

**⚠ HIGH ALERT**

## ramelteon (Rx)

(rah-mel'tee-on)

**Rozerem**

*Func. class.:* Sedative-hypnotic, anti-anxiety

*Chem. class.:* Melatonin receptor agonist

**Do not confuse:** Rozerem/Razadyne

**ACTION:** Binds selectively to melatonin receptors ($MT_1$, $MT_2$); thought to be involved in circadian rhythm and the normal sleep-wake cycle

**Therapeutic outcome:** Ability to fall asleep easily and decrease early-morning awakenings

**USES:** Insomnia (difficulty with sleep onset)

## CONTRAINDICATIONS

Breastfeeding, infants, children, hypersensitivity

**Precautions:** Pregnancy, hepatic disease, alcoholism, seizure disorder, sleep apnea, suicidal ideation, angioedema, depression, sleep-related behavior (sleepwalking), schizophrenia, bipolar disorder, alcohol intoxication, hepatic encephalopathy, aortic stenosis

## DOSAGE AND ROUTES

**Adult:** PO 8 mg within 30 min of bedtime

### Hepatic dose

Do not use in severe hepatic disease; use with caution in mild to moderate hepatic disease

**Available forms:** Tabs 8 mg

### Implementation

- Give within 30 min of bedtime for sleeplessness, give on empty stomach for fast onset
- Store in tight container in cool environment
- Do not break tabs, swallow whole

## ADVERSE EFFECTS

**CNS:** Dizziness, somnolence, fatigue, headache, insomnia, depression, complex sleep-related reactions: sleep driving, sleep eating, suicidal thoughts/behavior, syncope

**GI:** Nausea, diarrhea, dysgeusia, vomiting

**MISC:** Myalgia, arthralgia, decreased blood cortisol, influenza, upper respiratory tract infection

**SYST:** Severe allergic reactions, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Protein binding 82% |
| **Metabolism** | Rapid first-pass metabolism, liver |
| **Excretion** | 84% urine, 4% feces |
| **Half-life** | 2-5 hr metabolite |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | ½-1 ½ hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol, ciprofloxacin, fluconazole, fluvoxaMINE, ketoconazole: increased ramelteon effect, toxicity

Rifampin: decreased effect of ramelteon

### Drug classifications

Antiretroviral protease inhibitors: possible toxicity

Anxiolytics, azole antifungals, barbiturates, CYP1A2 inhibitors, strong CYP2C9 inhibitors, strong CYP3A4 inhibitors hypnotics, sedatives: increased ramelteon effect, toxicity

Strong CYP inducers: decreased ramelteon effect

Potassium-sparing diuretics, potassium supplement, angiotensin II receptor agonists: increased hyperkalemia

### Drug/food

High-fat/heavy meal: prolonged absorption, sleep onset reduced

### Drug/lab test

Increased: protein level

Decreased: testosterone level

## NURSING CONSIDERATIONS

### Assessment

- **Sleep characteristics:** assess type of sleep problem: falling asleep, staying asleep; complex sleep disorders (sleep walking/driving/eating) after taking product
- Assess mental status: mood, sensorium, affect, memory (long, short), suicidal thoughts/behaviors
- **Severe hypersensitivity reactions:** Assess for angioedema (facial swelling); discontinue product; notify prescriber immediately
- **Beers:** Avoid in older adults with a high risk of delirium, delirium might be induced or worsened
- **LFTS:** Before treatment, periodically

• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, may be toxic to fetus, cautious use in breastfeeding, excretion is unknown

### Patient/family education

• Advise patient to avoid driving or other activities requiring alertness until product is stabilized; drowsiness may continue the next day
• Advise patient to avoid alcohol ingestion or CNS depressants
• Teach patient alternative measures to improve sleep: reading, exercise several hr before bedtime, warm bath, warm milk, TV, self-hypnosis, deep breathing
• Teach patient to report if pregnancy is planned or suspected, avoid breastfeeding
• Advise patient to take within 30 min before going to bed
• Advise patient not to ingest a high-fat/heavy meal before taking
• Teach patient to report cessation of menses, galactorrhea (women), decreased libido, infertility, worsening of insomnia, behavioral changes, suicidal thoughts/behavior
• Med guide should be given to patient and reviewed

### Evaluation

**Positive therapeutic outcome**
• Ability to sleep at night, decreased amount of early-morning awakening

## ramipril (Rx)

(ra-mi′pril)
**Altace**
*Func. class.:* Antihypertensive
*Chem. class.:* Angiotensin-converting enzyme (ACE) inhibitor

**Do not confuse:** ramipril/enalapril, Altace/alteplase

**ACTION:** Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE; prevents conversion of angiotensin I to angiotensin II; results in dilatation of arterial, venous vessels

**Therapeutic outcome:** Decreased B/P in hypertension

**USES:** Hypertension, alone or in combination with thiazide diuretics; HF (after MI), reduction in risk of MI, stroke, death from CV disorders

## CONTRAINDICATIONS

Breastfeeding, children, hypersensitivity to ACE inhibitors, history of ACE inhibitor–induced angioedema

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Impaired renal/liver function, dialysis patients, hypovolemia, blood dyscrasias, COPD, HF, asthma, geriatric, renal artery stenosis, cough, African descent

## DOSAGE AND ROUTES

### Hypertension

**Adult:** PO 2.5 mg/day initially, then 2.5-20 mg/day divided bid or daily

### HF/Post MI

**Adult:** PO 1.25-2.5 mg bid, may increase to 5 mg bid

### Reduction in risk of MI, stroke, death

**Adult:** PO 2.5 mg/day × 7 days, then 5 mg/day × 21 days, then may increase to 10 mg/day

### Renal impairment

**Adult:** PO CCr <40 ml/min; reduce by 50%, titrate upward to max 5 mg/day

**Available forms:** Caps 1.25, 2.5, 5, 10 mg

### Implementation

• Caps may be opened and added to food, mixture is stable for 24 hr at room temperature, 48 hr refrigerated
• Swallow cap or tablets whole, do not chew, crush
• Store in airtight container at 86° F (30° C) or less

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness,* anxiety, insomnia, paresthesia, fatigue, depression, malaise, vertigo
**CV:** *Hypotension,* chest pain, palpitations, angina, syncope, dysrhythmia, heart failure, MI
**GI:** Nausea, constipation, vomiting, dyspepsia, dysphagia, anorexia, diarrhea, abdominal pain
**GU:** Proteinuria, increased BUN, creatinine, impotence
**INTEG:** Rash, sweating, photosensitivity, pruritus
**META:** *Hyperkalemia,* hyperglycemia
**MS:** Arthralgia, arthritis, myalgia
**RESP:** Cough, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Not known, crosses placenta |
| **Metabolism** | Liver, extensively; protein binding 73% |
| **Excretion** | Urine |
| **Half-life** | Ramipril (5 hr), ramiprilat (13-17 hr) |

R

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½-1 hr |
| **Peak** | 1-3 hr |
| **Duration** | 24-72 hr |

## INTERACTIONS

### Individual drugs

Do not use with aliskiren in moderate-severe renal disease
Alcohol: increased hypotension (large amounts)
Lithium: increased serum levels
HydrALAZINE, prazosin: increased toxicity
Indomethacin: decreased antihypertensive effect

### Drug classifications

Adrenergic blockers, antihypertensives, diuretics, ganglionic blockers, nitrates: increased hypotension
Antacids: decreased absorption
Diuretics (potassium sparing), potassium supplements, sympathomimetics, vasodilators: increased toxicity
NSAIDs, salicylates: decreased antihypertensive effect

### Drug/food

Potassium salt substitutes: increased hyperkalemia, avoid use

### Drug/herb

Hawthorn: increased antihypertensive effect
Ephedra: decreased antihypertensive effect

### Drug/lab test

Increased: LFTs, BUN, creatinine, glucose, potassium
Decreased: RBC, Hgb, platelets

## NURSING CONSIDERATIONS

### Assessment

- **Monitor blood tests:** neutrophils, decreased platelets; WBC with differential baseline, periodically q3mo; if neutrophils are $<1000/mm^3$, discontinue treatment
- **Hypertension: Monitor B/P baseline and regularly, check for orthostatic hypotension, syncope; if changes occur, dosage may need to be changed**
- **Renal disease:** Monitor renal function tests: protein, BUN, creatinine, potassium, sodium; watch for increased levels that may indicate nephrotic syndrome and renal failure; monitor renal symptoms: polyuria, oliguria, frequency, dysuria; establish baselines in renal, liver function tests before therapy begins and monitor periodically; liver function tests, uric acid, and glucose may be increased
- Check potassium levels throughout treatment, hyperkalemia occurs
- **HF:** check for edema in feet, legs daily, weight daily
- **Allergic reactions:** angioedema, Stevens-Johnson syndrome; rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help
- Monitor electrolytes baseline and periodically, potassium may be increased

### Patient/family education

- Caution patient not to discontinue product abruptly; advise patient to tell all persons associated with care
- Teach patient not to use OTC products (cough, cold, allergy) unless directed by physician; serious side effects can occur; xanthines such as coffee, tea, chocolate, cola can prevent action of product
- Instruct patient on the importance of complying with dosage schedule, even if feeling better; to continue with medical regimen to decrease B/P: exercise, cessation of smoking, decreasing stress, diet modifications
- Emphasize the need to rise slowly to sitting or standing position to minimize orthostatic hypotension; not to exercise in hot weather because increased hypotension can occur
- Teach patient to notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, coughing, shortness of breath
- Caution patient to report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P, maintain hydration
- Caution patient that product may cause dizziness, fainting, light-headedness; may occur during 1st few days of therapy; to avoid activities that may be hazardous
- Teach patient how to take B/P, and normal readings for age group

**BLACK BOX WARNING:** Inform prescriber if pregnancy is planned, do not use in pregnancy, breastfeeding

### Evaluation

**Positive therapeutic outcome**
- Decreased B/P in hypertension

## TREATMENT OF OVERDOSE:

0.9% NaCl **IV** inf, hemodialysis

## ranibizumab (Rx)

(ran-ih-biz'oo-mab)
**Lucentis**
*Func. class.:* Ophthalmic
*Chem. class.:* Selective vascular endothelial growth factor antagonist

**ACTION:** Binds to receptor-binding site of active forms of vascular endothelial growth

factor A (VEGF-A) that causes angiogenesis and cell proliferation

**Therapeutic outcome:** Prevention of increasing neovascular macular degeneration

**USES:** Macular degeneration age-related (neovascular) (wet), macular edema after retinal vein occlusion (RVO)

## CONTRAINDICATIONS

Hypersensitivity, ocular infections

**Precautions:** Pregnancy, breastfeeding, children, retinal detachment, increased intraocular pressure

## DOSAGE AND ROUTES

**Adult:** Intravitreal 0.3 mg (0.05 ml) of 10 mg/ml q28 days or 0.5 mg qmonth × 4 months, then 0.5 mg q3mo

**Available forms:** Sol for inj 6 mg/ml, 10 mg/ml

### Implementation

- Given by ophthalmologist via intravitreal injection using adequate anesthesia; use 19-gauge filter
- Store in refrigerator; do not freeze
- Protect from light

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, peripheral neuropathy
**EENT:** Blepharitis, cataract, conjunctival hemorrhage/hyperemia, detachment of the retinal pigment epithelium, dryness/irritation/pain in the eye, visual impairment, vitreous floaters, ocular infection
**GI:** Constipation, nausea
**MISC:** Hypertension, UTI, thromboembolism, non-ocular bleeding, anemia, arthralgia
**RESP:** Bronchitis, cough, sinusitis, URI
**INTEG:** Impaired wound healing

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Minimal |
| **Distribution** | None |
| **Metabolism** | None |
| **Excretion** | Elimination 9 days |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 day |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Verteporfin photodynamic therapy (PDT): increased severe inflammation

## NURSING CONSIDERATIONS

### Assessment

- Assess for eye changes: redness, sensitivity to light, vision change, intraocular pressure change; report to ophthalmologist immediately, complete procedure with anesthesia and antibiotic prior to use, check perfusion of optic nerve after use

### Patient/family education

- Teach patient that if eye becomes red, sensitive to light, or painful or if there is a change in vision, seek immediate care from ophthalmologist
- Teach patient reason for treatment, expected results, that product is injected into the eye, an anesthetic will be used
- **Hypersensitivity: monitor for inflammation**

### Evaluation

**Positive therapeutic outcome**

- Prevention of increasing neovascular macular degeneration

## ranitidine (Rx)

(ra-nit'i-deen)
**Acid Reducer, Nu-Ranit, Zantac, Zantac-C, Zantac EFFER-dose**
*Func. class.:* $H_2$ histamine receptor antagonist

**Do not confuse:** ranitidine/amantadine/rimantadine, Zantac/Xanax/Zofran/ZyrTEC

**ACTION:** Inhibits histamine at $H_2$ receptor site in the gastric parietal cells, which inhibits gastric acid secretion

**Therapeutic outcome:** Healing of duodenal ulcers or gastric ulcers; prevention of duodenal ulcers; decreased symptoms of gastroesophageal reflux disease (GERD), Zollinger-Ellison syndrome, or heartburn

**USES:** Short-term treatment of duodenal and gastric ulcers and maintenance; management of GERD, Zollinger-Ellison syndrome, active duodenal ulcers with *Helicobacter pylori* in combination with clarithromycin, hypersecretory conditions, stress ulcers, erosive esophagitis (maintenance), systemic mastocytosis, multiple endocrine adenoma syndrome, heartburn

**Unlabeled uses:** Prevention of aspiration pneumonitis, upper GI bleeding

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, child <12 yr, renal/hepatic disease

## DOSAGE AND ROUTES

### Erosive esophagitis

**Adult:** PO 150 mg qid for up to 12 wk
**Child ≥1 mo:** PO 5-10 mg/kg/day in 2-3 divided doses

### Duodenal ulcer

**Adult:** PO 150 mg bid or 300 mg/day after PM meal or at bedtime, maintenance 150 mg at bedtime
**Infant and child:** PO 2-4 mg/kg bid, max 300 mg/day

### Zollinger-Ellison syndrome

**Adult:** PO 150 mg bid, may increase if needed

### Gastric ulcer

**Adult:** PO 150 mg bid × 6 wk, then 150 mg at bedtime
**Infant/child:** PO 2-4 mg/kg bid, max 300 mg/day

### GERD

**Adult:** PO 150 mg bid

### Renal dose

**Adult:** CCr <50 ml/min give 50% of dose or extend dosing interval

**Available forms:** Tab 75, 150, 300 mg; sol for inj 25 mg/ml; caps 150, 300 mg; syrup 15 mg/ml

### Implementation

- Store at room temp
- Give qday dose at bedtime

**PO route**

- May be given with or without meals
- Give antacids 1 hr before or 1 hr after this product

**IM route**

- No dilution needed; inject in large muscle mass, aspirate

**IV direct route**

- Dilute to max 2.5 mg/ml (50 mg/20 ml) using 0.9% NaCl (nonpreserved) or $D_5W$, give dose over ≥5 min (max 4 mg/ml)

**Intermittent IV INF route**

- Dilute to max 0.5 mg/ml with $D_5W$, 0.9% NaCl, give over 15-20 min (5-7 ml/min); premixed ready-to-use bags as 1 mg/ml (50 mg/50 ml), inf over 15-20 min

**Continuous 24 hr IV INF route**

- **Adult:** dilute 150 mg/250 ml of $D_5W$ or 0.9% NaCl, run over 24 hr (6.25 mg/hr or as directed); use inf device and use within 48 hr; *Zollinger-Ellison:* dilute in $D_5W$ or 0.9% NaCl, max concentration 2.5 mg/ml, use inf device

**Y-site compatibilities:** Acyclovir, aldesleukin, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B liposome, amsacrine, anakinra, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, ceFAZolin, cefepime, cefonicid, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, ceftAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, DOBUTamine, DOCEtaxel, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin, DOXOrubicin liposome, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem/cilastatin, inamrinone, indomethacin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoXANtrone, morphine, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pancuronium, papaverine, PEMEtrexed, penicillin G, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, urokinase, vancomycin, vecuronium, vinCRIStine, vinorelbine, warfarin, zidovudine, zoledronic acid

**Y-site incompatibilities:** Amphotericin B cholesteryl, caspofungin, diazepam, diazoxide, insulin, pantoprazole, phenytoin, quinupristin/dalfopristin, trimethoprim/sulfamethoxazole

## ADVERSE EFFECTS

**CNS:** Headache, sleeplessness, dizziness, confusion, agitation, depression; hallucinations (geriatric)
**EENT:** Blurred vision, increased ocular pressure
**GI:** Constipation, abdominal pain, diarrhea, nausea, vomiting, hepatotoxicity

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, IM), completely absorbed (**IV**) |
| **Distribution** | Widely distributed, crosses placenta |
| **Metabolism** | Liver (30%) |
| **Excretion** | Kidneys unchanged (70%) |
| **Half-life** | 2-3 hr, increased renal disease |

### Pharmacodynamics

| | PO | IM/IV |
|---|---|---|
| **Onset** | Unknown | Unknown |
| **Peak** | 2-3 hr | 15 min |
| **Duration** | 8-12 hr | 8-12 hr |

## INTERACTIONS

### Individual drugs

Adefovir, pramipexole, procainamide, trospium, triazolam, memantine, saquinavir: increased effect of each product
Diazepam, metoclopramide: decreased absorption of ranitidine
Ketoconazole: decreased effect of ketoconazole
NIFEdipine, ext rel products: increased GI obstruction risk
Procainamide: increased absorption, toxicity

### Drug classifications

Anticholinergics, antacids: decreased ranitidine absorption
Anticoagulants, sulfonylureas: increased absorption, toxicity
Benzodiazepines, calcium channel blockers: increased effect of each product
Cephalosporins: decreased effects of cephalosporins
Iron salts: decreased effects of iron salts

### Drug/lab test

Increased: AST, creatinine, ALT
False positive: urine protein (multistix)

## NURSING CONSIDERATIONS

### Assessment

- **GI complaints:** assess patient with ulcers or suspected ulcers: epigastric or abdominal pain, hematemesis, occult blood in stools, blood in gastric aspirate before, throughout treatment
- Monitor I&O ratio, BUN, creatinine, CBC with differential monthly
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding, excreted in breast milk
- **Beers:** Avoid in older adults with or at high risk of delirium, may induce or make delirium worse, report confusion

### Patient/family education

- Caution patient that gynecomastia, impotence may occur and are reversible after treatment is discontinued
- Advise patient to avoid driving, other hazardous activities until stabilized on this medication; drowsiness or dizziness may occur
- Inform patient that smoking decreases the effectiveness of the product; that smoking cessation should be considered
- Instruct patient that product must be continued for prescribed time to be effective and taken exactly as prescribed; doses should not be doubled; a missed dose should be taken when remembered up to 1 hr before next dose
- Advise patient to report bruising, fatigue, malaise; blood dyscrasias may occur
- Inform patient to report diarrhea, black tarry stools, sore throat, rash, dizziness, confusion, or delirium to prescriber immediately
- Teach patient to take once-daily dose before bedtime
- Teach patient to report immediately coffee-grounds emesis, black tarry stools, abdominal pain, cramping

### Evaluation

**Positive therapeutic outcome**

- Decreased pain in abdomen, heartburn
- Healing of ulcers
- Absence of gastroesophageal reflux

## ranolazine (Rx)

(ruh-no'luh-zeen)
**Ranexa**
*Func. class.:* Antianginal
*Chem. class.:* Piperazine derivative

**ACTION:** Antianginal, antiischemic; unknown, may work by inhibiting portal fatty-acid oxidation

**Therapeutic outcome:** Decreased anginal pain and number of episodes

**USES:** Chronic stable angina pectoris; use in those that have not responded to other treatment options; should be used in combination with

R

other antianginals such as amlodipine, β-blockers, or nitrates

## CONTRAINDICATIONS

Preexisting QT prolongation, hepatic disease (Child-Pugh class A, B, C), hypersensitivity, hypokalemia, renal failure, torsades de pointes, ventricular dysrhythmia, ventricular tachycardia, hepatic cirrhosis

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal disease, hypotension, females at risk for torsades de pointes

## DOSAGE AND ROUTES

### Chronic angina

**Adult:** PO 500 mg bid and increased to 1000 mg bid based on response; max 1000 mg bid

**Available forms:** Ext rel tabs 500, 1000 mg; limit to 500 mg bid in those taking moderate CYP3A4 inhibitors

### Implementation

- Use in combination with H2 blockers, metroNIDAZOLE, proton pump inhibitor, and clarithromycin for *H. pylori*
- **Ext rel tabs:** Do not break, crush, or chew tabs; give products as prescribed; do not double or skip dose
- Give bid, without regard to meals
- Do not use with grapefruit juice or grapefruit

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness,* hallucinations
**CV:** Palpitations, QT prolongation, orthostatic hypotension
**EENT:** Tinnitus
**GI:** Nausea, vomiting, constipation, dry mouth
**MISC:** Peripheral edema
**RESP:** Dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Varied absorption |
| **Distribution** | Protein binding 62% |
| **Metabolism** | Liver, extensively by CYP3A, CYP2D6 (lesser) |
| **Excretion** | Urine 75%, feces 25% |
| **Half-life** | 7 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-5 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Haloperidol, chloroquine, droperidol, pentamidine, arsenic trioxide, levomethadyl; CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation
Digoxin, simvastatin: increased action of digoxin, simvastatin
Diltiazem, dofetilide, ketoconazole, PARoxetine, quiNIDine, sotalol, thioridazine, verapamil, ziprasidone: increased ranolazine action

### Drug classifications

Anti-retroviral protease inhibitors: increased ranolazine absorption, toxicity
Class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics; CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin); CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation
Macrolide antibiotics, protease inhibitors: increased ranolazine action
Macrolides (clarithromycin, erythromycin, troleandomycin): increased QTc interval

### Drug/food

Do not use with grapefruit or grapefruit juice

## NURSING CONSIDERATIONS

### Assessment

- Assess cardiac status: B/P, pulse, respiration, ECG; watch for prolongation of QT (in those with CCr 60 ml/min), if BUN and creatinine increase significantly, discontinue product
- **QT prolongation:** ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea, torsades de pointes may occur
- **Angina:** characteristics of pain (intensity, location, duration, alleviating/precipitating factors)
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excretion unknown

### Patient/family education

- Teach patient to avoid hazardous activities until stabilized on product, dizziness is no longer a problem
- Advise patient to avoid OTC drugs, grapefruit juice, drugs prolonging QTc (quiNIDine, dofetilide, sotalol, erythromycin, thioridazine, ziprasidone or protease inhibitors, diltiazem, ketoconazole, macrolide antibiotics, verapamil) unless directed by prescriber
- Advise patient to comply in all areas of medical regimen
- Teach patient to notify all health care providers of this product use

• Teach patient not to chew or crush, and to avoid grapefruit juice
• Advise patient to notify prescriber of palpitations, dizziness, fainting, edema, dyspnea
• For acute angina take other products prescribed; this product doesn't decrease acute attack

### Evaluation

**Positive therapeutic outcome**
• Decreased anginal pain, attacks and number of episodes

## rasagiline (Rx)

(ra-sa'ji-leen)
**Azilect**
*Func. class.:* Antiparkinson agent
*Chem. class.:* MAOI, type B

**ACTION:** Inhibits MAO type B at recommended doses; may increase DOPamine levels

**Therapeutic outcome:** Improved symptoms in those with Parkinson's disease

**USES:** Idiopathic Parkinson's disease monotherapy or with levodopa

## CONTRAINDICATIONS

Breastfeeding, hypersensitivity to this product or MAOIs, pheochromocytoma

**Precautions:** Pregnancy, children, psychiatric disorders, severe hepatic disorders

## DOSAGE AND ROUTES

### Idiopathic Parkinson's disease

### Monotherapy

**Adult:** PO 1 mg/day

### Adjunctive therapy

**Adult:** PO 0.5 mg/day, may be increased to 1 mg/day; change of levodopa dose in adjunct therapy; reduced levodopa dose may be needed

### Hepatic dose

**Adult:** PO 0.5 mg in mild hepatic disease

### Concomitant ciprofloxacin, other CYP1A2 inhibitors

**Adult:** PO 0.5 mg; plasma concentrations of rasagiline may double

**Available forms:** Tabs 0.5, 1 mg

### Implementation

• Give with meals to prevent nausea; continuing therapy usually reduces or eliminates nausea; do not give with foods/liquids containing large amounts of tyramine
• Give reduced dose of carbidopa/levodopa cautiously
• **Renal failure:** in dialysis, increase dose slowly

## ADVERSE EFFECTS

### Monotherapy

**CNS:** Drowsiness, hallucinations, depression, headache, malaise, paresthesia, vertigo, syncope
**CV:** Angina, hypertensive crisis (ingestion of tyramine products), orthostatic hypotension
**GI:** *Nausea,* diarrhea, dry mouth, dyspepsia
**GU:** Impotence, decreased libido
**HEMA:** Leukopenia
**INTEG:** Alopecia, skin cancers
**MISC:** Conjunctivitis, fever, flu syndrome, neck pain, allergic reaction, alopecia
**MS:** Arthralgia, arthritis, dyskinesia, falls
**RESP:** Rhinitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Protein binding >88%-94% |
| **Metabolism** | Liver, CYP1A2 |
| **Excretion** | Kidneys, half-life 3 hr |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Ciprofloxacin: increased levels of rasagiline up to twofold
Meperidine: do not give; serious reaction including coma and death may occur

### Drug classifications

Analgesics, sympathomimetics: do not give; serious reaction including coma and death may occur
Antidepressants (tricyclics, SSRIs, SNRIs, mirtazapine, cyclobenzaprine): increased severe CNS toxicity
CYP1A2 inhibitors (atazanavir, mexiletine, taurine): increased levels of rasagiline up to twofold
MAOIs: increased hypertensive crisis

### Drug/herb

St. John's wort, yohimbe: do not give

### Drug/food

Do not use with food/liquids that contain large amounts of tyramine (cured meats cheeses, pickled products)

### Drug/lab test

Increased: LFTs
Decreased: WBCs

## NURSING CONSIDERATIONS

### Assessment

- **Assess for Parkinson's symptoms:** tremor, ataxia, muscle weakness and rigidity; baseline, periodically; assess for increased dyskinesia and postural hypotension if used in combination with levodopa
- Assess mental status: hallucinations, confusion, notify prescriber
- **Serotonin syndrome:** Agitation, coma, tachycardia, hyperreflexia, nausea, vomiting, may be precipitated in those taking SSRIs, SNRIs
- **Assess for hypertensive crisis:** severe headache, blurred vision, seizures, chest pain, difficulty thinking, nausea/vomiting, signs of stroke; any unexplained severe headache should be considered to be hypertensive crisis
- Monitor arterial blood gases (ABGs), CBC with differential, LDH, serum bilirubin, creatinine, electrolytes, uric acid baseline and periodically
- Assess for melanomas frequently, perform periodic skin exams by a dermatologist
- Monitor cardiac status: B/P, ECG; periodically, orthostatic hypotension during first 2 months of treatment
- **Tyramine products:** assess for foods, other medications, may lead to hypertensive crisis (tachycardia, bradycardia, chest pain, nausea, vomiting, sweating, dilated pupils)
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

### Patient/family education

- Advise patient to change position slowly to prevent orthostatic hypotension
- Instruct patient to avoid hazardous activities until stabilized; dizziness can occur
- Advise patient to rinse mouth frequently, use sugarless gum to alleviate dry mouth
- Teach patient to take as prescribed, not to miss dose or double doses; take missed dose as soon as remembered if several hours before next dose
- Teach patient to prevent hypertensive crisis by avoiding tyramine foods >150 mg
- Teach patient to avoid CNS depressants, alcohol
- If drowsiness, daytime sleepiness, or falling asleep occurs, product may need to be discontinued
- Skin should be checked periodically for possible skin cancer

### Evaluation

**Positive therapeutic outcome**

- Improved symptoms in those with Parkinson's disease (decreasing tremors, ataxia, muscle weakness/rigidity)

**⚠ HIGH ALERT**

# rasburicase (Rx)

(rass-burr'i-case)

**Elitek, Fasturtec**

*Func. class.:* Enzyme

*Chem. class.:* Recombinant urate-oxidase enzyme

**ACTION:** Catalyzes enzymatic oxidation of uric acid into an inactive and a soluble metabolite (allantoin)

**Therapeutic outcome:** Decreased uric acid levels

**USES:** To reduce uric acid levels in leukemia, lymphoma, solid tumor malignancies who are receiving chemotherapy

## CONTRAINDICATIONS

Hypersensitivity

**BLACK BOX WARNING:** G6PD deficiency (Mediterranean, African descent), hemolytic reactions, or methemoglobinemia reactions to this product

**Precautions:** Pregnancy, breastfeeding, children <2 yr, anemia, acute bronchospasm, angina, patients of African or Mediterranean ancestry, hypotension

**BLACK BOX WARNING:** Anaphylaxis, interference with uric acid measurements

## DOSAGE AND ROUTES

**Adult/adolescent/child/infant: IV** INF 0.2 mg/kg as a single daily dose × 5 days

**Available forms:** Powder for inj 1.5, 7.5 mg/vial

### Implementation

**Intermittent IV INF route**

- Reconstitute with diluent provided, add 1 ml of diluent/vial, swirl, withdraw amount needed and mix with 0.9% NaCl to final volume of 50 ml, use within 24 hr, give over 30 min, do not use filter, use different line, if not possible flush with ≥15 ml of NaCl before and after use
- Chemotherapy is started 4-24 hr after 1st dose

## ADVERSE EFFECTS

**CNS:** *Headache,* fever

**CV:** Chest pain, hypotension

**GI:** *Nausea, vomiting, anorexia, diarrhea, abdominal pain, constipation, dyspepsia, mucositis*

**HEMA:** Neutropenia with fever, hemolysis, methemoglobinemia

**INTEG:** *Rash*
**MISC:** Edema
**RESP:** Bronchospasm, wheezing, dyspnea
**SYST:** Anaphylaxis, hemolysis, methemoglobinemia, sepsis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Elimination 16-21 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

### Drug/lab

**BLACK BOX WARNING:** Interference: uric acid

## NURSING CONSIDERATIONS

### Assessment

- Monitor blood studies: BUN, serum uric acid, urine CCr, electrolytes, CBC with differential before, during therapy
- Monitor temp q4hr; fever may indicate beginning infection; no rectal temp

**BLACK BOX WARNING:** Assess for anaphylaxis (dyspnea, urticaria, flushing, wheezing, swelling of lips, tongue, throat); have emergency equipment nearby

- Assess for G6PD deficiency, hemolytic reactions, methemoglobinemia; these patients should not be given this agent, screen patients who are higher risk for these disorders
- Assess GI symptoms: frequency of stools, cramping; if severe diarrhea occurs, fluid and electrolytes may need to be given
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk

### Patient/family education

- Advise of reason for therapy, expected results
- Advise to report trouble breathing, jaundice, chest pain

### Evaluation

**Positive therapeutic outcome**

- Decreased uric acid levels in children when antineoplastics causing high uric acid levels are used

**⚠ HIGH ALERT**

# regorafenib

(re'goe-raf'e-nib)

**Stivarga**

*Func. class.:* Antineoplastic biologic response modifier; multikinase inhibitor
*Chem. class.:* Signal transduction inhibitor (STI)

**ACTION:** Inhibits tyrosine kinase in patients with colorectal cancer

**Therapeutic outcome:** Decrease in spread or size of tumor

**USES:** Metastatic colorectal cancer in those who have received fluoropyrimidine, oxaliplatin, irinotecan-based chemotherapy, an anti-VEGF therapy; and an anti-EGFR therapy if *KRAS* wild type

## CONTRAINDICATIONS

Pregnancy

**Precautions:** Breastfeeding, children, geriatric patients, cardiac/renal/hepatic/dental disease, fistula, GI bleeding or perforation, bone marrow suppression, infection, wound dehiscence, thrombocytopenia, neutropenia, immunosuppression

**BLACK BOX WARNING:** Hepatic disease

## DOSAGE AND ROUTES

**Adult:** PO 160 mg/day with a low-fat breakfast × 21 days of a 28-day cycle, cycles may be repeated

**Available forms:** Tabs 40 mg

### Implementation

- Store at 77°F (25°C)
- Give at the same time each day with a low-fat breakfast that contains less than 30% fat such as 2 slices of white toast with 1 TBSP of low-fat margarine and 1 TBSP of jelly, and 8 oz of skim milk; or 1 cup of cereal, 8 oz of skim milk, 1 slice of toast with jam, apple juice, and 1 cup of coffee or tea
- Swallow tablets whole
- If a dose is missed, take as soon as possible that day; do not take 2 doses on the same day
- **Hand–foot skin reaction:**

Reduce to 120 mg (grade 2 palmar–plantar erythrodysesthesia); hold if grade 2 toxicity does not improve in 7 days or recurs; hold for 7 days in grade 3 toxicity; reduce to 80 mg for recurrent grade 2 toxicity; discontinue if 80 mg is not tolerated

R

- **Hypertension:**

Hold in grade 2 hypertension

- Other severe toxicity (except hepatotoxicity)

Hold until toxicity resolves in grade 3 or 4 toxicity; consider the risk/benefits of continuing therapy in grade 4 toxicity, reduce dosage to 120 mg; if grade 3 or 4 toxicity recurs, hold until toxicity resolves, then reduce to 80 mg; discontinue in those who do not tolerate 80-mg dose

### Hepatic dose

Baseline mild (Child-Pugh class A) or moderate (Child-Pugh class B): No change; baseline severe hepatic impairment (Child-Pugh class C): use not recommended

**AST/ALT elevations during therapy:**

For grade 3 AST/AST level elevations, hold dose; if therapy is continued, reduce to 120 mg after levels recover; discontinue in those with AST/ALT > 20 × ULN; AST/ALT > 3 × ULN and bilirubin > 2 × ULN; recurrence of AST/ALT >5 × ULN despite a reduction to 120 mg

## ADVERSE EFFECTS

**CNS:** Headache, tremor
**CV:** Hypertensive crisis, MI
**EENT:** Blurred vision, conjunctivitis
**GI:** Hepatotoxicity, GI hemorrhage, diarrhea, GI perforation, xerostomia
**HEMA:** Neutropenia, thrombocytopenia, bleeding
**INTEG:** Rash, alopecia
**META:** Hypokalemia
**MISC:** Fatigue, decreased weight, hand–foot syndrome, hypothyroidism

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 99% |
| **Metabolism** | by CYP3A4, UGT1A0 |
| **Half-life** | 14–58 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Simvastatin: Increased plasma concentrations of simvastatin

Warfarin: Increased plasma concentration of warfarin; avoid use; use low-molecular-weight anticoagulants instead

### Drug classifications

CYP3A4 inhibitors (ketoconazole, itraconazole, erythromycin, clarithromycin): Increase: regorafenib concentrations

Calcium-channel blockers, ergots: Increased plasma concentrations of each product

CYP3A4 inducers (dexamethasone, phenytoin, carBAMazepine, rifampin, PHENobarbital): Decrease: regorafenib concentrations

### Drug/food

Grapefruit juice; avoid use while taking product: Increased regorafenib effect

### Drug/herb

St. John's wort: Decreased imatinib concentration

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Hepatic disease:** fatal hepatotoxicity can occur; obtain LFTs baseline and at least every 2 wk × 2 mo, then monthly

- **Fatal bleeding:** From GI, respiratory, GU tracts; permanently discontinue in those with severe bleeding
- Assess any wounds for healing, report wound dehiscence, stop medication, notify prescriber
- **Pregnancy:** To identify if patient is pregnant or if pregnancy is planned, identify contraception type in both men and women, do not use in pregnancy, breastfeeding
- **Palmar–plantar erythrodysesthesia (hand–foot syndrome):** More common in those previously treated; reddening swelling, numbness, desquamation on palms, soles
- **GI perforation/fistula:** Discontinue if this occurs, assess for pain in epigastric area, dyspepsia, flatulence, fever, chills
- **Hypertension/hypertensive crisis:** Hypertension usually occurs in the first cycle in those with preexisting hypertension, do not start treatment until B/P is controlled; monitor B/P every wk × 6 wk, then at start of each cycle or more often if needed, temporarily or permanently discontinue for severe uncontrolled hypertension

### Patient/family education

- Teach patient to report adverse reactions immediately: bleeding, rash
- Teach patient the reason for treatment, expected results
- Advise patient that effect on male fertility is unknown
- Teach patient to take at same time of day with low-fat food, do not use grapefruit juice,

take missed dose on same day, do not take multiple doses on the same day, keep in original container
• Teach patient to report immediately hepatic effects (yellowing skin, eyes, nausea, vomiting, dark urine), increase B/P, (severe headache); GI perforation/fistula (dyspepsia, flatulence, fever, chills, epigastric pain)
• **Pregnancy:** Not to use in pregnancy if suspected or if breastfeeding, men and women to use contraception during and for 2 mo after termination of treatment

### Evaluation
**Positive therapeutic outcome**
• Decrease in spread or size of tumor

**⚠ HIGH ALERT**

## repaglinide (Rx)
(re-pag'lih-nide)
**Gluco Norm 🍁, Prandin**
*Func. class.:* Antidiabetic
*Chem. class.:* Meglitinides

**Do not confuse:** Prandin/Avandia

**ACTION:** Causes functioning β-cells in pancreas to release insulin, leading to drop in blood glucose levels; closes ATP-dependent potassium channels in the β-cell membrane; this leads to opening of calcium channels; increased calcium influx induces insulin secretion

**Therapeutic outcome:** Blood glucose controlled

**USES:** Type 2 diabetes mellitus

## CONTRAINDICATIONS
Hypersensitivity to meglitinides, diabetic ketoacidosis, type 1 diabetes

**Precautions:** Pregnancy, breastfeeding, children, geriatric, cardiac disease, severe renal/hepatic disease, thyroid disease, severe hypoglycemic reactions

## DOSAGE AND ROUTES
**Adult:** PO 0.5-4 mg with each meal, max 16 mg/day, adjust at weekly intervals; oral hypoglycemic-naïve patients or those with A1c <8% should start with 0.5 mg with each meal

### Renal/hepatic dose
**Adult:** PO CCr 20-39 ml/min: 0.5 mg/day; titrate upward cautiously

**Available forms:** Tabs 0.5, 1, 2 mg

### Implementation
• 15 min before meals: 2, 3, or 4 ×/day preprandially
• Skip dose if meal is skipped; add dose if meal is added
• Store in airtight container at room temperature
• May be added to metFORMIN for better control

## ADVERSE EFFECTS
**CNS:** *Headache, weakness,* paresthesia
**CV:** Angina
**EENT:** Sinusitis, tinnitus
**ENDO:** Hypoglycemia
**GI:** Nausea, vomiting, diarrhea, constipation, dyspepsia, pancreatitis
**INTEG:** Rash, allergic reactions
**MISC:** Chest pain, UTI, allergy
**MS:** Back pains, arthralgia
**RESP:** URI, sinusitis, rhinitis, bronchitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | 98% protein binding, crosses placenta |
| **Metabolism** | Liver by CYP3A4 |
| **Excretion** | Urine/feces |
| **Half-life** | 1 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 30 min |
| **Peak** | 1 hr |
| **Duration** | <4 hr |

## INTERACTIONS
### Individual drugs
CarBAMazepine, rifampin: increased repaglinide metabolism
Chloramphenicol, deferasirox, fenofibrate, gemfibrozil, probenecid, simvastatin: increased effect of repaglinide
Erythromycin, ketoconazole, miconazole: decreased repaglinide metabolism
Gemfibrozil, isophane insulin (NPH): Do not use together
Isoniazid, phenobarbital, phenytoin, rifampin: decreased action of repaglinide
Levonorgestrel/ethinyl estradiol: increase in both

### Drug classifications
Antifungals, CYP3A4 inhibitors, macrolides: decreased repaglinide metabolism
Barbiturates, CYP3A4 inducers: increased repaglinide metabolism
β-Adrenergic blockers, coumarins, MAOIs, NSAIDs, salicylates, sulfonamides: increased repaglinide effect

R

Calcium channel blockers, contraceptives (oral), corticosteroids, diuretics (thiazide), estrogens, phenothiazines, sympathomimetics, thyroid preparations: decreased repaglinide effect
CYP3A4, OATP1B1, CYP2C9 inhibitors: increased repaglinide effect

### Drug/herb
Chromium, garlic, horse chestnut: increased antidiabetic effect

### Drug/food
Decreased: repaglinide level; give before meals
Grapefruit juice: decreased repaglinide metabolism

### Drug/lab test
Increased/decreased: glucose

## NURSING CONSIDERATIONS
### Assessment
- Assess for hypoglycemic or hyperglycemic reaction, which can occur soon after meals; dizziness, weakness, headache, tremor, anxiety, tachycardia, hunger, sweating, abdominal pain, monitor A1c, fasting, postprandial glucose during treatment
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, usually insulin is used in pregnancy, do not breastfeed, excretion unknown

### Patient/family education
- Teach patient technique of blood glucose monitoring using blood glucose meter
- Teach patient the symptoms of hypoglycemia and hyperglycemia, what to do about each
- Teach patient that product must be continued on daily basis; explain consequence of discontinuing product abruptly
- Advise patient to avoid OTC medications unless ordered by prescriber, not to use alcohol
- Advise patient that diabetes is a lifelong illness; product will not cure disease
- Advise patient to eat all food included in diet plan to prevent hypoglycemia; that if a meal is omitted, dose should be omitted; to have glucagon emergency kit available; to take repaglinide 15-30 min before meals 2, 3, or 4×/day
- Instruct patient to carry/wear emergency ID for emergency purposes

### Evaluation
**Positive therapeutic outcome**
- Decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; blood glucose, A1c improvement

## retapamulin topical
*See Appendix B*

## retinoic acid
*See tretinoin*

## $Rh_o$ (D) immune globulin, standard dose IM
**HyperRHO SD, Rho Gam Ultra Filtered Plus**

## $Rh_o$ (D) immune globulin microdose IM
**HyperRHO S/D mini-Dose, MICRhoGAM Ultra Filtered Plus, mini-Gramulin R**

## $Rh_o$ (D) immune globulin microdose (IM, IV)
**Rhophylac**

## $Rh_o$ (D) immune globulin IV
**Rhophylac, WinRho SDF**

*Func. class.:* Immune globulins

**ACTION:** Suppresses immune nonsensitized $Rh_o$ (D or $D^u$)-negative patients who are exposed to $Rh_o$ (D or $D^u$)-positive blood

**Therapeutic outcome:** Absence of Rh factor and transfusion error

**USES:** Prevention of isoimmunization in Rh-negative women exposed to Rh-positive blood given after abortions, miscarriages, amniocentesis, chronic idiopathic thrombocytopenic purpura (Rhophylac)

## CONTRAINDICATIONS
Previous immunization with this product, $Rh_o$ (D)-positive/$D^u$-positive patient

**BLACK BOX WARNING:** Hemolysis

**Precautions:** Pregnancy

**BLACK BOX WARNING:** Requires a specialized setting

## DOSAGE AND ROUTES
**To reduce risk of Rh isoimmunization antepartum/suppression of Rh isoimmunization postpartum following delivery of full-term infant**

**Adult and adolescent ≥16 yr:** IM ([HyperRHO S/D] [full dose only]) 300 mcg (1500 international units) at 28 wk gestation, repeat within 72 hr of delivery of confirmed Rho(D)-positive infant; a dose is not needed after

delivery, if delivery is within 3 wk of last dose and no fetal maternal hemorrhage of >15 ml of RBC; IM (RhoGam only) 300 mcg (1500 international units) at 26-28 wk gestation, repeat within 72 hr even if status of Rho is unknown or if 72 hr have passed; IM/**IV** (WinRho SDF only) 300 mcg (1500 international units) at 28 wk gestation; if given earlier in pregnancy, give at 12-wk intervals during pregnancy, a 120-mcg (600 international units) dose; IM/**IV** should be given as soon as possible and preferably within 72 hr of delivery of a confirmed Rho(D)-positive infant, and even if status is unknown give up to 28 days after delivery

### Known or suspected massive fetomaternal hemorrhage (>15 ml of fetal RBC or >30 ml of fetal whole blood)

**Adult and adolescent ≥16 yr:** IM ([HyperRHO S/D] [full dose only]) 300 mcg (1500 international units) per every 15 ml of fetal blood cells or 30 ml of whole blood, multiple syringes may be injected IM at the same time in different sites, give within 72 hr of exposure, repeat dose within 72 hr of delivery; IM (RhoGAM only) 300 mcg (1500 international units) for every 15 ml of fetal blood cells or 30 ml of whole blood, give total dose within 72 hr of exposure; IM/**IV** (WinRho SDF only) if large fetomaternal hemorrhage is suspected, give **IV** 9 mcg (45 international units) or IM 12 mcg (60 international units) for every ml of fetal whole blood, give **IV** 600 mcg (3000 international units) q8hr or IM 1200 mcg (6000 international units) q12hr until total dose is given, total dose should be given within 72 hr of exposure

### Threatened abortion at any stage of pregnancy

**Adult and adolescent ≥16 yr:** IM ([HyperRHO S/D] [full dose only]) 300 mcg (1500 international units) as soon as possible; if given 13-18 wk gestation, give another 300 mcg (1500 international units) at 26-28 wk gestation; repeat dose within 72 hr of delivery; IM (RhoGam only) 300 mcg (1500 international units) as soon as possible and within 72 hr; IM/**IV** (Rhophylac only) 300 mcg (1500 international units) as soon as possible and within 72 hr; IM/**IV** (WinRho SDF only) 300 mcg (1500 international units) as soon as possible and within 72 hr, repeat dose at 12-wk intervals during pregnancy and 120 mcg (600 international units) as soon as possible after delivery and within 72 hr

### Following spontaneous abortion, induced termination of pregnancy, or ectopic pregnancy that occurs ≤12 wk gestation

**Adult and adolescent ≥16 yr:** IM (Minidose, HYperRHO Minidose, MICRORhoGAM only) 50 mcg (250 international units) as soon as possible, give within 3 hr of spontaneous or surgical removal, if possible within 72 hr

### Following spontaneous abortion, induced termination of pregnancy, or ruptured tubal pregnancy that occurs ≥13 wk

**Adult and adolescent ≥16 yr:** IM (full dose [HyperRHO S/D] RhoGAM only) 300 mcg (1500 international units) as soon as possible and within 72 hr of event

### Following spontaneous abortion, induced termination of pregnancy, amniocentesis, chorionic villus sampling, abdominal trauma, ruptured tubal pregnancy, or percutaneous umbilical cord sampling up to 34 wk gestation

**Adult and adolescent ≥16 wk:** IM/**IV** (WinRho SDF only) 300 mcg (1500 international units) within 72 hr, repeat at 12-wk intervals during pregnancy, give 120 mcg (600 international units) as soon as possible and preferably within 72 hr of delivery

**Available forms:** Hyper RHO S/D solution for injection 1500 IU/prefilled syringe; MICRhoGAM Ultra Filtered Plus Solution for inj 50 mcg/ml; RhoGam Ultra Filtered Plus Solution for inj 50 mcg; Rhophylac Pre-Filled Syringes Solution for inj 300 mcg/2 ml; WinRho SDF Liquid for inj

### Implementation

- BayRho-D is being changed to HyperRHO S/D
- HyperRHO S/D, MICRhoGAM, RhoGAM are given by IM only; do not give **IV**
- Rhophylac may be given IM or **IV**
- Inspect for particulate matter; do not use if particulate matter is present
- Reconstitution/dilution: no reconstitution or dilution is needed for BayRho-D (HyperRHO S/D), Rhophylac, MICRoGAM, RhoGAM, or the liquid formulation of WinRho SDF

**IM route**

- Use aseptic technique, observe for 20 min after administration
- Bring Rhophylac to room temperature before using
- Inject into the deltoid muscle of upper arm or anterolateral portion of the upper thigh; do not inject into gluteal muscle
- If dose calculated will need multiple vials or syringes, use different sites at the same time

**IV route**
- Use aseptic technique
- WinRhoSDF: remove entire contents of vial to obtain calculated dose; if partial vial contents are required for dosage calculation, withdraw the entire vial contents to ensure correct calculation; inf correct calculated dose over 3-5 min; do not inf with other fluids or products
- Rhophylac: bring to room temperature; inf by slow **IV**; observe for 20 min

## ADVERSE EFFECTS
**CNS:** Lethargy
**CV:** Hypo/hypertension
**INTEG:** Irritation at inj site, fever
**MISC:** Infection, ARDS, anaphylaxis, pulmonary edema, DIC
**MS:** Myalgia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS
### Drug classifications
Live virus vaccines (measles, mumps, rubella): decreased antibody response to vaccine

## NURSING CONSIDERATIONS
### Assessment
- Assess for allergies, reactions to immunizations; previous immunization with this product
- **Intravascular hemolysis:** assess for back pain, chills, hemoglobinuria, renal insufficiency; usually when WinRho SDF is given in those with immune thrombocytopenia purpura
- Obtain type and cross-match of mother's blood and of neonate's cord blood; neonate must be $Rh_o(D)$-positive, mother must be $Rh_o(D)$-negative and $(D^u)$-negative, medication should be given if there is a doubt

### Patient/family education
- Teach patient how product works; that product must be given after subsequent deliveries if subsequent babies are Rh-positive
- **Intravascular hemolysis:** Teach patient to report immediately: shaking, fever, chills, dark urine, swelling of hand or feet, back pain, SOB

### Evaluation
**Positive therapeutic outcome**
- Prevention of $Rh_o(D)$ sensitization in transfusion error
- Prevention of erythroblastosis fetalis in subsequent $Rh_o(D)$-positive neonates

# ribavirin (Rx)
(rye-ba-vye′rin)
**Virazole**
*Func. class.:* Synthetic antiviral
*Chem. class.:* Tricyclic amine

**ACTION:** Prevents replication of DNA and RNA synthesis

**Therapeutic outcome:** Resolution of severe lower respiratory tract infections

**USES:** Severe lower respiratory tract infections in infants and children

**Unlabeled uses:** Influenza A or B (early)

## CONTRAINDICATIONS
Pregnancy, breastfeeding, children <1 yr, hypersensitivity

**Precautions:** Epilepsy, renal/hepatic disease

## DOSAGE AND ROUTES
**Infant and young child:** INH 20 mg/ml × 12-18 hr/day × 3-7 days

**Available forms:** Powder for reconstitution for aerosol 6 g/vial

### Implementation
- Give by the Viratek small particle aerosol generator (SPAG-2), do not use other inhalation equipment
- May be given by an oxygen hood for infants, or a face mask may be attached to the SPAG-2
- Reconstitute 6 g of sterile water for inj or inh, place sol in the Erlenmeyer flask and dilute further to 20 mg/ml

## ADVERSE EFFECTS
**CNS:** Dizziness, faintness
**CV:** Hypotension, cardiac arrest
**EENT:** Eye irritation, conjunctivitis, blurred vision, photosensitivity
**INTEG:** Rash

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Inhalation (systemic) |
| **Distribution** | To respiratory tract |
| **Metabolism** | Liver |
| **Excretion** | Respiratory tract |
| **Half-life** | 9½ hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Inhalation's end |
| **Duration** | Unknown |

## INTERACTIONS

### Individual products

Zidovudine: decreased antiviral action, increased toxicity

### Drug classification

Cardiac glycosides: increased toxicity

## NURSING CONSIDERATIONS

### Assessment

- Assess allergies before initiation of treatment, reaction of each medication; list allergies on chart in bright red letters
- Monitor respiratory status: rate, character, wheezing, tightness in chest
- Obtain C&S test results before starting treatment
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Teach patient and parents aspects of product therapy

### Evaluation

**Positive therapeutic outcome**

- Absence of respiratory syncytial virus

# riboflavin (vitamin $B_2$) (OTC)

(rye'bo-flay-vin)

*Func. class.:* Vitamin $B_2$, water soluble

**ACTION:** Needed for respiratory reactions (catalyzes proteins) and for normal vision

**Therapeutic outcome:** Prevention or treatment of riboflavin deficiency

**USES:** Vitamin $B_2$ deficiency or polyneuritis; cheilosis adjunct with thiamine

**Precautions:** Pregnancy

## DOSAGE AND ROUTES

### Deficiency

**Adult:** PO 5-30 mg/day
**Child ≥12 yr:** PO 3-10 mg/day, then 0.6 mg/1000 cal ingested

### RDA

**Adult:** PO (Males) 1.3 mg; (females) 1.1 mg

**Available forms:** Tabs 5, 10, 25, 50, 100, 250 mg

### Implementation

- Give with food for better absorption
- Store in airtight, light-resistant container

## ADVERSE EFFECTS

**GU:** Yellow discoloration of urine (large doses)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (by active transport) |
| **Distribution** | 60% protein bound, widely distributed, crosses placenta |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys (unchanged), excess amounts |
| **Half-life** | 1-1½ hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Alcohol, probenecid: increased riboflavin need
Tetracycline: decreased action of tetracycline

### Drug classifications

Antidepressants (tricyclics), phenothiazines: increased riboflavin need

### Drug/lab test

False increase: urinary catecholamines

## NURSING CONSIDERATIONS

### Assessment

- Assess patient's nutritional status: liver, eggs, dairy products, yeast, whole grain, green vegetables
- Assess for vit $B_2$ deficiency: photophobia, cheilosis, stomatitis, ocular swelling
- **Pregnancy/breastfeeding:** Considered safe in pregnancy, breastfeeding at recommended dietary levels

### Patient/family education

- Inform patient that urine may turn bright yellow
- Instruct patient about needed addition of foods that are rich in riboflavin

### Evaluation

**Positive therapeutic outcome**

- Absence of headache, GI problems, cheilosis, skin lesions, depression, burning itchy eyes, anemia

# rifabutin (Rx)

(riff'a-byoo-tin)

**Mycobutin**

*Func. class.:* Antimycobacterial
*Chem. class.:* Rifamycin S derivative

**Do not confuse:** rifabutin/rifampin/rifapentine

**ACTION:** Inhibits DNA-dependent RNA polymerase in susceptible strains

**Therapeutic outcome:** Antimycobacterial death of *Escherichia coli, Bacillus subtilis;* mechanism of action against *Mycobacterium avium* unknown

**USES:** Prevention of *M. avium* complex (MAC) in patients with advanced HIV infection

**Unlabeled uses:** *Helicobacter pylori* that has not responded to other treatment

## CONTRAINDICATIONS

Hypersensitivity, active TB, WBC $<1000/mm^3$, platelets $<50{,}000/mm^3$

**Precautions:** Pregnancy, breastfeeding, children, hepatic disease, blood dyscrasias

## DOSAGE AND ROUTES

**Adult:** PO 300 mg/day (may take as 150 mg bid); max 600 mg/day

### Renal dose

**Adult:** PO CCr <30 ml/min reduce dose by 50%

**Available forms:** Caps 150 mg

### Implementation

- Give with meals to decrease GI symptoms; better to take on empty stomach 1 hr before or 2 hr after meals; high-fat food slows absorption, may take in 2 divided doses, may open capsule and mix with applesauce if unable to swallow whole
- Give antiemetic if vomiting occurs

## ADVERSE EFFECTS

**CNS:** *Headache,* fatigue, anxiety, confusion, insomnia
**GI:** *Nausea, vomiting, anorexia, diarrhea,* heartburn, hepatitis, discolored saliva, pseudomembranous colitis
**GU:** Discolored urine
**HEMA:** Hemolytic anemia, eosinophilia, thrombocytopenia, leukopenia
**INTEG:** *Rash*
**MISC:** Flulike syndrome, shortness of breath, chest pressure
**MS:** Asthenia, arthralgia, myalgia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver |
| **Excretion** | Kidney |
| **Half-life** | 45 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-3 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Amprenavir, busPIRone, clofibrate, cycloSPORINE, dapsone, delavirdine, disopyramide, doxycycline, efavirenz, fluconazole, indinavir, ketoconazole, losartan, nelfinavir, nevirapine, phenytoin, quiNIDine, saquinavir, theophylline, zidovudine, zolpidem: decreased action of each specific product
Ritonavir: increased rifabutin level

### Drug classifications

Anticoagulants, antidepressants (tricyclics), barbiturates, β-blockers, contraceptives (oral), corticosteroids, estrogens, sulfonylureas: decreased action of each specific product

### Drug/food

High-fat foods: decreased absorption

### Drug/lab test

Interference: folate level, vit $B_{12}$, BSP, gallbladder tests

## NURSING CONSIDERATIONS

### Assessment

- **Assess for active TB:** chest x-ray, sputum culture, blood culture, biopsy of lymph nodes, obtain PPD test; product should be given only for MAC and never for TB
- Monitor CBC for neutropenia, thrombocytopenia, eosinophilia
- **Pseudomembranous colitis:** assess for diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC and low serum albumin; stop product and usually give either vancomycin or IV metroNIDAZOLE, report immediately, may occur several weeks after discontinuing treatment

### Patient/family education

- Caution patient that compliance with dosage schedule and duration is necessary
- Instruct patient that scheduled appointments must be kept or relapse may occur
- Instruct patient to notify prescriber if hepatitis, neutropenia, or thrombocytopenia occurs: sore throat, fever, bleeding, bruising, yellow sclera, anorexia, nausea, vomiting, fatigue, weakness; myositis: muscle or bone pain
- **Hepatotoxicity:** Teach patient that decreased appetite, jaundice, dark urine, fatigue may occur

• Advise patient that urine, feces, saliva, sputum, sweat, tears may be colored red-orange; soft contact lenses may become permanently stained
• **Pregnancy/breastfeeding:** Caution patients using oral contraceptives to use a nonhormonal method of birth control because rifabutin may decrease efficiency of oral contraceptives; to notify prescriber if pregnancy is planned or suspected, do not use in pregnancy, breastfeeding

### Evaluation

**Positive therapeutic outcome**
• Decreased symptoms of *M. avium* in patients with HIV

## rifampin (Rx)

(rif′am-pin)
**Rifadin, Rofact** 🍁
*Func. class.:* Antitubercular
*Chem. class.:* Rifamycin B derivative

**Do not confuse:** rifampin/rifabutin/rifaximin

**ACTION:** Inhibits DNA-dependent polymerase, decreases tubercle bacilli replication

**Therapeutic outcome:** Bactericidal against the following organisms: mycobacteria, *Staphylococcus aureus, Haemophilus influenzae, Neisseria meningitidis, Legionella pneumophila*

**USES:** Pulmonary TB, meningococcal carriers (prevention)

## CONTRAINDICATIONS

Hypersensitivity to this product or rifamycins, active *Neisseria meningitidis* infection

**Precautions:** Pregnancy, breastfeeding, children <5 yr, hepatic disease, blood dyscrasias

## DOSAGE AND ROUTES

### Tuberculosis

**Adult:** PO/**IV** max 600 mg/day as single dose 1 hr before or 2 hr after meals, or 10 mg/kg/day 5 days/wk or 2-3 ×/wk
**Child >5 yr:** PO/**IV** 10-20 mg/kg/day as single dose 1 hr before or 2 hr after meals, max 600 mg/day, with other antitubercular products
**6-mo regimen:** 2-mo treatment of isoniazid, rifampin, pyrazinamide, and possibly streptomycin or ethambutol; then rifampin and isoniazid × 4 mo
**9-mo regimen:** Rifampin and isoniazid supplemented with pyrazinamide or streptomycin or ethambutol

### Meningococcal carriers

**Adult:** PO/**IV** 600 mg bid × 2 days, max 600 mg/dose
**Child >5 yr:** PO/**IV** 10-20 mg/kg bid × 2 days, max 600 mg/dose
**Infant 3 mo-1 yr:** PO 5 mg/kg bid for 2 days

**Available forms:** Caps 150, 300 mg; powder for inj 600 mg/vial

### Implementation

• Do not give IM or SUBCUT

**PO route**
• On empty stomach, 1 hr before or 2 hr after meals with a full glass of water; give with other products for TB
• Antiemetic if vomiting occurs
• Capsules may be opened and mixed with applesauce or gelatin

**Intermittent IV INF route**
• After diluting each 600 mg/10 ml of sterile water for inj (60 mg/ml), swirl, withdraw dose, and dilute in 100 ml or 500 ml of $D_5W$ given as an inf over 3 hr, or if diluted in 100 ml, give over ½ hr; do not admix with other sol or medications

**Y-site compatibilities:** Amiodarone, bumetanide, midazolam, pantoprazole, vancomycin

## ADVERSE EFFECTS

**CNS:** Headache, fatigue, anxiety, drowsiness, confusion
**EENT:** Visual disturbances
**GI:** *Nausea, vomiting, anorexia, diarrhea,* pseudomembranous colitis, *heartburn,* sore mouth and tongue, pancreatitis, elevated liver function tests
**GU:** Hematuria, acute renal failure, hemoglobinuria
**HEMA:** Hemolytic anemia, eosinophilia, thrombocytopenia, leukopenia
**INTEG:** Rash, pruritus, urticaria
**MISC:** Flulike syndrome, menstrual disturbances, edema, SOB, Stevens-Johnson syndrome, toxic epidermal necrolysis, angioedema, anaphylaxis
**MS:** Ataxia, weakness

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO), completely absorbed (**IV**) |
| **Distribution** | Widely distributed, crosses placenta |
| **Metabolism** | Liver—extensively |
| **Excretion** | Feces |
| **Half-life** | 1-5 hr |

R

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Rapid | Rapid |
| **Peak** | 2-3 hr | Inf end |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Acetaminophen, alcohol, chloramphenicol, clofibrate, cycloSPORINE, dapsone, digoxin, diltiazem, doxycycline, haloperidol, NIFEdipine, phenytoin, theophylline, verapamil, zidovudine: decreased effect of specific product

Isoniazid: increased hepatotoxicity, alcohol, ketoconazole, pyrazinamide

### Drug classifications

Anticoagulants, antidiabetics, barbiturates, benzodiazepines, β-blockers, contraceptives (oral), glucocorticoids, hormones, imidazole antifungals: decreased effect of each product

Protease inhibitors: do not use together

### Drug/lab test

Increased: alk phosphatase, ALT, AST, uric acid, bilirubin, eosinophils

Increased: LFTs

Decreased: Hgb

Interference: folate level, vit $B_{12}$

## NURSING CONSIDERATIONS

### Assessment

- Monitor liver function tests qmo: ALT, AST, bilirubin, decreased appetite, jaundice, dark urine, fatigue
- Monitor renal status: before, qmo: BUN, creatinine, output, specific gravity, urinalysis
- **Pseudomembranous colitis:** assess for diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC and low serum albumin; stop product and usually give either vancomycin or IV metroNIDAZOLE
- Monitor mental status often: affect, mood, behavioral changes; psychosis may occur
- **Infection:** assess sputum culture, lung sounds, susceptibility tests baseline and periodically to determine effectiveness and resistance
- C&S should be performed before beginning treatment, during, and after therapy is completed
- **Serious skin reactions:** assess for fever, sore throat, fatigue, ulcers, lesions in mouth, lips, rash; can be fatal
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excreted in breast milk

### Patient/family education

- Instruct patient that compliance with dosage schedule, duration is necessary
- Instruct patient that scheduled appointments must be kept or relapse may occur
- Instruct patient to notify prescriber if hepatitis, neutropenia, or thrombocytopenia occurs: sore throat, fever, bleeding, bruising, yellow sclera, anorexia, nausea, vomiting, fatigue, weakness, diarrhea with pus, mucus, blood
- Advise patient that urine, feces, saliva, sputum, sweat, tears may be colored red-orange; soft contact lenses may be permanently stained
- Caution patients using oral contraceptives to use a nonhormonal method of birth control because rifabutin may decrease the efficiency of oral contraceptives, to notify prescriber if pregnancy is planned or suspected
- Advise patient to avoid alcohol; hepatotoxicity may occur

### Evaluation

**Positive therapeutic outcome**

- Decreased symptoms of TB

## rifaximin (Rx)

(rif-ax′i-min)

**Xifaxan**

*Func. class.:* Misc. antiinfective

*Chem. class.:* Analog of rifampin

**Do not confuse:** rifaximin/rifampin

**ACTION:** Binds to bacterial DNA dependent RNA polymerase, thereby inhibiting bacterial RNA synthesis

**Therapeutic outcome:** Bacterial action against *E. coli*

**USES:** Traveler's diarrhea in those ≥12 yr old, caused by *E. coli*, hepatic encephalopathy, irritable bowel syndrome

## CONTRAINDICATIONS

Hypersensitivity to this product or rifamycins, diarrhea with fever, blood in stool

**Precautions:** Pregnancy, breastfeeding, children, geriatric patients

## DOSAGE AND ROUTES

### Traveler's diarrhea

**Adult and child ≥12 yr:** PO 200 mg tid × 3 days without regard to meals

### Hepatic encephalopathy

**Adult:** PO 550 mg bid

**Available forms:** Tabs 200, 550 mg

### Implementation
- May be administered without regard to food

## ADVERSE EFFECTS
**CNS:** Abnormal dreams, dizziness, insomnia, *headache,* fatigue, depression
**CV:** Hypotension, chest pain, peripheral edema, ascites
**GI:** *Abdominal pain, constipation, defecation urgency, flatulence, nausea, rectal tenesmus,* vomiting, ascites, pseudomembranous colitis
**GU:** Proteinuria, polyuria, increased urinary frequency
**MISC:** *Pyrexia,* motion sickness, tinnitus, rash, photosensitivity, exfoliative dermatitis
**MS:** Arthralgia, muscle pain, myalgia
**RESP:** Dyspnea, cough, pharyngitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Low, systemic |
| **Distribution** | Unknown |
| **Metabolism** | Induces CYP3A4 |
| **Excretion** | Feces |
| **Half-life** | 6 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-4 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Afatinib: increased effect of afatinib

### Drug/lab test
Increased: LFTs, potassium
Decreased: blood glucose, sodium

## NURSING CONSIDERATIONS
### Assessment
- Assess for GI symptoms: amount and character of diarrhea, abdominal pain, nausea, vomiting; do not use in those with blood in stool, increased temperature with diarrhea
- Assess for overgrowth of infection and pseudomembranous colitis
- **Pregnancy/breastfeeding:** Do not use in first trimester, use only if benefits outweigh fetal risk, do not breastfeed, excretion unknown

### Patient/family education
- Instruct patient to discontinue rifaximin and notify prescriber if diarrhea persists for more than 24-48 hr, if diarrhea worsens, or if blood is in stools and fever is present
- Advise patient to avoid hazardous activities if dizziness occurs
- Teach patient to take without regard to food
- Teach patient to take as directed, to consume all of the product prescribed

### Evaluation
**Positive therapeutic outcome**
- Absence of infection

# rilpivirine
(ril-pi-vir′ine)
**Edurant**
*Func. class.:* Antiretroviral
*Chem. class.:* Non-nucleoside transcriptase inhibitors (NNTIs)

**ACTION:** Inhibits HIV-1 reverse transcriptase; unlike nucleoside reverse transcriptase inhibitors (NRTIs), it does not compete for binding nor does it require phosphorylation to be active. Binds directly to a site on reverse transcriptase; causing disruption of the enzyme's active site thereby blocking RNA-dependent and DNA-dependent DNA polymerase activities

**Uses:** HIV in combination with other antiretrovirals

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, immune reconstitution syndrome, antimicrobial resistance, pancreatitis, depression, suicidal ideation, neonates, infants, children, adolescents <18 yr, QT prolongation, torsades de pointes, hyperlipidemia, hypertriglyceridemia, hypercholesterolemia

## DOSAGE AND ROUTES
**Treatment of antiretroviral treatment-naive adults with human immunodeficiency virus (HIV) in combination with other antiretroviral agents**
**Adult/child ≥12 yr and ≥35 kg:** PO 25 mg/day with a meal, if using with rifabutin also, increase rilpivirine dose to 50 mg qday; give with other antiretroviral agents.

**Available forms:** Tab 25 mg

### Implementation
- Store at room temperature away from heat and moisture

## ADVERSE EFFECTS
**CNS:** Depressed mood, dizziness, drowsiness, dysphoria, fatigue, headache, major depression, mood alteration, negative thoughts, suicide attempts

**GI:** Abdominal pain, cholecystitis, cholelithiasis, decreased appetite, diarrhea, elevated hepatic enzymes, hyperbilirubinemia, hypercholesterolemia, nausea, vomiting
**GU:** Glomerulonephritis membranous/glomerulonephritis mesangioproliferative
**INTEG:** Drug reaction with eosinophilia and systemic symptoms (DRESS)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Increased effect 40% (food), decreased effect 50% (high protein drink) |
| **Distribution** | Protein binding (99.7%) to albumin |
| **Metabolism** | Via oxidation CYP3A system |
| **Excretion** | Feces 25% excreted unchanged (85%); urine (6.1%) |
| **Half-life** | Terminal elimination 50 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4-5 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Aminoglutethimide, bexarotene, bosentan, efavirenz, flutamide, griseofulvin, metyrapone, modafinil, nafcillin, nevirapine, pioglitazone, primidone, ritonavir, topiramate: Decreased rilpivirine effect, treatment failure
Abarelix, alfuzosin, amiodarone, amoxapine, apomorphine, artemether, asenapine, chloroquine, ciprofloxacin, citalopram, cloZAPine, cyclobenzaprine, dasatinib, dolasetron, dronedarone, droperidol, eribulin, flecainide, fluconazole, gatifloxacin, gemifloxacin, haloperidol, iloperidone, lapatinib, levofloxacin, lopinavir, lumefantrine, maprotiline, mefloquine, moxifloxacin, nilotinib, norfloxacin, octreotide, ofloxacin, OLANZapine, ondansetron, paliperidone, palonosetron, pentamidine, posaconazole, QUEtiapine, ranolazine, saquinavir: Increased QT prolongation
Fluconazole, voriconazole: Increased rilpivirine adverse reactions, fungal infections

### Drug classifications

CYP3A4 inducers (phenytoin, fosphenytoin, barbiturates, OXcarbazepine, carBAMazepine, rifabutin, rifampin, rifapentine, dexamethasone), proton pump inhibitors (PPIs): Decreased rilpivirine effect, treatment failure
$H_2$ receptor antagonists (cimetidine, famotidine, nizatidine, ranitidine): Decreased rilpivirine effect, treatment failure; give 12 hr before or 4 hr after rilpivirine
Antacids: Decreased rilpivirine effect; use 2 hr or more before, or 4 hr after rilpivirine
CYP3A4 inhibitors (aldesleukin, amiodarone, aprepitant, atazanavir, basiliximab, boceprevir, bromocriptine, chloramphenicol, clarithromycin, conivaptan, dalfopristin, danazol, darunavir, dasatinib, delavirdine, diltiazem, dronedarone, efavirenz, erythromycin, ethinyl estradiol, fluconazole, FLUoxetine, fluvoxaMINE, fosamprenavir, fosaprepitant, IL-2, imatinib, indinavir, isoniazid, itraconazole, ketoconazole, lanreotide, lapatinib, miconazole, nefazodone, nelfinavir, niCARdipine, octreotide, posaconazole, quiNINE, ranolazine, rifaximin, tamoxifen, telaprevir, telithromycin, tipranavir, troleandomycin, verapamil, voriconazole, zafirlukast): Increased rilpivirine effect
Class IA/III antidysrhythmics, some phenothiazines, beta agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, arsenic trioxide, clarithromycin, erythromycin, levomethadyl, telithromycin, troleandomycin); CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone), halogenated anesthetics: Increased QT prolongation

### Drug/food

Increased adverse reactions: grapefruit juice

## NURSING CONSIDERATIONS

### Assessment

- **HIV:** Assess symptoms of HIV, including opportunistic infections before and during treatment; some may be life-threatening; monitor plasma HIV RNA, CD4+, CD8+ cell counts, serum β-2 microglobulin, serum ICD+24 antigen levels; treatment failures occur more frequently in those with baseline HIV-1 RNA concs >100,000 copies/ml than in patients with concs <100,000 copies/ml; monitor serum cholesterol, lipid panel, assess for redistribution of body fat
- Antiretroviral drug resistance testing before initiation of therapy in antiretroviral treatment-naive patients
- For adults and adolescents, initiation of antiretroviral therapy is recommended in any patient with a history of an AIDS-defining infection; with a CD4 ≤500/$mm^3$; who is pregnant; who has HIV-associated nephropathy; or who is being treated for hepatitis B (HBV) infection

- **DRESS:** May occur 2-8 wk, skin eruptions, eosinophilia, lymphadenopathy, fever, inflammation of internal organs, if these occur, report immediately, usually systemic steroids are given
- **Suicidal thoughts/behaviors:** Assess frequently for suicidal ideation; report any increase in depressive symptoms
- **Renal disease:** Monitor those with severe renal impairment baseline and periodically
- **Hepatic disease:** monitor for elevated hepatic enzymes (>2.5 × ULN); grade 3 and 4 may be higher in patients co-infected with hepatitis B or C
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, enroll pregnant patient in the Antiretroviral Pregnancy Registry 800-258-4263, do not breastfeed, excretion unknown

### Patient/family education

- Teach patient that product is not a cure but controls symptoms, that continuing use is required
- Teach patient that product must be taken in combination with other prescribed products, that if dose is missed, not to take if next dose is within 12 hr, to discuss all products taken including OTC, Rx, herbals, supplements, as there are many interactions
- Teach patient to advise prescriber of all products that are used
- Advise patient to report immediately mood changes and depression immediately
- Teach patient to report if pregnancy is suspected immediately, do not breastfeed
- Teach patient to report hypersensitivity reactions

### Evaluation

**Positive therapeutic outcome**

- Control of HIV-related symptoms

**RARELY USED**

## riluzole (Rx)

(ri-loo'zole)
**Rilutek**
*Func. class.:* Amyotropic lateral sclerosis (ALS) agent
*Chem. class.:* Benzathiazole

**Therapeutic outcome:** Decreased symptoms of ALS

**USES:** ALS

## CONTRAINDICATIONS

Hypersensitivity

## DOSAGE AND ROUTES

**Adult:** PO 50 mg q12hr; take 1 hr before or 2 hr after meals

## risedronate (Rx)

(rih-sed'roh-nate)
**Actonel, Actonel DR, Atelvia**
*Func. class.:* Bone resorption inhibitor
*Chem. class.:* Bisphosphonate

**Do not confuse:** Actonel/Actos

**ACTION:** Inhibits bone resorption; absorbs calcium phosphate crystal in bone and may directly block dissolution of hydroxyapatite crystals of bone

**Therapeutic outcome:** Increased bone mass, activity without fractures

**USES:** Paget's disease; prevention, treatment of osteoporosis in postmenopausal women; glucocorticoid-induced osteoporosis; osteoporosis in men

## CONTRAINDICATIONS

Hypersensitivity to bisphosphonates, inability to stand or sit upright for ≥30 min, esophageal stricture, achalasia, hypocalcemia

**Precautions:** Pregnancy, breastfeeding, children, renal disease, active upper GI disorders, dental disease, hyperparathyroidism, infection, vitamin D deficiency, coagulopathy, chemotherapy, asthma

## DOSAGE AND ROUTES

### Paget's disease (Actonel)

**Adult:** PO 30 mg/day × 2 mo; give calcium and vit D if dietary intake is lacking; if relapse occurs, retreatment is advised

### Treatment/prevention of postmenopausal osteoporosis

**Adult:** PO 5 mg/day or 35 mg qwk or 75 mg/day × 2 consecutive days 2 × mo or 150 mg qmo

### Glucocorticoid osteoporosis

**Adult:** PO 5 mg/day

### Osteoporosis in men

**Adult:** PO 35 mg qwk

### Renal dose

**Adult:** PO CCr <30 mg/min, avoid use

**Available forms:** Tabs 5, 30, 35, 75, 150 mg; tab, weekly 35 mg

### Implementation

- Give PO for 2 mo to be effective in Paget's disease

R

• Give with a full glass of water; patient should be in upright position, give delayed release tablet in AM after breakfast, only use with food (delayed release)
• Administer supplemental calcium and vit D in Paget's disease
• Give daily ≥30 min before meals
• Store in cool environment out of direct sunlight

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, depression, *asthenia, dizziness, insomnia, weakness*
**CV:** Chest pain, hypertension, atrial fibrillation
**GI:** *Abdominal pain,* diarrhea, *nausea,* constipation, esophagitis
**MS:** *Severe muscle/joint/bone pain,* osteonecrosis of the jaw, fractures
**MISC:** Rash, UTI, pharyngitis, hypocalcemia, hypophosphatemia, increased PTH
**SYST:** Angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | To bones (50%) |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys |
| **Half-life** | Terminal 23 hr<br>↑ determined by poor metabolizers or average metabolizers |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug classifications

Aluminum, antacids, calcium, iron, magnesium salts: decreased absorption of risedronate
NSAIDs, salicylates: increased GI irritation
$H_2$ antagonists, proton pump inhibitors: decreases absorption of delayed release risedronate; do not use together

### Drug/food

Food: decreased bioavailability; take ½ hr before food or drinks other than water

### Drug/lab test

Decreased: calcium, phosphorus

## NURSING CONSIDERATIONS

### Assessment

• **Paget's disease:** assess for headache, bone pain, increased head circumference
• **Osteoporosis:** in men or postmenopausal women; bone density study prior to and periodically during treatment
• **Hypocalcemia:** assess for paresthesia, twitching, laryngospasm, Chvostek's/Trousseau's signs
• **Serious skin reactions:** assess for angioedema
• Assess for atrial fibrillation
• Monitor phosphate, alkaline phosphatase, calcium; creatinine, BUN (renal disease)
• **Hypercalcemia:** assess for paresthesia, twitching, laryngospasm, Chvostek's/Trousseau's signs
• Assess dental health, cover with antiinfectives prior to dental extraction
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excretion unknown
• **Beers:** Avoid use in older adults except for schizophrenia, bipolar disorder, or as a short-term antiemetic in chemotherapy

### Patient/family education

• Advise patient to sit upright for ½ hr after dose to prevent irritation
• Teach patient to notify prescriber immediately if difficulty swallowing, severe heartburn, or pain in chest
• Instruct patient to comply with dietary restrictions, maintain good oral hygiene
• Advise patient to notify prescriber if pregnancy is planned or suspected

### Evaluation

**Positive therapeutic outcome**
• Increased bone mass, absence of fractures

## risperiDONE (Rx)

(res-pare'a-done)
**RisperDAL, Risperdal Consta, Risperdal M-TAB**
*Func. class.:* Antipsychotic
*Chem. class.:* Benzisoxazole derivative

**Do not confuse:** RisperDAL/reserpine

**ACTION:** Unknown; may be mediated through both DOPamine type 2 ($D_2$) and serotonin type 2 ($5\text{-}HT_2$) antagonism

**Therapeutic outcome:** Decreased hallucinations and disorganized thought

**USES:** Irritability associated with autism, bipolar disorder, mania, schizophrenia

## CONTRAINDICATIONS

Hypersensitivity, seizure

**Precautions:** Pregnancy, children, geriatric, cardiac/renal/hepatic disease, breast cancer,

Parkinson's disease, CNS depression, brain tumor, dehydration, diabetes, hematologic disease, seizure disorders, breastfeeding, abrupt discontinuation, suicidal ideation, phenylketonuria

**BLACK BOX WARNING:** Increased mortality in elderly patients with dementia-related psychosis

## DOSAGE AND ROUTES

**Adult:** PO 2 mg/day as a single dose or 2 divided doses, adjust dose at intervals of ≥24 hr and 1-2 mg/day as tolerated to 4-8 mg/day; IM establish dosing with PO prior to IM 25 mg q2wk, may increase to max 50 mg q2wk

**Adolescent:** PO 0.5 mg/day in AM or PM, adjust dose at intervals of ≥24 hr and 0.5-1 mg/day as tolerated to 3 mg/day

**Geriatric:** PO 0.5 mg daily-bid, increase by 1 mg qwk; IM 25 mg q2wk

### Hepatic dose/renal dose

**Adult:** PO 0.5 mg, increase by 0.5 mg bid, then increase to 1.5 mg bid at intervals ≥1 wk

**Available forms:** Tabs 0.25, 0.5, 1, 2, 3, 4 mg; oral sol 1 mg/ml; orally disintegrating tabs 0.25, 0.5, 1, 2, 3, 4 mg; long-acting inj kit (Risperdal Consta) 12.5, 25, 37.5, 50 mg

### Implementation

**PO route**

- Reduced dosage in geriatric patients
- Anticholinergic agent on order from prescriber, to be used for EPS
- Avoid use with CNS depressants
- Conventional tabs: give without regard to meals
- **Oral disintegrating tab** (Risperdal M-Tab): do not open blister pack until ready to use; tear 1 of the 4 units apart at perforation; bend corner where indicated; peel back foil; do not push tab through foil; remove from pack and place on tongue; tab disintegrates in seconds and can be swallowed with or without liquids, do not split or chew
- **Oral solution:** may dilute 3-4 oz of a beverage, measure dose using calibrated pipette, not compatible with tea, cola; compatible with water, coffee, orange juice, low-fat milk

**IM route**

- Only suspend in the diluent provided and with the supplied needle; prior to admixing, allow to come to room temperature for 30 minutes prior to reconstitution
- Remove colored cap from the vial without removing rubber stopper. Wipe top of the grey stopper with an alcohol wipe
- Peel back the blister pouch and remove the Vial Access Device by holding between the white luer cap and the skirt. Do not touch the spike tip at any time
- Place the vial on a hard surface and hold the base. Orient the Vial Access Device vertically over the vial so that the spike tip is at the center of the vial's rubber stopper
- With a straight downward push, press the spike tip of the Vial Access Device through the center of the vial's rubber stopper until the device securely snaps onto the vial top
- Hold the base of the vial and swab the syringe connection point (blue circle) of the Vial Access Device with an alcohol wipe and allow to dry prior to attaching the syringe
- Avoid over-tightening, or syringe component parts may loosen from the syringe body
- While holding the white collar of the syringe, insert and press the syringe tip into the blue circle of the Vial Access Device and twist. Hold the skirt of the Vial Access Device during attachment to prevent it from spinning. Keep the syringe and the Vial Access Device aligned
- Inject the entire contents of the syringe containing the diluent into the vial
- Shake the vial vigorously for a minimum of 10 seconds while holding the plunger rod down with the thumb. Mixing is complete when the suspension appears uniform, thick, and milky colored, and all the powder is dispersed in liquid. The microspheres will be visible in liquid, but no dry microspheres remain
- Invert the vial completely and slowly withdraw the entire content of the suspension from the vial into the syringe. Tear the section of the vial label at the perforation and apply the detached label to the syringe for identification purposes
- While holding the white collar of the syringe, unscrew the syringe from the Vial Access Device, then discard both the vial and the Vial Access Device appropriately
- Select the appropriate color-coded needle provided with the kit. Two distinct needles are provided. The needle with the yellow colored hub and print is for injection into the gluteal muscle (2-inch needle) and the needle with the green colored hub and print is for deltoid muscles (1-inch needle). They are not interchangeable; do not use the needle intended for gluteal injection for deltoid injection, and vice versa
- Peel the blister pouch of the Needle-Pro safety device open halfway. Grasp the transparent needle sheath using the plastic peel pouch. To prevent contamination, do not touch the orange Needle-Pro safety device's luer connector. While holding the white collar of the syringe, attach the luer connection of the orange Needle-Pro safety device to the syringe with an easy clockwise twisting motion

• While holding the white collar of the syringe, grasp the transparent needle sheath and seat the needle firmly on the orange Needle-Pro safety device with a push and a clockwise twist. Seating the needle will secure the connection between the needle and the orange Needle-Pro safety device
• While holding the white collar of the syringe, pull the transparent needle sheath straight away from the needle. Do not twist the sheath since this may loosen the luer connection
• Re-suspension will be necessary prior to administration, since settling will occur after reconstitution. Re-suspend the microspheres in the syringe by shaking vigorously
• May refer to the Instructions for Use section of the product labeling for detailed visual aids that accompany the written instructions

**Administration**

• **Only for IM; do not give IV**
• Re-suspension will be necessary prior to administration, since settling will occur after reconstitution. Re-suspend the microspheres in the syringe by shaking vigorously
• Remove any air bubbles by tapping the syringe and slowly depressing the plunger with the needle in an upright position
• Inject the entire contents of the syringe into the upper outer quadrant of the gluteal area or the deltoid muscle of the arm; inject immediately after reconstitution to avoid settling. Gluteal injections should be alternated between the two buttocks
• After the injection is complete, press the needle into the orange Needle-Pro safety device by gently pressing the orange Needle-Pro safety device against a flat surface with one hand. As the orange Needle-Pro safety device is pressed, the needle will firmly engage into the orange Needle-Pro safety device
• Visually confirm engagement of the needle into the Needle-Pro safety device, appropriately discard the used and unused needle provided in the dose pack
• Do not store the vial after reconstitution or the suspension may settle
• Do not combine 2 different dosage strengths of Risperdal Consta in a single administration
• The dose pack device is for single use only. Do not re-process for subsequent re-use because the integrity of the device may be compromised leading to a deterioration in performance
• *Stability after reconstitution:* Once in suspension, the product may remain at room temperature use within 6 hr. Always re-suspend prior to administration if not used immediately
• When switching from oral to inj, give oral dose with first inj and continue for 3 wk, then discontinue

## ADVERSE EFFECTS

**CNS:** *EPS (pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia), drowsiness, insomnia, agitation, anxiety, headache,* neuroleptic malignant syndrome, dizziness, seizures, suicidal ideation, head titubation (shaking)
**CV:** Orthostatic hypotension, tachycardia, heart failure, sudden death (geriatric), AV block
**EENT:** Blurred vision, tinnitus
**GI:** *Nausea,* vomiting, *anorexia, constipation,* jaundice, weight gain
**GU:** Hyperprolactinemia, gynecomastia, dysuria
**HEMA:** Neutropenia, granulocytopenia
**MS:** Rhabdomyolysis
**MISC:** Renal artery disease; weight gain, hyperprolactinemia (child)
**RESP:** Rhinitis, sinusitis, upper respiratory infection, cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively |
| **Excretion** | Urine 90% |
| **Half-life** | 3-24 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 hr |
| **Duration** | Up to 12 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased sedation
• Chloroquine, clarithromycin, droperidol, erythromycin, haloperidol, methadone, pentamidine, thioridazine, ziprasidone: increased QT prolongation
CarBAMazepine: increased risperiDONE excretion
Furosemide: increased risk of death in dementia-related psychosis
Levodopa: decreased levodopa effect
TraMADol: increased seizures
Valproic acid, verapamil: increased risperiDONE levels

### Drug classifications

Acetylcholinesterase inhibitors, CYP2D6 inhibitors, SSRIs: increased risperiDONE levels
Antipsychotics: increased EPS
β-agonists, class IA/III antidysrhythmics, local anesthetics, some phenothiazines, tricyclics: increased QT prolongation
CNS depressants: increased sedation

CYP2D6 inducers (carBAMazepine, barbiturates, phenytoin, rifampin): decreased risperiDONE action
CYP2D6 inhibitors (selective serotonin reuptake inhibitors): serotonin syndrome, neuroleptic malignant syndrome

### Drug/herb
Echinacea: decreased risperiDONE effect

### Drug/lab test
Increased: prolactin levels, blood glucose, lipids

## NURSING CONSIDERATIONS

### Assessment
- Suicidal thoughts, behaviors often occur when depression is lessened; assess mental status: orientation, mood, behavior, presence and type of hallucinations before initial administration, monthly; this product should significantly reduce psychotic behavior
- Monitor thyroid function test, blood glucose, serum electrolytes/prolactin/lipid profile, bilirubin, creatinine, weight, pregnancy test, CBC, LFTs, AIMS assessment, and weight baseline periodically
- Assess affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
- **QT prolongation:** Monitor B/P with patient in sitting, standing, and lying positions; take pulse and respirations q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; obtain baseline ECG and monitor Q- and T-wave changes
- Check for dizziness, faintness, palpitations, tachycardia on rising; severe orthostatic hypotension is common
- **Assess for neuroleptic malignant syndrome:** hyperpyrexia, muscle rigidity, increased CPK, altered mental status; product should be discontinued
- **EPS:** Assess for akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait); an antiparkinsonian product should be prescribed
- Assess for constipation, urinary retention daily; if these occur, increase bulk, water in diet
- Assess for weight gain, hyperglycemia, metabolic changes in diabetes, increased lipids
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, EPS may occur in the neonate, enroll pregnant patient in the National Pregnancy Registry for Atypical Antipsychotics 866-961-2388, do not breastfeed, excreted in breast milk
- **Beers:** Avoid use in older adults except for schizophrenia, bipolar disorder, or as a short-term antiemetic in chemotherapy

### Patient/family education
- Teach patient to use good oral hygiene; frequent rinsing of mouth, sugarless gum for dry mouth
- Caution patient to avoid hazardous activities until product response is determined; dizziness, blurred vision may occur
- Inform patient that orthostatic hypotension occurs often; patient should rise from sitting or lying position gradually and remain lying down for at least 30 min after IM inj
- Instruct patient to avoid hot tubs, hot showers, tub baths; hypotension may occur
- Inform patient that heat stroke may occur in hot weather and to take extra precautions to stay cool
- Advise patient to avoid abrupt withdrawal of this product, or EPS may result; product should be withdrawn slowly
- Teach patient to avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber; serious product interactions may occur; avoid use with alcohol, CNS depressants because increased drowsiness may occur
- Advise patient to use contraception, to inform prescriber if pregnancy is planned or suspected
- Teach patient to notify provider of suicidal thoughts/behaviors

### Evaluation
**Positive therapeutic outcome**
- Decrease in emotional excitement, hallucinations, delusions, paranoia
- Reorganization of patterns of thought, speech

## TREATMENT OF OVERDOSE:
Lavage, provide airway

## ritonavir (Rx)
(ri-toe′na-veer)
**Norvir**
*Func. class.:* Antiretroviral
*Chem. class.:* Protease inhibitor

**Do not confuse:** ritonavir/retrovir

**ACTION:** Inhibits HIV-1 protease and prevents maturation of the infectious virus

**Therapeutic outcome:** Improvement of HIV-1 infection

**USES:** HIV-1 in combination with at least 2 other antiretrovirals

## CONTRAINDICATIONS
Hypersensitivity

**BLACK BOX WARNING:** Coadministration with other drugs

**Precautions:** Pregnancy, breastfeeding, children, liver disease, pancreatitis, diabetes, hemophilia, AV block, hypercholesterolemia, immune reconstitution syndrome, neonates, cardiomyopathy, immune reconstitution syndrome

## DOSAGE AND ROUTES

**Adult/adolescent >16 yr:** PO 600 mg bid; if nausea occurs, begin dose at ½ and gradually increase, max 1200 mg/day in divided doses
**Adolescent ≤16 yr/child/infant:** PO 400 mg/m$^2$ bid up to 1200 mg/day in divided doses; may start lower and escalate

**Available forms:** Caps 100 mg; oral sol 80 mg/ml, tab 100 mg

### Implementation

- Oral sol: Shake oral sol well, use calibrated measuring device
- Store caps in refrigerator
- Mix liquid formulation with chocolate milk or liquid nutritional supplement to improve taste
- When switching from cap to tab, more GI symptoms may occur that will lessen over time
- Use dosage titration to minimize side effects
- Overdose: infants, children 43.2% alcohol, 26.57% propylene glycol oral solution, calculate total amount of alcohol, propylene glycol from all products given

## ADVERSE EFFECTS

**CNS:** *Paresthesia,* headache, seizures, dizziness, insomnia, fever, asthenia, intracranial bleeding
**CV:** QT, PR interval prolongation
**GI:** *Diarrhea,* buccal mucosa ulceration, *abdominal pain, nausea, taste perversion,* dry mouth, *vomiting, anorexia,* pancreatitis, pseudomembranous colitis, hepatitis
**HEMA:** leukopenia, thrombocytopenia
**INTEG:** Rash
**MISC:** Asthenia, angioedema, anaphylaxis, Stevens-Johnson syndrome, increased lipids, lipodystrophy, toxic epidermal necrolysis, immune reconstitution syndrome
**MS:** Pain, rhabdomyolysis, myalgia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well |
| **Distribution** | Unknown |
| **Metabolism** | 98% protein binding, liver |
| **Excretion** | Unknown |
| **Half-life** | 3-5 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

**BLACK BOX WARNING:** Amiodarone, astemizole, buPROPion, cisapride, cloZAPine, desipramine, encainide, ergotamine, flecainide, meperidine, midazolam, pimozide, piroxicam, propafenone, propoxyphene, quiNIDine, ranolazine, saquinavir, terfenadine, triazolam, zolpidem: toxicity, do not use together

Atovaquone, divalproex, ethinyl estradiol, lamoTRIgine, phenytoin, sulfamethoxazole, theophylline, voriconazole, zidovudine: decreased levels of each drug
Bosentan: increased levels of bosentan
Clarithromycin: increased level of both products
ddI: increased levels of both products
Fluconazole: increased ritonavir level

**BLACK BOX WARNING:** Haloperidol, chloroquine, droperidol, pentamidine, arsenic trioxide, levomethadyl: increased QT prolongation

Nevirapine, phenytoin: decreased ritonavir levels

### Drug classifications

Anticoagulants: decreased levels of anticoagulants
Azole antifungals, benzodiazepines, HMG-CoA reductase inhibitors, interleukins: toxicity, do not use together
Barbiturates, rifamycins: decreased ritonavir level

**BLACK BOX WARNING:** Class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (dasatinib, methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation

CYP2D6 inhibitors: toxicity, do not use together

### Drug/herb

Red yeast rice: avoid use
St. John's wort: decreased ritonavir levels, avoid concurrent use

### Drug/lab test

Increased: ALT, GGT, AST, CK, cholesterol, triglycerides, uric acid
Decreased: Hct, RBC, Hgb, neutrophils, WBC

## NURSING CONSIDERATIONS

### Assessment

- **QT prolongation:** ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea
- **Rhabdomyolysis:** muscle pain, increased CPK, weakness, swelling of affected muscles, dark urine; if these occur and if confirmed by CPK, product should be discontinued
- **Immune reconstitution syndrome:** may occur with combination therapy, may develop inflammatory response with opportunistic infection (MAC, Graves disease, Guillain-Barré syndrome, TB, PCP), may occur during initial treatment or months afterward
- Assess signs of infection, anemia
- Monitor viral load and CD4, blood glucose, plasma HIV RNA, serum cholesterol, lipid profile baseline, throughout therapy
- Resistance testing prior to starting therapy and after treatment failure
- Assess liver function tests: ALT, AST; in those with hepatic disease, monitor q3mo
- Monitor C&S before product therapy; product may be taken as soon as culture is done; repeat C&S after treatment; determine the presence of other STDs
- Assess bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
- **Serious skin disorders:** Stevens-Johnson syndrome, angioedema; anaphylaxis, toxic epidermal necrolysis
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, enroll pregnant patient in the Antiretroviral Pregnancy Registry 800-258-4263, do not breastfeed

### Patient/family education

- Teach patient to take as prescribed; if dose is missed, take as soon as remembered up to 1 hr before next dose; do not double dose
- Teach patient that product must be taken in equal intervals around the clock to maintain blood levels for duration of therapy
- Teach patient that product is not a cure for HIV; opportunistic infections may continue to be acquired, and others may continue to contract HIV from the patient

**BLACK BOX WARNING:** Advise patient to avoid other Rx, OTC meds, herbs, supplements unless approved by prescriber, not to use St. John's wort, that it decreases this product's effect

- Inform that redistribution of body fat or accumulation of body fat may occur

### Evaluation

**Positive therapeutic outcome**

- Decreasing symptoms of HIV
- Improving viral load and CD4 cell counts

**⚠ HIGH ALERT**

## riTUXimab (Rx)

(rih-tuks'ih-mab)

**Rituxan**

*Func. class.:* Antineoplastic—miscellaneous; DMARD

*Chem. class.:* Murine/human monoclonal antibody

**ACTION:** Directed against the CD20 antigen that is found on malignant B lymphocytes; CD20 regulates a portion of cell cycle initiation/differentiation

**Therapeutic outcome:** Decreased tumor size, prevention of spread of cancer

**USES:** Non-Hodgkin's lymphoma (CD20 positive, B-cell), bulky disease (tumors >10 cm), rheumatoid arthritis, Wegener's granulomatosis, microscopic polyangiitis

## CONTRAINDICATIONS

Hypersensitivity, murine proteins

**Precautions:** Pregnancy, breastfeeding, children, geriatric, cardiac/renal/pulmonary conditions

**BLACK BOX WARNING:** Exfoliative dermatitis, infusion-related reactions, progressive multifocal leukoencephalopathy, hepatitis B exacerbation

## DOSAGE AND ROUTES

### Relapsed or refractory low-grade or follicular, CD20 positive, B-cell non-Hodgkin's lymphoma (NHL)

**Adult: IV** 375 mg/m$^2$ qwk × 4 doses, may retreat with 4 more doses of 375 mg/m$^2$ qwk

### First-line treatment of follicular, CD20-positive, B-cell non-Hodgkin's lymphoma (NHL), in combination with chemotherapy

**Adult: IV** 375 mg/m$^2$ on day 1 of each cycle for up to 8; may be given with cyclophosphamide **IV** 750 mg/m$^2$ on day 1, vinCRIStine **IV** 1.4 mg/m$^2$ (max of 2 mg) on day 1, and predniSONE 40 mg/m$^2$/day PO on days 1-5

### Single-agent maintenance therapy in patients with follicular, CD20-positive, B-cell non-Hodgkin's lymphoma (NHL) (complete or partial response following first-line treatment with riTUXimab in combination with chemotherapy)

**Adult: IV** 375 mg/m$^2$ **IV** q8wk × 12 doses as maintenance therapy starting 8 wk after the completion of induction chemotherapy with 8 doses of riTUXimab with 6-8 cycles of cyclophosphamide, vinCRIStine, and predniSONE 4-6 cycles of cyclophosphamide, DOXOrubicin, vinCRIStine, and predniSONE

### As a component of the Zevalin (ibritumomab tiuxetan) regimen

**Adult: IV;** as a required component of the ibritumomab regimen; riTUXimab 250 mg/m$^2$ given within 4 hr prior to the administration of Yttrium-90 ibritumomab that may occur on day 7, 8, or 9

### First-line treatment of diffuse large B-cell, CD20-positive non-Hodgkin's lymphoma (NHL), in combination with CHOP or other anthracycline-based chemotherapy regimen

**Adult 18-59 yr: IV** 375 mg/m$^2$ on day 1 of each cycle for up to 8 infusions

### As single-agent maintenance therapy in patients with low-grade, CD20-positive, B-cell non-Hodgkin's lymphoma (NHL) with nonprogressing disease (stable disease or better) following first-line treatment with cyclophosphamide, vinCRIStine, and predniSONE (CVP)

**Adult: IV** 375 mg/m$^2$ qwk × 4 wk repeated q6mo × 2 years (total of 16 doses) as maintenance therapy starting 4 wk after the completion of first-line chemotherapy with 6 to 8 cycles of cyclophosphamide, vinCRIStine, and predniSONE (CVP)

**Available forms:** Inj 10 mg/ml (100 mg/10 ml, 500 mg/50 ml)

### Implementation

**Intermittent IV infusion route**

- Hold antihypertensive 2 hr before administration
- Administer after diluting to a final conc of 1-4 mg/ml; use 0.9% NaCl, $D_5W$, gently invert bag to mix; do not mix with other products
- Increase fluid intake to 2-3 L/day to prevent dehydration, unless contraindicated
- Store vials at 36° F-40° F; protect vials from direct sunlight; inf sol is stable at 36° F-46° F for 24 hr and at room temp for another 12 hr

**Y-site compatibilities:** Acyclovir, amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium gluconate, CARBOplatin, carmustine, cefAZolin, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, CISplatin, clindamycin, cyclophosphamide, cytarabine, DACTINomycin, DAUNOrubicin hydrochloride, dexamethasone, dexrazoxane, digoxin, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, DOXOrubicin liposome, doxycycline, droperidol, enalaprilat, etoposide phosphate, famotidine, fentaNYL, filgrastim, floxuridine, fluconazole, fludarabine, fluorouracil, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem/cilastatin, irinotecan, leucovorin, levorphanol, LORazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, methylPREDNISolone, metoclopramide, metroNIDAZOLE, mitoMYcin, mitoXANtrone, morphine, nalbuphine, netilmicin, PACLitaxel, pentamidine, piperacillin/tazobactam, plicamycin, potassium chloride, prochlorperazine, promethazine, ranitidine, sargramostim, streptozocin, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, trimethobenzamide, vinBLAStine, vinCRIStine, vinorelbine, zidovudine

**Y-site incompatibilities:** Aldesleukin, amphotericin B colloidal, ciprofloxacin, cycloSPORINE, DAUNOrubicin liposome, DOXOrubicin hydrochloride, furosemide, levofloxacin, minocycline, ondansetron, quinupristin/dalfopristin, sodium bicarbonate, topotecan, vancomycin

**Additive incompatibilities:** Do not admix with other products

## ADVERSE EFFECTS

**CNS:** Life-threatening brain infection (progressive multifocal leukoencephalopathy)
**CV:** Cardiac dysrhythmias, heart failure, MI, superventricular tachycardia, hypertension, angina
**GI:** *Nausea, vomiting, anorexia,* GI obstruction/perforation
**GU:** Renal failure
**HEMA:** Leukopenia, neutropenia, thrombocytopenia, anemia
**INTEG:** *Irritation at inj site, rash,* fatal mucocutaneous infections (rare)

**MISC:** *Fever,* chills, asthenia, *headache,* angioedema, hypotension, myalgia, bronchospasm, ARDs
**SYST:** Stevens-Johnson syndrome, exfoliative dermatitis, toxic epidermal necrolysis, tumor lysis syndrome
**META:** Hyperkalemia, hypocalcemia, hyperphosphatemia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Binds to CD20 sites on lymphoma cells |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Varies |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

CISplatin: increased nephrotoxicity—avoid concurrent use; if used, monitor renal status

### Drug classifications

Anticoagulants, NSAIDs: increased bleeding risk
Antihypertensives: increased hypotension, separate by 12 hr

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess for signs of fatal inf reaction: hypoxia, pulmonary infiltrates, ARDS, MI, ventricular fibrillation, cardiogenic shock; most fatal inf reactions occur with first inf, discontinue product

**BLACK BOX WARNING:** Hepatitis B exacerbation or fulminant hepatitis, hepatic failure, death may occur during or after treatment, screen all patients for HBV (HBsAg and HBc titers) before use, monitor those with current or prior HBV for signs of hepatitis or HBV reactivation for several months after therapy, if reactivation occurs, discontinue product

**BLACK BOX WARNING:** Assess for signs of severe mucocutaneous reactions: Stevens-Johnson syndrome, lichenoid dermatitis, toxic epidermal lysis; signs occur 1-13 wk after product was given, discontinue treatment immediately

**BLACK BOX WARNING:** Assess for tumor lysis syndrome: acute renal failure requiring hemodialysis, hyperkalemia, hypocalcemia, hyperuricemia, hyperphosphatasemia; allopurinol and adequate hydration may be needed

**BLACK BOX WARNING: Multifocal leukoencephalopathy:** confusion, dizziness, lethargy, hemiparesis, monitor periodically

- Monitor CBC, differential, platelet count weekly; withhold product if WBC is <3500/mm³ or platelet count <100,000/mm³; notify prescriber of these results; product should be discontinued
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, contraception should be used, enroll pregnant patient in the Mother To Baby Autoimmune Diseases Study 877-311-8972 (patients with rheumatoid arthritis) do not breastfeed, excretion unknown
- Monitor ECG, serum creatinine/BUN, electrolytes, uric acid; correct electrolyte imbalances before use, hyperkalemia, hypocalcemia, hyperphosphatemia occur often
- Assess GI symptoms: frequency of stools, abdominal pain, perforation/obstruction may occur
- **Infection:** assess for fever, increased temperature, flulike symptoms in those with WG and MPA, in those using DMARDs

### Patient/family education

- Advise patient to report to prescriber possible infection (cough, fever, chills, sore throat), renal issues (painful urination, back/side pain), bleeding (gums, stools, bruising, urine, emesis, fatigue), chest pain
- Advise to avoid OTC products
- Teach to use contraception during and up to 12 mo after therapy
- Avoid use with vaccines, toxoids
- Advise patient to increase fluid intake

### Evaluation

**Positive therapeutic outcome**

- Prevention of increasing cancer progression

**⚠ HIGH ALERT**

## rivaroxaban

(ri-va-rox'a-ban)
**Xarelto**
*Func. class.:* Anticoagulant
*Chem. class.:* Factor Xa inhibitor

**ACTION:** A novel, oral anticoagulant that selectively and potently inhibits coagulation factor Xa

**Therapeutic outcome:** Prevention of DVT, stroke, and systemic embolism

## USES:

For deep venous thrombosis (DVT) prophylaxis, pulmonary embolism (PE), in patients undergoing knee or hip replacement surgery; for stroke prophylaxis and systemic embolism prophylaxis in patients with nonvalvular atrial fibrillation

## CONTRAINDICATIONS

Severe hypersensitivity

**Precautions:** Moderate or severe hepatic disease (Child-Pugh Class B or C), hepatic disease associated with coagulopathy, creatinine clearance <30 ml/min for use as DVT prophylaxis and <15 ml/min for stroke and systemic embolism prophylaxis in nonvalvular atrial fibrillation, dental procedures, neonates, infants, children, adolescents, pregnancy aneurysm, diabetes retinopathy, breastfeeding, diverticulitis, endocarditis, geriatrics, GI bleeding, hypertension, obstetric delivery, peptic ulcer disease, stroke, surgery

## DOSAGE AND ROUTES

### Deep venous thrombosis (DVT) prophylaxis, which may lead to pulmonary embolism (PE) (knee or hip replacement surgery)

Administer the initial dose at least 6–10 hr after surgery once hemostasis has been established

**Adult: PO** 10 mg daily for 12 days after knee replacement surgery or for 35 days after hip replacement

### Stroke prophylaxis and systemic embolism prophylaxis (nonvalvular atrial fibrillation)

**Adult: PO** 20 mg daily with the evening meal (CrCl > 50 ml/min); **converting from warfarin to rivaroxaban:** discontinue warfarin and start rivaroxaban when INR is <3; **converting from another anticoagulant other than warfarin to rivaroxaban:** start rivaroxaban 0-2 hr before the next scheduled evening administration of anticoagulant (omit that dose of anticoagulant); for continuous infusion of unfractionated heparin, stop the infusion and initiate rivaroxaban simultaneously; **converting from rivaroxaban to another anticoagulant with rapid onset (not warfarin):** Discontinue rivaroxaban and give the first dose of the other anticoagulant (oral or parenteral) at the time that the next dose of rivaroxaban would have been administered

### Renal dose

**Adult:** PO (nonvalvular atrial fibrillation) CCr 15-50 ml/min, 15 mg/day; CCr <15 ml/min, avoid use; (treatment/prophylaxis of DVT/pulmonary embolism) CCr <30 ml/min, avoid use

### Hepatic dose

**Adult:** PO Child-Pugh class B or C: avoid use

**Available forms:** Tab 10, 15, 20, 50 mg

### Implementation

- **For DVT prophylaxis:** give daily without regard to food, give initial dose ≥6-10 hr after surgery when hemostasis has been established
- **For stroke/systemic embolism prophylaxis:** give daily with evening meal
- If dose is not given at correct time, give as soon as possible on the same day
- Unless pathological bleeding occurs, do not discontinue rivaroxaban in the absence of alternative
- Store at room temperature
- 15, 20 mg tablets should be taken with food, for those unable to swallow whole, 15 mg and 20 mg tablets may be crushed, mixed with applesauce, immediately following administration, instruct to eat, crushed tablets are stable in applesauce for up to 4 hr
- 10 mg tablet can be taken without regard to food

**Nasogastric (NG) tube or gastric feeding tube**

- Confirm gastric placement of tube
- Crush 15 mg or 20 mg tablet, suspend in 50 ml of water, and administer via NG or gastric feeding tube
- To minimize reduced absorption, avoid administration distal to the stomach
- Enteral feeding should immediately follow administration of a crushed dose
- Crushed tablets are stable in water for up to 4 hours

**Missed doses**

- Patients receiving 15 mg twice daily should take their missed dose immediately to ensure intake of 30 mg per day. Two 15-mg tablets may be taken at once followed by the regular 15 mg twice daily dose the next day
- For patients receiving once daily dosing, take the missed dose as soon as it is remembered

## ADVERSE EFFECTS

**GI:** Cholestasis, cytolytic hepatitis, hyperbilirubinemia, increased hepatic enzymes, jaundice, nausea

**HEMA:** Adrenal bleeding, bleeding, cerebral hemorrhage, epidural hematoma, GI bleeding, hemiparesis, intracranial bleeding, retinal hemorrhage, retroperitoneal hemorrhage, subdural hematoma, thrombocytopenia
**INTEG:** Anaphylactic reaction, anaphylactic shock, blister, hypersensitivity, pruritus
**SYST:** Stevens-Johnson syndrome

**BLACK BOX WARNING:** Active bleeding

**BLACK BOX WARNING:** Abrupt discontinuation, epidermal/spinal anesthesia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 80%-100% |
| **Distribution** | Protein binding (92%-95%) |
| **Metabolism** | Oxidative degradation |
| **Excretion** | Urine (66%), feces (17%) |
| **Half-life** | 5-9 hr; geriatric: 11-13 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-4 hrs |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Clarithromycin, conivaptan, erythromycin, itraconazole, ketoconazole, lopinavir/ritonavir, nicardipine: increased rivaroxaban effect, possible bleeding
CarBAMazepine, phenytoin, rifampin, ritonavir: decreased rivaroxaban effect
Amiodarone, azithromycin, darunavir, diltiazem, dronedarone, felodipine, fluconazole, lapatinib, mifepristone, nelfinavir, pantoprazole, posaconazole, quiNIDine, ranolazine, saquinavir, tamoxifen, telithromycin, verapamil: increased rivaroxaban effect in renal impairment

### Drug classifications

NSAIDs, other anticoagulants, platelet inhibitors, salicylates, thrombolytics: increased rivaroxaban effect, possible bleeding

### Drug/herb

St. John's wort: decreased rivaroxaban effect

### Drug/food

Grapefruit juice: increased rivaroxaban effect in renal disease
Food: decreased rivaroxaban effect

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Bleeding:** Monitor for bleeding, including bleeding during dental procedures, easy bruising, blood in urine, stools, emesis, sputum, epistaxis; there is no specific antidote

**BLACK BOX WARNING: Abrupt discontinuation:** Avoid the abrupt discontinuation unless an alternative anticoagulant is used in those with atrial fibrillation; discontinuing puts patients at increased risk for thrombotic events; if this product must be discontinued for reasons other than pathological bleeding, consider administering another anticoagulant

- **Pregnancy/breastfeeding:** pregnancy; identify if pregnancy is suspected or planned; pregnancy-related hemorrhage may occur, and anticoagulation cannot be monitored with standard laboratory testing; breastfeeding should be discontinued prior to use of this product, use only if benefits outweigh fetal risk

**BLACK BOX WARNING: Epidural/spinal anesthesia:** Epidural or spinal hematomas that may result in long-term/permanent paralysis may occur in patients who have received anticoagulants and are receiving neuraxial anesthesia or undergoing spinal puncture. The epidural catheter should not be removed <18 hr after the last dose of rivaroxaban; do not administer the next rivaroxaban dose <6 hr after the catheter removal; delay rivaroxaban administration for 24 hr if traumatic puncture occurs. Monitor for neuro changes

- **Hepatic/Renal disease:** Increase in effect of this product in hepatic disease (Child-Pugh Class B or C), hepatic disease with coagulopathy; renal failure/severe renal impairment (creatinine clearance <30 ml/min in DVT prophylaxis and <15 ml/min for stroke/systemic embolism prophylaxis in nonvalvular atrial fibrillation); product should be discontinued in acute renal failure; reduce dose in those with atrial fibrillation and CrCl 15-50 ml/min; monitor renal function periodically (creatinine clearance, BUN)
- **Beers:** Avoid use in older adults with CCr <30 ml/min, reduce dose in CCr 30-50 ml/min

### Patient/family education

- Advise patient to report numbness of extremities, weakness, tingling, contact

R

prescriber immediately (neuraxial anesthesia, spinal puncture)
• Advise patient to report if pregnancy is planned or suspected, not to breastfeed
• Teach patient to report bleeding (bruising, blood in urine, stools, sputum, emesis, heavy menstrual flow) and to use soft toothbrush, electric shaver
• Advise patient to inform all health care providers of use; report to prescriber all products used, to take all medication for duration, exactly as prescribed, to prevent clots, notify prescriber if unable to so a different anticoagulant may be used
• Advise patient to avoid abrupt discontinuation without another blood thinner
• Instruct patients, especially those with dental disease, in proper oral hygiene, including caution in use of regular toothbrushes, dental floss, and toothpicks.

### Evaluation

**Positive therapeutic outcome**
• Prevention of DVT, stroke and systemic embolism

## rivastigmine (Rx)

(riv-as-tig′mine)
**Exelon, Exelon Patch**
*Func. class.:* Anti-Alzheimer's agent
*Chem. class.:* Cholinesterase inhibitor

**ACTION:** Potent selective inhibitor of brain acetylcholinesterase (AChE) and butyrylcholinesterase (BChE)

**Therapeutic outcome:** Decreased signs and symptoms of Alzheimer's dementia

**USES:** Mild to severe Alzheimer's dementia, mild to moderate Parkinson's disease dementia (PDD)

## CONTRAINDICATIONS

Hypersensitivity to this product, other carbamates

**Precautions:** Pregnancy, breastfeeding, children, renal/hepatic/respiratory disease, seizure disorder, asthma, urinary obstruction, peptic ulcer, increased intracranial pressure, surgery, GI bleeding, jaundice

## DOSAGE AND ROUTES

**Adult:** PO 1.5 mg bid with food for 4 wk or more, may increase to 3 mg bid after 4 wk or more; may increase to 4.5 mg bid and thereafter 6 mg bid, max 12 mg/day; transdermal apply 4.6 mg/24 hr after 4 wk or more, may increase to 9.5 mg/24 hr; max 13.3 mg/24 hr; for those using 6-12 mg/day PO and switching to transdermal use one 9.5 mg/24 hr; for those using <6 mg/day PO and switching to transdermal use one 4.6 mg/24 hr

**Available forms:** Caps 1.5, 3, 4.5, 6 mg; transdermal patch 4.6, 9.5 mg/24 hr

### Implementation

• Give with meals; take with AM and PM meal even though absorption may be decreased
• Provide assistance with ambulation during beginning therapy
• Discontinue treatment for several doses and restart at same or next lower dosage level if adverse reactions cause intolerance
• If treatment is interrupted for longer than several days treatment should be initiated with the lowest daily dose and titrated as indicated above

**Transdermal route**
• Apply to clean, hairless, dry skin; not in an area that clothing will rub; rotate sites daily; remove liner; apply firmly; may be used during water activities; avoid saunas, avoid excess sunlight or external heat, each 5 $cm^2$ patch contains 9 mg base, rate of 4.6 mg/24 hr, each 10 $cm^2$ patch is 18 mg base, rate of 9.5 mg/24 hr

## ADVERSE EFFECTS

**CNS:** *Tremors, confusion, insomnia,* psychosis, hallucination, depression, dizziness, headache, anxiety, somnolence, fatigue, syncope, EPS, exacerbation of Parkinson's disease
**CV:** QT prolongation, AV block, cardiac arrest, MI, angina, palpitations, bradycardia
**GI:** *Nausea, vomiting, anorexia, abdominal distress, flatulence,* diarrhea, constipation, dyspepsia, colitis, eructation, fecal incontinence, GI bleeding/obstruction, GERD, gastritis, pancreatitis
**MISC:** UTI, asthenia, increased sweating, hypertension, flulike symptoms, weight change

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly, completely absorbed |
| **Distribution** | 40% protein binding |
| **Metabolism** | To decarbamylated metabolite |
| **Excretion** | Kidney—metabolites, clearance lowered in geriatric, hepatic disease, increased nicotine use |
| **Half-life** | 1½ hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Nicotine: increased metabolism, decreased blood level of rivastigmine

### Drug classifications

Anticholinergics, phenothiazines, sedating $H_1$ blockers, tricyclics: decreased rivastigmine effect
Cholinergic agonists, other cholinesterase inhibitors: increased synergistic effect
NSAIDs: increased GI effects

## NURSING CONSIDERATIONS

### Assessment

- Monitor liver function tests: AST, ALT, alkaline phosphatase, LDH, bilirubin, CBC
- Assess for severe GI effects: nausea, vomiting, anorexia, weight loss, GI bleeding
- Monitor B/P, respiration during initial treatment; hypo/hypertension should be reported
- **Cognitive/mental status:** affect, mood, behavioral changes, depression; complete suicide assessment
- **Pregnancy/breastfeeding:** Use only if clearly needed, do not breastfeed, excretion unknown
- **Beers:** Avoid use in older adults, increased risk of orthostatic hypotension or bradycardia

### Patient/family education

- Teach patient procedure for giving **oral sol**; use instruction sheet provided; teach application of **transdermal** product, to fold in half and discard, not to get in eyes, to wash hands after application, to not use heating pad, sauna, tanning bed
- Teach patient to notify prescriber of severe GI effects, do not discontinue abruptly
- Teach patient that product may cause dizziness, anorexia, weight loss

### Evaluation

#### Positive therapeutic outcome

- Increased coherence, decreased symptoms of Alzheimer's disease, improved mood
- Teach patient to give with food in AM, PM
- Teach patient to report nausea, vomiting, diarrhea
- Advise to inform prescriber of all products taken

## rizatriptan (Rx)

(rye-zah-trip'tan)
**Maxalt, Maxalt-MLT**
*Func. class.:* Migraine agent
*Chem. class.:* 5-$HT_1$-like receptor agonist

**ACTION:** Binds selectively to the vascular 5-$HT_{1B/1D}$ receptor subtype, exerts antimigraine effect; causes vasoconstriction in cranial arteries

**Therapeutic outcome:** After treatment, relief of migraine

**USES:** Acute treatment of migraine

## CONTRAINDICATIONS

Angina pectoris, history of MI, documented silent ischemia, Prinzmetal's angina, ischemic heart disease, concurrent ergotamine-containing preparations, uncontrolled hypertension, hypersensitivity, basilar or hemiplegic migraine

**Precautions:** Pregnancy, breastfeeding, children, postmenopausal women, men >40 yr, geriatric, risk factors for CAD, hypercholesterolemia, obesity, diabetes, impaired renal/hepatic function

## DOSAGE AND ROUTES

**Adult: PO** 5-10 mg single dose, redosing separate by 2 hr or more; max 30 mg/24 hr, use 5 mg in patient on propanolol; max 15 mg/24 hr

**Available forms:** Tabs (Maxalt) 5, 10 mg; orally disintegrating tabs (Maxalt-MLT) 5, 10 mg

### Implementation

- Provide quiet, calm environment with decreased stimulation for noise, bright light, excessive talking
- Do not open blister pack until ready to use, put orally disintegrating tab on tongue to dissolve; swallow with saliva

## ADVERSE EFFECTS

**CNS:** *Dizziness,* drowsiness, *headache, fatigue,* warm/cold sensation, flushing
**CV:** MI, ventricular fibrillation, ventricular tachycardia, coronary artery vasospasm, peripheral vascular ischemia, ECG changes
**ENDO:** Hot flashes, mild increase in growth hormone
**GI:** *Nausea,* dry mouth, diarrhea, abdominal pain, ischemic colitis
**RESP:** Chest tightness, pressure, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver (metabolite) |
| **Excretion** | Urine/feces |
| **Half-life** | 2-3 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 10 min-2 hr |
| **Peak** | Unknown |
| **Duration** | Unknown |

R

## INTERACTIONS

### Individual drugs

Cimetidine, isocarboxazid, pargyline, phenelzine, propranolol, trancyclomine: increased rizatriptan action
Ergot: increased vasospastic effects
Sibutramine: increased levels of sibutramine

### Drug classifications

Contraceptives (oral), MAOIs, MAOIs (nonselective types A and B): increased rizatriptan action
Ergot derivatives, 5-$HT_1$ receptor agonists: increased vasospastic effects
Selective serotonin reuptake inhibitors: increased weakness, hyperreflexia, incoordination

### Drug/herb

St. John's wort: serotonin syndrome

## NURSING CONSIDERATIONS

### Assessment

- Assess for stress level, activity, recreation, coping mechanisms
- Assess neurologic status: LOC, blurring vision, nausea, vomiting, tingling in extremities preceding headache
- **Ingestion of tyramine-containing foods:** Monitor for pickled products, beer, wine, aged cheese, food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, enroll in the registry 800-986-8999, cautious use in breastfeeding, excretion unknown

### Patient/family education

- **Teach patient use of orally disintegrating tab:** instruct patient not to open blister until use, to peel blister open with dry hands, to place tab on tongue, where it will dissolve, and to swallow with saliva (contains phenylalanine)
- Advise patient to report any side effects to prescriber
- Advise patient to use alternative contraception while taking product if oral contraceptives are being used
- Teach patient that product does not prevent or reduce number of migraines, main action is abortive, if first dose does not relieve pain, do not use more, notify prescriber

### Evaluation

#### Positive therapeutic outcome

- Decrease in frequency, severity of headache

## roflumilast

(roe-flue'mi-last)
**Daliresp**
*Func. class.:* Respiratory anti-inflammatory agent
*Chem. class.:* Phosphodiesterase-4 (PDE4) inhibitor

**ACTION:** Roflumilast and the active metabolite (roflumilast N-oxide), selectively inhibit phosphodiesterase-4 (PDE4); not a bronchodilator; instead, inhibition of the PDE4 enzyme blocks the hydrolyses and inactivation of cyclic adenosine monophosphate (cAMP), resulting in intracellular cAMP accumulation; decreases inflammatory activity, PDE4 inhibition may affect migration and actions of pro-inflammatory cells (neutrophils, other leukocytes, T lymphocytes, monocytes, macrophages, fibroblasts)

**Therapeutic outcome:** Decreasing exacerbations in COPD

**USES:** For the prevention of COPD exacerbations in those with severe chronic obstructive pulmonary disease (COPD) associated with chronic bronchitis and a history of exacerbations

## CONTRAINDICATIONS

Moderate to severe hepatic disease (Child-Pugh B or C)

**Precautions:** Pregnancy, breastfeeding, neonates, infants, children, and adolescents, acute bronchospasm, anxiety, insomnia, depression, and/or suicidal ideation or behavior

## DOSAGE AND ROUTES

**Adult: PO** 500 mcg/day

**Available forms:** Tab 500 mcg

### Implementation

#### PO route

- Give without regard to meals
- Store at room temperature

## ADVERSE EFFECTS

**CNS:** Anxiety, depression, dizziness, headache, insomnia, suicidal ideation, tremor
**EENT:** Rhinitis, sinusitis
**GI:** Abdominal pain, anorexia, diarrhea, dyspepsia, gastritis, nausea, vomiting, weight loss
**GU:** Urinary tract infection
**MS:** Back pain, muscle cramps/spasm
**SYST:** Infections, influenza

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 80% |
| **Distribution** | Protein binding 99%, 100% penetration across blood-brain barrier |
| **Metabolism** | Exclusively by CYP3A4, CYP1A2 |
| **Excretion** | 70% urine |
| **Half-life** | 17 hr (parent); 30 hr (metabolite) |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr (parent drug); 8 hrs (metabolite) |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

CYP3A4 inducers (alcohol, barbiturates, bexarotene, bosentan, carBAMazepine, dexamethasone, erythromycin, etravirine, fluvoxaMINE, ketoconazole, metyrapone, modafinil, nevirapine, OXcarbazepine, PHENobarbital, phenytoin, rifabutin, rifampin, ritonavir: decreased roflumilast effect

CYP3A4/CYP1A2 inhibitors (cimetidine, dalfopristin, delavirdine, enoxacin, indinavir, isoniazid, itraconazole, quinupristin, tipranavir): increased roflumilast effect

Oral contraceptives (gestodene and ethinyl estradiol): increased roflumilast effect

Fosamprenavir: altered effect

### Drug/herb

St. John's wort: decreased roflumilast effect

## NURSING CONSIDERATIONS

### Assessment

- Monitor lung sounds and respiratory function baseline and periodically thereafter
- Assess behavioral changes including mood, depression and suicidal thoughts/behaviors
- Monitor liver function tests baseline and periodically thereafter; if increases in liver function studies occur, product should be discontinued
- Monitor weight baseline and periodically, as weight loss is common
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excretion in breast milk

### Patient/family education

- Advise patient to take product as directed, do not skip or double doses, take missed doses as soon as remembered unless almost time for next dose
- Teach patient not to use OTC or other products without prescriber approval; not to discontinue other respiratory products unless approved by prescriber
- Advise patient not to be used for acute bronchospasm, but may be continued during acute asthma attacks
- **Suicidal thoughts/behaviors:** Instruct patient to notify prescriber of worsening depression or suicidal thoughts/behaviors

### Evaluation

**Positive therapeutic outcome**

- Decreasing exacerbations in COPD

**RARELY USED**

## romiPLOStim (Rx)

(roe-mi-ploe'stim)

**Nplate**

*Func. class.:* Hematopoietin

*Chem. class.:* Thrombopoietin receptor agonist

**ACTION:** A thrombopoietin-like fusion protein produced by DNA recombinant technology

**Therapeutic outcome:** Increase in platelet counts, absence of bleeding

**USES:** Chronic idiopathic thrombocytopenic purpura in patients who have had an insufficient response to corticosteroids, immunoglobulins, or splenectomy

## CONTRAINDICATIONS

Hypersensitivity to this product or mannitol

**Precautions:** Pregnancy, breastfeeding, malignancies, bleeding, bone marrow suppression, children

## DOSAGE AND ROUTES

### Thrombocytopenia in chronic idiopathic thrombocytopenic purpura (ITP) with insufficient response to corticosteroids, immunoglobulins, splenectomy

**Adult:** SUBCUT; initial dose is 1 mcg/kg SC qwk (based on actual body weight). Increase the weekly dose by 1 mcg/kg until the patient achieves a platelet count $\geq$50,000/mm$^3$; do not exceed a maximum weekly dose of 10 mcg/kg; use the lowest dose needed to achieve and maintain a platelet count $\geq$50,000/mm$^3$; monitor CBC, including platelet counts, qwk until a stable platelet count is achieved; platelets $\geq$50,000/mm$^3$ $\geq$4 wk without dose adjustment; then, monitor the CBC, including platelet counts, monthly. Once a stable dose is achieved, if the

platelet count falls to <50,000/mm$^3$, increase the dose by 1 mcg/kg/wk. If the platelet count increases to >200,000/mm$^3$ for 2 consecutive wk, reduce dose by 1 mcg/kg; if the platelet count is >400,000/mm$^3$, temporarily stop romiplostim, and continue to monitor the platelet count weekly; once the platelets are <200,000/mm$^3$, restart, but reduce the previous dose by 1 mcg/kg/wk. RomiPLOStim may be administered concomitantly with other medical ITP therapies. If platelet counts exceed 50,000/mm$^3$, other medical ITP therapies may be reduced or discontinued. Discontinue romiPLOStim if the platelet count does not increase to avoid important bleeding after 4 wk of therapy at max dose of 10 mcg/kg

**Available forms:** Inj vials 250, 500 mcg

### Implementation

- Store vials in refrigerator, do not freeze; protect from light; diluted sol is stable refrigerated or at room temperature for 24 hrs

**SUBCUT route**

- Use 0.01 ml graduations syringe
- Discard any unused portion in vial; do not pool unused portions from vials
- Dilute 250 mcg/0.72 preservative-free sterile water for inj; 500 mcg/1.2 preservative-free sterile water for inj; final concentration 500 mcg/ml
- Gently swirl until dissolved; do not shake
- Do not use if discolored or if particulate matter is present
- Inj into outer aspect of upper arm or abdomen except for 2 inches around navel or front aspect of middle thigh; do not use areas that are bruised, scratched, or scarred
- Rotate inj sites

## ADVERSE EFFECTS

**CNS:** *Dizziness, insomnia, headache,* fatigue
**GI:** Abdominal pain, dyspepsia, diarrhea
**HEMA:** Thromboembolism, thrombosis, bleeding, myelofibrosis, erythromelalgia
**MS:** Myalgia
**SYST:** Secondary malignancy, antibody formation

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Terminal 1-34 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 7-50 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Anticoagulants, NSAIDs, platelet inhibitors, thrombolytics, salicylates: possible risk of bleeding

## NURSING CONSIDERATIONS

### Assessment

- **Bone marrow suppression:** If cytopenias occur, product should be discontinued; may use a bone marrow biopsy and straining for fibrosis
- **Thromboembolic disease:** Do not use to normalize patients, use only in those with thrombocytopenia in ITP, maintain platelets ≥50,000/mm$^3$
- Assess blood studies: CBC during treatment weekly and for 2 wks after discontinuing

### Patient/family education

- Instruct patient to report bleeding, to avoid hazardous activities that may cause bleeding
- Inform the patient the reason for product and expected results
- Advise patient to report a missed dose to prescriber due to increased risk of bleeding
- Teach patient that lab tests will be done qwk and dose may be changed; if dose is not changed lab will be checked qmo; after drug is discontinued, labs will be checked qwk × 2 wk
- Teach patient to advise prescriber if spleen has been removed: bleeding or clotting problems
- Teach patient to notify prescriber if pregnancy is planned or suspected; if pregnancy occurs, call registry 877-675-2831

### Evaluation

**Positive therapeutic outcome**

- Increase in platelet counts, absence of bleeding

## rOPINIRole (Rx)

(roe-pin'e-role)
**Requip, Requip XL**
*Func. class.:* Antiparkinsonian agent
*Chem. class.:* Dopamine-receptor agonist, nonergot

**Do not confuse:** rOPINIRole/risperiDONE

**ACTION:** Selective agonist for DOPamine $D_2$ receptors (presynaptic/postsynaptic sites); binding at $D_3$ receptor contributes to antiparkinson effects

**Therapeutic outcome:** Decreased symptoms of Parkinson's disease (involuntary movements)

**USES:** Parkinsonism, restless legs syndrome

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, cardiac/renal/hepatic disease, dysrhythmias, affective disorders, psychosis

## DOSAGE AND ROUTES

### Parkinson's disease

**Adult: PO** (regular release) Initially, 0.25 mg PO tid × first wk; gradually titrate at weekly intervals; wk 2: give 0.5 mg tid; wk 3: 0.75 mg tid; wk 4; titrate to 1 mg tid; after wk 4, may increase by 1.5 mg/day wk, max 9 mg/day total dose, and then by 3 mg/day qwk, max 24 mg/day; PO (ext rel) Initially, 2 mg/day × 1-2 wk, may increase by mg/day at intervals ≥1 wk based upon response; max 24 mg/day. If significant interruption of therapy occurs, retitration may be necessary

### For conversion from immediate-release to ext rel tablets

**Oral dosage (ext rel tablets):**

*Adults currently on 0.75-2.25 mg/day:* Give 2 mg/day ext rel

*Adults currently on 3-4.5 mg/day:* Give 4 mg/day ext rel

*Adults currently on 6 mg/day:* Give 6 mg/day ext rel

*Adults currently on 7.5-9 mg/day:* Give 8 mg/day ext rel

*Adults currently on 12 mg/day:* Give 12 mg/day ext rel

*Adults currently on 15-18 mg/day:* Give 16 mg/day ext rel

*Adults currently on 21 mg/day:* Give 20 mg/day ext rel

*Adults currently on 24 mg/day:* Give 24 mg/day ext rel

### For the treatment of restless legs syndrome (RLS)

**Adult:** PO (reg rel) Initially, 0.25 mg/day, give 1-3 hr before bedtime; days 3-7, may increase to 0.5 mg/day; at the beginning of wk 2 (day 8) the dose may be increased to 1 mg/day × 1 wk; weeks 3-6, dose may be titrated up by 0.5 mg/wk (from 1.5-3 mg over the 5-wk period), as needed to achieve desired effect; wk 7, may increase dose to 4 mg/day; dose is titrated based on clinical response; give all doses 1-3 hr before bedtime

**Available forms:** Tabs 0.25, 0.5, 1, 2, 3, 4, 5 mg; ext rel tab 2, 4, 6, 8, 12 mg

### Implementation

- Give product until NPO before surgery
- Adjust dosage to patient's response
- Give with meals to decrease GI upset
- Test for diabetes mellitus, acromegaly if patient is receiving long-term therapy

## ADVERSE EFFECTS

**CNS:** Dystonia, *agitation, insomnia,* dizziness, psychosis, hallucinations, depression, somnolence, sleep attacks, impulse-control disorders
**CV:** *Orthostatic hypotension,* hypotension, syncope, palpitations, tachycardia, hypertension
**EENT:** Blurred vision
**GI:** *Nausea, vomiting, anorexia, dry mouth,* constipation, dyspepsia, flatulence
**GU:** Impotence, urinary frequency
**HEMA:** Hemolytic anemia, leukopenia, agranulocytosis
**INTEG:** Rash, sweating
**RESP:** Pharyngitis, rhinitis, sinusitis, bronchitis, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver, extensively by the liver by CYP450 CYP1A2 enzyme system |
| **Excretion** | Kidneys |
| **Half-life** | 6 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Cimetidine, ciprofloxacin, digoxin, diltiazem, enoxacin, erythromycin, fluvoxamine, levodopa, mexiletine, norfloxacin, tacrine, theophylline: increased effect of rOPINIRole
Metoclopramide: decreased rOPINIRole effect

### Drug classifications

Butyrophenones, phenothiazines, thioxanthenes: decreased ropinirole effect

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P, respiration during initial treatment; hypotension or hypertension should be reported

R

• Assess mental status: affect, mood, behavioral changes, depression; complete suicide assessment
• **Parkinsonism:** assess for akinesia, tremors, staggering gait, muscle rigidity, drooling; these symptoms should improve with therapy
• **Sleep attacks:** assess for drowsiness, falling asleep without warning even during hazardous activities
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, avoid breastfeeding, excretion unknown

### Patient/family education
• Teach patient to notify prescriber if pregnancy is planned or suspected, pregnancy, breastfeeding
• Teach patient to take with food to prevent nausea
• Teach patient to report hallucinations, confusion (usually in geriatrics)
• Advise patient that therapeutic effects may take several wk to a few mo
• Caution patient to change positions slowly to prevent orthostatic hypotension
• Instruct patient to use product exactly as prescribed; if product is discontinued abruptly, parkinsonian crisis may occur
• Teach patient that drowsiness, sleeping attacks may occur, to avoid driving or other hazardous activities until response is known
• Teach patient to avoid alcohol and CNS depressants (cough and cold products)
• Teach patient to notify prescriber of unusual urges

### Evaluation
**Positive therapeutic outcome**
• Decreased akathisia, other involuntary movements
• Increased mood

## ropivacaine (Rx)
(roe-pi'va-kane)
**Naropin**
*Func. class.:* Local anesthetic
*Chem. class.:* Amide

**ACTION:** Competes with calcium for sites in nerve membrane that control sodium transport across cell membrane; decreases rise of depolarization phase of action potential

**Therapeutic outcome:** Maintenance of local anesthesia

**USES:** Peripheral nerve block, caudal anesthesia, central neural block, vaginal, epidural, spinal block

## CONTRAINDICATIONS
Children <12 yr, geriatric, hypersensitivity to amide local anesthetics, severe liver disease, severe hypotension, complete heart block

**Precautions:** Pregnancy, severe product allergies, hyperthyroidism, CV, hepatic/neurologic disease

## DOSAGE AND ROUTES
### Lumbar epidural block for C-section
**Adult:** 20-30 ml of 0.5% SOL, or 15-20 ml of 0.75% SOL

### Thoracic epidural
**Adult:** 5-15 ml of 0.5%-0.75% SOL

### Major nerve block
**Adult:** 35-50 ml of 0.5% SOL or 10-40 ml of 0.75% SOL

### Labor pain epidural
**Adult:** 10-20 ml of 0.2% SOL, then 6-14 ml/hr

### Postoperative (lumbar/thoracic epidural)
**Adult:** 6-14 ml/hr of 0.2% SOL

### Infiltration/minor nerve block
**Adult:** 1-100 ml of 0.2% SOL or 1-40 ml of 0.5% SOL

**Available forms:** Inj 2, 5, 7.5 mg/ml

### Implementation
• Give only with resuscitative equipment nearby
• Give only products without preservatives for epidural or caudal anesthesia
• Use new sol; discard unused portions

## ADVERSE EFFECTS
**CNS:** Anxiety, restlessness, seizures, loss of consciousness, drowsiness, disorientation, tremors, shivering, paresthesia
**CV:** Myocardial depression, cardiac arrest, dysrhythmias, bradycardia, *hypo*/hypertension, fetal bradycardia
**EENT:** Blurred vision, tinnitus, pupil constriction
**ENDO:** Hypokalemia
**GI:** Nausea, vomiting
**GU:** Urinary retention
**INTEG:** Rash, urticaria, allergic reactions, edema, burning, skin discoloration at injection site, tissue necrosis
**RESP:** Status asthmaticus, respiratory arrest, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 2-8 min |
| **Peak** | Unknown |
| **Duration** | 3 hr, varies with inj site |

## INTERACTIONS

### Individual drugs

Amiodarone, cimetidine, ciprofloxacin, fluvoxaMINE, imipramine, theophylline: increased effect

Chloroprocaine: decreased action of ropivacaine

Enflurane, EPINEPHrine, halothane: increased dysrhythmias

### Drug classifications

Antidepressants (tricyclics), MAOIs, phenothiazines: increased hypertension

Azole antifungals: increased effect

## NURSING CONSIDERATIONS

### Assessment

- Assess B/P, pulse, respiration during treatment
- Assess fetal heart tones during labor
- Assess allergic reactions: rash, urticaria, itching
- Assess cardiac status: ECG for dysrhythmias, pulse, B/P during anesthesia

### Evaluation

**Positive therapeutic outcome**

- Anesthesia necessary for procedure

## TREATMENT OF OVERDOSE:

Airway, $O_2$, vasopressor, **IV** fluids, anticonvulsants for seizures

**⚠ HIGH ALERT**

# rosiglitazone (Rx)

(rose-i-glye′ta-zone)

**Avandia**

*Func. class.:* Antidiabetic, oral

*Chem. class.:* Thiazolidinedione

**Do not confuse:** rosiglitazone/pioglitazone, Avandia/Prandin

**ACTION:** Improves insulin resistance by hepatic glucose metabolism, insulin receptor kinase activity, insulin receptor phosphorylation

**Therapeutic outcome:** Decreased symptoms of diabetes mellitus

**USES:** Stable type 2 diabetes mellitus alone or in combination with sulfonylureas, metformin, or insulin

## CONTRAINDICATIONS

Breastfeeding, children, hypersensitivity to thiazolidinediones, diabetic ketoacidosis, jaundice, type 1 diabetes

**BLACK BOX WARNING:** NYHA III or IV acute heart failure, heart failure

**Precautions:** Pregnancy, geriatric, thyroid/renal/hepatic disease, heart failure, NYHA class I, II, MI

## DOSAGE AND ROUTES

**Adult:** PO 4 mg/day or in 2 divided doses, may increase to 8 mg/day or in 2 divided doses after 12 wk; may be added to metformin, sulfonylureas at the adult dose

**Available forms:** Tabs 2, 4, 8 mg

### Implementation

- Convert from other oral hypoglycemic agents if needed; change may be made without gradual dosage change; monitor blood glucose during conversion
- Give tabs crushed and mixed with meal or fluids for patients with difficulty swallowing

**PO route**

- Give once or in 2 divided doses without regard to food
- Store in airtight container in cool environment

## ADVERSE EFFECTS

**CNS:** Fatigue, *headache*

**CV:** HF, MI, death (geriatric patients)

**ENDO:** Hyper/hypoglycemia

**GI:** Weight gain, hepatotoxicity, increased total cholesterol, LDL, HDL, decreased free fatty acids

**MISC:** Accidental injury, upper respiratory tract infection, sinusitis, anemia, back pain, diarrhea, edema, bone fractures (female), pulmonary/macular/peripheral edema

**SYST:** Anaphylaxis, Stevens-Johnson syndrome, lactic acidosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 99.8% |
| **Metabolism** | Unknown |
| **Excretion** | Urine, feces, breast milk |
| **Half-life** | Elimination 3-4 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 6-12 wk |
| **Duration** | Unknown |

R

## INTERACTIONS

### Individual drugs

FluvoxaMINE, gemfibrozil, ketoconazole: increased hypoglycemia; monitor glucose
Insulin: avoid concurrent use

### Drug classifications

CYP2C5 inducers/inhibitors: may increase/decrease effect
Nitrates: avoid concurrent use

### Drug/herb

Horse chestnut: increased antidiabetic effect

### Drug/lab test

Increased: ALT, HDL, LDL, total cholesterol, blood glucose
Decreased: Hgb/Hct

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Use in NYHA III or IV acute heart failure is contraindicated; any deterioration in any cardiac status, discontinue product

**BLACK BOX WARNING: HF/MI:** assess for dyspnea, edema, weight gain ≥5 lb, jugular vein distention; may need to change or discontinue; do not use in acute coronary syndrome

- **Lactic acidosis:** assess for dyspnea, abdominal pain, muscle pain; notify prescriber immediately
- Assess for hypoglycemic reactions (sweating, weakness, dizziness, anxiety, tremors, hunger), hyperglycemic reactions soon after meals; monitor FBS, blood glucose glycosylated hemoglobin A1C (HbA1c)
- **Assess for systemic reactions:** anaphylaxis, Stevens-Johnson syndrome
- **Hepatotoxicity:** check liver function tests periodically; AST, ALT (if ALT is >2.5 × ULN, do not use)
- Monitor HbA2c, plasma lipids, lipoproteins, B/P, body weight baseline and periodically during treatment
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, usually insulin is used in pregnancy, do not breastfeed, excretion unknown
- **Beers:** Avoid in older adults, may promote fluid retention or exacerbate heart failure

### Patient/family education

- Teach patient to monitor capillary blood glucose test, that periodic liver function tests are mandatory; to report edema, weight gain
- Teach patient symptoms of hypo/hyperglycemia, what to do about each, that these symptoms are more likely to occur in those using insulin
- Advise patient that product must be continued on daily basis; explain consequence of discontinuing product abruptly
- Advise patient to avoid OTC medications, nitrates, insulin, or herbal preparations unless approved by prescriber
- Advise patient that diabetes is lifelong illness; that this product is not a cure, only controls symptoms
- Advise patient that all food included in diet plan must be eaten to prevent hypoglycemia
- Advise patient to carry/wear emergency ID and glucagon emergency kit for emergencies
- Instruct patient to notify prescriber if oral contraceptives are used
- Teach patient not to use if breastfeeding; may be secreted in breast milk, may alter blood glucose
- **Hepatotoxicity:** advise patient to report nausea, vomiting, abdominal pain, fatigue, anorexia, dark urine, jaundice; to report macular edema (change in vision) immediately
- Teach patient that 2 wk is needed to see a reduction in blood glucose, 2-3 mo to see full effect

### Evaluation

**Positive therapeutic outcome**

- Decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; blood glucose, A1c improvement

## rosuvastatin (Rx)

(roe-soo'va-sta-tin)
**Crestor**
*Func. class.:* Antilipemic
*Chem. class.:* HMG-CoA reductase inhibitor

**ACTION:** Inhibits HMG-CoA reductase, which reduces cholesterol synthesis

**Therapeutic outcome:** Decreasing cholesterol levels

**USES:** As an adjunct in primary hypercholesterolemia (types IIa, IIb), mixed dyslipidemia elevated serum triglycerides, homozygous/heterozygous familial hypercholesterolemia (FH), slowing of atherosclerosis, CV disease prophylaxis, MI, stroke prophylaxis (normal LDL)

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, active liver disease

**Precautions:** Children <10 yr, geriatric, past liver disease, alcoholism, severe acute infections, trauma, hypotension, uncontrolled seizure disorders, severe metabolic disorders, electrolyte imbalances, severe renal impairment, hypothyroidism, Asian patients

## DOSAGE AND ROUTES

Patient should first be placed on a cholesterol-lowering diet

### For the treatment of hypercholesterolemia, hyperlipoproteinemia, and/or hypertriglyceridemia as an adjunct to dietary control

For reduction of elevated total cholesterol, LDL-cholesterol, apolipoprotein B, and triglyceride concentrations, and to increase HDL-cholesterol in patients with primary hypercholesterolemia (heterozygous familial and nonfamilial) or mixed dyslipidemia (Fredrickson types IIa or IIb); or to treat Fredrickson Type IV (hypertriglyceridemia, increased VLDL); or to treat primary dysbetalipoproteinemia (Type III hyperlipoproteinemia)

**Adult:** PO The usual starting dose is 10 mg q day, 5 mg q day in those requiring less aggressive LDL-reductions, patients with CrCl less than 30 mL/minute, or patients at higher risk for myopathy

### For the reduction of total cholesterol, LDL-cholesterol, nonHDL-cholesterol, and apolipoprotein B concentrations in patients with homozygous familial hypercholesterolemia (HoFH)

**Adult:** PO the usual starting dose is 20 mg q day.

**Children and Adolescents:** 7 to 17 years PO 20 mg q day

### For the reduction of total cholesterol, LDL-cholesterol, and apolipoprotein B concentrations in pediatric patients with heterozygous familial hypercholesterolemia (HeFH)

**Children and Adolescents:** 10 to 17 yrs PO 5 to 20 mg q day, Individualize based on the goals of therapy. Adjust dose q 4 wk or more

**Children 8 to 9 yrs:** PO 5 to 10 mg q day, individualize based on the goals of therapy. Adjust dose q 4 wks or more.

### For slowing the progression of atherosclerosis (e.g., carotid, coronary)

**Adults:** PO The usual starting dose is 10 mg q day. 5 mg q day may be initiated in those requiring less aggressive LDL-reductions, patients with CCr less than 30 mL/minute, or patients at higher risk for myopathy.

### For primary prevention of cardiovascular disease including myocardial infarction prophylaxis and stroke prophylaxis, and to reduce the risk of arterial revascularization procedures in patients without evidence of coronary heart disease but who have risk factors for cardiovascular disease

**Adults:** PO The usual starting dose is 10 to 20 mg q day, with a dose range of 5 to 40 mg q day.

### Renal Dose

**Adult:** PO CCr < 30 ml/min: Initially, 5 mg q day in those not receiving dialysis. Max 10 mg q day

**Available forms:** Tabs 5, 10, 20, 40 mg

### Implementation

- May be taken at any time of day, with or without food
- Store in cool environment in airtight, light-resistant container

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness,* insomnia, paresthesia, confusion

**GI:** *Nausea, constipation, abdominal pain, flatus, diarrhea, dyspepsia, heartburn,* kidney failure, liver dysfunction, vomiting

**HEMA:** Thrombocytopenia, hemolytic anemia, leukopenia

**INTEG:** *Rash, pruritus*

**MS:** *Asthenia, muscle cramps, arthritis, arthralgia, myalgia,* myositis, rhabdomyolysis, leg, shoulder, or localized pain

**RESP:** Rhinitis, sinusitis, *pharyngitis,* increased cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 88% protein bound, crosses placenta |
| **Metabolism** | Minimal liver metabolism (about 10%) |
| **Excretion** | Primarily in feces (90%) |
| **Half-life** | 19 hr |

R

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3-5 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased hepatotoxicity
Clofibrate, cycloSPORINE, gemfibrozil, niacin: increased myalgia, myositis
Warfarin: increased bleeding

### Drug classifications

Antifungals (azole), antiretroviral protease inhibitors, fibric acid derivatives: increased myalgia, myositis
Bile acid sequestrants: increased effects

### Drug/herb

St. John's wort: decreased rosuvastatin effect

### Drug/lab test

Increased: CPK, liver function tests

## NURSING CONSIDERATIONS

### Assessment

- Assess diet: obtain diet history including fat, cholesterol in diet
- Monitor fasting cholesterol, LDL, HDL, triglycerides periodically during treatment
- Liver function: monitor liver function tests q1-2mo during the first 1½ yr of treatment; AST, ALT, liver function tests may increase
- Monitor renal function in patients with compromised renal system: BUN, creatinine, I&O ratio
- Obtain ophthalmic exam before, 1 mo after treatment begins, annually; lens opacities may occur
- **Rhabdomyolysis:** Assess for muscle pain, tenderness, obtain CPK; if these occur, product may need to be discontinued; for Asian ancestry: increased blood levels, rhabdomyolysis
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Advise to report suspected pregnancy, to use contraception while taking this product, pregnancy, not to breastfeed
- Advise that blood work and ophthalmic exam will be necessary during treatment
- Teach to report blurred vision, severe GI symptoms, dizziness, headache, muscle pain, weakness
- Teach that previously prescribed regimen will continue: low-cholesterol diet, exercise program, smoking cessation; liver injury (jaundice, anorexia, abdominal pain)

### Evaluation

**Positive therapeutic outcome**

- Cholesterol at desired level after 8 wk

**RARELY USED**

# rufinamide (Rx)

(roo-fin'a-mide)
**Banzel**
*Func. class.:* Anticonvulsant
*Chem. class.:* Triazole derivative

## ACTION:

May act through action at sodium channels; exact action is unknown

**Therapeutic outcome:** Decrease in severity of seizures

## USES:

Lennox-Gastaut syndrome

## CONTRAINDICATIONS

Hypersensitivity, familial short QT syndrome

**Precautions:** Pregnancy, breastfeeding, renal/hepatic disease, geriatric patients, child <16 yr, depression, dialysis, hazardous activities, suicidal ideation

## DOSAGE AND ROUTES

**Adult:** PO 400-800 mg/day divided bid, increase by 400-800 mg/day q2day to 3200 mg/day
**Child ≥4 yr:** PO 10 mg/kg/day divided equally bid; increase by 10 mg/kg/day every other day to 45 mg/kg/day or 3200 mg/day, whichever is less

**Available forms:** Tabs 200, 400 mg; oral susp 40 mg/ml

### Implementation

- **PO tabs:** Give with food, may give whole, crushed, or halved
- **Oral susp:** Shake well before use, use provided adapter and calibrated oral dosing syringe, insert adapter firmly in neck of bottle before use and keep in place for the duration of bottle use, insert dosing syringe into the adapter and withdraw dose from inverted bottle, replace cap after each use, use within 90 days of opening, give with food

## ADVERSE EFFECTS

**CNS:** Dizziness, ataxia, drowsiness, fever, seizures, tremor, fatigue, headache, gait disturbance
**EENT:** Diplopia, blurred vision, nystagmus
**GI:** Nausea, hepatitis, vomiting
**HEMA:** Anemia, leukopenia, neutropenia, thrombocytopenia, lymphadenopathy
**INTEG:** Rash, urticaria, Stevens-Johnson syndrome

**MISC:** Edema, hematuria, influenzae, nephrolithiasis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | Terminal 6-10 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4-6 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CarBAMazepine, PHENobarbital, phenytoin, primidone: decreased effect of rufinamide
Valproate: increased rufinamide effect

### Drug classifications

Hormonal contraceptives: decreased effect

### Drug/lab test

Increased: LFTs

## NURSING CONSIDERATIONS

### Assessment

- **Seizures:** Assess for duration, type, intensity precipitating factors
- **Assess mental status:** mood, sensorium, affect, memory (long, short), increased suicidal thoughts/actions

### Patient/family education

- Caution patient not to discontinue product abruptly; seizures may occur
- Advise patient to avoid hazardous activities until stabilized on product
- Instruct patient to carry emergency ID stating product use
- Instruct patient to notify prescriber if pregnancy is planned or suspected, to use alternative form of contraception; hormonal contraceptives may be decreased
- Inform patient to take adequate fluids

### Evaluation

#### Positive therapeutic outcome

- Decrease in severity of seizures

RABEprazole (Rx)

## salicylic acid topical

*See Appendix B*

## salmeterol (Rx)

(sal-met'er-ole)

**Serevent, Serevent Diskus**

*Func. class.:* Adrenergic $\beta_2$ agonist, (long acting) bronchodilator

**ACTION:** Causes bronchodilatation by action on $\beta_2$ (pulmonary) receptors by increasing levels of cyclic AMP, which relaxes smooth muscle; with very little effect on heart rate, maintains improvement in FEV from 3 to 12 hr; prevents nocturnal asthma symptoms

**Therapeutic outcome:** Ease of breathing

**USES:** Prevention of exercise-induced asthma, bronchospasm, COPD

## CONTRAINDICATIONS

Hypersensitivity to sympathomimetics, tachydysrhythmias, severe cardiac disease, monotherapy treatment of asthma

**Precautions:** Pregnancy, breastfeeding, cardiac disorders, hyperthyroidism, diabetes mellitus, hypertension, prostatic hypertrophy, closed-angle glaucoma, seizures, acute asthma, as a substitute for corticosteroids, QT prolongation

**BLACK BOX WARNING:** Asthma-related death, children <4 yr

## DOSAGE AND ROUTES

**Adult/child ≥4 yr:** INH 50 mcg (one inhalation as dry powder); **exercise-induced bronchospasm:** 50 mcg (2 INH) ½-1 hr prior to exercise

**Available forms:** Inhalation powder 50 mcg/blister

### Implementation

- Shake aerosol container, ask patient to exhale, then place mouthpiece in mouth, inhale slowly, hold breath, remove, exhale slowly; allow at least 1 min between inhalations
- Use this medication before other medications and allow at least 1 min between each
- Use spacing device for pediatric/geriatric patients
- Store in foil pouch; do not expose to temp >86° F (30° C); discard 6 wk after removal from foil pouch
- Use 1/2 hr prior to exercise for exercise-induced bronchospasm prevention
- Don't use spacer with this product

## ADVERSE EFFECTS

**CNS:** *Tremors, anxiety,* insomnia, headache, dizziness, fever

**CV:** Palpitations, tachycardia, angina, hypo/hypertension, dysrhythmias

**EENT:** Dry nose, irritation of nose and throat

**GI:** Heartburn, nausea, vomiting, abdominal pain

**MS:** Muscle cramps

**RESP:** Bronchospasm, cough, asthma-related death

### Pharmacokinetics

Unknown

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 5-15 min |
| **Peak** | 4 hr |
| **Duration** | 12 hr |

## INTERACTIONS

### Drug classifications

Antidepressants (tricyclics): increased salmeterol action

β-Adrenergic blockers: block therapeutic effect

Bronchodilators, aerosol: increased action of bronchodilator

CYP3A4 inhibitors (itraconazole, ketoconazole, nelfinavir, nefazodone, saquinavir): increased CV effects

MAOIs: increased action of salmeterol

### Drug/herb

Betel palm, butterbur, coffee, cola nut, figwort, fumitory, guarana, hawthorn, lily of the valley, motherwort, plantain, tea (black, green), yerba maté: increased stimulation

## NURSING CONSIDERATIONS

### Assessment

- **Respiratory function:** assess vital capacity, FEV, ABGs, lung sounds, heart rate, rhythm (baseline)
- **Paradoxical bronchospasm:** monitor for dyspnea, wheezing, chest tightness, do not use in bronchospasm

**BLACK BOX WARNING:** Children should not use this product as monotherapy for asthma; use only with persistent asthma in those that are not well-controlled with a long-term asthma product, after product controls asthma, use another bronchodilator

- **Hypersensitivity:** Assess for rash, urticaria, rarely leads to anaphylaxis, angioedema
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

**BLACK BOX WARNING:** Asthma-related death

### Patient/family education

- Caution patient not to use OTC medications because extra stimulation may occur
- Instruct patient to use this medication before other medications and to allow at least 1 min between each, to prevent overstimulation
- Teach patient how to use inhaler; to avoid getting aerosol in eyes; blurring may result; to wash inhaler in warm water daily and dry; to avoid smoking, smoke-filled rooms, and persons with respiratory infections; review package insert with patient
- Instruct patient on administration of dose, not to use more than prescribed; serious side effects may occur
- Teach patient not to use for exercise-induced bronchospasm, never exhale into diskus, hold level, keep mouthpiece dry
- Teach patient not to use for treatment of acute exacerbation, a fast-acting β-blocker should be used instead
- Teach patient to report immediately dyspnea after use, if 1 canister or more is used in 2 mo time
- Teach patient to notify prescriber if >4 inhalations are needed, or if product is no longer working
- **Multidose:** Advise patient not to get canister or mouthpiece wet, not to use spacer, not to exhale into mouthpiece
- Teach patient to take other products as prescribed

**BLACK BOX WARNING:** Asthma-related death: Teach patient to seek medical attention immediately for serious asthma attack, death may be greater in Black patients

- Advise patient to use 1/2-1 hr before exercising if using to prevent exercise-induced bronchospasm
- **Pregnancy/breastfeeding:** Advise patient to notify provider if pregnancy is planned or if breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Absence of dyspnea, wheezing
- Improved airway exchange
- Improved ABGs

## TREATMENT OF OVERDOSE:

Administer a $\beta_2$-adrenergic blocker

**⚠ HIGH ALERT**

## sargramostim (Rx)

(sar-gram′oh-stim)

**Leukine, rhu GM-CSF**

*Func. class.:* Biological modifier, hematopoietic agent cytokine

*Chem. class.:* Granulocyte-macrophage colony-stimulating factor (GM-CSF)

**Do not confuse:** Leukine/leucovorin/Leukeran

**ACTION:** Stimulates proliferation and differentiation of hematopoietic progenitor cells (granulocyte, macrophage)

**Therapeutic outcome:** WBC and differential recovery

**USES:** Acceleration of myeloid recovery in patients with non-Hodgkin's lymphoma, acute lymphoblastic leukemia, acute myelogenous leukemia, autologous bone marrow transplantation in Hodgkin's disease; bone marrow transplantation failure or engraftment delay; mobilization and transplant of peripheral blood progenitor cells (PBPCs)

**Unlabeled uses:** Aplastic anemia, Crohn's disease, ganciclovir- or zidovudine-induced neutropenia, myelodysplastic syndrome (MDS)

## CONTRAINDICATIONS

Hypersensitivity to GM-CSF, benzyl alcohol, yeast products; excessive leukemic myeloid blast in the bone marrow or peripheral blood, neonates

**Precautions:** Pregnancy, breastfeeding, children, renal/hepatic/lung/cardiac disease, pleural/pericardial effusions, peripheral edema, leukocytosis, mannitol hypersensitivity, hepatic/renal disease

## DOSAGE AND ROUTES

### Myeloid recovery in Hodgkin's disease, non-Hodgkin's lymphoma, acute lymphocytic leukemia

**Adult:** IV 250 mcg/m$^2$/day over a 2-hr period beginning 2-4 hr following infusion of bone marrow and not <24 hr after last dose of chemotherapy or radiotherapy

**Child (unlabeled):** SUBCUT/IV 250 mcg/m$^2$/day beginning 2-4hr after infusion of bone marrow and not <24hr after last dose of chemotherapy

### Acceleration of myeloid recovery

**Adult: IV** 250 mcg/m$^2$/day × 14 days; give over 2 hr; may repeat in 7 days, may repeat 500 mcg/m$^2$/day × 14 days after another 7 days if no improvement

### Mobilization of PBPCs
**Adult:** CONT **IV** 250 mcg/m$^2$/day over 24 hr or SUBCUT qday continue through collection during collection of PBPCs

### After PBPC transplantation
**Adult:** CONT **IV** 250 mcg/m$^2$/day until ANC >1500/mm$^3$ × 3 days

**Available forms:** Powder for inj lyophilized 250 mcg; solution for injection 500 mcg/ml

### Implementation
- Store in refrigerator; do not freeze

**SUBCUT route**
- No further dilution of reconstituted sol is needed; take care not to inject intradermally

**Intermittent IV infusion route**
- After reconstituting with 1 ml sterile water for inj without preservative; do not reenter vial; discard unused portion; direct reconstitution sol at side of vial; rotate contents, do not shake
- Dilute in 0.9% NaCl inj to prepare IV inf; if final concentration is <10 mcg/ml, add human albumin to make a final concentration of 0.1% to NaCl before adding sargramostim to prevent adsorption; for a final concentration of 0.1% albumin, add 1 mg human albumin/1 ml 0.9% NaCl inj run over 2 hr **(bone marrow transplant or failure of graft);** over 4 hr **(chemotherapy for AML);** over 24 hr as cont inf **(PBPCs);** give within 6 hr after reconstitution

**Y-site compatibilities:** Amikacin, aminophylline, aztreonam, bleomycin, butorphanol, calcium gluconate, CARBOplatin, carmustine, ceFAZolin, cefepime, cefotaxime, cefoTEtan, ceftizoxime, cefTRIAXone, cefuroxime, cimetidine, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, dexamethasone, diphenhydrAMINE, DOPamine, DOXOrubicin, doxycycline, droperidol, etoposide, famotidine, fentaNYL, floxuridine, fluconazole, fluorouracil, furosemide, gentamicin, granisetron, heparin, IDArubicin, ifosfamide, immune globulin, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, metoclopramide, metroNIDAZOLE, minocycline, mitoXANtrone, netilmicin, pentostatin, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, ranitidine, teniposide, ticarcillin, ticarcillin-clavulanate, trimethoprim-sulfamethoxazole, vinBLAStine, vinCRIStine, zidovudine

**Y-site incompatibilities:** Acyclovir, ampicillin, ampicillin/sulbactam, cefonicid, cefoperazone, cefTAZidime, chlorproMAZINE, ganciclovir, haloperidol, hydrocortisone, HYDROmorphone, hydrOXYzine, IDArubicin, imipenem/cilastatin, LORazepam, methylPREDNISolone sodium succinate, mitoMYcin, morphine, nalbuphine, ondansetron, piperacillin, sodium bicarbonate, tobramycin

## ADVERSE EFFECTS
**CNS:** Fever, malaise, CNS disorder, weakness, chills, dizziness, syncope, headache
**CV:** Transient supraventricular tachycardia, peripheral edema, pericardial effusion, hypotension, tachycardia
**GI:** Nausea, vomiting, diarrhea, anorexia, GI hemorrhage, stomatitis, liver damage, hyperbilirubinemia
**GU:** Urinary tract disorder, abnormal kidney function
**HEMA:** Blood dyscrasias, hemorrhage
**INTEG:** Alopecia, rash, peripheral edema
**MS:** Bone pain, myalgia
**RESP:** Dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Elimination **IV** 60 min; SUBCUT 2-3 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | 2 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Lithium: increased myeloproliferation

### Drug classifications
Antineoplastics or radiation, separate by ≥24 hr
Corticosteroids: increased myeloproliferation

### Drug/lab test
Increased: bilirubin, BUN, creatinine, eosinophils, LFTs, leukocytes

## NURSING CONSIDERATIONS
### Assessment
- **Monitor blood studies:** CBC, differential count before treatment and twice weekly; leukocytosis may occur (WBC >50,000 cells/mm$^3$, ANC >20,000 cells/mm$^3$), platelets; if ANC >20,000/mm$^3$ or 10,000/mm$^3$ after nadir has occurred or platelets >500,000/mm$^3$, reduce dose by ½ or discontinue; if blast cells occur, discontinue
- Monitor renal/liver function tests before treatment: BUN, creatinine, urinalysis; AST, ALT,

alkaline phosphatase; monitoring is needed twice a week in renal/hepatic disease
• **Gasping syndrome in neonates:** assess for, due to benzyl alcohol hypersensitivity, do not use
• Assess for **hypersensitivity reactions**/rashes and local inj site reactions; usually transient
• Assess for increased fluid retention in cardiac disease, body weight, hydration status, pulmonary function
• **Constitutional symptoms:** asthenia, chills, fever, headache, malaise
• Assess for myalgia, arthralgia in legs, feet; use analgesics, antipyretics
• **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding, excretion unknown

### Patient/family education
• Teach patient reason for medication and expected results
• Advise patient to notify nurse or prescriber immediately of dyspnea, excessive diarrhea, B/P increase
• Review all aspects of product use
• Advise patient bone pain may occur with use of this product and is normal

### Evaluation
**Positive therapeutic outcome**
• WBC and differential recovery
• Absence of infection

**⚠ HIGH ALERT**

## saxagliptin (Rx)
(sax-a-glip'tin)
**Onglyza**
*Func. class.:* Antidiabetic, oral
*Chem. class.:* Dipeptidyl-peptidase-4 (DPP-4) inhibitor

**Do not confuse:** saxagliptin/sitaGLIPtin

**ACTION:** Slows the inactivation of incretin hormones, improves glucose homeostasis, improves glucose-dependent insulin synthesis, lowers glucagon secretions and slows gastric emptying time

**Therapeutic outcome:** Decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; blood glucose at normal level

**USES:** Type 2 diabetes mellitus as monotherapy or in combination with other antidiabetic agents

## CONTRAINDICATIONS
Hypersensitivity, angioedema, serious rash

**Precautions:** Pregnancy, geriatric, GI obstruction, thyroid disease, surgery, renal/hepatic disease, trauma, diabetic ketoacidosis (DKA), type 1 diabetes mellitus, heart failure

## DOSAGE AND ROUTES
**Adjust diet, exercise to improve glycemic control (type 2 diabetes)**
**Adult:** PO 2.5-5 mg; may use with other antidiabetic agents (metformin, pioglitazone, rosiglitazone), if used with insulin, a lower dose is needed; max 2.5 mg with strong 3A4-5 inhibitors

### Renal dose
**Adult:** PO CCr ≤50 ml/min 2.5 mg/day; hemodialysis: 2.5 mg qday after hemodialysis

**Available forms:** Tabs 2.5; 5 mg

### Implementation
**PO route**
• May be taken with or without food
• Conversion from other antidiabetic agents; change may be made with gradual dosage change
• Store in tight container at room temperature
• Do not break or cut tabs

## ADVERSE EFFECTS
**CNS:** *Headache*
**CV:** Edema
**EENT:** Sinusitis
**ENDO:** Hypoglycemia (renal impairment)
**GI:** *Nausea, vomiting,* abdominal pain, pancreatitis
**GU:** UTI
**INTEG:** Urticaria, angioedema, anaphylaxis
**META:** *Hypoglycemia*
**MISC:** Lymphopenia, peripheral edema
**RESP:** Upper respiratory infection, sinusitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys 24% unchanged |
| **Half-life** | Terminal 2.5 hr, 3.1 hr metabolite |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-4 hr |
| **Duration** | 24 hr |

S

## INTERACTIONS

### Individual drugs

Aripiprazole, cloZAPine, fosphenytoin, OLANZapine, phenytoin, QUEtiapine, risperiDONE, ziprasidone: decreased antidiabetic effect

Cimetidine, disopyramide: increased saxagliptin level

Cimetidine, FLUoxetine: increased hypoglycemia

Digoxin: increased levels of digoxin

### Drug classifications

ACE inhibitors, estrogens, oral contraceptives, phenothiazines, progestins, protease inhibitors, sympathomimetics, thiazide diuretics: decreased antidiabetic effect

Androgens, β-blockers, corticosteroids, fibric acid derivatives, insulins, MAOIs, salicylates: increased hypoglycemia, dosage reduction may be needed

### Drug/herb

Garlic, horse chestnut: increased antidiabetic effect

### Drug/lab test

Decreased: lymphocytes, glucose

## NURSING CONSIDERATIONS

### Assessment

- **Hypoglycemic reactions** (sweating, weakness, dizziness, anxiety, tremors, hunger); monitor blood glucose (BG) as needed
- Monitor CBC (baseline, q3mo) during treatment; check liver function tests periodically, AST, LDH, renal studies: BUN, creatinine during treatment; glycosylated hemoglobin HbA1C
- **Heart failure:** history of risk factors for heart failure, use cautiously, in these patients
- **Pancreatitis:** abdominal pain, nausea, vomiting; discontinue product immediately, previous pancreatitis may be a contributing factor
- **Pregnancy/breastfeeding:** Use only if clearly needed, usually insulin is used in pregnancy, cautious use in breastfeeding, excretion unknown

### Patient/family education

- Teach patient to use regular self-monitoring of blood glucose using blood glucose meter
- Teach patient the symptoms of hypo/hyperglycemia; what to do about each
- Teach patient that product must be continued on daily basis; explain consequence of discontinuing product abruptly
- Advise patient to avoid OTC medications, alcohol, digoxin, exenatide, insulins, nateglinide, repaglinide, and other products that lower blood sugar, unless approved by prescriber
- Teach patient that diabetes is a lifelong illness; that this product is not a cure, only controls symptoms
- Teach patient that all food included in diet plan must be eaten to prevent hypo/hyperglycemia
- Teach patient to carry emergency ID
- Teach patient to take product without regard to food
- Teach patient to notify prescriber when surgery, trauma, or stress occurs, as dose may need to be adjusted, or insulin used
- **Pancreatitis:** Teach patient to immediately report and stop taking product if severe abdominal pain with vomiting occurs
- **Hypersensitivity:** Advise patient to immediately seek medical assistance and stop product if itching, rash, swelling of face, tongue occur

### Evaluation

**Positive therapeutic outcome**

- Decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; blood glucose at normal level

**RARELY USED**

## scopolamine (Rx)

(skoe-pol′a-meen)

**Transderm-Scop**

*Func. class.:* Cholinergic blocker

*Chem. class.:* Belladonna alkaloid

**Therapeutic outcome:** Absence of vomiting, secretions (preoperatively), involuntary movements

**USES:** Reduction of secretions before surgery, production of amnesia, prevention of motion sickness, Parkinson's symptoms

**Unlabeled uses:** Drooling (TD)

## CONTRAINDICATIONS

Hypersensitivity, closed-angle glaucoma, myasthenia gravis, GI/GU obstruction, hypersensitivity to belladonna, barbiturates

## DOSAGE AND ROUTES

### Prevention of motion sickness

**Adult:** Transdermal 1 patch placed behind ear 4 hr before travel, reapply q3day

### Preoperatively

**Adult:** IM/IV/SUBCUT 0.32-0.65 mg; TD apply 1 patch PM before surgery or 1 hr before C-section

### Nausea and vomiting

**Adult:** SUBCUT 0.6-1 mg

**Child:** SUBCUT 0.006 mg/kg; max 0.3 mg/dose

**Drooling (unlabeled)**
**Adult:** Transdermal 1.5 mg patch q3day

## secukinumab (Rx)

(sek′-ue-kin′-ue-mab)
**Cosentyx**
*Func. class.:* Immune response modifier

## ACTION

**ACTION:** Interleukin (IL)-12, IL-23 antagonist

**Therapeutic outcome:** Decreasing plaque psoriasis

## USES

**USES:** Plaque psoriasis

## CONTRAINDICATIONS

Hypersensitivity, active TB

**Precautions:** Pregnancy, breastfeeding, latex hypersensitivity, Crohn's disease, vaccination, infection

## DOSAGE AND ROUTES

**Adult: SUBCUT** 300 mg at wk 0, 1, 2, 3, 4, and then q4wk thereafter

**Available forms:** Sol for inj 150 mg/ml (pen, prefilled syringe) 2 packs, singles

### Implementation

- Use by **SUBCUT** inj only
- Those with latex hypersensitivity should not handle cap of inj

**SUBCUT Inj**

- Patients may use the prefilled syringe or Sensoready pen after proper training; the lyophilized powder is for health care provider use only
- Each 300-mg dose is used as 2 **SUBCUT** inj of 150 mg
- Do not administer where skin is tender, bruised, erythematous, indurated, or affected by psoriasis.

**Reconstitution of lyophilized powder:**

- Allow to warm to room temperature for 15-30 min, use 1 ml sterile water for inj to reconstitute, rotate, do not shake or invert vial, allow to stand for 10 min, again rotate vial, allow to stand for another 5 min (150 mg/ml)
- Storage: Use immediately or refrigerate for up to 24 hr. Do not freeze. If refrigerated, allow reconstituted solution to reach room temperature (15-30 min) before administration

**Preparation for use of prefilled syringe or Sensoready pen:**

- Remove prefilled syringe or Sensoready pen from refrigerator and allow 15-30 min to reach room temperature
- Storage: The prefilled syringe or Sensoready pen should be used within 1 hr

## ADVERSE EFFECTS

**EENT:** Ocular infections, sinusitis, oral ulceration, rhinitis, sinusitis
**GI:** Diarrhea
**INTEG:** Urticaria
**SYST:** Serious infections, anaphylaxis, antibody formation, candidiasis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Interstitial fluid in lesional and non-lesional skin |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 22-31 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 6 days |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Immunosupressives: avoid use with immunosuppressives
Vaccines: do not give concurrently with vaccines; immunizations should be brought up to date before treatment

### Drug/lab test

Increased: LFTs

## NURSING CONSIDERATIONS

### ASSESSMENT

- **TB:** TB testing should be done before starting treatment
- Bring immunizations up to date before starting treatment
- **Infection:** monitor for fever, sore throat, cough; do not use during active infections
- **Malignancy:** Skin cancer may occur especially in older patients who have used ultraviolet treatments with immunosuppressants
- Assess for inj site pain, swelling

### Patient/family education

- Advise patient that product must be continued for prescribed time to be effective, to use as prescribed
- Teach patient not to receive live vaccinations during treatment
- Teach patient to notify prescriber of possible infection (upper respiratory or other) or allergic reactions
- How to use pen and inj techniques and proper disposable

### Evaluation

- Decreasing plaque psoriasis

S

## selegiline (Rx)

(se-le′ji-leen)
**Eldepryl, Emsam, Zelapar**
*Func. class.:* Antiparkinson agent
*Chem. class.:* MAOI, type B

**Do not confuse:** selegiline/Salagen
Zelapar/ZyPREXA

**ACTION:** Increased dopaminergic activity by inhibition of MAO type B activity; not fully understood

**Therapeutic outcome:** Decreased symptoms of Parkinson's disease

**USES:** Adjunct management of Parkinson's disease in patients being treated with levodopa/carbidopa who have responded poorly to therapy, depression (transdermal)

**Unlabeled use:** Alzheimer's disease, depression

## CONTRAINDICATIONS

Children/adolescents (suicide/hypertensive crisis), hypersensitivity, breastfeeding, MAOIs

**Precautions:** Pregnancy, abrupt discontinuation, alcoholism, ambient temperature increases, behavioral changes, bipolar disorders, driving or operating machinery, geriatrics, heating pad, hepatic disease, hypertension, hypotension, melanoma, phenylketonuria, psychosis, renal disease, sunlight exposure

**BLACK BOX WARNING:** Children or adolescents (transdermal)

**BLACK BOX WARNING:** Suicidal ideation

## DOSAGE AND ROUTES

**Adult: PO** 10 mg/day in divided doses, 5 mg at breakfast and lunch with levodopa/carbidopa; after 2-3 days begin to reduce the dose of levodopa/carbidopa 10%-30%; **oral disintegrating tab** 1.25 mg (1 tab) initially, then 2.5 (2 tabs) dissolved on tongue daily before breakfast × 6 wk or more; max 2.5 mg/day; **transdermal** 6 mg/24 hr initially, increase by 3 mg/24 hr at ≥2 wk, up to 12 mg/24 hr if needed

### Alzheimer's disease (unlabeled)

**Adult:** PO 5 mg bid AM, PM

**Available forms:** Tabs 5 mg, caps 5 mg; oral disintegrating tabs 1.25 mg; transdermal 6 mg/24 hr (20 mg/20 $cm^2$), 9 mg/24 hr (30 mg/30 $cm^2$), 12 mg/24 hr (40 mg/40 $cm^2$)

### Implementation

- Do not use in children due to risk for hypertensive crisis
- Adjust dosage to patient's response
- Give with meals; limit protein taken with product
- Give at doses <10 mg/day because of risks associated with nonselective inhibition of MAO
- **Oral disintegrating tab:** peel back foil, place tab on tongue, allow to dissolve, swallow with saliva, no fluids for 5 min before and after use; avoid using >2.5 mg/day, hypertensive crisis is more common

**Transdermal route**

- Apply to dry, intact skin on upper torso/thigh or outer surface of upper arm q24hr

**BLACK BOX WARNING:** Do not use in children <12 yr

- When using 9 mg/24 hr or 12 mg/24 hr specific manufacturer recommendations for tyramine intake must be followed to prevent hypertensive crisis

## ADVERSE EFFECTS

**CNS:** Increased tremors, chorea, restlessness, blepharospasm, increased bradykinesia, grimacing, tardive dyskinesia, dystonic symptoms, involuntary movements, increased apraxia, hallucinations, dizziness, mood changes, nightmares, delusions, lethargy, apathy, overstimulation, sleep disturbances, headache, migraine, numbness, muscle cramps, confusion, anxiety, tiredness, vertigo, personality change, back/leg pain, suicide in children/adolescents, suicidal ideation in adults
**CV:** Orthostatic hypotension, hypertension, dysrhythmia, palpitations; angina pectoris, hypotension, edema, sinus bradycardia, syncope, hypertensive crisis (children)
**EENT:** Diplopia, dry mouth, blurred vision, tinnitus
**GI:** *Nausea,* weight loss, anorexia, diarrhea
**GU:** Slow urination, nocturia, prostatic hypertrophy, hesitation, retention, frequency, sexual dysfunction
**INTEG:** Increased sweating, alopecia, hematoma, rash, photosensitivity, facial hair
**RESP:** Asthma, shortness of breath

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed |
| **Metabolism** | Rapidly, liver |
| **Excretion** | Metabolites *N*-desmethyldeprenyl, amphetamine, methamphetamine |
| **Half-life** | 10 hr; oral disintegrating tab 1.3 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | ½-2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Dextromethorphan: increased unusual behavior, psychosis

FLUoxetine, fluvoxaMINE, PARoxetine, sertraline: increased serotonin syndrome (confusion, seizures, fever, hypertension, agitation) discontinue 5 wk before selegiline

Levodopa/carbidopa: increased side effects

Meperidine: do not use, fatal reaction

### Drug classifications

Antidepressants (tricyclics), opioids (especially meperidine): do not use, fatal reaction

Antihypertensives: increased hypotension

### Drug/lab test

Decreased: VMA

False positive: urine ketones, urine glucose

False negative: urine glucose (glucose oxidase)

False increase: uric acid, urine protein

## NURSING CONSIDERATIONS

### Assessment

- Monitor cardiac status: tachycardia, bradycardia; B/P, respiration throughout treatment

**BLACK BOX WARNING:** Assess mental status: affect, mood, behavioral changes, depression; perform suicide assessment, suicidal ideation may occur

- **Parkinson's symptoms:** assess for rigidity, unsteady gait, weakness, tremors; these should decrease in severity
- Assess opioids; if patient has received, do not give selegiline; fatal reactions have occurred
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excretion unknown
- **Orthostatic hypotension:** May occur during first few weeks of use, more frequent in those >60 yr
- **Suicidal ideation:** Report change in symptoms, worsening depression, or suicidal thoughts/behaviors, treatment may need to be changed

### Patient/family education

- Caution patient to change positions slowly to prevent orthostatic hypotension
- **Hypertensive crisis:** teach patient to report nausea, vomiting, sweating, agitation, change in mental status, headache, chest pain to prescriber immediately
- **Pregnancy:** teach patient to report if pregnancy is planned or suspected, do not breastfeed
- Teach patient to use during the day to prevent insomnia
- Caution patient to use product exactly as prescribed; if product is discontinued abruptly, parkinsonian crisis may occur
- Instruct patient to avoid foods high in tyramine: cheese, pickled products, wine, beer, large amounts of caffeine as per manufacturer
- Instruct patient not to exceed recommended dose of 10 mg; might precipitate a hypertensive crisis; report severe headache or other unusual symptoms
- **Serotonin syndrome:** teach patient to report twitching, sweating, shivering, diarrhea to prescriber immediately
- Teach patient to avoid heating pads, hot tubs when using transdermal products
- Teach patient to avoid hazardous activities until response is known

### Evaluation

**Positive therapeutic outcome**

- Decreased symptoms of Parkinson's disease

## TREATMENT OF OVERDOSE:

**IV** fluids for hypertension, **IV** dilute pressure agent for B/P titration

## selenium topical

*See Appendix B*

## sertraline (Rx)

(ser'tra-leen)

**Zoloft**

*Func. class.:* Antidepressant

*Chem. class.:* Selective serotonin reuptake inhibitor (SSRI)

**Do not confuse:** Zoloft/Zocor

**ACTION:** Inhibits serotonin reuptake in CNS, thus increasing action of serotonin; does not affect DOPamine, norepinephrine

**Therapeutic outcome:** Relief of depression, obsessive-compulsive disorder (OCD), posttraumatic stress disorder (PTSD), panic disorder

**USES:** Major depression, OCD, PTSD, social anxiety disorder, panic disorder, premenstrual dysphoric disorder (PMDD), separation anxiety disorder

## CONTRAINDICATIONS

Hypersensitivity to this product or selective serotonin reuptake inhibitors

**Precautions:** Pregnancy, breastfeeding, geriatric, renal/hepatic disease, epilepsy, recent MI, latex sensitivity (dropper of oral conc)

**BLACK BOX WARNING:** Suicidal ideation, children

## DOSAGE AND ROUTES

### Major depression/OCD

**Adult/geriatric:** PO 25-50 mg/day; may increase to a maximum of 200 mg/day, do not change dose at intervals of <1 wk; administer daily in AM or PM

**Child 6-12 yr (unlabeled):** PO 25 mg/day, max 200 mg/day

### Premenstrual disorders

**Adult:** PO 50-150 mg nightly

### Social anxiety disorder

**Adult:** PO 25 mg qday, may increase by 50 mg qday after 7 days, range 50-200 mg/day

### Hepatic dose

**Adult:** PO; use lower dose or less frequent dosing intervals

**Available forms:** Tabs 25, 50, 100 mg; oral sol 20 mg/ml

### Implementation

- Administer dosage at bedtime if oversedation occurs during day; may take entire dose at bedtime; may crush
- Give with food, milk for GI symptoms
- Give crushed if patient is unable to swallow medication whole
- Use sugarless gum, hard candy; frequent sips of water for dry mouth
- **Oral concentration:** dilute before use with 4 oz (½ cup) of water, orange juice, ginger ale, or lemon/lime soda; do not mix with other liquids
- Store at room temperature; do not freeze
- Dropper contains latex

## ADVERSE EFFECTS

**CNS:** *Insomnia, agitation, somnolence, dizziness, headache, tremor, fatigue,* paresthesia, twitching, confusion, ataxia, gait abnormality (geriatric), seizures, neuroleptic malignant syndrome–like reactions, serotonin syndrome, suicidal ideation, anxiety, drowsiness
**CV:** Palpitations, chest pain
**EENT:** Vision abnormalities, yawning, tinnitus, intraocular pressure
**ENDO:** Syndrome of inappropriate antidiuretic hormone (geriatric), diabetes mellitus
**GI:** *Diarrhea, nausea, constipation, anorexia, dry mouth,* dyspepsia, *vomiting, flatulence,* weight gain/loss, hepatitis
**GU:** *Male sexual dysfunction,* micturition disorder
**INTEG:** Increased sweating, rash, hot flashes
**MISC:** Hyponatremia, neonatal abstinence syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown, steady state 1 wk |
| **Metabolism** | Liver, extensively |
| **Excretion** | Feces (14%) |
| **Half-life** | 26 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4.5-8.4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Cimetidine, warfarin: increased sertraline effect
CloZAPine: increased effects of cloZAPine
Diazepam: increased diazepam effect
Disulfiram: disulfiram reaction with oral conc due to alcohol content
Lithium: altered lithium levels
Phenytoin: increased effects of phenytoin
Pimozide: sertraline is contraindicated with pimozide, fatal reactions, avoid concurrent use
Sibutramine, traZODone, busPIRone, linezolid, traMADol: increased serotonin syndrome, increased neuroleptic malignant syndrome
SUMAtriptan: increased SUMAtriptan effects
TOLBUTamide: increased effect of TOLBUTamide
Warfarin: increased warfarin effect

### Drug classifications

Anticoagulants, NSAIDs, thrombolytics, platelet inhibitors, salicylates: increased bleeding risk
Antidepressants (tricyclics), benzodiazepines: increased effect
Highly protein-bound products: increased sertraline levels
SSRIs, SNRIs, serotonin-receptor agonists, tricyclics: increased serotonin syndrome, increased neuroleptic malignant syndrome, avoid concurrent use
MAOIs: fatal reactions

### Drug/herb

Kava, valerian: increased CNS effect

SAM-e, St. John's wort, tryptophan: increased effect of SSRIs, serotonin syndrome; do not use together

### Drug/lab test

Increased: AST, ALT
False positive: urine screen for benzodiazepines

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Assess mental status:** mood, sensorium, affect, suicidal tendencies (child/young adult); increase in psychiatric symptoms: depression, panic attacks, OCD, PTSD, social anxiety disorder, usually occurs in first few months of treatment

- Identify alcohol consumption; if alcohol is consumed, hold dose until AM
- **Serotonin syndrome:** assess for hyperthermia, hypertension, rigidity, delirium, coma, myoclonus or neuroleptic malignant-like syndrome (muscle cramps, fever, unstable B/P, agitation, tremors, mental changes)
- **Bleeding (platelet serotonin depletion):** assess for GI bleeding, ecchymoses, epistaxis, hematomas, petechiae, hemorrhage)
- LFTs, thyroid function test, growth rate, weight baseline and periodically
- **Hypertension:** B/P (lying/standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; VS q4hr in patients with CV disease
- Weight qwk; appetite may decrease with product
- Urinary retention, constipation, especially in geriatric patients
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, serious complications may occur in the neonate, cautious use in breastfeeding, excretion unknown
- **Beers:** Avoid in older adults unless safer alternatives are not available, may cause ataxia, impaired psychomotor function

### Patient/family education

- Teach patient that therapeutic effects may take 1 wk or longer
- Instruct patient to notify prescriber if pregnant or planning to become pregnant or breastfeed, pregnancy
- Instruct patient to use caution in driving or other activities requiring alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting to standing, especially geriatric
- Advise patient to avoid alcohol ingestion, other CNS depressants
- **Teach patient not to discontinue medication quickly after long-term use:** may cause nausea, headache, malaise
- Caution patient to wear sunscreen or large hat because photosensitivity can occur
- Teach patient to increase fluids, bulk in diet if constipation, urinary retention occur, especially geriatric
- Instruct patient to take gum, hard sugarless candy, or frequent sips of water for dry mouth
- Teach patient that medication may be taken without regard to food
- **Serotonin syndrome:** teach patient to report agitation, nausea, vomiting, diarrhea, twitching, sweating, shivering to prescriber immediately

**BLACK BOX WARNING: Suicidal ideation:** Teach patient that suicidal thoughts/behavior may occur (children/adolescents)

### Evaluation

**Positive therapeutic outcome**

- Decrease in depression, OCD
- Absence of suicidal thoughts

## TREATMENT OF OVERDOSE:

ECG monitoring, induce emesis, lavage, administer anticonvulsant

## sildenafil (Rx)

(sil-den'a-fill)
**Revatio, Viagra**
*Func. class.:* Erectile agent; antihypertensive, pulmonary vasodilator
*Chem. class.:* Selective inhibitor of cyclic GMP-PDE5

S

**Do not confuse:** Viagra/Allegra

**ACTION:** Enhances the effect of nitric oxide (NO) by inhibiting phosphodiesterase type 5 (PDE5), which is necessary for degrading cyclic GMP in the corpus cavernosum

**Therapeutic outcome:** Ability to achieve and maintain erection

**USES:** Treatment of erectile dysfunction, pulmonary hypertension; improvement in exercise ability

**Unlabeled uses:** Sexual dysfunction (women)

## CONTRAINDICATIONS

Hypersensitivity to this product or nitrates

**Precautions:** Pregnancy, anatomical penile deformities, sickle cell anemia, leukemia, multiple

myeloma, retinitis pigmentosa, bleeding disorders, active peptic ulceration, CV/renal/hepatic disease, multidrug antihypertensive regimens, geriatric patients

## DOSAGE AND ROUTES

### Erectile dysfunction (Viagra only)

**Adult male <65 yr:** PO 50 mg 1 hr before sexual activity; may be increased to 100 mg or decreased to 25 mg; max frequency once/day
**Adult ≥65 yr (male):** PO 25 mg prn about 1 hr before sexual activity

### Renal/hepatic dose

**Adult:** PO (Child-Pugh A, B) 25 mg, take 1 hr before sexual activity, do not use more than 1 ×/day; CCr <30 ml/min 25 mg starting dose

### Pulmonary hypertension (Revatio only)

**Adult:** PO 20 mg tid, take 4-6 hr apart; **IV** BOL 10 mg tid

**Available forms:** Tabs 20, 25, 50, 100 mg, sol for inj 10 mg/12.5 ml

### Implementation

- **Erectile dysfunction:** give approximately 1 hr before sexual activity, do not use more than once a day, give on empty stomach for better absorption
- Tab may be split
- **Pulmonary hypertension:** Give 3×/day, 4-6 hr apart

## ADVERSE EFFECTS

**CNS:** *Headache, flushing, dizziness,* transient global amnesia, seizures
**CV:** MI, sudden death, CV collapse, TIAs, ventricular dysrhythmias, CV hemorrhage
**MISC:** *Dyspepsia, nasal congestion, UTI, abnormal vision, diarrhea, rash,* NAION (nonarteritic ischemic optic neuropathy), hearing loss, priapism, sickle cell crisis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly, bioavailability (40%) |
| **Distribution** | Unknown |
| **Metabolism** | Liver (active metabolites) |
| **Excretion** | Feces, urine |
| **Half-life** | 4 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | ½-1½ hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol, amLODIPine: decreased B/P
Bosentan, rifampin, carBAMazepine, dexamethasone, phenytoin, nevirapine, rifabutin, troglitazone: decreased sildenafil levels
Cimetidine, erythromycin, itraconazole, ketoconazole, tacrolimus: increased sildenafil levels
Riociguat: Fatal fall in B/P, do not use together

### Drug classifications

Antacids, barbiturates, CYP450 inducers: decreased sildenafil levels
Antiretroviral protease inhibitors: increased sildenafil levels
α-Blockers, angiotensin II receptor blockers: decreased B/P
Nitrates: fatal fall in B/P; do not use together

### Drug/food

Grapefruit: increased product effect
High-fat meal: decreased absorption

## NURSING CONSIDERATIONS

### Assessment

- **Phosphodiesterase type 5 inhibitors with lopinavir/ritonavir (Kaletra):** assess for hypotension, visual changes, prolonged erection, syncope; give only 25 mg q48hr and monitor for adverse reactions
- For erectile dysfunction before use (Viagra), question about whether failure to achieve erection or failure to maintain intercourse, anorgasmia
- Identify organic nitrates that should not be used with this product
- Assess for any severe loss of vision while taking this or any similar products; these products should not be used if vision loss has occurred
- **Assess for MI, sudden death, CV collapse:** Those with an MI within 6 mo, resting hypotension <90/50, resting hypertension >170/100, fluid depletion should use this product cautiously, may occur right after sexual activity to days afterward
- **Sickle cell crisis (vasoocclusive crisis):** when used for pulmonary hypertension, may require hospitalization
- Cardiac status, hemodynamic parameters, exercise tolerance in pulmonary hypertension: B/P pulse (Revatio)
- **Pregnancy/breastfeeding:** Not indicated for women (Viagra), unknown in pulmonary hypertension, cautious use in breastfeeding (Revatio)

### Patient/family education
- Teach patient that product does not protect against STDs, including HIV
- Teach patient that product absorption is reduced with a high-fat meal, to take on empty stomach for faster absorption, to take 30 min to 4 hr before sexual activity, peak in 2 hr
- Teach patient that product should not be used with nitrates in any form or soluble guanylate cyclase stimulators (pulmonary hypertension: Riociguat)
- Teach patient that tab may be split
- Teach patient to notify prescriber immediately and stop taking product if vision loss occurs
- Do not use more often than 100 mg in 24 hr
- Teach patient to notify prescriber immediately and to stop taking product if vision/hearing loss occurs or erection lasts >4 hr
- Teach patient to use only as directed
- Advise patient that color change that is visualized may change

### Evaluation
**Positive therapeutic outcome**
- Ability to achieve and maintain an erection

## silodosin (Rx)
(si-lo′do-seen)
**Rapaflo**
*Func. class.:* Selective $\alpha_1$-adrenergic blocker, BPH agent
*Chem. class.:* Sulfamoylphenethylamine derivative

**ACTION:** Binds preferentially to $\alpha_{1A}$-adrenoceptor subtype located mainly in the prostate

**Therapeutic outcome:** Decreased symptoms of benign prostatic hyperplasia

**USES:** Symptoms of benign prostatic hyperplasia (BPH)

## CONTRAINDICATIONS
Hypersensitivity, renal failure, hepatic disease

**Precautions:** Pregnancy breastfeeding, children, renal/hepatic disease, females, hypotension, ocular surgery, orthostatic hypotension, prostate cancer, syncope, geriatric patients

## DOSAGE AND ROUTES
**Adult:** PO 8 mg/day with a meal; max 8 mg/day

### Renal dose
**Adult:** PO CCr 30-49 ml/min 4 mg/day; CCr <30 ml/min not recommended

**Available forms:** Tabs 8 mg

### Implementation
- Give with meal at same time of day
- Store at room temperature; protect from light and moisture

## ADVERSE EFFECTS
**CNS:** *Dizziness, headache,* asthenia, insomnia, syncope
**CV:** Orthostatic hypotension
**EENT:** Nasal congestion, rhinorrhea, sinusitis
**GI:** Diarrhea, abdominal pain, jaundice
**GU:** *Abnormal ejaculation,* priapism, urinary incontinence
**HEMA:** Purpura

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Decreased with high-fat/high-calorie meal |
| **Distribution** | Extensive protein binding 97% |
| **Metabolism** | Liver |
| **Excretion** | Urine |
| **Half-life** | 24 hr (metabolite) |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Drug classifications
CYP3A4 inhibitors (clarithromycin, itraconazole, ritonavir, anti-retroviral protease inhibitors, aprepitant, chloramphenicol, conivaptan, dalfopristin, danazol, delavirdine, efavirenz, fosaprepitant, fluconazole, fluvoxaMINE, imatinib, isoniazid, mifepristone, nefazodone, tamoxifen, telithromycin, troleandomycin, voriconazole, zileuton, zafirlukast): increased silodosin effect

### Drug/food
Grapefruit juice: increased silodosin effect

### Drug/lab test
Increased: LFTs

## NURSING CONSIDERATIONS
### Assessment
- **Prostatic hyperplasia:** assess for change in urinary patterns, baseline and throughout treatment, testing for prostate cancer prior to administration is recommended
- Monitor BUN, uric acid, urodynamic studies (urinary flow rates, residual volume), CCr, contraindicated in CCr <30 ml/min
- Assess I&O ratios, weight daily, edema, report weight gain or edema
- B/P, monitor for orthostatic hypotension
- **Pregnancy/breastfeeding:** Not indicated for women

### Patient/family education

- Caution patient not to drive or operate machinery until effect is known
- Advise patient not to use with grapefruit juice
- Teach patient to take with same meal each day, contents of capsule may be sprinkled on room-temperature applesauce if used within 5 min, follow with 8 oz of water

### Evaluation

**Positive therapeutic outcome**

- Decreased symptoms of benign prostatic hyperplasia

## simeprevir

(sim-e′pre-vir)

**Olysio**

*Chem. class.:* NS3/4A protease inhibitor

*Func. class.:* Antiviral, antihepatitis agent

**ACTION:** Prevents formation of mature viral proteins by inhibiting hepatitis C viral (HCV) replication by blocking proteolytic activity of the hepatitis C virus NS3/4A protease

**Therapeutic outcome:** Decreased symptoms of chronic hepatitis C

**USES:** Chronic hepatitis C infection, hepatitis, (HCV, genotype 1) in adults with compensated liver disease

## CONTRAINDICATIONS

Hypersensitivity, male-mediated teratogenicity, pregnancy in combination

**Precautions:** Pregnancy (alone), breastfeeding, Asian patients, liver transplant, UV exposure, hepatic disease, serious rash, children, hepatitis C and HIV coinfection

## DOSAGE AND ROUTES

### For the treatment of chronic hepatitis C infection, genotype 1, in patients with compensated liver disease

**Adult:** PO (with sofosbuvir) Treatment-naive and experienced: 150 mg q day with sofosbuvir X 12 wks (without cirrhosis), 24 wks (with cirrhosis); never give as monotherapy. If sofosbuvir is discontinued for any reason, then simeprevir must also be discontinued.

**Adult:** PO (with peginterferon alfa and ribavirin) Treatment-naive and prior relapse adults with or without cirrhosis (Child-Pugh A) who are HIV-negative 150 mg q day with peginterferon alfa and ribavirin, for an initial 12 wks; never administer simeprevir as monotherapy. After the initial 3-drug regimen, give an additional 12 wks of only peginterferon alfa and ribavirin (24 wks for total course); Treatment-naive and prior relapse adults with HIV coinfection and cirrhosis (Child-Pugh A) 150 mg q day with peginterferon alfa and ribavirin, for an initial 12 wks of treatment; never administer simeprevir as monotherapy. After the initial 3-drug regimen, give an additional 36 wks of only peginterferon alfa and ribavirin (48 wks for total course); Adult prior nonresponders (including partial and null responders) with or without cirrhosis (Child-Pugh A) and with or without HIV coinfection 150 mg q day with peginterferon alfa and ribavirin, for an initial 12 wks; never give simeprevir as monotherapy. After the initial 3-drug regimen, give an additional 36 wks of only peginterferon alfa and ribavirin (48 wks for total course).

### For the treatment of chronic hepatitis C infection, genotype 4, in patients with compensated liver disease

**Adult:** PO Treatment-naive and prior relapse adults with or without cirrhosis (Child-Pugh A) who are HIV-negative 150 mg q day with peginterferon alfa and ribavirin for an initial 12 wks; never administer simeprevir as monotherapy. After the initial 3-drug regimen, give an additional 12 wks of only peginterferon alfa and ribavirin (24 wks for total course): Treatment-naive and prior relapse adults with HIV coinfection but without cirrhosis 150 mg q day with peginterferon alfa and ribavirin for an initial 12 wks; never administer simeprevir as monotherapy. After the initial 3-drug regimen, give an additional 12 wks of only peginterferon alfa and ribavirin (24 wks for total course).

Treatment-naive and prior relapse adults with HIV coinfection and cirrhosis (Child-Pugh A) 150 mg q day with peginterferon alfa and ribavirin for an initial 12 wks of treatment; never give simeprevir as monotherapy. After the initial 3-drug regimen, give an additional 36 wks of only peginterferon alfa and ribavirin (48 wks for total course); Adult prior nonresponders (including partial and null responders) with or without cirrhosis (Child-Pugh A) and with or without HIV coinfection

150 mg q day with peginterferon alfa and ribavirin for an initial 12 wks; never administer simeprevir as monotherapy. After the initial 3-drug regimen, give an additional 36 wks of

only peginterferon alfa and ribavirin (48 wks for total course).

**For the treatment of recurrent hepatitis C infection in patients after liver transplantation (unlabeled), including those with compensated cirrhosis**

**Adult:** PO 150 mg q day with sofosbuvir with or without ribavirin for 12 to 24

### Hepatic disease

No dosage adjustments are needed for mild hepatic impairment (Child-Pugh Class A). Avoid use in patients with moderate or severe hepatic impairment (Child-Pugh Class B or C

**Available forms:** Cap 150 mg

### Implementation

- Give by mouth with food, swallow whole
- Do not use monotherapy; if peginterferon alfa or ribavirin is discontinued, discontinue simeprevir and do not restart
- Obtain NS3 Q80K polymorphism test before starting treatment
- Treatment-naïve/prior relapse: after initial 3-drug treatment, give another 12 wk with peginterferon alfa and ribavirin × another 12 wk; if HCV RNA concentrations ≥25 interstitial units/ml, discontinue all 3 drugs
- Prior nonresponders (partial/null): after initial 3-drug treatment give an additional 36 wk of peginterferon alfa and ribavirin; monitor HCV RNA at wk 4, 12, 24; if ≥25 interstitial units/ml, discontinue products

## ADVERSE EFFECTS

**EENT:** Blurred vision, conjunctivitis
**GI:** Hyperbilirubinemia, nausea, hepatotoxicity
**INTEG:** Exfoliative dermatitis, pruritus, *photosensitivity*, vasculitis
**MISC:** *Rash, dyspnea, myalgia, pruritus*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 99.9 % protein binding |
| **Metabolism** | Primarily by CYP3A4, also a mild inhibitor of intestinal CYP3A4 and CYP1A2 |
| **Excretion** | 91% feces |
| **Half-life** | 40 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Bromocriptone, chloramphenicol, cimetidine, dalfopristin/quinupristin, danazol, erythromycin, FLUoxetine, isoniazid, lanreotide, octreotide, zafirlukast: increased simeprevir effect

### Drug/herb

Increase: Simeprevir effect: milk thistle

### Drug classifications

CYP3A4 inhibitors (clarithromycin, cobicistat, delavirdine, darunavir/ritonavir, erythromycin, fluconazole, posaconazole, ritonavir, telithromycin, voriconazole): increased effects of these agents

### Drug/Lab

Increase: Bilirubin, alkaline phosphatase amylase
CYP3A4 inducers (carBAMazepine, dexamethasone, PHENobarbital, OXcarbazepine, phenytoin, rifAMPin, efavirenz, etravirine)
Decrease: Simeprevir effect

## NURSING CONSIDERATIONS

### Assessment

- Allergic reaction: assess for rash, pruritus, exfoliative dermatitis, assess for sulfa allergy, contains sulfa
- **Asian patients:** levels may be 3-fold to 4-fold higher
- **Pregnancy:** if planned or suspected; if pregnant call the Pregnancy Registry 800-258-4263, obtain pregnancy test before using do not use in pregnancy
- Liver function tests: Monitor HCV, RNA concentrations at weeks 4, 12, and 24 and at end of treatment; if bilirubin is 2.5 times UNL and other LFTs are increased, discontinue treatment
- HBV reactivation: Test required before beginning treatment, monitor throughout treatment
- HCV infection: Test for HCV; if phenotype 1a or being treated with peg-interferon alfa and HBV, test for N53Q80K, if positive do not use

**BLACK BOX WARNING:** Hepatitis B exacerbation: Assess for liver toxicity, yellow eyes, skin, fatigue, weakness, anorexia, nausea, vomiting, clay-colored stools

### Patient/family education

- Teach patient that optimal duration of treatment is unknown, that product is not a cure, that transmission may still occur
- Teach patient to avoid use with other medications unless approved by prescriber
- Teach patient to use protective clothing, sunscreen; photosensitivity may occur and can be severe

S

• Teach patient not to stop abruptly unless directed; worsening of hepatitis may occur
• Teach patient to notify prescriber if pregnancy is planned or suspected, avoid breastfeeding; use 2 reliable forms of contraception, do not try to conceive for at least 6 mo after discontinuation of this drug combination
• Teach patient to use cautiously in sulfonamide allergy; do not take the drug as single agent; must use as combination therapy
• Teach patient to report rash, swelling of face, lips, mouth sores, poor appetite, yellow eyes or skin

### Evaluation

**Positive therapeutic outcome**
• Decreased symptoms of chronic hepatitis C

## silver nitrate 1% ophthalmic
*See Appendix B*

## silver nitrate sulfacetamide sodium ophthalmic
*See Appendix B*

## silver sulfADIAZINE topical
*See Appendix B*

## RARELY USED

## simethicone (Rx, OTC)
(si-meth'i-kone)
**Barriere, Gas Relief, Gas-Relief, Gas-X, Mylanta Gas, Mylanta Gas Relief, Mylicon, Ovol, Phazyme**
*Func. class.:* Antiflatulent

**USES:** Flatulence

### CONTRAINDICATIONS
Hypersensitivity, GI obstruction/perforation

### DOSAGE AND ROUTES
**Adult and child >12 yr:** PO 40-125 mg after meals and at bedtime prn, max 500 mg/day
**Child 2-12 yr:** PO 40 mg after meals and at bedtime prn, max 240 mg/day
**Child <2 yr:** PO 20 mg qid prn

## simvastatin (Rx)
(sim-va-stat'in)
**Zocor**
*Func. class.:* Antilipidemic
*Chem. class.:* HMG-CoA reductase inhibitor

**Do not confuse:** Zocor/Cozaar/Zoloft

**ACTION:** Inhibits HMG-CoA reductase enzyme, which reduces cholesterol synthesis; this enzyme is needed for cholesterol production

**Therapeutic outcome:** Decreasing cholesterol levels and LDLs, increased HDLs

**USES:** As an adjunct in primary hypercholesterolemia (types IIa, IIb), isolated hypertriglyceridemia (Frederickson type IV) and type III hyperlipoproteinemia, CAD, heterozygous familial hypercholesterolemia; MI/stroke prophylaxis

### CONTRAINDICATIONS
Pregnancy, breastfeeding, hypersensitivity, active liver disease

**Precautions:** Past liver disease, alcoholism, severe acute infections, trauma, severe metabolic disorders, electrolyte imbalances, Chinese patients

### DOSAGE AND ROUTES
**Adult:** PO 20-40 mg/day in PM initially, usual range 5-40 mg/day daily in PM max, 40 mg/day for most patients; max 80 mg/day (for patients taking 80 mg/day chronically without myopathy); dosage adjustments may be made at 4-wk intervals or more; those taking verapamil and amiodarone max 20 mg/day, max <80 mg for Chinese patients taking lipid-modifying niacin doses

#### With diltiazem/verapamil
**Adult:** PO 5-10 mg q PM, max 10 mg/day with amiodarone/amLODIPine/ranolazine
**Adult:** PO 5-20 mg q PM, max 20 mg/day
**Child and adolescent ≥10 yr including girls ≥1 yr postmenarche:** PO 10 mg q PM, range 10-40 mg/day

#### With amiodarone, amLODIPine, ranolazine
**Adult:** PO 5-20 mg/day in evening, max 20 mg/day

#### Heterozygous familial hypercholesterolemia
**Adult:** PO 40 mg qday in evening; make dosage adjustments q4wk

**Heterozygous familial hypercholesterolemia in boys and postmenarchal girls**
**Child 10-17 yr:** PO 10 mg qday in the evening, max 40 mg/day

**Renal dose**
**Adult:** PO 5 mg qday in the evening (severe renal disease)

**Available forms:** Tabs 5, 10, 20, 40, 80 mg

### Implementation
- Give 30 min before AM and PM meals
- Store in cool environment in tight container protected from light
- Discontinuing use before surgery is recommended in renal failure, restart afterward

## ADVERSE EFFECTS
**CNS:** Headache, cognitive impairment
**GI:** Nausea, constipation, diarrhea, dyspepsia, flatus, abdominal pain, liver dysfunction, pancreatitis, hyperglycemia
**INTEG:** Rash, pruritus
**MS:** Muscle cramps, myalgia, myositis, rhabdomyolysis, myopathy
**RESP:** Upper respiratory tract infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 85% |
| **Distribution** | Unknown |
| **Metabolism** | Liver—extensively |
| **Excretion** | 70% feces, 20% kidneys |
| **Half-life** | 3 hr |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Individual drugs
Clarithromycin, clofibrate, cycloSPORINE, erythromycin, gemfibrozil, itraconazole, ketoconazole, niacin, danazol, delavirdine, nefazodone, verapamil, diltiazem, amiodarone, azole antifungals, telithromycin: increased myalgia, myositis, rhabdomyolysis
CycloSPORINE, gemfibrozil: do not use with simvastatin
Digoxin: increased digoxin levels
Warfarin: increased risk of bleeding

### Drug classifications
Macrolide antiinfectives, protease inhibitors: increased myalgia, myositis, rhabdomyolysis
Increased: simvastatin effect ATP1B1 inhibitors

### Drug/herb
Red yeast rice, kava; eucalyptus: increased simvastatin effect
St. John's wort: decreased effect

### Drug/food
Increased: simvastatin level: grapefruit juice (large amounts)

### Drug/lab test
Increased: CPK, liver function tests, HbA1C, ALT/AST

## NURSING CONSIDERATIONS
### Assessment
- Assess nutrition: fat, protein, carbohydrates; nutritional analysis should be completed by dietitian before treatment is initiated
- **Rhabdomyolysis:** assess for muscle tenderness, increased CPK levels 10× ULN; therapy should be discontinued, more likely in those receiving >80 mg/day, first year of treatment, those ≥65 yr, females
- **Chinese patients:** Avoid high doses (80 mg) if taking niacin >1 g/day, may increase myopathy
- Monitor bowel pattern daily; diarrhea may be a problem
- Monitor triglycerides, cholesterol baseline, throughout treatment; LDL, HDL, triglycerides and cholesterol should be watched closely at 6-8 wk and q6mo; if increased, product should be discontinued

### Patient/family education
- Inform patient that compliance is needed for positive results to occur, not to double doses
- Advise patient to lower risk factors: high-fat diet, smoking, alcohol consumption, absence of exercise, smoking cessation
- Advise patient to notify prescriber of planned or suspected
- Teach patient to take in evening
- Teach patient to report muscle pain, weakness, abdominal pain, dark urine, yellowing of skin or eyes, memory loss

### Evaluation
**Positive therapeutic outcome**
- Decreased cholesterol levels, serum triglycerides and improved ratio with HDLs

**HIGH ALERT**

## sirolimus (Rx)
(seer-roe'li-mus)
**Rapamune**
*Func. class.:* Immunosuppressant
*Chem. class.:* Macrolide

**ACTION:** Produces immunosuppression by inhibiting T-lymphocyte activation and proliferation

**Therapeutic outcome:** Prevention of rejection in organ transplant

## USES:
Organ transplants: to prevent rejection, recommended use is with cycloSPORINE and corticosteroids

## CONTRAINDICATIONS
Breastfeeding, hypersensitivity to this product or to components of the product

**Precautions:** Pregnancy, children <13 yr, severe cardiac/renal/hepatic disease, diabetes mellitus, hyperkalemia, hyperuricemia, hypertension, interstitial lung disease, hyperlipidemia, soy lecithin hypersensitivity

**BLACK BOX WARNING:** Lymphomas, infection, other malignancies, liver/lung transplant, requires a specialized setting, requires an experienced clinician

## DOSAGE AND ROUTES
**Adult/adolescent ≥40 kg:** PO 2 mg daily with 6 mg loading dose
**Child >13 yr <40 kg (88 lb):** PO 1 mg/m$^2$/day, 3 mg/m$^2$/loading dose

### Hepatic dose
**Adult and child ≥13 yr <40 kg:** PO reduce by 33% in maintenance dose (mild to moderate hepatic impairment); reduce by 50% in maintenance dose (severe hepatic impairment)

**Available forms:** Oral sol 1 mg/ml; tabs 0.5, 1, 2 mg

### Implementation
- Administer prophylaxis for *Pneumocystis jiroveci* pneumonia for 1 yr after transplantation; prophylaxis for cytomegalovirus (CMV) is recommended for 90 days after transplantation in those at increased risk for CMV
- Use amber oral dose syringe and withdraw amount of oral sol needed from the bottle, empty correct dose into plastic/glass container holding 60 ml of water/orange juice, stir vigorously and have patient drink at once, refill container with additional 120 ml of water/orange juice, stir vigorously, and have patient drink at once; if using a pouch squeeze entire contents into container and follow preceding directions
- Give all medications PO if possible; avoid IM inj because bleeding may occur
- Give for 3 days before transplant surgery; patients should be placed in protective isolation, give at same time of day, give 4 hr after cycloSPORINE oral sol or caps, do not use with grapefruit juice
- Store protected from light; refrigerate; stable for 24 months

**BLACK BOX WARNING:** Only those experienced in immunosuppressant therapy and transplant should use this drug; must use in a specialized care setting with adequate medical equipment

## ADVERSE EFFECTS
**CNS:** *Tremors, headache, insomnia,* paresthesia, chills, fever
**CV:** Hypo/hypertension, atrial fibrillation, HF, palpitations, tachycardia, peripheral edema, thrombosis
**EENT:** Blurred vision, photophobia
**GI:** Nausea, vomiting, diarrhea, constipation, hepatotoxicity
**GU:** UTI, albuminuria, hematuria, proteinuria, renal failure, nephrotic syndrome
**HEMA:** Anemia, thrombocytopenia purpura, leukopenia, pancytopenia
**INTEG:** *Rash, acne,* photosensitivity
**META:** Increased creatinine, edema, hypercholesterolemia, *hyperlipemia,* hypophosphatemia, weight gain, hyperglycemia, hypo/hyperkalemia, hyperuricemia, hypomagnesemia, hypertriglyceridemia
**MS:** Arthralgia
**RESP:** Pleural effusion, atelectasis, *dyspnea,* pneumonitis, pulmonary embolism/fibrosis
**SYST:** Lymphoma, exfoliative dermatitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | 92% protein binding |
| **Metabolism** | Liver; extensively by CYP3A4 enzyme system |
| **Excretion** | Unknown |
| **Half-life** | 57-63 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr single dose, 2 hr multiple dosing |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
Bromocriptine, cimetidine, cycloSPORINE, danazol, erythromycin, metoclopramide: increased blood level

CarBAMazepine, PHENobarbital, phenytoin, rifamycin, rifapentine: decreased blood levels

### Drug classifications

ACE inhibitors, angiotensin II receptor antagonists, cephalosporins, iodine-containing radiopaque contrast media, neuromuscular blockers, NSAIDs, penicillins, salicylates, thrombolytics: increased angioedema

Antifungal agents, calcium channel blockers, HIV protease inhibitors: increased blood levels

Live virus vaccines: decreased effect of vaccines

### Drug/herb

St. John's wort: decreased sirolimus effect

### Drug/food

Food: alters bioavailability, use consistently with or without food

Grapefruit juice: do not use with grapefruit juice

### Drug/lab test

Increased: LFTs, alk phos, lipids, triglycerides, total cholesterol, BUN, creatinine, LDH, phosphate

Decreased: platelets, sodium

Increased or decreased: magnesium, glucose, calcium

## NURSING CONSIDERATIONS

### Assessment

- **Wound dehiscence and anastomotic disruption:** assess wound, vascular, airway, ureteral, biliary, inhibition of growth factors; do not combine with corticosteroids, not recommended in lung or liver transplant

**BLACK BOX WARNING:** Infection: Immunosuppression may lead to susceptibility to infection

**BLACK BOX WARNING:** Neoplastic disease: Lymphoma, skin cancer may occur, limit UV exposure, use protective clothing, sunscreen not recommended, mortality and graft loss may occur

- **Anaphylaxis, angioedema, exfoliative dermatitis:** assess for, more common when given with ACE inhibitors; do not use if a hypersensitivity reaction occurs
- **Bone marrow suppression:** Hgb, WBC, platelets monthly during treatment; if leukocytes are $<3000/mm^3$ or platelets $<100,000/mm^3$, product should be discontinued or reduced; decreased Hgb level
- Monitor blood levels in those who may have altered metabolism, trough levels $\geq 15$ ng/ml are associated with increased adverse reactions
- **Pulmonary fibrosis, pulmonary effusion, pneumonitis:** assess for dyspnea, cough, hypoxia; some fatal cases have occurred
- Monitor lipid profile: cholesterol, triglycerides; a lipid-lowering agent may be needed

**BLACK BOX WARNING:** Creatinine/BUN, CBC, serum potassium

- Assess for infection and development of lymphoma
- Only those experienced in immunosuppressant therapy and organ transplantation should use this product; use only in renal transplant
- **High risk:** those with Banff grade 3 acute rejection or vascular rejection prior to cycloSPORINE withdrawal, dialysis dependent, creatinine >4.5 mg/dl, African descent, re-transplant, multiorgan transplant, high panel of reactive antibodies
- **Hepatotoxicity:** alk phos, AST, ALT, amylase, bilirubin: dark urine, jaundice, itching, light-colored stools; product should be discontinued

### Patient/family education

- Instruct patient to report fever, rash, severe diarrhea, chills, sore throat, fatigue because serious infections may occur; clay-colored stools, cramping may indicate hepatotoxicity; fever, chills, sore throat (infection)
- Caution patient to avoid crowds or persons with known infections to reduce risk of infection
- Teach patient to use contraception before, during, and 12 wk after product has been discontinued, avoid breastfeeding
- Teach patient to use sunscreen, protective clothing to prevent burns
- Teach patient that lifelong use is required to prevent rejection
- Teach patient that continuing follow-up exams and blood work will be required
- Teach patient not to get on skin
- Teach patient how to use product
- Teach patient to take at same time, consistently, with or without regard to food
- Teach patient to take 4 hr after oral cycloSPORINE when used for renal transplant

### Evaluation

**Positive therapeutic outcome**

- Absence of graft rejection

**⚠ HIGH ALERT**

## sitaGLIPtin (Rx)

(sit-a-glip'tin)

**Januvia**

*Func. class.:* Antidiabetic, oral

*Chem. class.:* Dipeptidyl-peptidase-4 inhibitor (DPP-4 inhibitor)

**ACTION:** Slows the inactivation of incretin hormones; improves glucose homeostasis, improves glucose-dependent insulin secretion, lowers glucagon secretions and slows gastric emptying time

**Therapeutic outcome:** Decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait; blood glucose at normal level

**USES:** Type 2 diabetes mellitus as monotherapy or in combination with other antidiabetic agents

## CONTRAINDICATIONS

Angioedema, diabetic ketoacidosis (DKA)

**Precautions:** Pregnancy, geriatric, hypersensitivity, GI obstruction, thyroid disease, surgery, renal/hepatic disease, trauma, breastfeeding, pancreatitis, hypercortisolism, hyperglycemia, hyperthyroidism, hypoglycemia, ileus, pituitary insufficiency, surgery, type 1 diabetes mellitus, adrenal insufficiency, burns, diabetic ketoacidosis

## DOSAGE AND ROUTES

**Adult:** PO 100 mg/day; when used with a sulfonylurea or insulin

### Renal dose

**Adult:** PO CCr 30-50 ml/min 50 mg qd; CCr <30 ml/min 25 mg qd

**Available forms:** Tabs 25, 50, 100 mg

### Implementation

- May be taken with or without food
- Conversion from other antidiabetic agents; change may be made with gradual dosage change
- Store in tight container at room temperature
- Do not split, crush, chew, swallow whole

## ADVERSE EFFECTS

**CNS:** *Headache*
**ENDO:** Hypoglycemia
**GI:** *Nausea, vomiting,* abdominal pain, diarrhea, pancreatitis, constipation
**GU:** Acute renal failure
**MISC:** Peripheral edema
**SYST:** Anaphylaxis, Stevens-Johnson syndrome, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys, 79% unchanged |
| **Half-life** | Terminal 12.4 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

ARIPiprazole, cloZAPine, fosphenytoin, OLANZapine, phenytoin, QUEtiapine, risperiDONE, ziprasidone: decreased antidiabetic effect
Cimetidine, disopyramide: increased sitaGLIPtin level
Cimetidine, FLUoxetine: increased hypoglycemia
Digoxin: increased levels of digoxin

### Drug classifications

ACE inhibitors, estrogens, oral contraceptives, progestins, phenothiazines, protease inhibitors, sympathomimetics, thiazide diuretics: decreased antidiabetic effect
Androgens, β-blockers, corticosteroids, fibric acid derivatives, insulins, MAOIs, salicylates, sulfonylureas: increased hypoglycemia

### Drug/herb

Garlic, green tea, horse chestnut: increased antidiabetic effect

### Drug/lab test

Increased: creatinine, LFTs

## NURSING CONSIDERATIONS

### Assessment

- **Hypoglycemic reactions:** assess for sweating, weakness, dizziness, anxiety, tremors, hunger, hyperglycemic reactions soon after meals
- Monitor CBC (baseline, q3mo) during treatment; check liver function tests periodically, AST, LDH, renal studies: BUN, creatinine during treatment; Hgb A1c
- Monitor blood glucose (BG) as needed
- **Serious skin reactions:** assess for swelling of face, mouth, lips, dyspnea, wheezing
- **Pancreatitis:** assess for severe abdominal pain, nausea, vomiting; discontinue product
- **Renal studies:** monitor BUN, creatinine during treatment, especially in geriatrics or those with renal disease
- Monitor hemoglobin A1C; monitor blood glucose as needed

### Patient/family education

- Teach patient to use regular self-monitoring of blood glucose using blood glucose meter
- Teach patient the symptoms of hypo/hyperglycemia, what to do about each
- Teach patient that product must be continued on daily basis; explain consequence of discontinuing product abruptly
- Teach patient to notify prescriber if pregnancy is planned or suspected; to continue health regimen (diet, exercise)
- Advise patient to avoid OTC medications, alcohol, digoxin, exenatide, insulins, nateglinide, repaglinide, and other products that lower blood sugar, unless approved by prescriber
- Teach patient that diabetes is a lifelong illness; that this product is not a cure, only controls symptoms
- Teach patient that all food included in diet plan must be eaten to prevent hypo/hyperglycemia
- Teach patient to carry emergency ID
- Teach patient to notify prescriber immediately of hypersensitivity reactions (rash, swelling of face, trouble breathing)
- Advise patient to report severe joint pain immediately, may have a late onset

### Evaluation

**Positive therapeutic outcome**

- Decrease in polyuria, polydipsia, polyphagia; clear sensorium; absence of dizziness; stable gait, blood glucose, A1C improvement

## sodium bicarbonate (Rx, OTC)

**baking soda, Brosch-Neut, Citrocarbonate, Neut, Sellymin**

*Func. class.:* Alkalinizer; antacid

*Chem. class.:* $NaHCO_3$

**ACTION:** Orally neutralizes gastric acid, which forms water, NaCl, $CO_2$; increases plasma bicarbonate, which buffers $H^+$ ion concentration; reverses acidosis **IV**

**Therapeutic outcome:** Correction of acidosis, gastric acid neutralization

**USES:** Acidosis (metabolic), cardiac arrest, alkalinization (systemic/urinary); antacid (PO); salicylate poisoning

## CONTRAINDICATIONS

Respiratory/metabolic alkalosis, hypochloremia, hypocalcemia

**Precautions:** Pregnancy, HF, cirrhosis, toxemia, renal disease, hypertension, hypokalemia, breastfeeding, hypernatremia, Bartter's syndrome, Cushing's syndrome, hyperaldosteronism, children

## DOSAGE AND ROUTES

### Acidosis, metabolic (not associated with cardiac arrest)

**Adult and child:** **IV** INF 2-5 mEq/kg over 4-8 hr depending on $CO_2$, pH, ABGs

### Cardiac arrest

**Adult and child:** **IV** BOL 1 mEq/kg of 7.5% or 8.4% SOL, then 0.5 mEq/kg q5-10min, then doses based on ABGs

**Infant:** **IV** 1 mEq/kg over several min (use only the 0.5 mEq/ml [4.2%] sol for inj)

### Alkalinization of urine

**Adult:** PO 325 mg-2 g qid or 48 mEq/kg (4 g), then 12-24 mEq q4hr

**Child:** PO 84-840 mg/kg/day (1-10 mEq/kg), in divided doses q4-6hr

### Antacid

**Adult:** PO 300 mg-2 g chewed, taken with water daily-qid

**Available forms:** Tabs 300, 325, 600, 650 mg; inj 4.2%, 5%, 7.5%, 8.4%

### Implementation

**PO route**

- Antacid tab must be chewed and taken with 8 oz of water
- Dissolve effervescent tab in water
- May be used to neutralize gastric acid in peptic ulcer disease, given 1 and 3 hr after meals and at bedtime

**Direct IV route**

- Use in cardiac emergencies, use ampules or prefilled syringes only, give by rapid bolus dose, flush with 0.9% NaCl before and after use

**Continuous IV infusion route**

- Prepared sol or diluted in an equal amount of any dextrose/saline combination; administer 2-5 mEq/kg over 4-8 hr, max 50 mEq/hr; slower rate in children

**Y-site compatibilities:** Acyclovir, amifostine, asparaginase, aztreonam, bivalirudin, bumetanide, cefepime, cefmetazole, cefTRIAXone, chloramphenicol, cyclophosphamide, cytarabine, DAUNOrubicin, dexamethasone, DOXOrubicin, etoposide, famotidine, fentaNYL, filgrastim, fluconazole, fludarabine, furosemide, gallium nitrate, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, ifosfamide, indomethacin, insulin, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, melphalan,

S

mesna, meperidine, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, milrinone, morphine, nafcillin, nitroglycerin, nitroprusside, PACLitaxel, palonosetron, pantoprazole, PEMEtrexed, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, propofol, propranolol, protamine, ranitidine, remifentanil, tacrolimus, teniposide, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, tolazoline, vasopressin, vitamin B complex with C, voriconazole

**Y-site incompatibilities:** Allopurinol, amiodarone, amphotericin B, amphotericin B cholesteryl sulfate complex, ampicillin, anidulafungin, calcium chloride, calcium gluconate, caspofungin, cefotaxime, cefOXitin, cefuroxime, diazepam, diphenhydrAMINE, DOBUTamine, DOXOrubicin liposome, doxycycline, EPINEPHrine, fenoldopam, ganciclovir, haloperidol, hydrOXYzine, IDArubicin, imipenem/cilastatin, inamrinone, isoproterenol, lansoprazole, leucovorin, midazolam, nalbuphine, norepinephrine, ondansetron, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, sargramostim, trimethoprim/sulfamethoxazole, verapamil, vinCRIStine, vinorelbine

## ADVERSE EFFECTS

**CNS:** Irritability, headache, confusion, stimulation, tremors, *twitching, hyperreflexia,* tetany, weakness, seizures caused by alkalosis
**CV:** Irregular pulse, cardiac arrest, water retention, edema, weight gain
**GI:** Flatulence, *belching, distention*
**GU:** Calculi
**META:** *Alkalosis*
**MS:** Muscular twitching, tetany, irritability

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Widely distributed—extracellular fluids |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | 2 min | Rapid |
| **Peak** | ½ hr | Rapid |
| **Duration** | 1-3 hr | Unknown |

## INTERACTIONS

### Individual drugs

ChlorproPAMIDE, lithium: decreased effect of each specific product
Flecainide, mecamylamine, pseudoephedrine, quiNIDine, quiNINE: increased effects of each specific product

### Drug classifications

Amphetamines, anorexiants, sympathomimetics: increased effects of each specific product
Barbiturates: decreased effects of barbiturates
Benzodiazepines: decreased effects of each specific product
Corticosteroids: increased sodium; decreased potassium, decreased effects of corticosteroids
Ketoconazoles: decreased effects of ketoconazoles
Salicylates: decreased effect of salicylates

### Drug/herb

Oak bark: decreased action of sodium bicarbonate

### Drug/lab test

Increased: sodium, lactate
Decreased: potassium

## NURSING CONSIDERATIONS

### Assessment

- Assess respiratory and pulse rate, rhythm, depth, lung sounds; notify prescriber of abnormalities
- Assess for $CO_2$ in GI tract; may lead to perforation if ulcer is severe
- **Fluid balance** (I&O ratio, weight daily, edema); notify prescriber of fluid overload, assess for edema, crackles, SOB
- Monitor electrolytes, blood pH, $PO_2$, $HCO_3$ during beginning treatment; ABGs frequently during emergencies
- Monitor extravasation with **IV** administration (tissue sloughing, ulceration, and necrosis)
- **Alkalosis:** irritability, confusion, twitching, hyperreflexia, stimulation, slow respirations, cyanosis, irregular pulse
- **Milk-alkali syndrome**: confusion, headache, nausea, vomiting, anorexia, urinary stones, hypercalcemia
- **Pregnancy/breastfeeding:** Use as an antacid is considered unsafe, may breastfeed

### Patient/family education

- Instruct patient to chew antacid tab and drink 8 oz of water; not to take antacid with milk because milk-alkali syndrome may result; not to use antacid for more than 2 wk
- Advise patient to notify prescriber if indigestion is accompanied by chest pain; trouble breathing; diarrhea; dark, tarry stools; vomit that looks like coffee grounds; swelling of feet/ankles
- Teach patient about sodium-restricted diet; to avoid use of baking soda for indigestion

### Evaluation

**Positive therapeutic outcome**
- ABGs, electrolytes, blood pH, $HCO_3$ normal levels
- Decreased gastric pain

## sodium biphosphate/ sodium phosphate (OTC)

**Fleet Enema, Phospho-soda**

*Func. class.:* Laxative, saline

**ACTION:** Increases water absorption in the small intestine by osmotic action; laxative effect occurs by increased peristalsis and water retention

**Therapeutic outcome:** Absence of constipation

**USES:** Constipation, bowel or rectal preparation for surgery, examination

## CONTRAINDICATIONS

Hypersensitivity, rectal fissures, abdominal pain, nausea/vomiting, appendicitis, acute surgical abdomen, ulcerated hemorrhoids, Na-restricted diets, renal failure, hyperphosphatemia, hypocalcemia, hypokalemia, hypernatremia, Addison's disease, HF, ascites, bowel perforation, megacolon, imperforate anus

**BLACK BOX WARNING:** GI obstruction, renal failure

**Precautions:** Pregnancy

**BLACK BOX WARNING:** Colitis, elderly, hypovolemia, renal disease

## DOSAGE AND ROUTES

**Adult:** PO 20-30 ml (Phospho-soda)
**Child:** PO 5-15 ml (Phospho-soda)
**Adult and child >12 yr:** RECT enema (118 ml)
**Child 2-12 yr:** RECT ½ enema (59 ml)

**Available forms:** Enema 7 g/phosphate and 19 g/biphosphate/118 ml; oral sol 18 g phosphate/48 g biphosphate/100 ml

### Implementation

**PO route**
- Give on empty stomach
- Mix oral sol in cold water
- Take alone for better absorption; do not take within 1 hr of other products

## ADVERSE EFFECTS

**CV:** Dysrhythmias, cardiac arrest, hypotension, widening QRS complex
**GI:** *Nausea, cramps,* diarrhea
**META:** Electrolyte, fluid imbalances

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Up to 20% (rec) |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics

| | PO | Rect |
|---|---|---|
| **Onset** | ½-3 hr | 5 min |
| **Peak** | Unknown | Unknown |
| **Duration** | Unknown | Unknown |

## NURSING CONSIDERATIONS

### Assessment
- Assess stools: color, amount, consistency
- Assess for bowel pattern, bowel sounds (frequency, intensity), flatulence, distention, increased temp, dietary patterns (fluid, bulk), exercise
- Assess for cramping, rectal bleeding, nausea, vomiting; if these symptoms occur, product should be discontinued

### Patient/family education
- Advise patient not to use laxatives or enema for long-term therapy; bowel tone will be lost
- Teach patient that normal bowel movements do not always occur daily
- Caution patient not to use in presence of abdominal pain, nausea, vomiting
- Caution patient to notify prescriber if constipation is unrelieved or if symptoms of electrolyte imbalance occur: muscle cramps, pain, weakness, dizziness, excessive thirst
- Instruct patient to maintain adequate fluid consumption to help prevent constipation

### Evaluation

**Positive therapeutic outcome**
- Decrease in constipation

## sodium polystyrene sulfonate (Rx)

(po-lee-stye'reen)

**Kalexate, Kayexalate, K-Exit, Kionex, SPS**

*Func. class.:* Potassium-removing resin
*Chem. class.:* Cation exchange resin

**ACTION:** Removes potassium by exchanging sodium for potassium in body; occurs primarily in large intestine

**Therapeutic outcome:** Potassium levels within accepted range

**USES:** Hyperkalemia in conjunction with other measures

## CONTRAINDICATIONS

Hypersensitivity to saccharin or parabens that may be in some products; GI obstruction, neonate (reduced gut motility)

**Precautions:** Pregnancy, geriatric, renal failure, HF, severe edema, severe hypertension, sodium restriction, constipation, GI bleeding, hypocalcemia

## DOSAGE AND ROUTES

**Adult:** PO 15 g daily-qid; RECT enema 30-50 q1-2hr initially prn, then q6hr prn
**Child (unlabeled):** PO 1 g/kg q6hr prn; RECT 1 g/kg q2-6hr prn

**Available forms:** Powder for susp 453.6 g, 454 g; oral susp 15 g/60 ml

### Implementation

**PO route**

• Powdered resin: Usually given orally as a suspension in water or in a syrup. Usually, the amount of fluid ranges 20-100 ml, depending on the dose, or 3-4 ml per g of resin. Suspensions should be freshly prepared and not stored for longer than 24 hr. The suspension may also be introduced into the stomach via a tube or the powdered resin may be mixed with the patient's food; the powder should not be mixed with foods or liquids that contain a large amount of potassium (bananas or orange juice)

**Rectal route**

• Precede retention enema with a cleansing enema; instruct patient to lie down on left side with lower leg extended and the upper leg flexed for support or place the patient in the knee-chest position. Gently insert a soft, large (French 28) rubber tube into the rectum for a distance of about 20 cm; the tip should be well into the sigmoid colon. Tape the tube in place. Suspend the sodium polystyrene sulfonate powdered resin in 100 ml of an aqueous vehicle (water or sorbitol) which has been warmed to body temperature and introduce through the tube by gravity. The particles should be kept suspended by stirring the suspension during administration. Alternatively, 120-180 ml of a commercially available suspension may be administered as a retention enema after the suspension has been warmed to body temperature. Following administration, flush the tube with 50-100 ml of fluid and clamp the tube and leave in place. The suspension should be retained in the colon for at least 30-60 min or for several hours, if possible

• After several hours have passed, administer a cleansing enema using a nonsodium containing solution at body temperature. Up to 2 quarts of fluid may be necessary. Drain fluid through a Y-tube connection. Observe the drainage if sorbitol was used

## ADVERSE EFFECTS

**GI:** *Constipation,* anorexia, nausea, vomiting, diarrhea (sorbitol), *fecal impaction,* gastric irritation
**META:** Hypocalcemia, hypokalemia, hypomagnesemia, sodium retention

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | None |
| **Distribution** | None |
| **Metabolism** | None |
| **Excretion** | Feces |
| **Half-life** | Unknown |

### Pharmacodynamics

| | PO | Rect |
|---|---|---|
| **Onset** | 2-12 hr | 2-12 hr |
| **Peak** | Unknown | Unknown |
| **Duration** | 6-24 hr | 4-6 hr |

## INTERACTIONS

### Individual drugs

Sorbitol: increased colonic necrosis, do not use concurrently
Lithium: decreased effect of lithium

### Drug classifications

Diuretics (loop), cardiac glycosides: increased hypokalemia
Magnesium/calcium antacids: increased metabolic acidosis
Thyroid hormones: decreased effect of thyroid hormones

## NURSING CONSIDERATIONS

### Assessment

• Assess bowel function daily: amount of stool, color, characteristics
• Assess for hypotension: confusion, irritability, muscular pain, weakness
• Hyperkalemia: assess for confusion, dyspnea, weakness, dysrhythmias
• Monitor electrolytes: potassium, sodium, calcium, magnesium; I&O ratio, weight daily
• Monitor ECG for spiked T-waves, depressed ST segments, prolonged QT interval, and widening QRS complex
• Monitor I&O ratio, weight daily, crackles, dyspnea, jugular vein distention, edema

• Monitor for digoxin toxicity (nausea, vomiting, blurred vision, anorexia, dysrhythmia) in those receiving digoxin

### Patient/family education

• Explain reason for medication and expected results
• Teach patient to avoid laxatives, antacids, electrolyte-based products unless approved by prescriber
• Teach patient to use a low-potassium diet, provide sample diet

### Evaluation

**Positive therapeutic outcome**
• Potassium level 3.5-5 mg/dl

## sofosbuvir

(soe-fos′bue-vir)
**Sovaldi**
*Func. class.:* Antiviral, antihepatitis agent
*Chem. class.:* Adenosine monophosphate analog

**ACTION:** Inhibits hepatitis C virus RNA polymerase by incorporating the polymerase into the viral RNA, also acts as a chain terminator

**Therapeutic outcome:** Decreased symptoms of chronic hepatitis C

**USES:** Chronic hepatitis C (genotypes 1, 2, 3, 4) with compensated liver disease

## CONTRAINDICATIONS

Hypersensitivity, pregnancy in combination; male-mediated teratogenicity

**Precautions:** Pregnancy breastfeeding, children, hepatic/renal disease

**BLACK BOX WARNING:** Hepatitis B exacerbation

## DOSAGE AND ROUTES

### Genotype 1, 4

**Adult: PO** 400 mg/day with peginterferon alfa and ribavirin × 12 wk; may consider use for genotype 1 with ribavirin × 24 wk

### Genotype 2

**Adult: PO** 400 mg/day with ribavirin × 12 wk

### Genotype 3

**Adult: PO** 400 mg/day with ribavirin or daclatasvir × 24 wk

### Available forms: Tabs 400 mg

### Implementation

• Give by mouth without regard to food
• Do not use as monotherapy

## ADVERSE EFFECTS

**CNS:** Headache, chills, weakness, fatigue, fever, insomnia
**GI:** Diarrhea, hyperbilirubinemia
**MISC:** Rash, pruritus, neutropenia, anemia, myalgia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 61%-65% protein |
| **Metabolism** | Unknown |
| **Excretion** | By kidneys 80% |
| **Half-life** | 0.4-27 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | ½-2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

OXcarbazepine, rifabutin, rifapentine, tipranavir: decreased sofosbuvir effect, avoid concurrent use

### Drug classifications

P-glycoprotein (P-gp) inducers (carBAMazepine, PHENobarbital, phenytoin, rifampin): decreased sofosbuvir effect, avoid concurrent use

## NURSING CONSIDERATIONS

### Assessment

• Severe renal disease/eGFR <30 ml/min/1.73 $m^2$: monitor BUN, creatinine
• Monitor geriatric patients more carefully; may develop renal, cardiac symptoms more rapidly
• **Pregnancy:** if planned or suspected; if pregnant call the Pregnancy Registry 800-258-4263, obtain pregnancy test before starting treatment

**BLACK BOX WARNING:** Hepatitis B exacerbation: Monitor HBsAg, HBV DNA, hepatic enzymes, bilirubin

• **HBV reactivation:** Test is required before starting product, monitor throughout, monitor coinfected patients closely

### Patient/family education

• Teach patient that optimal duration of treatment is unknown, that product is not a cure, that transmission may still occur
• Instruct patient to avoid use with other medications unless approved by prescriber
• Instruct patient not to stop abruptly unless directed, worsening of hepatitis may occur
• **Pregnancy:** Teach patient to notify prescriber if pregnancy is planned or suspected,

S

use 2 forms of reliable contraception, avoid breastfeeding

**BLACK BOX WARNING:** Hepatitis B exacerbation: Notify prescriber immediately of liver toxicity: yellow eyes, skin, fatigue, weakness, loss of appetite, nausea/vomiting, light-colored stools

### Evaluation

**Positive therapeutic outcome**

- Therapeutic response: decreased symptoms of chronic hepatitis C

## sofosbuvir/velpatasvir

(soe-fosbue-vir/vel-patas-vir)

**Epclusa**

*Func. class.:* Antiviral, antihepatitis agent

**ACTION:** **Sofosbuvir:** A nucleotide prodrug that prevents hepatitis C viral (HCV) replication by inhibiting the activity of HCV NS5B RNA polymerase. It undergoes intracellular metabolism to form an active uridine analog triphosphate. Hepatitis C virus NS5B RNA polymerase incorporates this metabolite into the viral RNA, where it acts as a chain terminator. It does not inhibit human DNA or RNA polymerase, nor does it block mitochondrial RNA polymerase
**Velpatasvir:** Inhibits the HCV NS5A protein, which is required for viral replication

**Therapeutic outcome:** Decreased symptoms of chronic hepatitis C

**USES:** Treatment of chronic hepatitis C infection, including genotypes 1, 2, 3, 4, 5, and 6 in those without cirrhosis and in patients with compensated cirrhosis (Child-Pugh A); treatment of chronic hepatitis C infection in patients with decompensated cirrhosis (Child-Pugh B or C)

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Breastfeeding, hepatitis C and HIV coinfection, male-mediated teratogenicity, pregnancy, renal failure/impairment

**BLACK BOX WARNING:** Hepatitis B exacerbation

## DOSAGE AND ROUTES

**Treatment of chronic hepatitis C infection in patients without cirrhosis and in patients with compensated cirrhosis (Child-Pugh A)**

**Adult: PO** 1 tablet (400 mg sofosbuvir; 100 mg velpatasvir) qday × 12 wk

**Treatment of chronic hepatitis C infection in patients with decompensated cirrhosis (Child-Pugh B or C)**

**Adult: PO** 1 tablet (400 mg sofosbuvir; 100 mg velpatasvir) qday plus ribavirin × 12 wk. The dose of ribavirin is based on weight as follows: <75 kg give 500 mg bid; ≥75 kg 600 mg bid

**Available forms:** Tablet 400-100 mg

### Implementation:

- Take without regard to food
- If given with ribavirin, take ribavirin with food

## ADVERSE EFFECTS

**CNS:** *Fatigue, headache, insomnia,* depression, irritability, asthenia
**GI:** *Nausea, diarrhea*
**Hema:** Anemia
**Integ:** Rash
**Meta:** Hyperbilirubinemia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Sofosbuvir: 61%-65% protein binding; velpatasvir 99.5% protein binding |
| **Metabolism** | Sofosbuvir: Converted in the liver from the nucleotide prodrug to active nucleoside analog triphosphate<br>Velpatasvir: Metabolized by CYP2B6, CYP2C8, and CYP3A4 |
| **Excretion** | Sofosbuvir: Elimination via kidneys 80%, feces 14%, expired air 2.5%<br>Velpatasvir: Excretion in bile 77% of the parent drug, 95% feces, 0.4% urine |
| **Half-life** | Sofosbuvir: Half-life of 25 hr<br>Velpatasvir: Terminal elimination half-life 15 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Sofosbuvir: Peak 0.5-1 hr Velpatasvir: Peak 3 hr, increased by high-fat meal |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

CYP3A4 inducers (armodafinil, barbiturates, bexarotene, bosentan, carbamazepine, dexamethasone, efavirenz, enzalutamide, eslicarbazepine, ethanol, etravirine, felbamate, flutamide, griseofulvin, lesinurad, modafinil,

nafcillin, nevirapine, primidone, phenytoin, phenobarbital, pioglitazone, rifampin, rifapentine, rifabutin); antacids, PPIs: separate by 4 hr: decreased velpatasvir level
CYP3A4 inhibitors (aldesleukin, aliskiren, amlodipine, amprenavir, aprepitant, atazanavir, boceprevir, bromocriptine, chloramphenicol, ciprofloxacin, clarithromycin, cyclosporine, dalfopristin/quinupristin, danazol, darunavir, dasatinib, delavirdine, diltiazem, dronedarone, erythromycin, fluconazole, fluoxetine, fluvoxamine, fosaprepitant, idelalisib, imatinib, indinavir, isavuconazonium, isoniazid, itraconazole, ketoconazole, miconazole, ritonavir, tipranavir), P-gp inhibitors: increased velpatasvir level
P-glycoprotein (P-gp) inducers avoid concurrent use: decreased sofosbuvir level

### Individual drugs

Amiodarone, avoid using together: increased bradycardia
Atorvastatin: increased myopathy, rhabdomyolysis
Azithromycin, boceprevir, canagliflozin, carvedilol, clarithromycin, crizotinib: increased effect of both products
Carvedilol, cobicistat: increased sofosbuvir level
Ritonavir: decreased levels of ritonavir

### Drug/herb

St. John's wort, do not use together: decreased sofosbuvir level

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Hepatitis B exacerbation:** Monitor serum HCV-RNC baseline and periodically, continue to monitor coinfected patients during and after treatment for clinical and laboratory signs of hepatitis B exacerbation (HBsAg, HBV DNA, hepatic enzymes, bilirubin), assess for signs of liver toxicity (yellow eyes or skin, fatigue, weakness, loss of appetite, nausea, vomiting, or light-colored stools); to decrease the risk of reactivating an HBV infection, screen all potential recipients for evidence of current or prior HBV infection by testing HBsAg and anti-HBc concentrations. For those patients whose screening reveals serologic evidence of HBV infection, a baseline HBV DNA concentration should be obtained before starting this product; monitor LFTs

- Severe renal disease/GFR <30 ml/min/1.73 $m^2$, monitor BUN, creatinine
- Geriatric patients more carefully, may develop renal, cardiac symptoms more rapidly
- **Pregnancy:** The use of sofosbuvir/velpatasvir in combination with ribavirin is contraindicated in pregnant women and in the male partners of women who are pregnant, birth defects and/or death of the fetus may occur. Ribavirin therapy also may cause male-mediated teratogenicity and is contraindicated for use during pregnancy, in females who may become pregnant, or in men whose female partners are pregnant. Patients and their partners are required to use 2 reliable forms of effective contraception during treatment and for 6 months after use of these combination therapies. Patients who are not willing to practice strict contraception should not receive sofosbuvir/velpatasvir with ribavirin. Females must also undergo a pregnancy test immediately before initiation of therapy, monthly during therapy, and for 6 months post-therapy. To monitor maternal-fetal outcomes of pregnancies in female patients and female partners of male patients exposed to ribavirin during treatment and for 6 months following cessation of treatment, health care providers are encouraged to report any cases to the Ribavirin Pregnancy Registry; telephone (800) 593-2214. For patients who are also infected with HIV and taking concomitant antiretrovirals, an Antiretroviral Pregnancy Registry is available at (800) 258-4263, not to breastfeed
- **Anemia:** Monitor Hgb/Hct if anemia is suspected

### Patient/family education

- That optimal duration of treatment is unknown; that product is not a cure, that transmission to others may still occur
- To avoid use with other products unless approved by prescriber
- Not to stop abruptly unless directed, worsening of hepatitis may occur, keep in original container

**BLACK BOX WARNING: Hepatitis exacerbation:** report to provider immediately signs of liver toxicity (yellow eyes or skin, fatigue, weakness, loss of appetite, nausea, vomiting, or light-colored stools)

- **Pregnancy:** Teach patients that they and their partners are required to use 2 reliable forms of effective contraception during treatment and for 6 months after use of these combination therapies, pregnancy tests are needed immediately before initiation of therapy, monthly during therapy, and for 6 months post-therapy, not to breastfeed

### Evaluation

- Decreased symptoms of chronic hepatitis C

## solifenacin (Rx)

(sol-i-fen′a-sin)

**VESIcare**

*Func. class.:* Urinary antispasmodic, anticholinergic

*Chem. class.:* Antimuscarinic receptor antagonist

**Do not confuse:** Vesicare/Vesanoid

**ACTION:** Relaxes smooth muscles in urinary tract by inhibiting acetylcholine at postganglionic sites

**Therapeutic outcome:** Decreased dysuria, frequency, nocturia, incontinence

**USES:** Overactive bladder (urinary frequency, urgency, incontinence)

## CONTRAINDICATIONS

Hypersensitivity, uncontrolled closed-angle glaucoma, urinary retention, gastric retention

**Precautions:** Pregnancy, breastfeeding, children, geriatric patients, renal/hepatic disease, controlled closed-angle glaucoma, bladder outflow obstruction, GI obstruction, decreased GI motility, history of QT prolongation

## DOSAGE AND ROUTES

**Adult:** PO 5 mg/day, max 10 mg/day

### Renal/hepatic dose

**Adult:** PO CCr <30 ml/min 5 mg/day; Child-Pugh B max 5 mg/day

**Available forms:** Tabs 5, 10 mg

### Implementation

**PO route**

- Without regard to meals
- Swallow product whole with water, liquid

## ADVERSE EFFECTS

**CNS:** Anxiety, paresthesia, fatigue, *dizziness,* headache, confusion, delirium, depression, drowsiness, fatigue

**CV:** Chest pain, hypertension, QTc prolongation, peripheral edema, palpitations, sinus tachycardia

**EENT:** *Vision abnormalities, xerophthalmia,* nasal dryness

**GI:** *Nausea, vomiting, anorexia,* abdominal pain, *constipation,* dry mouth, dyspepsia

**GU:** Dysuria, urinary retention, frequency, UTI

**INTEG:** Rash, pruritus, angioedema, exfoliative dermatitis, erythema multiforme

**MISC:** Hyperthermia

**RESP:** Bronchitis, cough, pharyngitis, URI

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid (90%) |
| **Distribution** | 98% protein bound |
| **Metabolism** | Extensively metabolized by CYP3A4 |
| **Excretion** | Excreted in urine (69%)/ feces (22%) |
| **Half-life** | Terminal half-life 45-68 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug classifications

Azoles, macrolides, fluoroquinolones, class IA, III antidysrhythmics: increased QT prolongation

Benzodiazepines, hypnotics, opioids, sedatives: increased CNS depression

CYP3A4 inducers (carBAMazepine, nevirapine, phenobarbital, phenytoin): decreased effects of solifenacin

CYP3A4 inhibitors (clarithromycin, diclofenac, doxycycline, erythromycin, isoniazid, ketoconazole, nefazodone, propofol, protease inhibitors, verapamil): increased action of solifenacin, max dose 5 mg

### Drug/herb

St. John's wort: decreased effects

### Drug/food

Grapefruit juice: increased effect

### Drug/lab test

Increased: LFTs

## NURSING CONSIDERATIONS

### Assessment

- **Urinary patterns:** assess for distention, nocturia, frequency, urgency, incontinence
- **Allergic reactions:** assess for rash; if this occurs, product should be discontinued
- **Cardiac patients:** monitor ECG for QT prolongation, avoid products that can increase QT prolongation
- **Angioedema:** assess for swelling of face, lips, tongue, larynx
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excretion unknown

### Patient/family education

- Caution patient to avoid hazardous activities; dizziness may occur
- Advise patient that constipation, blurred vision may occur, to notify prescriber if abdominal pain with constipation occurs
- Instruct patient to call prescriber if severe abdominal pain or constipation lasts for 3 or more days

- Advise patient that heat prostration may occur if used in a hot environment, sweating is decreased
- Teach patient to take without regard to food
- Teach patient to swallow tab whole, do not crush, chew

### Evaluation

**Positive therapeutic outcome**
- Urinary status: decreased dysuria, frequency, nocturia, incontinence

**⚠ HIGH ALERT**

## somatropin (Rx)

(soe-ma-troe′pin)

**Genotropin, Humatrope, Norditropin, Norditropin Flexpro, Nutropin, Nutropin AQ, Omnitrope, Saizen, Serostim, Zomacton, Zorbtive**

*Func. class.:* Pituitary hormone
*Chem. class.:* Growth hormone

**Do not confuse:** somatropin/somatrem/SUMAtriptan

**ACTION:** Stimulates growth; similar to natural growth hormone—both preparations are developed by recombinant DNA technique

**Therapeutic outcome:** Increase in height as a result of skeletal growth in pituitary growth hormone deficiency

**USES:** Pituitary growth hormone deficiency (hypopituitary dwarfism), children with human growth hormone deficiency, AIDS wasting syndrome, cachexia, adults with somatropin deficiency syndrome (SDS), short stature in Noonan syndrome, SHOX deficiencies; Turner's syndrome, Prader-Willi syndrome

## CONTRAINDICATIONS

Hypersensitivity to benzyl alcohol, creosol, glycerin hypersensitivity (for medications that contain these products), closed epiphyses, acute respiratory failure, Prader-Willi syndrome with obesity, trauma

**Precautions:** Pregnancy, breastfeeding, newborns, geriatric, diabetes mellitus, hypothyroidism, intracranial lesions, prolonged treatment in adults, scoliosis, sleep apnea, chemotherapy, respiratory disease

## DOSAGE AND ROUTES

### >> Genotropin

**Child:** SUBCUT 0.16-0.24 mg/kg/wk, divided into 6 or 7 daily inj, give in abdomen, thigh, buttocks

**Adult:** SUBCUT 0.4-0.8 mg/kg/wk divided in 6-7 daily doses

### >> Humatrope

**Child:** SUBCUT/IM 0.006 mg/kg divided into equal doses either on 3 alternate days or 6 ×/wk, max 0.3 mg/kg/wk
**Adult:** IM 0.018 units/kg/day, max 0.0125 units/kg/day

### Growth hormone deficiency

### >> Nutropin/Nutropin AQ

**Child:** SUBCUT 0.3 mg/kg/wk

### >> Serostim

**Adult:** SUBCUT at bedtime >55 kg 6 mg, 45-55 kg 5 mg, 35-45 kg 4 mg

### >> Norditropin

**Child:** SUBCUT 0.024-0.034 mg/kg 6-7 ×/wk

### Replacement of GH in GH deficiency

**Adult:** SUBCUT (Saizen) 0.005 mg/kg/day; may increase after 4 wk to max 0.01 mg/kg/day

**Available forms:** Powder for inj (lyophilized) 1.5 mg (4 international units/ml), 4 mg (12 international units/vial), 5 mg (13 international units/vial), 5 mg (15 international units/vial), rDNA origin, 5.8 mg (15 international units/ml), 6 mg (18 international units/ml), 8 mg (24 international units/vial), 10 mg (26 international units/vial), inj 10 mg (30 international units/vial); 5, 10, 15 mg/1.5 ml

### Implementation

- Store in refrigerator for <1 mo; if reconstituted, <1 wk; do not use discolored or cloudy sol
- Give IM or subcut, do not use IV
- Discontinue therapy if final height is achieved or epiphyseal fusion occurs
- Visually inspect parenteral products for particulate matter and discoloration

### >> Genotropin

- Powder, filled in a two-chamber cartridge with the active substance in the front chamber and the diluent in the rear chamber. Available in a 5 mg cartridge (green tip) and a 12 mg cartridge (purple tip). The 5 and 12 mg cartridges can be used with the Genotropin Pen or the Genotropin Mixer. Also, in various doses ranging from 0.2 mg to 2 mg, in single use, auto-mix devices called Genotropin Miniquicks
- *Cartridges:* Store cartridges refrigerated prior to reconstitution, do not freeze; protect from light. A reconstitution device is supplied and is used to mix the powder and the diluent. After the powder and diluent are mixed, gently tip the cartridge upside down a few times until

dissolved. DO NOT SHAKE. If the solution is cloudy, do not use. Following reconstitution, the 5 mg cartridge will contain a 5 mg/ml and the 12 mg cartridge will contain 12 mg/ml solution; both the 5 mg and 12 mg cartridges contain overfill. The cartridges contain diluent with preservative (m-cresol) and may be stored refrigerated ≤28 days after reconstitution. Do not use the 5 mg and 12 mg cartridges in patients with m-cresol hypersensitivity

• *Genotropin Miniquicks:* After dispensing, but prior to reconstitution, store at or 77 degrees ≤3 mo. A reconstitution device is supplied and is used to mix the powder and diluent. Ten different strengths are available that each deliver a fixed volume of 0.25 ml. This product contains a diluent with no preservative, refrigerate after reconstitution and use within 24 hr. Use the reconstituted solution only once and discard any remaining

## >> Humatrope

• Prior to reconstitution, store refrigerated

• *Vials:* Reconstitute each 5-mg vial with 1.5-5 ml of the diluent (contains m-cresol as a preservative) or Bacteriostatic Water for Injection (contains benzoyl alcohol as a preservative); sterile water for injection can be used with a hypersensitivity to both m-cresol and benzoyl alcohol. Direct the liquid against the glass vial wall. Swirl until contents are dissolved. Do not shake. If the solution is cloudy, do not use. Small, colorless particles may be present after refrigeration; this is not unusual for solutions containing proteins. Vials reconstituted with the diluent or bacteriostatic water are stable for 14 days when refrigerated; for vials reconstituted with sterile water, use the vial only once and discard; if not used immediately, refrigerate and use within 24 hr; avoid freezing

• *Cartridges:* Reconstitute cartridges using ONLY the supplied diluent syringe; the cartridges are designed for use only with the Humatrope injection device. Once reconstituted, the cartridges are stable for up to 28 days when stored refrigerated. Store the injection device without the needle attached; avoid freezing reconstituted solutions

## >> Norditropin

• Do not use reconstituted solution if cloudy or contains particulate matter

• Prior to use, store refrigerated

• Reconstitution of the cartridges is not required. The cartridge is intended for use only with the NordiPen injector; a prefilled, disposable pen, NordiFlex Pen injector, is also available. Each cartridge size (5 mg, 10 mg, or 15 mg per 1.5 ml cartridge) has a color-coded corresponding pen, which is graduated to deliver an appropriate dose based on the solution concentration; NordiPen and NordiFlex Pen allow for administration of a minimum 0.25-mg dose to a maximum 4.5-mg dose, depending on cartridge concentrations. Follow directions provided in Pen injector instruction booklet

• After a cartridge has been inserted into the NordiPen injector or once a NordiFlex pen is in use, the pen should be stored refrigerated and used within 4 wk. Alternatively, the 5-mg and 10-mg cartridges may be stored in the pen at room temperatures, no higher than 77° F, for up to 3 wk. NovoFine needles are recommended for administration. Wipe the stopper of the pen cartridge with rubbing alcohol

## >> Nutropin

• Prior to reconstitution, store refrigerated

• Reconstitute each 5-mg vial with 1-5 ml bacteriostatic water for injection (benzyl alcohol preserved) and each 10-mg vial with 1-10 ml of bacteriostatic water for injection (benzyl alcohol preserved). If using for newborns, reconstitute with sterile water for injection. Direct the liquid against the glass vial wall. Swirl vial with a gentle rotary motion until contents are dissolved completely. Do not shake. If the solution is cloudy after reconstitution or refrigeration, do not use. Small, colorless particles may be present after refrigeration; this is not unusual for solutions containing proteins

• Solutions reconstituted with bacteriostatic water for injection are stable for 14 days refrigerated

• Solutions reconstituted with sterile water for injection should be used immediately and only once; discard any unused portions. Avoid freezing reconstituted solutions

## >> Nutropin AQ

• Does not require reconstitution. Solution should be clear. Small, colorless particles may be present after refrigeration; this is not unusual for solutions containing proteins. Allow vial or pen cartridge to come to room temperature and gently swirl. If solution is cloudy, do not use

• *Vials:* Before needle insertion, wipe the vial septum with rubbing alcohol or antiseptic solution to prevent contamination by microorganisms that may be introduced by repeated needle insertions. Administer using sterile, disposable syringes and needles. Use syringes with small enough volume that the prescribed dose can be drawn from the vial with reasonable accuracy

• *Pen cartridge:* Two strengths are available: 10 mg and 20 mg; intended for use only with Nutropin AQ Pen. Each pen and cartridge are color coded to ensure accurate placement

of the 10-mg or 20-mg cartridge into the appropriate pen. Do not use the 20-mg cartridge in the pen intended for the 10-mg cartridge, and vice versa. Wipe septum of pen cartridge with rubbing alcohol or antiseptic solution to prevent contamination by microorganisms that may be introduced by repeated needle insertions. Administer using sterile, disposable needles. Follow the directions provided in the Nutropin AQ Pen Instructions for Use. The Nutropin AQ 10 pen allows for administration of a minimum 0.1-mg dose to a maximum 4-mg dose, in 0.1-mg increments. The Nutropin AQ 20 pen allows for administration of a minimum 0.2-mg dose to a maximum 8-mg dose, in 0.2-mg increments

• *Prefilled device:* A prefilled multi-dose, dial-a-dose device is available in 3 strengths. Administer using disposable needles. Follow the directions provided in the Nutropin AQ NuSpin Instructions for Use. The Nutropin AQ Nuspin 5 allows for administration of a minimum dose of 0.05 mg to a maximum dose of 1.75 mg, in increments of 0.05 mg. The Nutropin AQ Nuspin 10 allows for administration of a minimum dose of 0.1 mg to a maximum dose of 3.5 mg, in increments of 0.1 mg. The Nutropin AQ Nuspin 20 allows for administration of a minimum dose of 0.2 mg to a maximum dose of 7 mg, in increments of 0.2 mg

• After initial use, vials, cartridges, and prefilled devices are stable for 28 days refrigerated; avoid freezing. Vials, cartridges, and prefilled devices are light sensitive; protect from light

### >> Omnitrope

• Prior to reconstitution, store vials refrigerated. Store in the carton; Omnitrope is sensitive to light

• *Vials:* Reconstitute the vial with diluent provided using a sterile, disposable syringe. Swirl the vial gently, but do not shake. If the solution is cloudy after reconstitution, the contents must not be injected. After reconstitution, the 1.5-mg vial may be refrigerated ≤24 hr. The 1.5-mg vial does not contain a preservative and should only be used once; discard any remaining solution. The 5.8-mg vial diluent contains benzoyl alcohol as a preservative. After reconstitution, the contents must be used within 3 wk. After the first injection, store the 5.8-mg vial in the carton, to protect from light, in the refrigerator; avoid freezing

• *Omnitrope Pen 5 cartridge:* Each 5-mg cartridge must be inserted into the Omnitrope Pen 5 delivery system. Follow the directions provided in the Omnitrope Instructions for Use. The cartridge contains benzyl alcohol as a preservative. Once initially used, store refrigerated ≤28 days, protect from light, avoid freezing

• *Omnitrope Pen 10 cartridge:* Each 10-mg cartridge must be inserted into the Omnitrope Pen 10 delivery system. Follow the directions provided in the Omnitrope Instructions for Use. Once initially used, store refrigerated ≤28 days, protect from light, avoid freezing

### >> Saizen

• Prior to reconstitution, store at room temperature

• *Vials:* Reconstitute each 5 mg vial with 1-3 ml bacteriostatic water for injection; reconstitute each 8.8-mg vial with 2-3 ml bacteriostatic water for injection (benzyl alcohol preserved). In patients with hypersensitivity to benzyl alcohol, the vials can be mixed with sterile water for injection. Direct the liquid against the glass vial wall. Swirl vial with a gentle rotary motion until contents are dissolved completely. Do not shake. The solution should be clear; if it is cloudy immediately after reconstitution or refrigeration, do not use. Small, colorless particles may be present after refrigeration; this is not unusual for solutions containing proteins. After reconstitution, store vials mixed with bacteriostatic water for injection refrigerated and use within 14 days. For vials mixed with sterile water for injection, the solution should be used immediately, and any unused portion should be discarded. Avoid freezing

• *Cartridges:* Available in 4-mg and 8.8-mg click.easy cartridges for use in a compatible injection device. A reconstitution device supplied by the manufacturer is used to mix the Saizen with accompanying diluent containing metacresol. Cartridges reconstituted with the diluent containing metacresol are stable under refrigeration for up to 21 days. Avoid freezing

### >> Serostim

• Prior to reconstitution, store vials and diluent at room temperature (15-30° C / 59-86° F).

• *Vials:* Reconstitute the 5-mg or 6-mg vials with 0.5-1 ml of supplied diluent (sterile water for injection). Reconstitute the 4-mg vial with 0.5-1 ml of bacteriostatic water for injection (benzyl alcohol preserved) and the 8.8-mg vial with 1-2 ml of bacteriostatic water for injection (benzyl alcohol preserved). Direct the liquid against the glass vial wall. Swirl vial with a gentle rotary motion until contents are dissolved completely. Do not shake. The solution should be clear; if it is cloudy immediately after reconstitution or refrigeration, do not use. Small, colorless particles may be present after refrigeration; this is not unusual for solutions containing proteins. If reconstituted with sterile water for injection, use within 24 hr. If reconstituted with bacteriostatic water for injection (benzyl alcohol preserved), the solution is stable for up to

14 days under refrigeration (2-8° C or 36-46° F). Avoid freezing
• *Cartridges:* Available in 8.8-mg click.easy cartridges for use in a compatible injection device. A reconstitution device is supplied by the manufacturer and is used to mix the Serostim with accompanying diluent containing metacresol. After reconstitution, cartridges are stable under refrigeration for up to 21 days. Avoid freezing

### >> Serostim LQ
• Prior to use, store refrigerated
• Available in 6-mg single-use cartridges that do not require reconstitution. Administer using sterile, disposable syringes and needles
• Bring to room temperature prior to use. Discard single-use cartridge after use, even if some drug remains. Discard cartridges after the expiration date stated on the product. Do not freeze. Protect from light

### >> Zomacton
(formerly Tev-Tropin)
• Prior to reconstitution, store refrigerated
• Reconstitute each 5-mg vial with 1-5 ml bacteriostatic 0.9% sodium chloride (benzyl alcohol preserved) for injection. Direct the liquid against the glass vial wall. Swirl vial with a gentle rotary motion until contents are dissolved completely. Do not shake. The solution should be clear; if it is cloudy immediately after reconstitution, do not inject. Small, colorless particles may be present after refrigeration; this is not unusual for solutions containing proteins. When administering to newborns, reconstitute with sterile normal saline for injection that is unpreserved
• Solution reconstituted with bacteriostatic 0.9% sodium chloride is stable for 14 days when stored refrigerated. Solution reconstituted with sterile normal saline should be used only once, with any remaining solution discarded. Avoid freezing

### >> Valtropin
• Prior to dispensing, store vials and diluent refrigerated. After dispensing to patients, may be stored at or below 77° F for up to 3 months
• Reconstitute each 5-mg vial with the entire contents of the accompanying diluent, which contains metacresol as a preservative. If patients are allergic to metacresol, sterile water for injection can be used. Direct the liquid against the glass vial wall. Swirl vial with a gentle rotary motion until contents are dissolved completely. Do not shake. The solution should be clear; if it is cloudy or contains particulate matter immediately after reconstitution or after refrigeration, do not inject. The final concentration of the reconstituted solution is 3.33 mg/ml
• After reconstituted with the provided diluent, solutions can be stored refrigerated for up to 14 days. After reconstituted with sterile water for injection, use only one dose of Valtropin per vial and discard the unused portion if not used immediately

### >> Zorbtive
• Unreconstituted vials of drug and diluent may be stored at room temperature until expiration date
• Reconstitute each vial of 4 mg, 5 mg, or 6 mg with 0.5-1 ml sterile water for injection, USP. Reconstitute each 8.8 mg with 1-2 ml bacteriostatic water for injection (0.9% benzyl alcohol preserved); in newborns or patients with a benzyl alcohol hypersensitivity, sterile water for injection can be used. Review manufacturer's labeling for expected concentrations. Direct the liquid against the glass vial wall. Swirl vial with a gentle rotary motion until contents are dissolved completely. Do not shake. The solution should be clear; if it is cloudy after reconstitution or refrigeration, do not use. Small, colorless particles may be present after refrigeration; this is not unusual for solutions containing proteins
• After reconstitution with sterile water for injection, use the solution immediately and discard any unused portion. When using bacteriostatic water for injection, reconstituted solutions are stable for up to 14 days refrigerated. Avoid freezing vials of drug or diluent, or reconstituted vials

**IM route**
• Inject deeply into a large muscle; aspirate prior to injection; rotate injection sites daily

**Subcut route**
• Volumes >1 ml of reconstituted solution is not recommended; do not inject intradermally
• Allow refrigerated solutions to come to room temperature prior to injection
• Subcutaneous injections may be given in the thigh, buttocks, or abdomen; rotate injection sites daily

## ADVERSE EFFECTS
**CNS:** Headache, growth of intracranial tumor, fever, aggressive behavior
**ENDO:** *Hyperglycemia, ketosis, hypothyroidism*
**GI:** Nausea, vomiting
**GU:** *Hypercalciuria*
**INTEG:** Rash, urticaria, pain, inflammation at inj site; hematoma
**MS:** Tissue swelling, joint and muscle pain
**SYST:** Antibodies to growth hormone

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (SUBCUT/IM) |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 15-60 min |

### Pharmacodynamics

| | IM/SUBCUT (growth) |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | 7 days |

## INTERACTIONS

### Drug classifications

Androgens, thyroid hormones: increased epiphyseal closure
Glucocorticosteroids: decreased growth
Insulins, antidiabetics: decreased antidiabetic effect, adjust dosage

### Drug/lab test

Increased: glucose, urine glucose
Decreased: glucose thyroid hormones

## NURSING CONSIDERATIONS

### Assessment

- Assess for signs/symptoms of diabetes
- Identify growth hormone antibodies if patient fails to respond to therapy
- Monitor thyroid function tests: $T_3$, $T_4$, $T_7$, TSH to identify hypothyroidism, thyroid hormone replacement may be needed
- Assess for allergic reaction: rash, itching, fever, nausea, wheezing
- Assess for hypercalciuria: urinary stones; groin, flank pain; nausea, vomiting, frequency, hematuria, chills
- Monitor growth rate, bone age of child at intervals during treatment
- **Respiratory infection:** in those with Prader-Willi syndrome, may have sleep apnea, upper airway obstruction; discontinue if obstruction occurs
- Rapid growth: assess for slipped capital femoral epiphysis; may also occur in endocrine disorders
- Monitor ophthalmologic status baseline and periodically, intracranial hypertension may occur
- Identify creosol or benzyl alcohol hypersensitivity before use
- **Pregnancy/breastfeeding:** Effects unknown, cautious use in breastfeeding
- **Beers:** Avoid in older adults except as hormone replacement after pituitary gland removal

### Patient/family education

- Explain reason for medication and expected results; that treatment may continue for yr
- Advise patient that routine follow-up is needed to monitor growth rate
- Instruct parents on procedure for medication preparation and inj use; request demonstration, return demonstration; provide written instructions
- Teach patient about SUBCUT injection, always rotate site to avoid tissue atrophy, do not shake, report peripheral edema, swelling to provider
- Teach patient to maintain growth record, report knee, hip pain or limping
- Advise patient treatment is very expensive

### Evaluation

**Positive therapeutic outcome**

- Growth in children until epiphyseal plates close

**⚠ HIGH ALERT**

**RARELY USED**

## sonidegib

(soe′-ni-deg′-ib)
**Odomzo**
*Func. class.:* Antineoplastic

**Uses:** Locally advanced basal cell carcinoma that has recurred following surgery or radiation therapy or in those who are not candidates for surgery or radiation therapy

## CONTRAINDICATIONS

Hypersensitivity

### Precautions:

**BLACK BOX WARNING:** Pregnancy, intrauterine fetal death, contraceptive requirement

## DOSAGE AND ROUTES

**Adults: PO** 200 mg qday until disease progression or unacceptable toxicity; take on an empty stomach ≥ 1 hr before or 2 hr after a meal. Avoid use with strong CYP3A inhibitors or strong and moderate CYP3A inducers.

**Available forms:** Cap 200 mg

**⚠ HIGH ALERT**

## sotalol (Rx)

(soe-ta′lole)
**Betapace, Betapace AF, Rylosol 🍁, Sorine, Sotylize**
*Func. class.:* Antidysrhythmic, group III
*Chem. class.:* Nonselective β-blocker

**Do not confuse:** sotalol/Sudafed

**ACTION:** Blockade of $\beta_1$- and $\beta_2$-receptors leads to antidysrhythmic effect, prolongs action potential in myocardial fibers without affecting conduction, prolongs QT interval, no effect on QRS duration

**Therapeutic outcome:** Decreased B/P, heart rate, AV conduction

## USES:
Life-threatening ventricular dysrhythmias; Betapace AF: to maintain sinus rhythm in symptomatic atrial fibrillation/flutter

## CONTRAINDICATIONS
Hypersensitivity to β-blockers, cardiogenic shock, heart block (2nd or 3rd degree), sinus bradycardia, HF, bronchial asthma, CCr <40 ml/min, hypokalemia

**BLACK BOX WARNING:** Congenital or acquired long QT syndrome

**Precautions:** Pregnancy, breastfeeding, major surgery, diabetes mellitus, renal/thyroid disease, COPD, well-compensated heart failure, CAD, nonallergic bronchospasm, electrolyte disturbances, bradycardia, peripheral vascular disease

**BLACK BOX WARNING:** Cardiac dysrhythmias, torsades de pointes, ventricular dysrhythmias, ventricular fibrillation, requires a specialized care setting

## DOSAGE AND ROUTES
**Available forms:** Tabs 80, 120, 160, 240 mg; (Betapace AF) 80, 120, 160 mg; inj 150 mg/10 ml (15 mg/ml)

### Implementation
**PO route**
- Given before meals, at bedtime, tab may be crushed or swallowed whole; give with food to prevent GI upset; reduce dosage in renal dysfunction
- Betapace and Betapace AF are not interchangeable
- Store in dry area at room temp; do not freeze

**IV route**
- Dilute to a volume of either 120 ml or 300 ml with $D_5W$, LR
- **75-mg dose:** withdraw 6 ml sotalol inj (90 mg), add 114 ml diluent to make 120 ml (0.75% mg/ml); or withdraw 6 ml sotalol inj (90 mg), add 294 ml diluent to make 300 ml (0.3 mg/ml)
- **112.5-mg dose:** withdraw 9 ml sotalol inj, (135 ml), add 111 ml diluent to 120 ml (1.125 mg/ml); or withdraw 9 ml sotalol (135 mg) and add 291 ml diluent to 300 ml (0.45 mg/ml)
- **150-mg dose:** withdraw 12 ml sotalol (180 mg), add 108 ml to 120 ml (1.5 mg/ml); or withdraw 12 ml of sotalol (180 mg), add 288 ml to 300 ml (0.6 mg/ml)
- Use inf pump and infuse 100 or 250 ml over 5 hr at a constant rate

## ADVERSE EFFECTS
**CNS:** Dizziness, mental changes, drowsiness, fatigue, headache, catatonia, depression, anxiety, nightmares, paresthesia, lethargy, insomnia, decreased concentration
**CV:** Orthostatic hypotension, bradycardia, HF, chest pain, ventricular dysrhythmias, prolonged QT, AV block, peripheral vascular insufficiency, palpitations, prodysrhythmia, torsades de pointes; Betapace AF: life-threatening ventricular dysrhythmias
**EENT:** Tinnitus, visual changes, sore throat, double vision, dry, burning eyes
**GI:** Nausea, vomiting, diarrhea, dry mouth, flatulence, constipation, anorexia, indigestion
**GU:** Impotence, dysuria, ejaculatory failure, urinary retention
**HEMA:** Agranulocytosis, thrombocytopenic purpura (rare), thrombocytopenia, leukopenia
**INTEG:** Rash, alopecia, urticaria, pruritus, fever, diaphoresis
**MISC:** Facial swelling, decreased exercise tolerance, weight change, Raynaud's disease
**MS:** Joint pain, arthralgia, muscle cramps, pain
**RESP:** Bronchospasm, dyspnea, wheezing, nasal stuffiness, pharyngitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Variable (30%) |
| **Distribution** | Crosses placenta, minimal penetration in CNS |
| **Metabolism** | Liver, protein binding 0% |
| **Excretion** | 70% unchanged—kidneys |
| **Half-life** | 10-24 hr, increased in renal disease |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Several hr | 5-10 min |
| **Peak** | Unknown | Unknown |
| **Duration** | Unknown | Unknown |

## INTERACTIONS
### Individual drugs
**BLACK BOX WARNING:** Haloperidol, chloroquine, droperidol, pentamidine; arsenic trioxide, levomethadyl: increased QT prolongation

Insulin: increased hypoglycemia
Lidocaine: increased effects of lidocaine
Nitroglycerin: increased hypotension
Theophylline: decreased bronchodilating effects of theophylline

### Drug classifications

Antihypertensives, diuretics: increased hypotension
$\beta_2$-Agonists: decreased bronchodilating effects
Class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation
Sulfonylureas: decreased hypoglycemic effects
Sympathomimetics: decreased β-blocker effects

### Drug/herb

Hawthorn: do not use concurrently

### Drug/lab test

False: increased urinary catecholamines
Interference: glucose, insulin tolerance tests

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: QT syndrome:** Monitor B/P during beginning treatment, periodically thereafter; pulse q4hr; note rate, rhythm, quality: apical/radial pulse before administration; notify prescriber of any significant changes (pulse <50 bpm); monitor ECG continuously (Betapace AF); use QT interval to determine patient eligibility; baseline QT must be ≤450 msec, if ≥500 msec, frequency or dosage must be decreased or drug must be discontinued

**BLACK BOX WARNING:** Requires a specialized care setting: for a minimum of at least 3 days on maintenance dose with continuous ECG monitoring, creatinine clearance, calculate before dosing

**BLACK BOX WARNING:** Cardiogenic shock, acute pulmonary edema: do not use, as effect can further depress cardiac output

- Check for baselines in renal function tests, before therapy begins
- Assess for edema in feet, legs daily, monitor I&O ratio, daily weight; check for jugular vein distention, crackles, bilaterally, dyspnea (HF)
- **Abrupt discontinuation:** do not discontinue abruptly; taper over 1-2 wk
- Dose should be adjusted slowly, with at least 3 days between changes; monitor ECG for QT interval
- Monitor electrolytes (hypokalemia, hypomagnesemia); may increase dysrhythmias
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excreted in breast milk

### Patient/family education

- Teach patient not to discontinue product abruptly, taper over 2 wk; may cause precipitate angina if stopped abruptly
- Teach patient not to use OTC products containing α-adrenergic stimulants (such as nasal decongestants, cold preparations); to avoid alcohol and smoking and to limit sodium intake as prescribed
- Teach patient how to take pulse and B/P at home, advise when to notify prescriber
- Instruct patient to comply with weight control, dietary adjustments, modified exercise program
- Caution patient to carry/wear emergency ID to identify product being taken, allergies
- Inform patient that product controls symptoms but does not cure
- Caution patient to avoid hazardous activities if dizziness, drowsiness are present
- Teach patient to report symptoms of **HF:** difficulty breathing, especially on exertion or when lying down; night cough; swelling of extremities; bradycardia; dizziness; confusion; depression; fever
- Teach patient to take product as prescribed, not to double or skip doses; take any missed doses as soon as remembered if at least 4 hr until next dose
- Teach patient that hospitalization will be required for ≥3 days

### Evaluation

**Positive therapeutic outcome**
- Absence of dysrhythmias

## spironolactone (Rx)

(speer'on-oh-lak'tone)
**Aldactone, Novo-Spiroton** 🍁
*Func. class.:* Potassium-sparing diuretic
*Chem. class.:* Aldosterone antagonist

**Do not confuse:** Aldactone/Aldactazide

**ACTION:** Competes with aldosterone at receptor sites in the distal tubule in the renal system, resulting in excretion of sodium chloride, water, retention of potassium, phosphate

**Therapeutic outcome:** Diuretic and antihypertensive effect while retaining potassium; lowered aldosterone levels

**USES:** Edema of HF, hypertension, diuretic-induced hypokalemia, primary hyperaldosteronism (diagnosis, short-term treatment, long-term

treatment), edema of nephrotic syndrome, cirrhosis of the liver with ascites

**Unlabeled uses:** HF, hirsutism in women

## CONTRAINDICATIONS

Pregnancy, hypersensitivity, anuria, severe renal disease, hyperkalemia

**Precautions:** Breastfeeding, dehydration, renal/hepatic disease, electrolyte imbalances, metabolic acidosis, gynecomastia

**BLACK BOX WARNING:** Secondary malignancy

## DOSAGE AND ROUTES

### Edema/hypertension

**Adult:** PO 25-200 mg/day in 1-2 divided doses

### HF

**Adult:** PO 12.5-25 mg/day, max 50 mg/day

### Edema

**Child:** PO 1.5-3.3 mg/kg/day in single or divided doses

### Hypertension

**Child (unlabeled):** PO 1.5-3.3 mg/kg in divided doses

### Hypokalemia

**Adult:** PO 25-100 mg/day; if PO, potassium supplements must not be used

### Primary hyperaldosteronism diagnosis

**Adult:** PO 400 mg/day × 4 days or 4 wk depending on the test, then 100-400 mg/day maintenance

### Edema (nephrotic syndrome, HF, hepatic disease)

**Adult:** PO 100 mg/day given as a single dose or in divided doses, titrate to response
**Child:** PO 1.5-3.3 mg/kg/day or 60 mg/m$^2$/day given once daily or in 2-4 divided doses

### Renal dose

**Adult:** PO CCr 10-50 ml/min; give dose q12-24hr; CCr <10 ml/min, avoid use

### Polycystic ovary syndrome/hirsutism in women (unlabeled)

**Adult:** PO 50-200 mg in 1-2 divided doses

**Available forms:** Tabs 25, 50, 100 mg

### Implementation

- Give in AM to avoid interference with sleep
- Give with food if nausea occurs; absorption may be increased; take at same time each day
- Effect may take 2 wk

## ADVERSE EFFECTS

**CNS:** Headache, confusion, drowsiness, lethargy, ataxia
**ELECT:** Hyperchloremic metabolic acidosis, hyperkalemia, hyponatremia
**ENDO:** Impotence, gynecomastia, irregular menses, amenorrhea, postmenopausal bleeding, hirsutism, deepening voice, breast pain
**GI:** Diarrhea, cramps, bleeding, gastritis, vomiting, anorexia, nausea, hepatocellular toxicity
**HEMA:** Agranulocytosis
**INTEG:** *Rash, pruritus,* urticaria

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | GI tract; well absorbed |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver to canrenone (active metabolite) |
| **Excretion** | Renal; breast milk |
| **Half-life** | 12-24 hr (canrenone) |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 24-48 hr |
| **Peak** | 48-72 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Aspirin: decreased action of spironolactone
Cholestyramine: increased hyperchloremic acidosis in cirrhosis
Digoxin: increased digoxin action
Lithium: increased action, toxicity

### Drug classifications

ACE inhibitors, diuretics (potassium-sparing), angiotensin II receptor antagonists potassium products, salt substitute: increased hyperkalemia
Anticoagulants: decreased effects of anticoagulants, monitor INR/PT
Antihypertensives: increased action
NSAIDs: decreased effect of spironolactone

### Drug/food

Potassium-rich foods, potassium salt substitutes: increased hyperkalemia

### Drug/herb

Ephedra: decreased antihypertensive effect
Hawthorn, horse chestnut: increased hypotension
St. John's wort: severe photosensitivity

### Drug/lab test

Increased: BUN, potassium
Decreased: sodium, magnesium
Interference: 17-OHCS, 17-KS, radioimmunoassay, digoxin assay

## NURSING CONSIDERATIONS

### Assessment

- **Hypokalemia:** assess for polyuria, polydipsia, dysrhythmias including a U wave on ECG
- **Hyperkalemia:** assess for weakness, fatigue, dyspnea, dysrhythmias, confusion
- HF assessment daily: Assess fluid volume status: I&O ratios and record, count or weigh diapers as appropriate, weight, distended red veins, crackles in lung, color, quality, and specific gravity of urine, skin turgor, adequacy of pulses, moist mucous membranes, bilateral lung sounds, peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth and mucous membranes should be reported, potassium must be checked within 3 days, 1 wk, 1 mo × 3, then q3mo, recheck after starting products that alter potassium
- Monitor electrolytes: potassium, sodium, calcium, magnesium; also include BUN, ABGs, uric acid, CBC, blood glucose
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, fetal harm has occurred, do not breastfeed, excreted in breast milk

**BLACK BOX WARNING:** Secondary malignancy: assess periodically

- **Beers:** Avoid in older adults with heart failure or CCr <30 ml/min

### Patient/family education

- Teach patient to take medication early in day to prevent nocturia
- Instruct patient to take with food or milk if GI symptoms of nausea and anorexia occur
- Teach patient to maintain a record of weight on a weekly basis and notify prescriber of weight loss of >5 lb
- Caution patient that this product causes an increase in potassium levels, that foods high in potassium should be avoided: oranges, bananas, salt substitutes, dried apricots, dates; avoid potassium salt substitutes; refer to dietitian for assistance planning
- Teach patient to take in AM, to prevent sleeplessness
- Teach patient to avoid hazardous activities until reaction is known
- Teach patient to notify prescriber if pregnancy is planned or suspected, pregnancy do not breastfeed
- Teach patient not to use alcohol or any OTC medications without prescriber's approval; serious product reactions may occur
- Emphasize the need to contact prescriber immediately if muscle cramps, weakness, nausea, dizziness, or numbness occur
- Teach patient to take own B/P and pulse and record
- Teach patient to notify prescriber of cramps, diarrhea, lethargy, thirst, headache, skin rash, menstrual abnormalities, deepening voice, breast enlargement
- Advise patient that dizziness and confusion may occur; avoid driving or other hazardous activities if alertness is decreased
- Teach patient to continue taking medication even if feeling better; this product controls symptoms but does not cure the condition
- Advise patient with hypertension to continue other treatment (exercise, weight loss, relaxation techniques, cessation of smoking)

### Evaluation

**Positive therapeutic outcome**

- Prevention of hypokalemia (diuretic use)
- Decreased edema
- Decreased B/P
- Decreased aldosterone levels
- Increased diuresis

## TREATMENT OF OVERDOSE

- Lavage if taken orally, monitor electrolytes
- Administer sodium bicarbonate
- Monitor hydration, CV, renal status

## stavudine d4t (Rx)

(sta′vu-deen)
**Zerit**
*Func. class.:* Antiretroviral
*Chem. class.:* Nucleoside reverse transcriptase inhibitor (NRTI)

**Do not confuse:** stavudine/cetirizine
Zerit/ZyrTEC

**ACTION:** Prevents replication of HIV-1 by inhibition of reverse transcriptase; causes DNA chain termination

**Therapeutic outcome:** Decreasing diarrhea, fatigue, night sweats; increased body weight

**USES:** Treatment of HIV-1; used in combination with other antiretrovirals

## CONTRAINDICATIONS

Hypersensitivity to this product or zidovudine, didanosine, zalcitabine; severe peripheral neuropathy

**Precautions:** Breastfeeding, advanced HIV infections, bone marrow suppression, renal, peripheral neuropathy, osteoporosis, obesity, pregnancy

S

**BLACK BOX WARNING:** Hepatic disease, pancreatitis, lactic acidosis

## DOSAGE AND ROUTES

**Adult >60 kg:** PO 40 mg q12hr
**Adult <60 kg:** PO 30 mg q12hr
**Child <30 kg:** PO 1 mg/kg q12hr
**Child ≥30 kg ≤60 kg:** PO 30 mg q12hr
**Child >60 kg:** PO 40 mg q12hr

### Renal dose

**Adult >60 kg:** CCr 26-50 ml/min 20 mg q12hr; CCr 10-25 ml/min 20 mg q24hr
**Adult <60 kg:** CCr 26-50 ml/min 15 mg q12hr; CCr 10-25 ml/min 15 mg q24hr

**Available forms:** Caps 15, 20, 30, 40 mg; oral powder for sol 1 mg/ml

### Implementation

- Give with or without meals; absorption does not appear to be lowered when taken with food
- Give product q4hr around the clock, even during night
- Shake susp well before using
- Use after hemodialysis

## ADVERSE EFFECTS

**CNS:** *Peripheral neuropathy,* insomnia, anxiety, depression, dizziness, confusion, *headache,* chills/fever, malaise, neuropathy
**CV:** Chest pain, vasodilatation, hypertension
**EENT:** Conjunctivitis, abnormal vision
**GI:** Hepatotoxicity, *diarrhea, nausea, vomiting,* anorexia, dyspepsia, constipation, stomatitis, pancreatitis
**HEMA:** Bone marrow suppression, leukopenia, macrocytosis
**INTEG:** *Rash,* sweating, pruritus, benign neoplasms
**MISC:** Lactic acidosis, asthenia, lipodystrophy
**MS:** Myalgia, arthralgia
**RESP:** Dyspnea, pneumonia, asthma

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed, 82% bioavailability |
| **Distribution** | Cerebrospinal fluid |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | Elimination: 1-1.6 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Chloramphenicol, dapsone, didanosine, ethambutol, hydrALAZINE, lithium, phenytoin, vinCRIStine, zalcitabine: increased peripheral neuropathy
Methadone, zidovudine: decreased stavudine effect
Probenecid: increased stavudine levels

### Drug classifications

Myelosuppressants: increased myelosuppression

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess for lactic acidosis and severe hepatomegaly with steatosis; death may result; monitor LFTs

- Monitor viral load and CD4 counts, plasma HIV RNA baseline, throughout treatment
- Monitor for peripheral neuropathy: tingling, pain in extremities; if these occur, discontinue product, may not resolve after treatment is discontinued

**BLACK BOX WARNING: Monitor for pancreatitis:** severe upper abdominal pain, weakness, fatigue, dyspnea, nausea, vomiting throughout treatment; if these occur, discontinue product

- Monitor blood tests: WBC, differential, RBC, Hct, Hgb, platelets, serum amylase, lipase, blood glucose, plasma hepatitis CRNA, pregnancy test, serum cholesterol, serum lipids, hepatitis serology, baseline and periodically
- Monitor renal function tests: urinalysis, protein, blood, serum creatinine
- Lipoatrophy/lipodystrophy during treatment
- Monitor bowel pattern before, during treatment
- Monitor fluid overload; product requires large volume to stay in sol
- Assess for weakness, tremors, confusion, dizziness, psychosis; if these occur, product may have to be decreased or discontinued
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, register pregnant patient in the Antiretroviral Pregnancy Registry 800-258-4263, do not breastfeed

### Patient/family education

- Teach patient signs of peripheral neuropathy: burning, weakness, pain, pricking feeling in the extremities
- Caution patient that this product should not be given with antineoplastics
- Inform patient that GI complaints and insomnia resolve after 3-4 wk of treatment

• Inform patient that product is not a cure for AIDS but controls symptoms
• Advise patient to call prescriber if sore throat, swollen lymph nodes, malaise, fever occur; may indicate presence of other infections
• Caution patient that even with product administration, virus is still infective and may be passed on to others
• Caution patient that follow-up visits must be continued because serious toxicity may occur; blood counts must be done q2wk
• Teach patient that product must be taken q4hr around the clock even during night
• Caution patient that serious product interactions with other medications may occur, check with prescriber first if taking chloramphenicol, dapsone, cisplatin, didanosine, ethambutol, lithium, antifungals
• Teach patient to notify prescriber if pregnancy is planned or suspected, fatal lactic acidosis may occur, pregnancy avoid breastfeeding
• Inform patient that other products may be necessary to prevent other infections
• Inform patient that product may cause fainting or dizziness

### Evaluation

**Positive therapeutic outcome**
• Decreased symptoms of HIV infection

**⚠ HIGH ALERT**

## succinylcholine (Rx)

(suk-sin-ill-koe′leen)
**Anectine, Quelicin**
*Func. class.:* Neuromuscular blocker (depolarizing—ultra short)

**ACTION:** Inhibits transmission of nerve impulses by binding with cholinergic receptor sites, antagonizing action of acetylcholine; causes release of histamine

**Therapeutic outcome:** Paralysis of skeletal muscles

**USES:** Facilitation of endotracheal intubation, skeletal muscle relaxation during orthopedic manipulations

## CONTRAINDICATIONS

Hypersensitivity, malignant hyperthermia, trauma

**Precautions:** Pregnancy, breastfeeding, geriatric or debilitated patients, severe burns, fractures (fasciculation may increase damage), electrolyte imbalances, dehydration, neuromuscular disease, respiratory disease, collagen diseases, glaucoma, eye surgery, renal/hepatic/cardiac disease, hyperkalemia

**BLACK BOX WARNING:** Myopathy, rhabdomyolysis, children <2 yr

## DOSAGE AND ROUTES

**Adult: IV** 0.3-1.1 mg/kg, max 150 mg, maintenance 0.04-0.07 mg/kg q5-10min as needed; CONT **IV** INF dilute to concentration of 1-2 mg/ml in $D_5W$ or NS 10-100 mcg/kg/min
**Child: IV** initially 1-2 mg/kg; CONT **IV** INF not recommended

**Available forms:** Inj 20, 50, 100 mg/ml; powder for inj 100, 500 mg/vial, 1 g/vial

### Implementation

• Store in refrigerator, powder at room temp; close tightly
• Give IV or IM; only experienced clinicians familiar with the use of neuromuscular blocking drugs should administer or supervise the use of this product
• Visually inspect parenteral products for particulate matter and discoloration prior to use
• Monitor heart rate and mechanical ventilator status during use

**Rapid IV injection route**
• Due to tachyphylaxis and prolonged apnea, this method is not recommended for prolonged procedures. Rapid IV injection of succinylcholine may result in profound bradycardia or asystole in pediatric patients; as with adults, the risk increases with repeated doses. Pretreatment with atropine may be needed
• No dilution of injection solution necessary
• Inject rapidly IV over 10-30 seconds

**Continuous IV infusion route**
• Not recommended for infants and children due to risk of malignant hyperthermia
• This route is preferred for long surgical procedures due to possible tachyphylaxis and prolonged apnea associated with administration of repeated fractional doses
• Dilute succinylcholine to a concentration of 1-2 mg/ml with $D_5W$, $D_5NS$, NS, or 1/6 M sodium lactate injection. One g of the powder for injection or 20 ml of a 50-mg/ml solution may be added to 1 L or 500 ml of diluent to give solutions containing 1 or 2 mg/ml, respectively. Alternatively, 500 mg of the powder for injection or 10 ml of a 50 mg/ml solution may be added to 500 ml or 250 ml of diluent to give solutions containing 1 or 2 mg/ml, respectively
• Infuse IV at a rate of 2.5 mg/min (range = 0.5-10 mg/min); adjust rate based on patient response and requirements

S

**IM route**
- Recommended for infants and other patients in whom a suitable vein is not accessible
- Inject into a large muscle, preferably high into the deltoid muscle. Aspirate prior to injection

**Y-site compatibilities:** Etomidate, heparin, potassium chloride, propofol, vit B/C

**Additive incompatibilities:** Barbiturates, nafcillin, sodium bicarbonate

## ADVERSE EFFECTS

**CV:** Bradycardia, tachycardia; increased, decreased B/P, sinus arrest, dysrhythmias, edema
**EENT:** Increased secretions, increased intraocular pressure
**HEMA:** Myoglobulinemia
**INTEG:** Rash, flushing, pruritus, urticaria
**MS:** Weakness, muscle pain, fasciculation, prolonged relaxation, myalgia, rhabdomyolysis
**RESP:** Prolonged apnea, bronchospasm, cyanosis, respiratory depression, wheezing, dyspnea
**SYST:** Anaphylaxis, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM) |
| **Distribution** | Widely distributed, crosses placenta |
| **Metabolism** | Plasma (90%) |
| **Excretion** | Hydrolyzed in blood, excreted in urine (active/inactive metabolites) |
| **Half-life** | Unknown |

### Pharmacodynamics

| | IM | IV |
|---|---|---|
| **Onset** | 2-3 min | 1 min |
| **Peak** | Unknown | 2-3 min |
| **Duration** | 10-30 min | 6-10 min |

## INTERACTIONS

### Individual products

Clindamycin, enflurane, isoflurane, lincomycin, lithium, oxytocin, procainamide, quiNIDine: increased neuromuscular blockade
Theophylline: increased dysrhythmias

### Drug classifications

Aminoglycosides, anesthetics (local), antibiotics (polymyxin), β-adrenergic blockers, cardiac glycosides, magnesium salts, opioids, thiazides: increased neuromuscular blockade

### Drug/herb

Melatonin: blocks succinylcholine

## NURSING CONSIDERATIONS

### Assessment

- Assess for electrolyte imbalances (potassium, magnesium); may lead to increased action of this product
- Monitor VS (B/P, pulse, respirations, airway) until fully recovered; rate, depth, pattern of respirations, strength of hand grip
- Monitor I&O ratio; check for urinary retention, frequency, hesitancy
- **Recovery:** assess for decreased paralysis of face, diaphragm, leg, arm, rest of body
- **Allergic reactions:** assess for rash, fever, respiratory distress, pruritus; product should be discontinued if these occur
- Assess temperature for malignant hyperthermia, previous reactions to anesthesia, or paralytics
- **Pregnancy/breastfeeding:** Use only if clearly needed, cautious use in breastfeeding, excretion unknown

**BLACK BOX WARNING: Myopathy, rhabdomyolysis:** in pediatric patients (rare)

### Patient/family education

- Explain reason for medication and expected results
- Provide reassurance if communication is difficult during recovery from neuromuscular blockade; postoperative stiffness is normal, soon subsides

### Evaluation

**Positive therapeutic outcome**
- Paralysis of jaw, eyelid, head, neck, rest of body

## TREATMENT OF OVERDOSE:

Neostigmine, atropine, monitor VS; may require mechanical ventilation

## sucralfate (Rx)

(soo-kral′fate)
**Carafate, Sulcrate**
*Func. class.:* Protectant; antiulcer
*Chem. class.:* Aluminum hydroxide/sulfated sucrose

**Do not confuse:** Carafate/Cafergot

**ACTION:** Forms a complex that adheres to ulcer site, adsorbs pepsin

**Therapeutic outcome:** Healing of ulcers

**USES:** Duodenal ulcer, oral mucositis, stomatitis after radiation of head and neck

**Unlabeled uses:** Gastric ulcers, gastroesophageal reflux

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, renal failure, hypoglycemia (diabetics)

## DOSAGE AND ROUTES
### Duodenal ulcers
**Adult:** PO 1 g qid 1 hr before meals and at bedtime
**Child:** PO 40-80 mg/kg/day divided

**Available forms:** Tabs 1 g; oral susp 1 g/10 ml

### Implementation
- Do not break, crush, or chew tabs
- Give on empty stomach 1 hr before meals and at bedtime
- Avoid antacids ½ hr before or 1 hr after taking this product
- Store at room temperature

## ADVERSE EFFECTS
**GI:** *Dry mouth, constipation,* bezoar (critically ill patients)

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Minimally absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Not metabolized |
| **Excretion** | Feces (90%) |
| **Half-life** | 6-20 hr |

### Pharmacodynamics
| | |
|---|---|
| **Onset** | ½ hr |
| **Peak** | Unknown |
| **Duration** | 6 hr |

## INTERACTIONS
### Individual drugs
Cimetidine, ranitidine: decreased absorption of sucralfate
Digoxin, ketoconazole, phenytoin, tetracycline, theophylline: decreased action of each specific product

### Drug classifications
Antacids: decreased absorption of sucralfate
Fat-soluble vitamins: decreased action of fat-soluble vitamins
Fluoroquinolones: decreased absorption

## NURSING CONSIDERATIONS
### Assessment
- **GI symptoms:** assess for abdominal pain, blood in stools
- **Hypoglycemia:** may occur in those with diabetes mellitus, monitor blood glucose carefully

### Patient/family education
- Instruct patient to take medication on empty stomach
- Caution patient to take full course of therapy, not to use >8 wk, to avoid smoking
- Caution patient to take 2 hr after product, to avoid antacids, milk alkalotics, water within 2 hr of the product
- Advise patient to increase fluids, bulk, exercise to lessen constipation

### Evaluation
**Positive therapeutic outcome**
- Absence of pain or GI complaints

## sulfamethoxazole/trimethoprim (cotrimoxazole) (Rx)
(sul-fa-meth-ox′a-zole/trye-meth′oh-prim [ko-trye-mox′a-zole])
**Apo-Sulfatrim, Bacter-Aid DS, Bactrim DS, Novo-Trimel, Nu-Cotrimox, Septra, Protin DF, Septra DS, SMZ/TMP, Sultrex**
*Func. class.:* Antiinfective
*Chem. class.:* Sulfonamide—miscellaneous

**ACTION:** Sulfamethoxazole (SMZ) interferes with bacterial biosynthesis of proteins by competitive antagonism of PABA when adequate levels are maintained; trimethoprim (TMP) blocks synthesis of tetrahydrofolic acid; combination blocks two consecutive steps in bacterial synthesis of essential nucleic acids, protein

**Therapeutic outcome:** Absence of infection, based on C&S

**USES:** UTI, otitis media, acute and chronic prostatitis, shigellosis, chancroid, traveler's diarrhea, *Enterobacter, Escherichia coli, Haemophilus influenzae* (beta-lactamase negative), *Haemophilus influenzae* (beta-lactamase positive), *Klebsiella, Morganella morganii, Pneumocystis carinii, Pneumocystis jiroveci, Proteus mirabilis, Proteus, Shigella flexneri, Shigella sonnei, Streptococcus* pneumonia; **may also be effective for** *Acinetobacter baumannii, Actinomadura madurae, Actinomadura pelletieri, Bordetella pertussis, Burkholderia pseudomallei, Cyclospora cayetanensis, Haemophilus ducreyi, Isospora belli, Klebsiella granulomatis, Legionella micdadei, Legionella pneumophila, Listeria monocytogenes, Moraxella catarrhalis, Neisseria gonorrhoeae, Nocardia asteroides, Nocardia brasiliensis,*

S

*Nocardia otitidiscaviarum, Pediculus capitis, Plasmodium falciparum, Providencia, Salmonella, Serratia, Shigella, Staphylococcus aureus* (MRSA), *Staphylococcus aureus* (MSSA), *Staphylococcus epidermidis, Stenotrophomonas maltophilia, Streptococcus pyogenes* (group A beta-hemolytic streptococci), *Streptomyces somaliensis, Toxoplasma gondii, Vibrio cholerae, Viridans* streptococci, *Yersinia enterocolitica*

## CONTRAINDICATIONS

Pregnancy at term, breastfeeding, infants <2 mo, hypersensitivity to trimethoprim or sulfonamides, megaloblastic anemia, CCr <15 ml/min

**Precautions:** Pregnancy **C,** infants, geriatric, renal disease, G6PD deficiency, impaired renal/hepatic function, possible folate deficiency, severe allergy, bronchial asthma, UV exposure, porphyria, hyperkalemia, hypothyroidism

## DOSAGE AND ROUTES

Based on TMP content

### UTI

**Adult:** PO 160 mg TMP q12hr × 10-14 days
**Child:** PO 8 mg/kg TMP daily in 2 divided doses q12hr (treatment); 2 mg/kg/day (prophylaxis)

### Otitis media

**Child:** PO 8 mg/kg TMP daily in 2 divided doses q12hr × 10 days

### Chronic bronchitis

**Adult:** PO 160 mg TMP q12hr × 10-14 days

### *Pneumocystis jiroveci* pneumonitis

**Adult and child:** PO 15-20 mg/kg TMP daily in 4 divided doses q6hr × 14-21 days; **IV** 15-20 mg/kg/day (based on TMP) in 3-4 divided doses for up to 14 days

### Renal dose

Dosage reduction necessary in moderate to severe renal impairment (CCr <30 ml/min)

**Available forms:** Tabs 80 mg TMP/400 mg SMZ, 160 mg TMP/800 mg SMZ; susp 200 mg-40 mg/5 ml, 800 mg-160 mg/20 ml; **IV** 16 mg/80 mg/ml

### Implementation

- Give with full glass of water to maintain adequate hydration; increase fluids to 2 L/day to decrease crystallization in kidneys
- Give medication after C&S; repeat C&S after full course of medication
- Store in airtight, light-resistant container at room temp
- Give without regard to meals

**Intermittent IV infusion route**

- Dilute 5 ml ampule/100-125 ml of $D_5W$, stable for 6 hr, give over ½ hr, do not refrigerate, if using Septra ADD-Vantage vials dilute each 10-ml vial in ADD-Vantage diluent containers containing 250 ml of $D_5W$, infuse over 60-90 min, change site q48-72hr

**Y-site compatibilities:** Acyclovir, aldesleukin, allopurinol, amifostine, atracurium, aztreonam, cefepime, cyclophosphamide, diltiazem, enalaprilat, esmolol, filgrastim, fludarabine, gallium, granisetron, HYDROmorphone, labetalol, LORazepam, magnesium sulfate, melphalan, meperidine, morphine, pancuronium, perphenazine, piperacillin/tazobactam, sargramostim, tacrolimus, teniposide, thiotepa, vecuronium, zidovudine

**Y-site incompatibilities:** Alfentanil, amikacin, aminophylline, amphotericin B colloidal, ampicillin, ampicillin/sulbactam, ascorbic acid, atropine, azaTHIOprine, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, caspofungin, ceFAZolin, cefotaxime, cefOXitin, cefTAZidime, cefTRIAXone, chloramphenicol, chlorproMAZINE, cimetidine, clindamycin, codeine, cyanocobalamin, cycloSPORINE, dantrolene, dexamethasone, diazepam, diazoxide, digoxin, diphenhydrAMINE, DOBUTamine, DOPamine, DOXOrubicin, doxycycline, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, erythromycin, famotidine, fentaNYL, fluconazole, folic acid, furosemide, ganciclovir, gentamicin, glycopyrrolate, haloperidol, heparin, hydrALAZINE, hydrocortisone, hydrOXYzine, IDArubicin, imipenem/cilastatin, inamrinone, indomethacin, insulin, isoproterenol, ketorolac, lidocaine, mannitol, mechlorethamine, metaraminol, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, multi-vitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, papaverine, penicillin G, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, phenytoin, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, quinupristin/dalfopristin, ranitidine, sodium bicarbonate, succinylcholine, SUFentanil, thiamine, ticarcillin/clavulanate, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, verapamil, vinorelbine

## ADVERSE EFFECTS

**CNS:** Headache, insomnia, hallucinations, depression, vertigo, fatigue, anxiety, seizures, drug fever, chills, aseptic meningitis

**CV:** Allergic myocarditis
**EENT:** Tinnitus
**GI:** *Nausea, vomiting, abdominal pain,* stomatitis, hepatitis, glossitis, pancreatitis, diarrhea, enterocolitis, anorexia, pseudomembranous colitis
**GU:** Renal failure, toxic nephrosis; increased BUN, creatinine; crystalluria
**HEMA:** Leukopenia, neutropenia, thrombocytopenia, agranulocytosis, hemolytic anemia, hypoprothrombinemia, Henoch-Schölein purpura, methemoglobinemia, eosinophilia
**INTEG:** Rash, dermatitis, urticaria, erythema, photosensitivity, pain, inflammation at injection site, toxic epidermal necrolysis, erythema multiforme
**RESP:** Cough, shortness of breath
**SYST:** Anaphylaxis, systemic lupus erythematosus, Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid |
| **Distribution** | Breast milk, crosses placenta, 68% protein bound |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 8-13 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CycloSPORINE: decreased response
Dofetilide: increased levels of dofetilide
Methenamine: increased crystalluria
Methotrexate: increased bone marrow depression
Phenytoin: decreased hepatic clearance of phenytoin

### Drug classifications

Anticoagulants (oral): increased anticoagulant effect
CYP2C9, CYP3A4 inducers: decreased hepatic clearance
Diuretics (potassium-sparing), potassium supplements: increased potassium levels
Diuretics (thiazide): increased thrombocytopenia
Sulfonylureas: increased hypoglycemic response

### Drug/lab test

Increased: creatinine, bilirubin
Decreased: Hgb, platelets

## NURSING CONSIDERATIONS

### Assessment

- Monitor I&O ratio; note color, character, pH of urine if product administered for UTI; output should be 800 ml less than intake; if urine is highly acidic, alkalization may be needed
- Monitor renal function tests: BUN, creatinine, urinalysis (long-term therapy)
- Assess type of infection; obtain C&S before starting therapy
- Assess blood dyscrasias, skin rash, fever, sore throat, bruising, bleeding, fatigue, joint pain
- Assess allergic reaction: rash, dermatitis, urticaria, pruritus, dyspnea, bronchospasm, AIDS patients are more susceptible, identify if patient has a sulfa allergy
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, may be harmful to fetus, do not breastfeed

### Patient family education

- Teach patient to take each oral dose with full glass of water to prevent crystalluria; drink 8-10 glasses of water/day
- Teach patient to complete full course of treatment to prevent superinfection
- Teach patient to avoid sunlight or use sunscreen to prevent burns
- Teach patient to avoid OTC medications (aspirin, vit C) unless directed by prescriber
- If diabetic, teach patient to use Clinistix or Tes-Tape
- Teach patient to use alternative contraceptive measures; decreased effectiveness of oral contraceptives may result
- Teach patient to notify prescriber if skin rash, sore throat, fever, mouth sores, unusual bruising, bleeding occur

### Evaluation

**Positive therapeutic outcome**

- Absence of pain, fever, C&S negative

## sulfaSALAzine (Rx)

(sul-fa-sal'a-zeen)
**Azulfidine, Azulfidine EN-tabs, Salazopyrin, Salazopyrin EN-tabs** 🍁
*Func. class.:* GI Antiinflammatory, antirheumatic (DMARD)
*Chem. class.:* GI Sulfonamide

**Do not confuse:** sulfaSALAzine/sulfiSOXAZOLE

**ACTION:** Proproduct to deliver sulfapyridine and 5-aminosalicylic acid to colon; antiinflammatory in connective tissue

**Therapeutic outcome:** Treatment of ulcerative colitis, rheumatoid arthritis

## USES:
Ulcerative colitis, rheumatoid arthritis, juvenile rheumatoid arthritis (Azulfidine EN-tabs)

**Unlabeled uses:** Crohn's disease

## CONTRAINDICATIONS
Pregnancy at term, children <2 yr, hypersensitivity to sulfonamides or salicylates, intestinal, urinary obstruction, porphyria

**Precautions:** Pregnancy, breastfeeding, impaired renal/hepatic function, severe allergy, bronchial asthma, megaloblastic anemia

## DOSAGE AND ROUTES
### Bowel disease
**Adult:** PO 3-4 g/day in divided doses; maintenance 2 g/day in divided doses q6hr
**Child ≥6 yr:** PO 40-60 mg/kg/day in 4-6 divided doses, then 30 mg/kg/day in 4 doses, max 2 g/day

### Rheumatoid arthritis
**Adult:** PO 0.5-1 g/day, then increase daily dose by 500 mg qwk to 2 g/day in 2-3 divided doses

### Juvenile rheumatoid arthritis
**Child ≥6 yr:** PO 30-50 mg/kg/24 hr, divided into 2 doses

### Renal dose
**Adult:** PO CCr 10-30 ml/min give bid; CCr <10 ml/min give daily

**Available forms:** Tabs 500 mg; oral susp 250 mg/5 ml; del rel tabs 500 mg

### Implementation
- Give with full glass of water to maintain adequate hydration; increase fluids to 2 L/day to decrease crystallization in kidneys; contact lenses, urine, skin may be yellow-orange
- Give total daily dose in evenly spaced doses and after meals to help minimize GI intolerance
- Give at bedtime
- Store in airtight, light-resistant container at room temperature

## ADVERSE EFFECTS
**CNS:** Headache, confusion, insomnia, hallucinations, depression, vertigo, fatigue, anxiety, seizures, drug fever, chills
**CV:** Allergic myocarditis
**GI:** *Nausea, vomiting, abdominal pain,* stomatitis, hepatitis, glossitis, pancreatitis, diarrhea
**GU:** Renal failure, toxic nephrosis, increased BUN, creatinine, crystalluria
**HEMA:** Leukopenia, neutropenia, thrombocytopenia, agranulocytosis, hemolytic anemia
**INTEG:** Rash, dermatitis, urticaria, Stevens-Johnson syndrome, erythema, photosensitivity
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Partially absorbed |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 6 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1 hr |
| **Peak** | 1½-6 hr |
| **Duration** | 6-12 hr |

## INTERACTIONS
### Individual drugs
AzaTHIOprine, mercaptopurine: increased leucopenia risk
CycloSPORINE: decreased effect of cycloSPORINE
Digoxin: decreased digoxin effect
Folic acid: decreased folic acid effect
Methotrexate: decreased renal excretion

### Drug classifications
Anticoagulants (oral): increased anticoagulant effect
Hypoglycemics (oral): increased hypoglycemic response

### Drug/food
Iron, folic acid will be poorly absorbed

### Drug/lab test
False positive: urinary glucose test

## NURSING CONSIDERATIONS
### Assessment
- Monitor I&O ratio; note color, amount, character, pH of urine if product administered for UTIs; output should be 800 ml less than intake; if urine is highly acidic, alkalization may be needed
- Monitor kidney function tests: BUN, creatinine, urinalysis if on long-term therapy
- **Blood dyscrasias:** assess for rash, fever, sore throat, bruising, bleeding, fatigue, joint pain; monitor CBC before and q3mo
- **Allergic reaction:** assess for rash, dermatitis, urticaria, pruritus, dyspnea, bronchospasm, identify sulfa, salicylate allergy
- **Ulcerative colitis, proctitis, other inflammatory bowel disease:** monitor character, amount, consistency of stools, abdominal pain, cramping, blood, mucus

• **Rheumatoid arthritis:** assess mobility, joint swelling, pain, activities of daily living
• **Pregnancy/breastfeeding: Use only if clearly needed, cautious use in breastfeeding, excreted in breast milk**

### Patient/family education

• Advise patient to take each oral dose with full glass of water to prevent crystalluria
• Teach patient to avoid sunlight or to use sunscreen to prevent burns
• Teach patient to avoid OTC medication (aspirin, vit C) unless directed by prescriber
• Advise patient to notify prescriber if skin rash, sore throat, fever, mouth sores, unusual bruising, bleeding occur
• Advise patient to use rectal susp at bedtime and retain all night
• Advise patient that decreased sperm production may occur and resolves after completion of product
• Notify prescriber if enteric-coated tablets are seen in the stool, discontinue if present

### Evaluation

**Positive therapeutic outcome**
• Absence of fever, mucus in stools or pain in joints

## SUMAtriptan (Rx)

(soo-ma-trip'tan)
**ALSUMA Auto-injector, Imitrex, Sumavel Dose Pro, Zecuity**
*Func. class.:* Antimigraine agent
*Chem. class.:* 5-$HT_1$ receptor agonist

**Do not confuse:** SUMAtriptan/somatropin

**ACTION:** Binds selectively to the vascular 5-$HT_1$ receptor subtype and exerts antimigraine effect; causes vasoconstriction in cranial arteries

**Therapeutic outcome:** Absence of migraines

**USES:** Acute treatment of migraine with or without aura and cluster headache

## CONTRAINDICATIONS

Angina pectoris, history of MI, documented silent ischemia, Prinzmetal's angina, ischemic heart disease, **IV** use, concurrent ergotamine-containing preparations, uncontrolled hypertension, hypersensitivity, basilar or hemiplegic migraine

**Precautions:** Pregnancy, breastfeeding, children <18 yr, postmenopausal women, men >40 yr, geriatric, risk factors for CAD, hypercholesterolemia, obesity, diabetes, impaired renal/hepatic function, overuse

## DOSAGE AND ROUTES

**Adult:** SUBCUT 6 mg or less, may repeat in 1 hr, max 12 mg/24 hr; PO 25 mg with fluids if no relief in 2 hr, give another dose, max 200 mg/day; NASAL 1 dose of 5, 10, or 20 mg in one nostril, may repeat in 2 hr, max 40 mg/24 hr, 1 puff each nostril q2hr; TD 1 patch (6.5 mg/4 hr); after application push activation button

### Hepatic dose

**Adult:** PO 25 mg, if no response after 2 hr, give up to 50 mg

**Available forms:** Inj 4, 6 mg/0.5 ml; tabs 25, 50, 100 mg; nasal spray 5 mg/100 mcl-units dose spray device 20 mg/100 mcl-units; transdermal patch 6.5 mg/4 hr

### Implementation

**PO route**
• Swallow tab whole; do not break, crush, or chew
• Take with fluids as soon as symptoms appear; may take a second dose >4 hr, max 200 mg/24 hr

**SUBCUT route**
• Give by SUBCUT route only, avoid IM or **IV** administration, use only for actual migraine attack
• Give 1st dose supervised by medical staff in those with CAD or those at risk for CAD

**Nasal route**
• Spray once in 1 nostril, may repeat if headache returns, do not repeat if pain continues after 1st dose

**Transdermal route**
• Do not cut; apply to dry, intact skin of upper arm or thigh; do not use over scars, tattoos, cuts, scratches, burns, abrasions
• Apply another patch if headache is not relieved ≥2 hr after 1st patch; push activation button within 15 min of applying or patch will not work; do not bathe, shower, swim; may be taped with medical tape if needed
• Do not use with MRI
• Remove slowly, cleanse with soap and water, may cause redness
• Dispose of after folding in half

## ADVERSE EFFECTS

**CNS:** *Tingling, hot sensation, burning, feeling of pressure, tightness, numbness, dizziness, sedation,* headache, anxiety, fatigue, cold sensation
**CV:** *Flushing,* MI, hypo/hypertension
**EENT:** Throat, mouth, nasal discomfort, vision changes
**GI:** Abdominal discomfort
**INTEG:** *Inj site reaction,* sweating
**MS:** *Weakness, neck stiffness,* myalgia
**RESP:** Chest tightness, pressure

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (SUBCUT) |
| **Distribution** | 10%-20% plasma protein binding |
| **Metabolism** | Liver (metabolite) |
| **Excretion** | Urine, feces |
| **Half-life** | 2 hr |

### Pharmacodynamics

| | SUBCUT |
|---|---|
| **Onset** | 10-20 min |
| **Peak** | 10 min-2 hr |
| **Duration** | Up to 24 hr (pain relief) |

## INTERACTIONS

### Individual drugs

Ergotamine: increased risk of vasospastic reaction

### Drug classifications

Ergot derivatives: extended vasospastic effects
MAOIs, SSRIs, SNRIs, serotonin-receptor agonists: increased SUMAtriptan levels

### Drug/herb

SAM-e, St. John's wort: serotonin syndrome

## NURSING CONSIDERATIONS

### Assessment

- **Serotonin syndrome:** assess for delirium, coma, agitation, diaphoresis, hypertension, fever, tremors, may resemble neuroleptic malignant syndrome (in patients taking SSRIs, SNRIs)
- Assess for tingling, hot sensation, burning, feeling of pressure, numbness, flushing, inj site reaction
- Assess B/P; signs/symptoms of coronary vasospasm
- Monitor stress level, activity, reaction, coping mechanisms of patient
- Assess neurologic status: LOC, blurring vision, nausea, vomiting, tingling in extremities preceding headache
- Assess for ingestion of tyramine-containing foods (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, avoid breastfeeding

### Patient/family education

- Caution patient not to take more than 2 doses/day or 12 mg/day; allow at least 1 hr between doses
- Caution patient to avoid driving or hazardous activities if dizziness or drowsiness occurs
- Teach patient to report chest tightness, heat, flushing, drowsiness, dizziness, fatigue, sudden severe abdominal pain or any allergic reactions that occur to prescriber immediately
- Inform patient to report any side effects to prescriber
- Caution patient to use contraception when taking product, to notify prescriber if pregnancy is suspected or planned
- **Nasal spray:** one spray in one nostril, may repeat if headache returns, do not repeat if pain continues after 1st dose

### Evaluation

**Positive therapeutic outcome**

- Decrease in frequency, severity of headache

**⚠ HIGH ALERT**

## SUNItinib (Rx)

(soo-nit'in-ib)

**Sutent**

*Func. class.:* Antineoplastic—miscellaneous

*Chem. class.:* Protein-tyrosine kinase inhibitor

**ACTION:** Inhibits multiple receptor tyrosine kinases (RTKs), some are responsible for tumor growth

**Therapeutic outcome:** Decrease in size of tumor

**USES:** Gastrointestinal stromal tumors (GIST) after disease progression or intolerance to imatinib; advanced renal carcinoma, pancreatic neuroendocrine tumors (pNET) in those with unresectable locally advanced/metastatic disease

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity

**Precautions:** Children, geriatric, active infections, QT prolongation, torsades de pointes, stroke, heart failure

**BLACK BOX WARNING:** Hepatotoxicity

## DOSAGE AND ROUTES

### Gastrointestinal stromal tumors (GIST)/renal cell cancer

**Adult:** PO 50 mg/day × 4 wk, then 2 wk off; may increase or decrease dose by 12.5 mg; if administered with CYP3A4 inducers, give 87.5 mg/day; if given with CYP3A4 inhibitors give 37.5 mg/day

### Pancreatic neuroendocrine (pNET)

**Adult:** PO 37.5 mg/day continuously, increase or decrease by 12.5 mg based on tolerance, avoid potent CYP3A4 inhibitors/inducers, if used with

CYP3A4 inhibitor decrease SUNItinib dose to a minimum of 25 mg/day; if used with CYP3A4 inducer increase SUNItinib to a max of 62.5 mg/day

**Available forms:** Caps 12.5, 25, 37.5, 50 mg

### Implementation

- Give with meal and large glass of water to decrease GI symptoms
- Give nutritious diet with iron, vitamin supplement, low fiber, few dairy products
- Store at 25°C (77°F)

## ADVERSE EFFECTS

**CNS:** CNS hemorrhage, headache, dizziness, insomnia, seizures, fatigue
**CV:** Hypertension, left ventricular dysfunction; QT prolongation, cardiotoxicity, thrombotic microangiopathy, torsades de pointes
**ENDO:** Hyper/hypothyroidism
**GI:** *Nausea,* hepatotoxicity, vomiting, dyspepsia, *anorexia, abdominal pain,* altered taste, *constipation,* stomatitis, mucositis, pancreatitis, diarrhea, GI bleeding/perforation
**GU:** Nephrotic syndrome
**HEMA:** Neutropenia, thrombocytopenia, hemolytic anemia, leukopenia
**INTEG:** *Rash, yellow skin discoloration,* depigmentation of hair or skin, alopecia
**MS:** Pain, arthralgia, myalgia, myopathy, rhabdomyolysis
**RESP:** Cough, dyspnea, pulmonary embolism
**SYST:** Bleeding, electrolyte abnormalities, hand-foot syndrome, serious infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 95% |
| **Metabolism** | By CYP3A4 |
| **Excretion** | Feces, small amount in urine |
| **Half-life** | Terminal 40-60 hr (SUNItinib); active metabolite 80-110 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 6-12 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Acetaminophen: increased hepatotoxicity
Bevacizumab: microangiopathic hemolytic anemia; avoid concurrent use
Dexamethasone, carBAMazepine, PHENobarbital, phenytoin, rifampin: decreased SUNItinib concentrations
Haloperidol, chloroquine, droperidol, pentamidine, arsenic trioxide, levomethadyl: increased QT prolongation
Simvastatin: increased plasma concentrations
Warfarin: increased plasma concentration; avoid use with warfarin, use low-molecular-weight anticoagulants instead

### Drug classifications

Calcium channel blockers: increased plasma concentrations
Class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation

### Drug/herb

St. John's wort: decreased SUNItinib concentration

### Drug/food

Grapefruit juice: increased plasma concentrations

## NURSING CONSIDERATIONS

### Assessment

- Monitor ANC and platelets; if ANC $<1 \times 10^9$/L and/or platelets $<50 \times 10^9$/L, stop until ANC $>1.5 \times 10^9$/L and platelets $>75 \times 10^9$/L; if ANC $<0.5 \times 10^9$/L and/or platelets $<10 \times 10^9$/L, reduce dose by 200 mg; if cytopenia continues, reduce dose by another 100 mg; if cytopenia continues for 4 wk, stop product until ANC $\geq 1 \times 10^9$/L
- Assess CV status: hypertension, QT prolongation can occur; monitor left ventricular ejection fraction (LVEF) MUGA baseline periodically, ECG, B/P
- **Assess for renal toxicity:** if bilirubin $>3 \times$ IULN, withhold SUNItinib until bilirubin levels return to $<1.5 \times$ IULN; electrolytes
- **Tumor lysis syndrome:** Usually in renal cell carcinoma or GI stromal tumor, may be fatal, monitor for hyperkalemia, severe muscle weakness, hypocalcemia, hyperphosphatemia, myopathy, hyperuricemia, monitor serum electrolytes before each dose
- **Osteoporosis of the jaw:** Dental disease or use of bisphosphonates may increase risk, invasive dental procedures should be avoided
- **QT prolongation:** Those taking CYP3A4 inhibitors, those with bradycardia, cardiac disease, or electrolyte disturbances are at greater risk, monitor electrolytes, especially magnesium, potassium; ECG

S

• Hand-foot syndrome: Assess for redness, swelling, numbness, desquamation on palms and soles of the feet, may occur days after use; if these occur, product should be discontinued
• **Nephrotic syndrome:** Monitor urinalysis and proteinuria

**BLACK BOX WARNING: Hepatotoxicity:** monitor liver function tests, before treatment and qmo; if liver transaminases >5 × IULN, withhold SUNItinib until transaminase levels return to <2.5 × IULN

• Assess for **HF, adrenal insufficiency** in those experiencing trauma
• Assess for bleeding: epistaxis rectal, gingival, upper GI, genital, wound bleeding; tumor-related hemorrhage may occur rapidly
• **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

• Advise patient to report adverse reactions immediately: shortness of breath, bleeding
• Teach patient reason for treatment, expected result
• Teach patient that many adverse reactions may occur: high B/P, bleeding, mouth swelling, taste change, skin discoloration, depigmentation of hair/skin
• Teach patient to avoid persons with known upper respiratory infections; immunosuppression is common
• Teach to avoid grapefruit juice
• Teach patient to report if pregnancy is planned or suspected

### Evaluation

**Positive therapeutic outcome**
• Decrease in size of tumor

## suvorexant

(soo'voe-rex'ant)
**Belsomra**
*Func. class.:* Psychotropic—sedative/hypnotic, anxiolytic
*Chem. class.:* Orexin receptor antagonist
**Controlled Substance Schedule IV**

**ACTION:** Alters the signaling of neurotransmitters called orexins, which are responsible for regulating the sleep–wake cycle

**Therapeutic outcome:** Normalized sleeping patterns

**USES:** The treatment of insomnia characterized by difficulties with sleep onset and/or sleep maintenance

**CONTRAINDICATIONS:** Narcolepsy, hypersensitivity

**Precautions:** Preexisting respiratory disease, COPD, breastfeeding, pregnancy **C,** labor, geriatrics, hepatic disease, sleep apnea, substance abuse, alcohol use, suicidal ideation, mental changes, depression

## DOSAGE AND ROUTES

**Adult: PO** 10 mg every night within 30 min of going to bed, and with ≥7 hr remaining before the planned time of awakening, may increase to maximum 20 mg every night

**Available forms:** Tabs 5, 10, 15, 20 mg

### Implementation

• Give 30 min before bedtime
• Effect may be delayed if taken with food, take on empty stomach for faster effect

## ADVERSE EFFECTS

**CNS:** Amnesia, suicidal ideation, anxiety, dizziness, drowsiness, hallucinations, headache, memory impairment, sleep paralysis
**GI:** Diarrhea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | High-protein binding |
| **Metabolism** | Unknown |
| **Excretion** | Feces (66%), urine (23%) |
| **Half-life** | Terminal half-life 12 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

CNS depressants: increased effects of both products
CYP3A inducers: decreased suvorexant effect
CYP3A inhibitors: avoid concurrent use

### Drug/herb

Kava kava, melatonin, valerian: increased suvorexant effect

## NURSING CONSIDERATIONS

### Assessment

• Sleeping patterns: waking in the night, inability to fall asleep, stay asleep, amnesia
• Teach patient to notify provider if pregnancy is planned or suspected, or if breastfeeding
• Teach patient that complex sleep behaviors may occur (sleep driving, sleep eating)

• Teach patient that daytime drowsiness or dizziness may occur, to avoid hazardous activities until response is known
• Teach patient to avoid grapefruit juice
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown
• **Beers:** Avoid in older adults with or at high risk for delirium

## Patient/family education

• Advise patient to use on an empty stomach for faster effect
• Teach patient to report suicidal thoughts/behaviors immediately or if depression worsens
• Teach patient to avoid use with other products unless approved by prescriber

## Evaluation

### Therapeutic response

• Normalized sleeping patterns

salicylic acid topical
saxagliptin (Rx)
selegiline (Rx)

## tacrolimus (PO, IV) (Rx)

(tak-row'lim-us)

**Astagraf XL, Prograf**

## tacrolimus (topical) (Rx)

**Protopic**

*Func. class.:* Immunosuppressant

*Chem. class.:* Macrolide

**Do not confuse:** Prograf/PROzac

**ACTION:** Produces immunosuppression by inhibiting lymphocytes (T)

**Therapeutic outcome:** Prevention of rejection in organ transplant

**USES:** Organ transplants, to prevent rejection; **topical:** atopic dermatitis

**Unlabeled uses:** Severe recalcitrant psoriasis graft-versus-host disease

## CONTRAINDICATIONS

Hypersensitivity to this product or to some kinds of castor oil, long-term use (topical), child <2 yr (topical)

**Precautions:** Pregnancy, breastfeeding, children <12 yr, severe renal/hepatic disease, diabetes mellitus, hyperkalemia, hyperuricemia, lymphomas, hypertension, acute bronchospasm, African descent, heart failure, seizures, QT prolongation

**BLACK BOX WARNING:** Children <12 yr, lymphomas, infection, neoplastic disease, neonates, infants; requires a specialized setting and an experienced clinician; liver transplant (ext rel)

## DOSAGE AND ROUTES-NTI

### Kidney transplant rejection prophylaxis

**Adult:** **IV** 0.03-0.05 mg/kg/day as cont INF, give no sooner than 6 hr after transplantation

### Liver transplant rejection prophylaxis

**Adult:** PO 0.1-0.15 mg/kg/day in 2 divided doses q12h, give no sooner than 6 hr after transplantation; **IV** 0.03-0.05 mg/kg/day as a cont INF, give no sooner than 6 hr after transplantation; ext rel caps 0.1 mg/kg qday preoperatively on empty stomach, 1st dose 12 hr prior to reperfusion and 0.2 mg/kg once daily postoperatively 1st dose within 12 hr of reperfusion but ≥ 4 hr after preoperative dose in combination with mycophenolate and corticosteroids

### Heart transplant rejection prophylaxis

**Adult:** PO 0.075 mg/kg/day in 2 divided doses q12h, give no sooner than 6 hr after transplantation; **IV** 0.01 mg/kg/day as a cont INF, give no sooner than 6 hr after transplantation

### Atopic dermatitis

**Adult:** TOP use 0.03% or 0.1% ointment, apply bid × 7 day after clearing of signs

**Child 2-5 yr:** TOP 0.03% ointment, apply bid × 7 day after clearing of signs

**Available forms:** Inj **IV** 5 mg/ml; caps 0.5, 1, 5 mg; ext rel cap 0.5, 1, 5 mg; ointment 0.03%, 0.1%

### Implementation

**Conventional immediate-release capsules**

- Give consistently with or without food

**Extended-release capsules (Astagraf XL)**

- Take in the morning, preferably on an empty stomach, at least 1 hr before a meal or at least 2 hr after a meal
- Swallow whole; do not chew, divide, or crush capsules
- Do not administer with an alcoholic beverage
- If a dose is missed up to 14 hr from the scheduled time, take the dose. If a dose is missed at more than 14 hr from the scheduled time, skip the dose and take the next dose at the regularly scheduled time

**Extended-release tablets (Envarsus XR)**

- Take in the morning, preferably on an empty stomach, at least 1 hr before a meal or at least 2 hr after a meal
- Swallow whole; do not chew, divide, or crush capsules
- Do not administer with an alcoholic beverage
- If a dose is missed up to 15 hr from the scheduled time, take the dose. If a dose is missed at more than 15 hr from the scheduled time, skip the dose and take the next dose at the regularly scheduled time
- Topical ointment has risk of developing cancer; use only when other options have failed

**IV route**

- Visually inspect for particulate matter and discoloration before use
- Because of the risk of hypersensitivity reactions, IV use should be reserved for those who cannot take tacrolimus orally. Oral therapy should replace IV therapy as soon as possible
- Observe patients for 30 min after beginning the infusion and frequently thereafter for possible hypersensitivity reactions

• Due to chemical instability, tacrolimus should not be mixed or infused with solutions with a pH of 9 or more (acyclovir or ganciclovir)

**Dilution**

• The concentrate for injection must be diluted with NS or D5W injection to a final concentration between 0.004 mg/ml and 0.02 mg/ml
• Prepare solutions in polyethylene or glass containers to allow storage for 24 hr, do not use polyvinyl chloride (PVC) containers because stability is decreased and the polyoxyl 60 hydrogenated castor oil in the formulation may leach phthalates from PVC containers

**Continuous IV infusion**

• Give through non-PVC tubing to minimize the potential for drug adsorption onto the tubing
• Infuse the required daily dose of the diluted IV solution over 24 hr

**Y-site compatibilities:** Alemtuzumab, alfentanil, amifostine, amikacin, aminophylline, amiodarone, amphotericin B colloidal, amphotericin B liposome, anidulafungin, atracurium, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate/chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefoperazone, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, DOXOrubicin hydrochloride, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, micafungin, midazolam, milrinone, mitoMYcin, mitoXANtrone, mivacurium, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pancuronium, PEMEtrexed, penicillin G, pentamidine, pentazocine, perphenazine, phentolamine, phenylephrine, piperacillin/tazobactam, potassium chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanil, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

**Y-site incompatibilities:** Acyclovir, allopurinol, azaTHIOprine, cefepime, dantrolene, diazepam, diazoxide, espmeprazole, folic acid, ganciclovir, iron sucrose, levothyroxine, omeprazole, phenytoin, thiopental

## ADVERSE EFFECTS

**CNS:** *Tremors, headache,* insomnia, paresthesia, chills, fever, seizures, posterior reversible encephalopathy syndrome, BK-virus-associated nephropathy, coma, posterior reversible encephalopathy syndrome (PRES)
**CV:** Hypertension, myocardial hypertrophy, prolonged QTc, cardiomyopathy
**EENT:** Blurred vision, photophobia
**GI:** Nausea, vomiting, diarrhea, constipation, GI bleeding, GI preforation
**GU:** Urinary tract infections, albuminuria, hematuria, proteinuria, renal failure, hemolytic uremic syndrome
**HEMA:** Anemia, leukocytosis, thrombocytopenia, purpura
**INTEG:** Rash, flushing, itching, alopecia
**META:** Hyperglycemia, hyperuricemia, hypokalemia, hyperkalemia
**MS:** Back pain, muscle spasms
**RESP:** Pleural effusion, atelectasis, dyspnea, interstitial lung disease
**SYST:** Anaphylaxis, infection, malignancy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Erratically absorbed (PO), completely absorbed (**IV**) |
| **Distribution** | Crosses placenta, 75% protein binding |
| **Metabolism** | Liver to metabolite |
| **Excretion** | Kidney—minimal; breast milk, bile |
| **Half-life** | 10 hr |

T

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Unknown | Unknown |
| **Peak** | 1-4 hr | Unknown |
| **Duration** | 12 hr | 12 hr |

## INTERACTIONS

### Individual drugs

CarBAMazepine, PHENobarbital, phenytoin, rifamycin: decreased blood levels
Cimetidine, danazol, erythromycin, mycophenolate, mofetil: increased blood levels
CISplatin, cycloSPORINE: increased toxicity
Haloperidol, chloroquine, droperidol, pentamidine, arsenic trioxide, CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation; do not use together
Ibuprofen: increased oliguria

### Drug classifications

Aminoglycosides: increased toxicity
Antifungals, calcium channel blockers: increased blood levels
Class IA/III antidysrhythmics, some phenothiazines, β-agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation
Live virus vaccines: decreased effect of vaccines

### Drug/herb

Astragalus, echinacea, melatonin: decreased immunosuppression, ginseng, St. John's wort

### Drug/food

Decreased absorption of food
Grapefruit juice: increased effect of tacrolimus

### Drug/lab test

Increased: glucose, BUN, creatinine
Decreased: magnesium, Hgb, platelets
Increased or decreased: LFTs, potassium

## NURSING CONSIDERATIONS

### Assessment

- Assess for caster oil allergy (HCO-60) do not use if present
- **Monitor blood studies:** Hgb, WBC, platelets during treatment monthly; if WBC is $<3000/mm^3$ or platelet count $<100,000/mm^3$, product should be discontinued or reduced; decreased Hgb level may indicate bone marrow suppression
- **QT prolongation:** ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea
- **Monitor liver function tests:** alkaline phosphatase, AST, ALT, amylase, bilirubin, and for hepatotoxicity: dark urine, jaundice, itching, light-colored stools; product should be discontinued
- Monitor serum creatinine/BUN, serum electrolytes, lipid profile, serum tacrolimus concentration
- **Assess for anaphylaxis:** rash, pruritus, wheezing, laryngeal edema; stop inf, initiate emergency procedures
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excretion unknown

### Patient/family education

**BLACK BOX WARNING:** Advise patient to report if pregnancy is planned or suspected

**BLACK BOX WARNING:** Advise patient to report symptoms of lymphoma, or skin cancer

- Instruct patient to report fever, rash, severe diarrhea, chills, sore throat, fatigue because serious infections may occur; clay-colored stools, cramping may indicate hepatotoxicity, signs of diabetes mellitus
- Caution patient to avoid crowds or persons with known infections to reduce risk of infection, to avoid eating raw shellfish

**BLACK BOX WARNING: Liver transplant:** extended-release product should not be used due to increased female death rate

**BLACK BOX WARNING: Specialized care setting, experienced clinician:** this product should only be used when equipped and staffed with adequate supportive medical services and by those experienced in immunosuppressive therapy and organ transplantation

**BLACK BOX WARNING: Children, infants, neonates**: Not approved use of ointment in those <2 yr old, ext rel in those <16 yr not approved for pediatric kidney/heart transplant

### Topical:

- Teach patient to stop using topical product when atopic dermatitis is resolved, not to use over 6 wk if symptoms do not improve, not to shower or swim after applying
- Teach patient not to consume grapefruit juice

### Evaluation

**Positive therapeutic outcome**
- Absence of graft rejection
- Immunosuppression in autoimmune disorders

## tadalafil (Rx)

(tah-dal'a-fil)
**Adcirca, Cialis**
*Func. class.:* Impotence agent
*Chem. class.:* Phosphodiesterase type 5 inhibitor

**ACTION:** Inhibits phosphodiesterase type 5 (PDE5); enhances erectile function by increasing the amount of cyclic GMP, which causes smooth muscle relaxation and increased blood flow into the corpus cavernosum; improves erectile function for up to 36 hr

**Therapeutic outcome:** Erection

**USES:** Treatment of erectile dysfunction; pulmonary arterial hypertension (PAH) (Adcirca only), benign prostatic hyperplasia (BPH) with or without erectile dysfunction

## CONTRAINDICATIONS

Newborns, women, children, hypersensitivity, patients taking organic nitrates regularly or intermittently, patients taking any α-adrenergic antagonist other than 0.4 mg once-daily tamsulosin

**Precautions:** Pregnancy, anatomic penile deformities, sickle cell anemia, leukemia, multiple myeloma, CV/renal/hepatic disease, bleeding disorders, active peptic ulcer, prolonged erection

## DOSAGE AND ROUTES

### Erectile dysfunction

**Adult:** PO (Cialis) CCr 51-80 ml/min erectile dysfunction no adjustment; 20 mg/day initially, pulmonary hypertension; 10 mg, taken prior to sexual activity, dose may be reduced to 5 mg or increased to a max of 20 mg; usual max dosing frequency is once per day; once-daily dosing 2.5 mg/day at same time each day

### For improvement in exercise ability in patients with WHO Group I pulmonary hypertension (Adcirca)

**Adult:** PO 40 mg (two 20-mg tablets) qday with or without food

### BPH

**Adult:** PO 5 mg bid at the same time every day

### Renal dose

**Adult:** PO CCr 31-50 ml/min 5 mg/day, max 10 mg q48hr; CCr <30 ml/min, max 5 mg q72hr

### Hepatic dose

**Adult:** PO Child-Pugh class A, B, max 10 mg/day or 20 mg/day (pulmonary hypertension) max 40 mg/day; Child-Pugh class C, not recommended

### Concomitant medications

Ketoconazole, itraconazole, ritonavir, max 10 mg q72hr

**Available forms:** Tabs (Cialis) 2.5, 5, 10, 20 mg; tab 20 mg (Adcirca)

### Implementation

- **Sexual dysfunction:** give before sexual activity; do not use more than once a day
- **Pulmonary hypertension:** give Adcirca without regard to meals
- Product should not be used with nitrates in any form

## ADVERSE EFFECTS

**CNS:** *Headache, flushing, dizziness,* seizures, transient global amnesia
**CV:** MI, hypotension, QT prolongation
**INTEG:** Stevens-Johnson syndrome, exfoliative dermatitis, urticaria
**MISC:** Back pain/myalgia, *dyspepsia, nasal congestion, UTI,* blurred vision, changes in color vision, *diarrhea,* pruritus, priapism, nonarteritic ischemic optic neuropathy (NAION), hearing loss

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid; rate and extent of absorption of tadalafil are not influenced by food |
| **Distribution** | 94% protein bound |
| **Metabolism** | Liver |
| **Excretion** | Excreted primarily as metabolites, feces, urine; plasma concentration 61% in feces, 36% in urine |
| **Half-life** | 17.5 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | 6 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol, amlodipine, enalapril: decreased B/P
Bosentan: decreased effects of tadalafil
Itraconazole, ketoconazole, ritonavir: increased levels (although not studied, may also include other HIV protease inhibitors)

T

### Drug classifications

• Do not use with nitrates because of unsafe drop in B/P that could result in heart attack or stroke
α-blockers, angiotensin II receptor blockers: decreased B/P
Antacids: decreased effects of tadalafil

### Drug/food

Grapefruit: increased tadalafil effect

## NURSING CONSIDERATIONS

### Assessment

• **Cialis:** assess for underlying cause of erectile dysfunction prior to treatment; organic nitrates that should not be used with this product; assess for severe loss of vision
• **Adcirca:** monitor hemodynamic parameters baseline and periodically
• **Pregnancy/breastfeeding:** Use only if clearly needed (Adcirca only). Cialis is not indicated for women, cautious use in breastfeeding
• **Beers:** Use with caution in older adults, may exacerbate syncope, monitor frequently for syncope
• Teach patient to notify provider immediately and to stop taking product if vision, hearing loss occurs

### Patient/family education

• Teach patient to take 1 hr before sexual activity
• Teach patient not to drink large amounts of alcohol
• Advise that product does not protect against STDs, including HIV
• Instruct to tell physician if patient has a bleeding problem
• Advise that product should not be used with nitrates in any form
• Advise that product has no effect in the absence of sexual stimulation
• Instruct to seek medical help if an erection lasts more than 4 hr or if chest pain occurs
• Advise to notify physician of all medicines, vitamins, and herbs patient is taking, especially α-blockers, erythromycin, indinavir, itraconazole, ketoconazole, nitrates, ritonavir
• Advise that tadalafil is contraindicated for use with α-blockers except 0.4 mg/daily tamsulosin

### Evaluation

#### Positive therapeutic outcome

• Sustainable erection
• Improvement in exercise ability (pulmonary hypertension)

**⚠ HIGH ALERT**

## tamoxifen (Rx)

(ta-mox'i-fen)
**Apo-Tamox, Soltamox, Tamofen, Tamone, Tamoplex**
*Func. class.:* Antineoplastic
*Chem. class.:* Antiestrogen

**ACTION:** Inhibits cell division by binding to cytoplasmic estrogen receptors; resembles normal cell complex but inhibits DNA synthesis and estrogen response of target tissue

**Therapeutic outcome:** Prevention of rapidly growing malignant cancer

**USES:** Advanced breast carcinoma that has not responded to other therapy in estrogen receptor–positive patients (usually postmenopausal), prevention of breast cancer, after breast surgery/radiation in ductal carcinoma in situ (DCIS)

**Unlabeled uses:** Mastalgia, pain/size of gynecomastia, ovulation stimulation, malignant carcinoid tumor, carcinoid syndrome, metaplastic melanoma, desmoid tumors, McCune-Albright syndrome (female pediatric patients)

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity

**BLACK BOX WARNING:** Thromboembolic disease, endometrial cancer, stroke

**Precautions:** Leukopenia, thrombocytopenia, cataracts, women of childbearing age

**BLACK BOX WARNING:** Uterine cancer

## DOSAGE AND ROUTES

### Breast cancer (men/women)

**Adult:** PO 20-40 mg/day × 5 yr, doses >20 mg/day divide AM/PM

### High risk for breast cancer

**Adult:** PO 20 mg/day × 5 yr

### Ductal carcinoma in situ

**Adult:** PO 20 mg/day × 5 yr

**Available forms:** Tabs 10, 20 mg; oral solution 10 mg/5 ml

### Implementation

• Do not break, crush, or chew tabs
• Give with food or fluids for GI upset; repeat dose may be needed if vomiting occurs
• Store in light-resistant container at room temperature
• Oral solution: use calibrated container; dose >20 mg/day should be divided morning and

evening; may be used with food for gastric irritation

## ADVERSE EFFECTS

**CNS:** *Hot flashes, headache, light-headedness,* depression, mood changes
**CV:** Chest pain, stroke, fluid retention, flushing
**EENT:** Ocular lesions, cataracts, retinopathy, corneal opacity, blurred vision (high doses)
**GI:** *Nausea, vomiting,* altered taste (anorexia)
**GU:** Vaginal bleeding, pruritus vulvae, uterine malignancies, *altered menses, amenorrhea*
**HEMA:** Thrombocytopenia, leukopenia, deep vein thrombosis
**INTEG:** *Rash,* alopecia
**META:** Hypercalcemia
**RESP:** Pulmonary embolism

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Adequately absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver—extensively |
| **Excretion** | Feces—slowly, small amounts (kidneys) |
| **Half-life** | 1 wk |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4-7 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Aminoglutethimide, rifamycin: decreased tamoxifen levels
Bromocriptine: increased tamoxifen level
Letrozole: decreased levels of letrozole
PARoxetine: increased risk for death from breast cancer
Radiation: increased myelosuppression

### Drug classifications

Anticoagulants: increased risk of bleeding
Cytotoxics: increased thromboembolic action
CYP2D6 inhibitors (antidepressants): decreased tamoxifen effect
CYP3A4 inducers (barbiturates, bosentan, carBAMazepine, efavirenz, phenytoin, nevirapine, rifabutin, rifampin): decreased tamoxifen effect
CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, FLUoxetine, fluvoxaMINE, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole): increased toxicity

### Drug/herb

Black cohosh, dong quai, St. John's wort: avoid use

### Drug/lab test

Increased: serum calcium, $T_4$, AST, ALT, cholesterol, triglycerides, BUN

## NURSING CONSIDERATIONS

### Assessment

- Monitor CBC, differential, platelet count weekly; withhold product if WBC is $<4000/mm^3$ or platelet count is $<75{,}000/mm^3$; notify prescriber of results; monitor calcium levels (hypercalcemia is common); breast exam, mammogram, pregnancy test, bone mineral density, LFTs, serum calcium, serum lipid profile, periodic eye exams (cataracts, retinopathy)
- **Assess for tumor flare:** increase in bone, tumor pain during beginning treatment; give analgesics as ordered to decrease pain
- **Assess for bleeding:** hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr, no rectal temp
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding
- **Severe allergic reactions:** Rash, pruritus, urticaria, purpuric skin lesions, itching, flushing
- Bone pain; May give analgesics; pain usually transient

**BLACK BOX WARNING: Assess for uterine malignancies:** symptoms of stroke, PE that may occur in women with DCIS and women at high risk for breast cancer, monitor gynecologic exams periodically

### Patient/family education

- Teach patient to use nonhormonal contraception during treatment and for 2 months after discontinuing treatment
- **Teach patient to notify prescriber of stroke:** blurred vision, headache, weakness on one side of the body; pulmonary embolism: chest pain, fainting sweating, difficulty breathing
- Instruct patient to report any complaints, side effects to prescriber; if dose is missed, do not double next dose; that use may be 5 yr
- Advise patient that vaginal bleeding, pruritus, hot flashes can occur and are reversible after discontinuing treatment
- Instruct patient to report immediately decreased visual acuity, which may be irreversible; stress need for routine eye exams
- Inform patient about who should be told about tamoxifen therapy

T

- Advise patient to report vaginal bleeding immediately; that tumor flare (increase in size or tumor, increased bone pain) may occur and will subside rapidly; may take analgesics for pain; that premenopausal women must use mechanical birth control method because ovulation may be induced (teratogenic product)
- **Tumor flare:** Advise patient that increase in size of tumor, increased bone pain may occur and will subside rapidly; may take analgesics for pain
- Teach patient that hair loss may occur during treatment; a wig or hairpiece may make patient feel better; new hair may be different in color, texture
- Advise patient to increase fluids to 2 L/day unless contraindicated

### Evaluation

**Positive therapeutic outcome**
- Decreased spread of malignant cells in breast cancer

## tamsulosin (Rx)

(tam-sue-lo'sen)
**Flomax**
*Func. class.:* Selective α-adrenergic blocker, BPH agent
*Chem. class.:* Sulfamoyl phenethylamine derivative

**Do not confuse:** Flomax/Fosamax/Volmax

**ACTION:** Binds preferentially to α IA-adrenoceptor subtype located mainly in the prostate

**Therapeutic outcome:** Decreased symptoms of benign prostatic hyperplasia (BPH)

**USES:** Symptoms of BPH

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, hepatic disease, CAD, severe renal disease, prostate cancer; cataract surgery (floppy iris syndrome)

## DOSAGE AND ROUTES

**Adult:** PO 0.4 mg/day, increasing to 0.8 mg/day if required

### Hepatic dose (moderate impairment)

**Adult:** PO reg rel 50 mg q8hr, titrate; ext rel 50 mg q24hr, titrate, max 100 mg q24hr; avoid use in severe impairment

**Available forms:** Caps 0.4 mg

### Implementation

- Swallow caps whole; do not break, crush, or chew
- Store in airtight container at 86° F (30° C) or less
- Give without regard to food, but may be given with food to prevent GI symptoms; ½ hr after same meal each day
- If treatment is interrupted for several days, restart at lowest dose (0.4 mg/day)

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache,* asthenia, insomnia
**CV:** Chest pain, orthostatic hypotension
**EENT:** Amblyopia, floppy iris syndrome
**GI:** Nausea, diarrhea, dysgeusia
**GU:** Decreased libido, abnormal ejaculation, priapism
**MS:** Back pain
**RESP:** Rhinitis, pharyngitis, cough
**SYST:** Angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Not known; 98% plasma protein bound |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys |
| **Half-life** | 9-15 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Cimetidine: increased toxicity
Doxazosin, prazosin, terazosin, vardenafil: do not use together

### Drug classifications

α-blockers: do not use together

### Drug/food

Decreased: absorption with food

## NURSING CONSIDERATIONS

### Assessment

- Monitor CBC with differential and liver function tests; B/P and heart rate
- Monitor urodynamic studies/urinary flow rates, residual volume
- **Assess for BPH:** change in urinary patterns, baseline, throughout treatment; monitor I&O ratios, weight daily, edema, report weight gain or edema
- **Orthostatic hypotension:** monitor B/P standing, sitting
- **Pregnancy/breastfeeding:** Not to be used for women

### Patient/family education

- Teach patient not to discontinue product abruptly; emphasize the importance of complying with dosage schedule, even if feeling better; if dose is missed take as soon as remembered; take at same time each day
- Teach patient not to use OTC products (cough, cold, allergy) unless directed by prescriber; also to avoid large amounts of caffeine
- Caution patient that product may cause dizziness, may occur during 1st few days of therapy; to avoid hazardous activities
- Teach patient to take ½ hr after same meal each day
- Teach patient about priapism (rare)
- Advise patient not to crush, break, chew caps
- Teach patient that decreased ejaculate or absence may occur, resolves after discontinuing

### Evaluation

**Positive therapeutic outcome**

- Decreased symptoms of BPH

**⚠ HIGH ALERT**

## tapentadol (Rx)

(ta-pen'ta-dol)

**Nucynta, Nucynta IR 🍁, Nucynta ER**

Func. class.: Analgesic, miscellaneous

*Chem. class.:* μ-Opioid receptor agonist

**Controlled substance schedule II**

**ACTION:** Centrally acting synthetic analgesic; μ-opioid agonist activity is thought to result in analgesia; inhibits norepinephrine uptake

**Therapeutic outcome:** Relief of pain

**USES:** Moderate to severe pain

## CONTRAINDICATIONS

Hypersensitivity, asthma, ileus

**BLACK BOX WARNING:** Respiratory depression

**Precautions:** Pregnancy, breastfeeding, children <18 yr, increased intracranial pressure, MI (acute), severe heart disease, respiratory depression, renal/hepatic disease, GI obstruction, ulcerative colitis, sleep apnea, seizure disorder

**BLACK BOX WARNING:** Accidental exposure, avoid ethanol, substance abuse, neonatal opioid withdrawal/syndrome, potential for overdose, poisoning, coadministration with other CNS depressants

## DOSAGE AND ROUTES

**Adult:** PO 50-100 mg q4-6hr; may give second dose 1 hr or more after 1st dose; max 700 mg on day 1, 600 mg/day thereafter; ext rel 50 mg q12hr (opioid-naive), titrate to 100-250 mg q12hr, max 250 mg q12hr

### Hepatic disease

**Adult:** PO immediate rel sol 50 mg q8hr; may titrate to response; ext rel 50 mg qday max 100 mg/day

**Available forms:** Tab 50, 75, 100 mg; tabs, ext rel 50, 100, 150, 200, 250 mg

### Implementation

- Give with antiemetic if nausea, vomiting occur
- Give when pain is beginning to return; determine dosing interval by response
- Store in light-resistant area at room temperature
- Provide assistance with ambulation
- Provide safety measures: night-light, call bell within easy reach
- Not to crush, chew, break, or use with alcohol: ext rel product
- This is the preferred analgesic in those with altered cytochrome P450 or mild hepatic disease, mild to moderate renal disease

**BLACK BOX WARNING:** These products have high potential for overdose, poisoning; may be fatal due to respiratory depression

## ADVERSE EFFECTS

**CNS:** *Drowsiness, dizziness, confusion, headache, euphoria,* hallucinations, restlessness, syncope, anxiety, flushing, psychological dependence, insomnia, lethargy, tremor, seizures
**CV:** Palpitations, bradycardia, hypo/hypertension, orthostatic hypotension, sinus tachycardia
**GI:** *Nausea, vomiting, anorexia, constipation, cramps,* gastritis, dyspepsia, biliary spasms
**GU:** Urinary retention/frequency
**INTEG:** *Rash,* urticaria, diaphoresis, pruritus
**RESP:** Respiratory depression, cough
**SYST:** Anaphylaxis, infection, serotonin syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 32% |
| **Distribution** | Protein binding 20% |
| **Metabolism** | Liver, extensively |
| **Excretion** | Urine 99% |
| **Half-life** | Terminal 4 hr |

T

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

**BLACK BOX WARNING:** Alcohol: increased effects with other CNS depressants

### Drug classifications

Antipsychotics, opioids, sedatives/hypnotics, skeletal muscle relaxants: increased effects with other CNS depressants

MAOIs: increased toxicity

Serotonin-receptor agonists, SSRIs, SNRIs, tricyclics: increased serotonin syndrome

**Black Box Warning:** Do not use with alcohol; fatal overdose may occur

### Drug/herb

Kava, St. John's wort, valerian: increased sedative effect

## NURSING CONSIDERATIONS

### Assessment

- Monitor I&O ratio; check for decreasing output; may indicate urinary retention
- Assess CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
- Assess for allergic reactions: rash, urticaria, anaphylaxis
- **Seizures:** History of seizures, increased with SSRIs, SNRIs, tricyclic antidepressants
- **Serotonin syndrome:** Assess for increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer a serotonin antagonist if needed

**BLACK BOX WARNING: Addiction risk, previous substance abuse** before using extended-release product, some may crush extended-release product and snort, inject product that is dissolved

**BLACK BOX WARNING: Accidental exposure:** Identify if alcohol has been used before giving this product; may be fatal if used with tapentadol, keep from children, pets, avoid coadministration with other CNS depressants

**BLACK BOX WARNING: Assess for respiratory dysfunction:** respiratory depression, character, rate, rhythm; notify prescriber if respirations are <10/min; also B/P, pulse

- **Assess for pain:** intensity, location, type, characteristics; need for pain medication by pain/sedation scoring; physical dependence

**BLACK BOX WARNING:** Neonatal opioid withdrawal syndrome: May be fatal, monitor neonates for irritability, hyperactivity, abnormal sleep patterns, high-pitched cry, tremors, vomiting, diarrhea, failure to gain weight

**BLACK BOX WARNING:** Pregnancy/breastfeeding: Use only if benefits outweigh fetal risk, including neonatal opioid withdrawal syndrome, do not breastfeed, excretion unknown

### Patient/family education

- Teach patient to report any symptoms of CNS changes, allergic reactions
- Advise that physical dependency may result from extended use
- Inform that withdrawal symptoms may occur: nausea, vomiting, cramps, fever, faintness, anorexia
- Teach to avoid CNS depressants, alcohol
- Advise to avoid driving, operating machinery if drowsiness occurs

**BLACK BOX WARNING:** Not to use with alcohol, may be fatal

### Evaluation

**Positive therapeutic outcome**

- Decrease in pain

## RARELY USED

## tasimelteon

(tas'i-mel'tee-on)

**Hetlioz**

*Func. class.:* Anxiolytic/sedative/hypnotic

**USES:** Sleep-wake disorder in the blind

**CONTRAINDICATIONS:** Hypersensitivity

## DOSAGE AND ROUTES

**Adult: PO** 20 mg before bedtime at the same time every night; take without food

## tavaborole topical

*See Appendix B*

## tazobactam

*See piperacillin/tazobactam*

**RARELY USED**

## teduglutide

(te′due-gloo′tide)

**Gattex**

*Func. class.:* GI disorder agent

*Chem. class.:* Recombinant glucagonlike peptide-2 analog

**ACTION:** Increases intestinal, portal blood flow, inhibits gastric acid secretion, decreases gastric motility

**Therapeutic outcome:** Increased absorption of nutrients

**USES:** Short bowel syndrome in patients who are dependent on parenteral support

**Precautions:** Pregnancy, breastfeeding, diarrhea, pancreatitis, renal disease, electrolyte imbalances, GI obstruction, heart failure, neoplastic disease, biliary tract disease, cardiac disease, gastric cancer, GI disease

## DOSAGE AND ROUTES

**Adult:** SUBCUT 0.05 mg/kg/day

**Available forms:** Powder for injection 5 mg

### Implementation

**SUBCUT route**

• ***Reconstitution:*** Slowly inject the 0.5 ml of preservative-free sterile water for injection provided in the prefilled syringe into the vial; allow to stand for 30 sec and gently roll the vial between your palms for 15 sec; do not shake; allow to stand 2 min; if undissolved powder is present, roll the vial again until all material is dissolved; if the product remains undissolved after the second attempt, do not use; discard unused portion; use within 3 hr after reconstitution

**SUBCUT injection**

• Calculate dose, withdraw into a syringe, and give; do not use IV, IM; if a dose is missed, it should be given as soon as possible on the same day; two doses should not be given on the same day; alternate sites

## ADVERSE EFFECTS

**CNS:** Headache, fatigue

**GI:** Nausea, abdominal pain, cholecystitis, cholestasis, GI obstruction, pancreatitis, vomiting

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 2 hr; 1.3 hr (short bowel syndrome) |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Benzodiazepine, carBAMazepine, cycloSPORINE, digoxin, disopyramide, ethosuximide, flecainide, lerothyromixe, lithium, phenytoin, procainamide, quiNIDine, sirolimus, tacrolimus, theophylline, valproic acid, warfarin: increased absorption of each of these products

## NURSING CONSIDERATIONS

### Assessment

• GI symptoms: nausea, abdominal pain

• Monitor alk phos, amylase, bilirubin, serum electrolytes, lipase—baseline and q6mo

### Patient/family education

• Instruct patient to notify prescriber of GI symptoms

### Evaluation

**Positive therapeutic outcome**

• Increased absorption of nutrients

## telavancin (Rx)

(tel-a-van′sin)

**Vibativ**

*Func. class.:* Antiinfective—miscellaneous

*Chem. class.:* Lipoglycopeptide

**ACTION:** Inhibits bacterial cell wall synthesis, disrupts cell membrane integrity, blocks glycopeptides

**Therapeutic outcome:** Negative culture

**USES:** Skin/skin structure infections caused by *Enterococcus faecalis, E. faecium, Staphylococcus aureus* (MSRA), *S. aureus* (MSSA), *S. epidermidis, S. haemolyticus, Streptococcus agalactiae* (group B), *S. dysgalactiae, S. pyogenes* (group A beta tremolytic), *S. anginosus, S. intermedius, S. constellatus,* nosocomial pneumonia caused by susceptible gram-positive bacteria

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Breastfeeding, geriatric patients, renal disease, antimicrobial resistance, children, diabetes mellitus, diarrhea, GI disease, heart failure, hypertension, pseudomembranous colitis, QT prolongation, vancomycin hypersensitivity

T

**BLACK BOX WARNING:** Pregnancy, females, renal disease

## DOSAGE AND ROUTES

### Complicated skin/skin structure infections

**Adult: IV** INF 10 mg/kg over 60 min q24hr × 7-14 days

### Nosocomial pneumonia

**Adult: IV** INF 10 mg/kg q24hr × 7-21 days

### Renal dose

**Adult:** IV CCr 30-50 ml/min 7.5 mg/kg q24hr; CCr 10-29 ml/min 10 mg/kg q48hr

**Available forms:** Lyophilized powder for inj 250, 750 mg

### Implementation

- Use only for susceptible organisms to prevent drug-resistant bacteria
- Give antihistamine if red man syndrome occurs: decreased B/P, flushing of neck, face
- Store in refrigerator
- Have EPINEPHrine, suction, tracheostomy set, endotracheal intubation equipment on unit; anaphylaxis may occur
- Give adequate intake of fluids (2 L/day) to prevent nephrotoxicity
- Avoid IM, subcut use

**Intermittent IV infusion route**

- Administer after reconstituting with 15 ml $D_5W$ sterile water for inj; 0.9% NaCl (15 mg/ml) 250 mg vial; add 45 ml to 750 mg vial (15 mg/ml) for dose of 150-800 mg; further dilute with 100-250 ml of compatible sol; for dose <150 mg or 800 mg, further dilute to a conc of 0.6-8 mg/ml with compatible sol; give over 60 min, avoid rapid IV, may cause red man syndrome; reconstituted or diluted solution is stable for 4 hr at room temperature, 7 hr refrigerated

**Y-site compatibilities:** Amphotericin B lipid complex (Abelcet), ampicillin-sulbactam, azithromycin, calcium gluconate, caspofungin, cefepime, cefTAZidime, cefTRIAXone, ciprofloxacin, dexamethasone, diltiazem, DOBUTamine, DOPamine, doripenem, doxycycline, ertapenem, famotidine, fluconazole, gentamicin, hydrocortisone, labetalol, magnesium sulfate, mannitol, meropenem, metoclopramide, milrinone, norepinephrine, ondansetron, pantoprazole, phenylephrine, piperacillin-tazobactam, potassium chloride/phosphates, ranitidine, sodium bicarbonate, sodium phosphates, tigecycline, tobramycin, vasopressin

## ADVERSE EFFECTS

**CNS:** Anxiety, chills, flushing, headache, insomnia, dizziness
**CV:** QT prolongation, irregular heartbeat
**EENT:** Hearing loss
**GI:** Nausea, vomiting, pseudomembranous colitis, abdominal pain, constipation, diarrhea, metallic/soapy taste
**GU:** Nephrotoxicity, *increased BUN, creatinine,* renal failure, foamy urine
**HEMA:** Leukopenia, eosinophilia, anemia, thrombocytopenia
**INTEG:** Chills, fever, rash, thrombophlebitis at inj site, urticaria, pruritus, necrosis (red man syndrome)
**SYST:** Anaphylaxis, superinfection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown, protein binding 90% |
| **Metabolism** | Unknown, hepatic metabolism |
| **Excretion** | Urine 76% |
| **Half-life** | 8-9 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Adefovir, amphotericin B, bacitracin, cidofovir, CISplatin, colistin, cycloSPORINE, foscarnet, ganciclovir, IV pentamidine, acyclovir, pamidronate, polymyxin, streptozotocin, tacrolimus, zoledronic acid: increased toxicity, nephrotoxicity

Chloroquine, clarithromycin, dronedarone, droperidol, erythromycin, grepafloxacin, haloperidol, levomethadyl, methadone, pimozide, ziprasidone: increased QT prolongation

### Drug classifications

Aminoglycosides, cephalosporins, nondepolarizing muscle relaxants: increased toxicity, nephrotoxicity

Class IA, III antidysrhythmics, some phenothiazines: increased QT prolongation

### Drug/lab test

False increase: INR, PT, PTT

## NURSING CONSIDERATIONS

### Assessment

- **Nephrotoxicity:** Monitor I&O ratio; report hematuria, oliguria; avoid in those with CCr

≤50 mL/min; more common in those with diabetes, heart failure, hypertension, geriatrics, renal disease
- Monitor C&S throughout treatment
- Assess auditory function during, after treatment, hearing loss, ringing, roaring in ears; product should be discontinued
- **Pseudomembranous colitis:** Monitor for diarrhea, fever, blood in stools, abdominal cramps; may be several weeks after therapy ends; report to prescriber immediately

**BLACK BOX WARNING:** Pregnancy/breastfeeding: Obtain a pregnancy test before use; if a woman has taken this product during pregnancy, the national registry should be notified at 866-658-4228

- **Anaphylaxis:** Monitor for rash, itching, wheezing, laryngeal edema; discontinue and notify prescriber immediately; emergency equipment and EPINEPHrine should be nearby
- Monitor B/P during administration; sudden drop may indicate red man syndrome; also flushing, pruritus, rash, use slow IV infusion to prevent
- Assess respiratory status: rate, character, wheezing, tightness in chest

### Patient/family education
- Teach all aspects of product therapy; culture may be taken after completed course of medication
- Advise patient to notify prescriber if infection continues
- That bitter taste, nausea, vomiting, headache may occur
- Advise to report sore throat, fever, fatigue; could indicate superinfection; diarrhea (pseudomembranous colitis); hearing loss; rash, wheezing, tightness of chest, itching, tightening of throat (anaphylaxis)

**BLACK BOX WARNING:** Teach patient to use contraception while taking this product; do not breastfeed; to notify prescriber if pregnancy is planned or suspected

### Evaluation
**Positive therapeutic outcome**
- Negative culture

## telbivudine (Rx)
(tel-bi'vyoo-deen)
**Sebivo, Tyzeka**
*Func. class.:* Antiretroviral
*Chem. class.:* Nucleoside reverse transcriptase inhibitor (NRTI)

**ACTION:** Inhibits replication of HBV DNA polymerase, which inhibits HBV replication

**Therapeutic outcome:** Decreased hepatitis B serology

**USES:** Treatment of chronic hepatitis B

## CONTRAINDICATIONS
Hypersensitivity, breastfeeding

**Precautions:** Pregnancy, children, severe renal disease, anemia, organ transplant, dialysis, HIV, obesity, alcoholism; Hispanic or African descent (safety not established)

**BLACK BOX WARNING:** Impaired hepatic function, lactic acidosis

## DOSAGE AND ROUTES
**Adult and adolescent >16 yr:** PO 600 mg/day; max 600 mg/day

### Renal dose
**Adult:** PO CCr 30-49 ml/min 600 mg tab q48hr or 400 mg oral sol/day; CCr <30 ml/min (not requiring dialysis) 600 mg tab q72hr or 200 mg oral sol/day

**Available forms:** Tabs 600 mg

### Implementation
- Give with or without food with a full glass of water
- Store at room temperature

## ADVERSE EFFECTS
**CNS:** *Fever, headache, malaise,* weakness, *dizziness, insomnia*
**EENT:** Taste change, hearing loss, photophobia
**GI:** *Nausea, vomiting, diarrhea, anorexia,* abdominal pain, hepatomegaly, hepatotoxicity
**INTEG:** *Rash*
**MISC:** Lactic acidosis
**MS:** Myalgia, arthralgia, muscle cramps
**RESP:** Cough

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Steady state 5-7 days, protein binding 3.3% |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys, unchanged |
| **Half-life** | Terminal 40-49 hr |

T

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CycloSPORINE, erythromycin, hydrochloroquine, niacin, penicillamine, zidovudine, ZDV: increased myopathy risk

Do not use with pegylated interferon alfa-2a

### Drug classifications

Any agent altering renal function: altered telbivudine levels

Azole antifungals, corticosteroids, fibric acid derivatives, HMG-CoA reductase inhibitors: increased myopathy risk

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Hepatotoxicity:** Monitor liver function tests, hepatitis B serology, creatine kinase, periodically; monitor HBV DNA after 24 wk, if viral suppression is incomplete (≥300 copies/ml) start alternate therapy, monitor HBV DNA q6mo

**BLACK BOX WARNING: Lactic acidosis, severe hepatomegaly with steatosis:** obtain baseline LFTs, if elevated, discontinue treatment; discontinue even if LFTs are normal but lactic acidosis, hepatomegaly are present, may be fatal

- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, register patients in the Antiretroviral Pregnancy Registry 800-258-4263, do not breastfeed, excreted in breast milk

### Patient/family education

- Advise patient that GI complaints and insomnia may resolve after 3-4 wk of treatment
- Teach patient that product does not cure hepatitis B and does not stop the spread to others
- Teach patient that follow-up visits must be continued
- Teach patient that serious product interactions may occur if OTC products are ingested; check with prescriber before taking
- Advise patient that product may cause dizziness; avoid hazardous activities until response is known
- Teach patient to report symptoms of cough, difficulty sleeping or excessive headache, muscle pain/weakness
- **Teach patient to report progressive liver dysfunction:** light-colored stools, dark urine, poor appetite, nausea, yellowing of skin, eyes
- Advise patient that product will not cure HBV, and precaution should be taken to protect others

### Evaluation

**Positive therapeutic outcome**

- Decreased hepatitis B serology

## telmisartan (Rx)

(tel-mih-sar'tan)

**Micardis**

*Func. class.:* Antihypertensive

*Chem. class.:* Angiotensin II receptor (type $AT_1$)

**ACTION:** Blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the $AT_1$ receptor found in tissues

**Therapeutic outcome:** Decreased B/P

**USES:** Hypertension, alone or in combination; stroke, MI prophylaxis (>55 yr) in those unable to take ACE inhibitors

**Unlabeled uses:** Heart failure, proteinuria in diabetic nephropathy

## CONTRAINDICATIONS

Hypersensitivity

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Pregnancy (1st trimester), breastfeeding, children, geriatric, hypersensitivity to angiotensin-converting enzyme (ACE) inhibitors, renal/hepatic disease, renal artery stenosis, dialysis, HF, hyperkalemia, hypotension, hypovolemia, African descent

## DOSAGE AND ROUTES

**Adult:** PO 40 mg/day; range 20-80 mg/day

### Stroke, MI prophylaxis

**Adult >55 yr:** PO 80 mg/day

**Available forms:** Tabs 20, 40, 80 mg

### Implementation

- Give without regard to meals
- Give increased dose to African American, Hispanic patients, B/P response may be reduced
- Do not remove from blister pack until ready to use

## ADVERSE EFFECTS

**CNS:** Dizziness, insomnia, *anxiety,* headache, fatigue, syncope

**GI:** *Diarrhea,* dyspepsia, *anorexia, vomiting*
**META:** Hyperkalemia
**MS:** *Myalgia, pain*
**RESP:** *Cough, upper respiratory tract infection,* sinusitis, pharyngitis
**SYST:** Angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Highly protein bound |
| **Metabolism** | Liver, extensively |
| **Excretion** | Urine/feces |
| **Half-life** | Terminal 24 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 3-hr |
| **Peak** | 0.5-1 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Digoxin: increased digoxin peak, trough concentrations

### Drug classifications

ACE inhibitors, potassium-sparing diuretics, potassium salt substitutes: increased hyperkalemia
Antihypertensives, diuretics, NSAIDs: increased antihypertensive action
NSAIDs, salicylates: decreased antihypertensive effect

### Drug/lab test

Increased: LFTs

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Pregnancy test: if positive, stop treatment, can cause death to fetus, do not breastfeed

- Monitor B/P, pulse q4hr; note rate, rhythm, quality; if severe hypotension occurs, place in supine position **IV** NS, usually occurs during first few weeks of treatment
- Monitor baselines in renal, electrolytes, liver function tests before therapy begins
- Assess edema in feet, legs daily
- Assess skin turgor, dryness of mucous membranes for hydration status
- **Overdose:** dizziness, bradycardia or tachycardia

### Patient/family education

- Instruct patient to comply with dosage schedule, even if feeling better
- Advise patient to notify prescriber immediately of mouth sores, fever, swelling of hands or feet, face, lips irregular heartbeat, chest pain
- Teach patient that excessive perspiration, dehydration, vomiting, diarrhea may lead to fall in blood pressure; consult prescriber if these occur
- Teach patient not to stop medication abruptly, increased B/P will occur

**BLACK BOX WARNING:** Teach patient that product may cause dizziness, fainting; lightheadedness may occur; to avoid hazardous activities until response is known; to rise slowly from sitting to prevent drop in B/P

**BLACK BOX WARNING:** Advise patient to use contraception while taking this product, do not use in pregnancy, breastfeeding

- Teach patient to notify prescriber of all prescriptions, OTC preparations, and supplements taken

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P

**⚠ HIGH ALERT**

## temazepam (Rx)

(tem-az'a-pam)
**Restoril**
*Func. class.:* Sedative-hypnotic
*Chem. class.:* Benzodiazepine, short-intermediate acting
**Controlled substance schedule IV (USA), schedule F (Canada)**

**Do not confuse:** Restoril/RisperDAL

**ACTION:** Produces CNS depression at limbic, thalamic, hypothalamic levels of the CNS; may be mediated by neurotransmitter γ-aminobutyric acid (GABA); results are sedation, hypnosis, skeletal muscle relaxation, anticonvulsant activity, anxiolytic action

**Therapeutic outcome:** Decreased insomnia

**USES:** Insomnia (short-term treatment, generally 7-10 days)

## CONTRAINDICATIONS

Pregnancy **X,** breastfeeding, hypersensitivity to benzodiazepines

**Precautions:** Children <15 yr, geriatric, anemia, pulmonary/renal/hepatic disease, suicidal patients, product abuse, psychosis, acute

T

closed-angle glaucoma, seizure disorders, angioedema, sleep-related behavior (sleep walking), COPD, dementia, myasthenia gravis, intermittent porphyria

**BLACK BOX WARNING:** Coadministration with other CNS depressants

## DOSAGE AND ROUTES

**Adult:** PO 7.5-30 mg at bedtime
**Geriatric:** PO 7.5 mg at bedtime

**Available forms:** Caps 7.5, 15, 22.5, 30 mg

### Implementation

- Without regard to food
- Give with food or milk to decrease GI symptoms; if patient is unable to swallow medication whole, tab may be crushed and mixed with foods or fluids
- Give sugarless gum, hard candy, frequent sips of water for dry mouth

**BLACK BOX WARNING:** Avoid use with CNS depressants; serious CNS depression may result

- Store in tight container in cool environment
- 15-30 min before bedtime for sleeplessness

## ADVERSE EFFECTS

**CNS:** *Lethargy, drowsiness, daytime sedation,* dizziness, confusion, light-headedness, headache, anxiety, irritability, complex sleep-related reactions (sleep driving, sleep eating), fatigue
**CV:** Chest pain, pulse changes, hypotension
**EENT:** Blurred vision
**GI:** Nausea, vomiting, diarrhea, heartburn, abdominal pain, constipation, anorexia
**SYST:** Severe allergic reactions

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed, crosses placenta, crosses blood-brain barrier |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 10-20 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½ hr |
| **Peak** | 1-2 hr |
| **Duration** | 6-8 hr |

## INTERACTIONS

### Individual drugs

**BLACK BOX WARNING:** Alcohol: increased actions of both products

Cimetidine, disulfiram: increased effect of each specific product
Probenecid: increased effect of temazepam
Rifampin: decreased action of rifampin
Theophylline: decreased effects of theophylline

### Drug classifications

Antacids: decreased effect of antacids
Contraceptives (oral): increased effect
CNS depressants: increased action of both products

### Drug/herb

Chamomile, skullcap, valerian: increased CNS depression

### Drug/food

Caffeine: decreased temazepam effect

### Drug/lab test

Increased: AST/ALT
Decreased: radioactive iodine uptake
False increase: 17-OHCS

## NURSING CONSIDERATIONS

### Assessment

- Assess mental status: mood, sensorium, anxiety, affect, sleeping pattern (baseline, periodically), drowsiness, dizziness, especially geriatric; physical dependency, withdrawal symptoms: anxiety, panic attacks, agitation, orientation, headache, nausea, vomiting, muscle pain, weakness; indications of increasing tolerance and abuse
- **Beers:** Avoid in older adults, increased sensitivity to benzodiazepines and decreased metabolism, may cause delirium

### Patient/family education

- Inform patient that product may be taken with food, and that tab may be crushed or swallowed whole
- Advise patient not to use for everyday stress or longer than 3 mo unless directed by prescriber; not to take more than prescribed amount; may be habit forming; not to double or skip doses
- Caution patient to avoid OTC preparations unless approved by prescriber; alcohol and CNS depressants will increase CNS depression, may cause dizziness, drowsiness
- Advise patient to avoid driving, activities that require alertness, drowsiness may occur; to avoid alcohol ingestion or other psychotropic medications; to rise slowly or fainting may occur, especially in geriatric; that drowsiness may worsen at beginning of treatment

• Caution patient not to discontinue medication abruptly after long-term use; withdrawal symptoms include vomiting, cramping, tremors, seizures
• Advise patient to use contraception while taking this product, to notify prescriber if pregnancy is planned or suspected, do not use in pregnancy, cautious use in breast-feeding, excretion unknown
• Advise patient that complex sleep-related behavior may occur (sleep driving/eating/walking)
• Teach patient to limit to 7-10 days continuous use, to take as directed, not to increase dose unless approved by prescriber

### Evaluation

**Positive therapeutic outcome**
• Decreased anxiety, restlessness, sleeplessness (short-term treatment only)

## TREATMENT OF OVERDOSE:
Lavage, VS, supportive care

**⚠ HIGH ALERT**

## temozolomide (Rx)
(tem-oo-zole'oo-mide)
**Temodar**
*Func. class.:* Antineoplastic alkylating agents
*Chem. class.:* Imidazotetrazine derivative

**ACTION:** A proproduct that undergoes conversion to 5-(3-methyl-1-triazeno) imidazole-4-carboxamide (MTIC); MTIC action prevents DNA transcription

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Anaplastic astrocytoma with relapse, glioblastoma multiforme, malignant glioma

**Unlabeled uses:** Metastatic melanoma

## CONTRAINDICATIONS
Pregnancy, breastfeeding, hypersensitivity to this product, carbazine, or gelatin

**Precautions:** Radiation therapy, renal/ hepatic disease, bone marrow suppression, infection, geriatric, myelosuppression

## DOSAGE AND ROUTES
### Anaplastic astrocytoma
**Adult:** PO adjust dose based on nadir neutrophil and platelet counts 150 mg/m$^2$/day × 5 days during 28-day cycle

### Glioblastoma multiforme
**Adult:** PO/**IV** 75 mg/m$^2$/day × 42 days with focal radiotherapy; maintenance dose 150 mg/m$^2$ on day 1-5 of a 28 day cycle × 6 cycles

### Malignant glioma
**Adult:** 150 mg/m$^2$/day over 90 min day 1-5, q28day; may increase to 200 mg/m$^2$/day on day 1-5, q28day if hematologic parameters permit

**Available forms:** Caps 5, 20, 100, 140, 180, 250 mg; powder for inj 100 mg

### Implementation
**PO route**
• Give fluids **IV** or PO before chemotherapy to hydrate patient
• Give antiemetic 30-60 min before giving product to prevent vomiting, and prn; antibiotics for prophylaxis of infection
• Capsules should not be opened; if accidentally damaged, do not allow contact with skin, or inhale; take caps one at a time with 8 oz of water at the same time of day; use cytotic handling procedure
• Give on empty stomach at bedtime to prevent nausea/vomiting
• Store in light-resistant container in a dry area

**IV route**
• Bring vial to room temperature, discard if cloudy
• Inject 41 ml sterile water for inj into vial (2.5 mg/ml)
• Gently swirl, do not shake

**Intermittent IV infusion route**
• Withdraw up to 40 ml from each vial to make total dose and transfer to empty 250 ml PVC inf bag, flush before and after inf
• Run over 90 min
• Use reconstituted sol within 14 hr including inf time
• Do not admix

## ADVERSE EFFECTS
**CNS:** Seizures, hemiparesis, dizziness, poor coordination, amnesia, insomnia, paresthesia, somnolence, paresis, ataxia, anxiety, dysphagia, depression, confusion
**GI:** Nausea, anorexia, vomiting, abdominal pain, constipation
**GU:** Urinary incontinence, UTI, frequency
**HEMA:** Thrombocytopenia, leukopenia, anemia, myelosuppression, neutropenia
**INTEG:** Rash, pruritus
**MISC:** Headache, fatigue, asthenia, fever, edema, back pain, weight increase, diplopia
**RESP:** Upper respiratory tract infection, pharyngitis, sinusitis, coughing
**SYST:** Anaphylaxis, secondary malignancy

T

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid, complete |
| **Distribution** | Crosses blood-brain barrier |
| **Metabolism** | To MTIC and metabolite |
| **Excretion** | Urine, feces |
| **Half-life** | 1.8 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Digoxin: decreased action of digoxin
Radiation: increased toxicity, bone marrow suppression

### Drug classifications

Anticoagulants, NSAIDs, platelet inhibitors, thrombolytics: increased bleeding risk
Antineoplastics: increased bone marrow suppression
Live virus vaccines, toxoids: increased adverse reactions, decreased antibody reaction

### Drug/food

Decreased drug absorption

### Drug/lab test

Decreased: Hgb, platelets, WBC, neutrophils

## NURSING CONSIDERATIONS

### Assessment

- Assess symptoms indicating severe allergic reaction: rash, pruritus, urticaria, purpuric skin lesions, itching, flushing; product should be discontinued
- Assess tumor response during treatment
- Obtain CBC on day 22 (21 days after 1st dose), CBC weekly until recovery if ANC is $<1.5 \times 10^9$/L and platelets $<100 \times 10^9$/L, do not administer to patients that do not tolerate 100 mg/m$^2$; myelosuppression usually occurs late in the treatment cycle
- Assess for seizures, mental status throughout treatment
- Monitor renal function studies: BUN, creatinine, urine CCr before, during therapy; I&O ratio; report fall in urine output to <30 ml/hr
- Monitor temp q4hr (may indicate beginning of infection)
- Monitor liver function tests before, during therapy (bilirubin, AST, ALT, LDH) as needed or monthly; note jaundice of skin or sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea; hepatotoxicity can be serious and fatal
- Assess for bleeding: hematuria, stool guaiac, bruising or petechiae, mucosa or orifices; check for inflammation of mucosa, breaks in skin
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Teach patient to avoid use of products containing aspirin or NSAIDs, razors, commercial mouthwash, since bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
- Instruct patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath)
- Caution patient not to have any vaccinations without the advice of prescriber; serious reactions can occur
- Advise patient contraception is needed during treatment and for several months after completion of therapy; product has teratogenic properties, pregnancy, not to breastfeed

### Evaluation

**Positive therapeutic outcome**

- Prevention of rapid division of malignant cells

**RARELY USED**

## temsirolimus (Rx)

(tem-sir-oh'li-mus)
**Torisel**
*Func. class.:* Biological response modifier
*Chem. class.:* Kinase inhibitor, mTOR antagonist

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity to this product or to sirolimus, polysorbate 80

**Precautions:** Children <13 yr, females, severe pulmonary/renal/hepatic disease (bilirubin >1-1.5 × ULN or AST > ULN, but bilirubin ≤ULN), diabetes mellitus, hyperkalemia, hyperuricemia, hypertension, bone marrow suppression, hypertriglyceridemia/hyperlipidemia, surgery, brain tumor

## DOSAGE AND ROUTES

**Adult: IV** 25 mg over 30-60 min qwk; treat until disease progression or severe toxicity occurs

### Hepatic dose

**Adult:** IV (mild impairment) (bilirubin >1-1.5 × ULN or AST > ULN but bilirubin ≤ ULN)

**⚠ HIGH ALERT**

## tenecteplase (TNK-tPA) (Rx)

(ten-ek'ta-place)
**TNKase**
*Func. class.:* Thrombolytic
*Chem. class.:* Tissue plasminogen activator

**Do not confuse:** TNKase/Activase

**ACTION:** Activates conversion of plasminogen to plasmin (fibrinolysin): plasmin breaks down clots (fibrin), fibrinogen, factors V, VII; occlusion of venous access lines

**Therapeutic outcome:** Resolution of MI

**USES:** Acute MI, coronary artery thrombosis

## CONTRAINDICATIONS

Hypersensitivity, arteriovenous malformation, aneurysm, active bleeding, intracranial, intraspinal surgery or trauma within 2 mo, CNS neoplasms, severe hypertension, severe renal disease, hepatic disease, history of CVA, increased ICP, stroke

**Precautions:** Pregnancy, breastfeeding, children, geriatric, arterial emboli from left side of heart, hypocoagulation, subacute bacterial endocarditis, rheumatic valvular disease, cerebral embolism/thrombosis/hemorrhage, intraarterial diagnostic procedure or surgery (10 days), recent major surgery, dysrhythmias, hypertension

## DOSAGE AND ROUTES

### Total dose, max 50 mg, based on patient's weight

**Adult <60 kg:** **IV** BOL 30 mg, give over 5 sec
**Adult 60-70 kg:** **IV** BOL 35 mg, give over 5 sec
**Adult 70-80 kg:** **IV** BOL 40 mg, give over 5 sec
**Adult 80-90 kg:** **IV** BOL 45 mg, give over 5 sec
**Adult ≥90 kg:** **IV** BOL 50 mg, give over 5 sec, max 50 mg total dose

**Available forms:** Powder for inj, lyophilized 50 mg

### Implementation

**Intermittent IV infusion route**
- Give as soon as thrombi are identified; not useful for thrombi >1 wk old
- Administer cryoprecipitate or fresh frozen plasma if bleeding occurs
- Give heparin after fibrinogen level >100 mg/dl; heparin inf to increase PTT to 1.5-2 × baseline for 3-7 days; **IV** heparin with loading dose is recommended
- Aseptically withdraw 10 ml of sterile water for inj from diluent vial, use red cannula syringe-filling device, inject all contents of syringe into product vial, direct into powder, swirl, withdraw correct dose, discard any unused sol; stand the shield with dose vertically on flat surface and passively recap the red cannula; remove entire shield assembly by twisting counterclockwise; give by **IV** bol
- **IV** therapy: use upper extremity vessel that is accessible to manual compression
- Provide bed rest during entire course of treatment
- Avoid venous or arterial puncture, inj, rectal temp, any invasive treatment
- Treat fever with acetaminophen or aspirin
- Apply pressure for 30 sec to minor bleeding sites; inform prescriber if this does not attain hemostasis; apply pressure dressing

## ADVERSE EFFECTS

**CV:** Dysrhythmias, hypotension, pulmonary edema, pulmonary embolism, cardiogenic shock, cardiac arrest, heart failure, myocardial reinfarction, myocardial rupture, tamponade, pericarditis, pericardial effusion, thrombosis, CVA
**HEMA:** Decreased Hct, bleeding
**INTEG:** Rash, urticaria, phlebitis at **IV** inf site, itching, flushing
**SYST:** GI, GU, intracranial, retroperitoneal bleeding, surface bleeding, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Unknown |
| **Half-life** | 20-24 min |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Immediate |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Aspirin, cefamandole, cefoperazone, cefoTEtan, clopidogrel, dipyridamole, indomethacin, phenylbutazone, ticlopidine: increased bleeding potential

### Drug classifications

Anticoagulants, antithrombolytics, glycoprotein IIb, IIIa inhibitors, NSAIDs, SNRIs, SSRIs: increased bleeding

### Drug/herb

Anise, basil, dong quai, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, green tea, horse chestnut: increased risk of bleeding

### Drug/lab test

Increased: INR, PT, PTT

T

## NURSING CONSIDERATIONS

### Assessment

- **Assess for allergy:** fever, rash, itching, chills; mild reaction may be treated with antihistamines
- Assess for bleeding during 1st hr of treatment; hematuria, hematemesis, bleeding from mucous membranes, epistaxis, ecchymosis; may require transfusion (rare), continue to assess for bleeding for 24 hr
- **AVM, recent surgery, active bleeding: Assess for contraindications before use**
- Monitor blood tests (Hct, platelets, PTT, protime, TT, aPTT) before starting therapy; protime or aPTT must be less than 2 × control before starting therapy; PTT or pro-time q3-4hr during treatment
- **Cholesterol embolism:** assess for blue-toe syndrome, renal failure, MI, cerebral/spinal cord/bowel/retinal infarction, hypertension; can be fatal
- **Assess for hypersensitive reactions:** fever, rash, dyspnea; product should be discontinued
- Monitor VS, B/P, pulse, respirations, neurologic signs, temp at least q4hr; temp >104° F (40° C) indicates internal bleeding; systolic pressure increase >25 mm Hg should be reported to prescriber
- Assess for neurologic changes that may indicate intracranial bleeding
- **Assess for retroperitoneal bleeding:** back pain, leg weakness, diminished pulses
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

### Patient/family education

- Teach patient to notify prescriber immediately of severe headache
- Advise patient to notify prescriber of bleeding, hypersensitivity, fast, slow, or uneven heart rate, feeling of fainting, blood in urine/stools, nose bleeds
- Teach patient about proper dental care to avoid bleeding

### Evaluation

**Positive therapeutic outcome**

- Resolution of myocardial infarction

## tenofovir (Rx)

(ten-oh-foh'veer)

**Viread, Vemlidy**

*Func. class.:* Antiretroviral

*Chem. class.:* Nucleoside reverse transcriptase inhibitor (NRTI)

**ACTION:** Inhibits replication of HIV-1 virus by competing with the natural substrate and then incorporating into cellular DNA by viral reverse transcriptase, thereby terminating cellular DNA chain

**Therapeutic outcome:** Improved symptoms of HIV-1 infection

**USES:** HIV-1 infection with at least 2 other antiretrovirals, hepatitis B

## CONTRAINDICATIONS

Hypersensitivity

**BLACK BOX WARNING:** Lactic acidosis

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal disease, hepatic insufficiency, CCr <60 ml/min, osteoporosis, immune reconstitution syndrome

**BLACK BOX WARNING:** Hepatic disease, hepatitis

## DOSAGE AND ROUTES

### For the treatment of HIV infection in combination with other antiretroviral agents

**Adult, adolescent, and child ≥ 35 kg:** PO tablet: 300 mg PO once daily; PO oral powder 300 mg (7.5 scoops) qday with 2-4 oz of soft food

**Child and adolescent weighing 28-34 kg:** PO tablet: 250 mg qday

**Child ≥ 2 yr and older and 22-27 kg:** PO tablet 200 mg qday

**Child ≥ 2 yr and 17-21 kg:** PO tablet 150 mg qday

**Child and adolescent ≥ 2 yr and < 35 kg:** PO oral powder 8 mg/kg/dose qday with 2-4 oz of soft food. Round dose to the nearest 20-mg increment

### For the treatment of chronic hepatitis B infection (Vemlidy)

**Adult: PO** 25 mg q day with food

### Renal dose

**Adult:** PO CCr 30-49 ml/min 300 mg q48hr; CCr 10-29 ml/min 300 mg q72-96hr; CCr <10 ml/min not recommended

**Child ≥2 yr:** PO 8 mg/kg/day approximate; ≥35 kg 300 mg/day; 28-34 kg 250 mg/day; 22-27 kg 200 mg/day; 17-21 kg 150 mg/day

**Available forms:** Tabs 150, 200, 250, 300 mg; oral powder 40 mg/scoop

### Implementation

- Administer PO without regard to meals
- Store at 25° C (77° F)
- Give product 2 hr before or 1 hr after taking didanosine (if used)
- Oral powder: use scoop provided, mix powder into 2-4 oz (¼-½ cup) of applesauce or yogurt, do not mix with liquid, product will not mix; product is bitter; use immediately after mixing, clean scoop

## ADVERSE EFFECTS

**CNS:** *Headache,* asthenia
**GI:** *Nausea, vomiting, diarrhea,* anorexia, *flatulence, abdominal pain,* pancreatitis
**GU:** Renal failure, renal tubular acidosis/necrosis, Fanconi syndrome
**HEMA:** Neutropenia, osteopenia
**INTEG:** *Rash,* angioedema
**META:** Lactic acidosis, hypokalemia, hypophosphatemia
**MS:** *Myopathy,* rhabdomyolysis
**SYST:** Lipodystrophy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Extravascular space; bound to serum plasma <0.7%, to serum proteins <7.2% |
| **Metabolism** | Unknown |
| **Excretion** | Urine, unchanged (70%-80%) |
| **Half-life** | Terminal 17 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Acyclovir, cidofovir, ganciclovir, valacyclovir, valganciclovir: increased level of tenofovir
Didanosine: increased level of didanosine when coadministered with tenofovir

### Drug classifications

Increased: levels of tenofovir with any product that decreases renal function

## NURSING CONSIDERATIONS

### Assessment

- Monitor viral load, CD4+ T cell count, plasma HIV RNA, serum creatinine/BUN/phosphate

**BLACK BOX WARNING: Hepatitis exacerbations:** Monitor resistance testing at start of therapy and at treatment failure

- Assess liver function tests: AST, ALT, bilirubin; amylase, lipase, triglycerides periodically during treatment
- **Assess for bone, renal toxicity:** if bone abnormalities are suspected, obtain tests: serum phosphorus, creatinine

**BLACK BOX WARNING:** Lactic acidosis, severe hepatomegaly with steatosis: Obtain baseline LFTs, if elevated discontinue treatment; discontinue even if LFTs are normal but lactic acidosis, hepatomegaly are present, may be fatal

- **Pregnancy/breastfeeding:** Use only if clearly needed, register pregnant patient in the Antiretroviral Pregnancy Registry 800-258-4263, do not breastfeed

### Patient/family education

- Instruct patient to take this product 2 hr before or 1 hr after taking didanosine (if used)
- Instruct patient to take product with meal
- Advise patients that GI complaints resolve after 3-4 wk of treatment
- Caution patient not to breastfeed while taking this product
- Inform patient that product must be taken daily even if patient feels better
- Advise patient to continue follow-up visits since serious toxicity may occur; blood counts must be done q2wk
- Inform patient that product controls symptoms but is not a cure for HIV; patient is still infectious, may pass HIV virus on to others
- Advise patient that other products may be necessary to prevent other infections
- Advise patient that changes in body fat distribution may occur usually breast, neck, back

**BLACK BOX WARNING:** Lactic acidosis: teach patient symptoms of lactic acidosis, to notify prescriber (nausea, vomiting, weakness, abdominal pain)

### Evaluation

**Positive therapeutic outcome**

- Decrease in signs/symptoms of HIV

## terazosin (Rx)

(ter-ay'zoe-sin)
*Func. class.:* Antihypertensive
*Chem. class.:* α-Adrenergic blocker (peripherally acting)

**ACTION:** Peripheral blood vessels are dilated, peripheral resistance is lowered; reduction in blood pressure results from α-adrenergic receptors being blocked

**Therapeutic outcome:** Decreased B/P in hypertension, decreased symptoms of benign prostatic hyperplasia (BPH)

**USES:** Hypertension, as a single agent or in combination with diuretics or β-blockers, BPH

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, prostate cancer, renal disease, syncope

T

## DOSAGE AND ROUTES

### Hypertension

**Adult:** PO 1 mg at bedtime, may increase dosage slowly to desired response; max 20 mg/day divided q12hr

### Benign prostatic hyperplasia

**Adult:** PO 1 mg at bedtime, gradually increase up to 5-10 mg, max 20 mg divided q12hr

**Available forms:** Caps 1, 2, 5, 10 mg

### Implementation

- May be used in combination with other antihypertensives
- Give at same time each day
- May be given with food to prevent GI symptoms
- Store in airtight container at 86° F (30° C) or less
- If treatment is interrupted for several days, restart with initial dose
- Give without regard to food
- Feeding tube: place cap in 60 ml of warm tap water, stir until liquid spills from ruptured shell (5 min), stir until cap dissolves, draw solution into oral syringe, give through feeding tube, flush with water

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache, drowsiness,* anxiety, depression, vertigo, weakness, fatigue, syncope
**CV:** *Palpitations, orthostatic hypotension,* tachycardia, *edema,* rebound hypertension
**EENT:** Blurred vision, epistaxis, tinnitus, dry mouth, red sclera, nasal congestion, sinusitis
**GI:** *Nausea,* vomiting, diarrhea, constipation, abdominal pain
**GU:** Urinary frequency, incontinence, impotence, priapism
**RESP:** Dyspnea, cough, pharyngitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Not known |
| **Metabolism** | Liver (50%) |
| **Excretion** | Kidneys unchanged (10%), feces unchanged (20%) |
| **Half-life** | 9-12 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 15 min |
| **Peak** | 2-3 hr |
| **Duration** | 24 hr |

## INTERACTIONS

### Individual drugs

Alcohol, nitroglycerin, verapamil: increased hypotensive effects, not to drink alcohol

### Drug classifications

Antihypertensives (other): increased hypotension
β-Blockers: increased hypotensive effects
Estrogens, NSAIDs, salicylates, sympathomimetics: decreased antihypertensive effect

### Drug/herb

Hawthorn: increased antihypertensive effect
Ephedra: decreased antihypertensive effect

## NURSING CONSIDERATIONS

### Assessment

- **Hypertension:** monitor B/P, orthostatic hypotension, syncope; check for edema in feet, legs daily; I&O ratio; weight daily; notify prescriber of changes
- **Benign prostatic hyperplasia (BPH):** assess urinary patterns (hesitancy, frequency, change in stream, dribbling, dysuria, urgency)
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown
- **Beers:** Avoid use in older adults as an antihypertensive, high risk of orthostatic hypotension

### Patient/family education

- Caution patient not to discontinue product abruptly; the importance of complying with dosage schedule, even if feeling better; if dose is missed take as soon as remembered; take medication at same time each day
- Teach patient not to use OTC products (cough, cold, allergy) unless directed by prescriber; to avoid large amounts of caffeine
- Emphasize the need to rise slowly to sitting or standing position to minimize orthostatic hypotension
- Teach patient to notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain
- Caution patient to report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P
- Caution patient that product may cause dizziness, fainting, light-headedness; may occur during 1st few days of therapy; to avoid hazardous activities
- **Hypertension:** teach patient how to take B/P and normal readings for age group; to take B/P q7day; to continue with regimen including diet and exercise

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P in hypertension
- Decreased symptoms of BPH

## TREATMENT OF OVERDOSE:

Administer volume expanders or vasopressors; discontinue product; place patient in supine position

## terbinafine, oral (Rx)

(ter-bin′a-feen)
**LamISIL, Lamisil AT**
*Func. class.:* Antifungal, systemic
*Chem. class.:* Synthetic allylamine derivative

**Do not confuse:** LamISIL/LaMICtal/lamoTRIgine

**ACTION:** Interferes with cell membrane permeability in fungi such as *Trichophyton rubrum, Trichophyton mentagrophytes, Trichophyton tonsurans, Epidermophyton floccosum, Microsporum canis, Microsporum audouinii, Microsporum gypseum, Candida*, broad-spectrum antifungal

**Therapeutic outcome:** Resolution of fungal infection

**USES:** Onychomycosis of the toenail or fingernail due to dermatophytes, tinea capitis/corporis/cruris/pedis/versicolor

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, chronic/active renal/hepatic disease GFR ≤50 mg/min, immunosuppression

## DOSAGE AND ROUTES

**Adult:** PO 250 mg/day × 6 wk (fingernail); × 12 wk (toenail)

**Available forms:** Tabs 250 mg; oral granules 125, 187.5 mg

### Implementation

- **PO:** give without regard to food
- **Granules:** take with food, sprinkle packet contents on pudding or non-acidic soft food, swallow without chewing, do not use fruit-based foods
- Store at 25° C (77° F), protect from light

## ADVERSE EFFECTS

**CNS:** Depression
**EENT:** Tinnitus, hearing impairment
**GI:** Diarrhea, dyspepsia, abdominal pain, nausea, hepatitis
**HEMA:** Neutropenia
**INTEG:** Rash, pruritus, urticaria, Stevens-Johnson syndrome, photosensitivity
**MISC:** Headache, hepatic enzyme changes, taste, visual/olfactory disturbance

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 80% |
| **Distribution** | Extensive, most to hair, scalp, nails; excreted in breast milk; protein binding 99% |
| **Metabolism** | Liver, extensively |
| **Excretion** | Unknown |
| **Half-life** | 22 days or longer |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Up to 1 wk |
| **Peak** | Several days-weeks |
| **Duration** | Several weeks |

## INTERACTIONS

### Individual drugs

Atomoxetine: decreased metabolism of atomoxetine
Cimetidine: increased effect
CycloSPORINE: increased cycloSPORINE clearance
Dextromethorphan: increased levels
Rifampin: increased terbinafine clearance

### Drug/herb

Cola nut, guarana, yerba maté, tea (black, green), coffee: side effects

### Drug/lab test

Increased: LFTs

## NURSING CONSIDERATIONS

### Assessment

- Assess hepatic studies (ALT, AST) before beginning treatment; do not use in presence of hepatic disease
- Monitor CBC in treatment >6 wk
- Assess for continuing infection
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, avoid during pregnancy, breastfeeding

### Patient/family education

- Teach patient to notify prescriber of nausea, vomiting, fatigue, jaundice, dark urine, clay-colored stool, RUQ pain, that may indicate hepatic dysfunction
- Teach patient to avoid using OTC medication unless approved by prescriber
- Teach patient that treatment may take 12 wk (toenail), 6 wk (fingernail)
- Teach patient to take without regard to meals, granules may be sprinkled on soft food but not chewed, do not mix with fruit-based products
- Advise patient to report vision changes immediately

T

## Evaluation

**Positive therapeutic outcome**
- Decrease in size, number of lesions

## terbinafine topical

*See Appendix B*

## terbutaline (Rx)

(ter-byoo′ta-leen)
**Bricanyl**
*Func. class.:* Selective $\beta_2$-agonist; bronchodilator
*Chem. class.:* Catecholamine

**Do not confuse:** Brethine/Methergine

**ACTION:** Relaxes bronchial smooth muscle by direct action on $\beta_2$-adrenergic receptors through accumulation of cyclic AMP at β-adrenergic receptor sites; results are bronchodilatation, diuresis, and CNS and cardiac stimulation; relaxes uterine smooth muscle

**Therapeutic outcome:** Bronchodilatation with ease of breathing

**USES:** Bronchospasm

**Unlabeled uses:** Premature labor

## CONTRAINDICATIONS

Hypersensitivity to sympathomimetics; closed-angle glaucoma, tachydysrhythmias

**Precautions:** Pregnancy, breastfeeding, geriatric, cardiac disorders, hyperthyroidism, diabetes mellitus, prostatic hypertension, hypertension, seizure disorder

**BLACK BOX WARNING:** Labor

## DOSAGE AND ROUTES

### Bronchospasm

**Adult and child >12 yr:** PO 2.5-5 mg q8hr; SUBCUT 0.25 mg q15-30min, max 0.5 mg in 4 hr
**Adolescent ≤15 yr and child ≥12 yr:** PO 2.5 mg tid, max 7.5 mg/day

### Renal dose

**Adult:** PO CCr 10-50 ml/min 50% of dose; CCr <10 ml/min avoid use

### Severe renal failure

**Adult:** PO avoid if GFR <10 ml/min

### Tocolytic (preterm labor) (unlabeled)

**Adult:** SUBCUT 0.25 mg q20min to 6 hr, hold if pulse >120 bpm

**Available forms:** Tabs 2.5, 5 mg; inj 1 mg/ml

## Implementation

- Use this medication before other medications and allow 5 min between each to prevent overstimulation

**PO route**
- Give PO with meals to decrease gastric irritation; tab may be crushed and mixed with food or fluid

**SUBCUT route**
- May give by SUBCUT route; do not give by IM route

**Aerosol route**
- Give after shaking; ask patient to exhale, place mouthpiece in mouth, then inhale slowly; hold breath, remove, exhale slowly; allow at least 1 min between inhalations
- Store in light-resistant container, do not expose to temperatures over 86° F (30° C)

**IV route**
- Give at 5 mcg q10min until contractions are stopped; use inf pump for correct dose; after ½-1 hr with no contraction decrease dose by 5 mcg; switch to PO dose when possible

**Y-site compatibilities:** Regular insulin

## ADVERSE EFFECTS

**CNS:** Tremors, anxiety, insomnia, headache, dizziness, stimulation
**CV:** Palpitations, tachycardia, hypertension, dysrhythmias, cardiac arrest, QT prolongation
**GI:** Nausea, vomiting
**META:** Hypokalemia, hyperglycemia
**RESP:** Paradoxical bronchospasm, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (SUBCUT), partially absorbed (PO) |
| **Distribution** | Unknown |
| **Metabolism** | Liver, partially |
| **Excretion** | Unknown |
| **Half-life** | PO 3-4 hr, subcut 5-7 hr |

### Pharmacodynamics

| | PO | INH | SUBCUT | IV |
|---|---|---|---|---|
| **Onset** | ½ hr | 5-15 min | 10-15 min | Rapid |
| **Peak** | 1-2 hr | 1-2 hr | ½-1 hr | Unknown |
| **Duration** | 4-8 hr | 4-6 hr | 1½-4 hr | Unknown |

## INTERACTIONS

### Individual drugs

Arsenic trioxide, chloroquine, droperidol, haloperidol, levomethadyl, pentamidine: increased QT prolongation

### Drug classifications

Beta agonists, class IA/III antidysrhythmics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin), CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone), local anesthetics, some phenothiazines, tricyclics: increased QT prolongation

β-Adrenergic blockers: do not use together, block therapeutic effect

MAOIs: increased chance of hypertensive crisis

Sympathomimetics: increased effects of both products

### Drug/herb

Green tea (large amounts), guarana: increased effect

## NURSING CONSIDERATIONS

### Assessment

- **Monitor respiratory function:** vital capacity, FEV, ABGs, lung sounds, heart rate, rhythm (baseline)
- Determine that patient has not received theophylline therapy before giving dose; assess client's ability to self-medicate
- Monitor for evidence of allergic reactions; withhold dose and notify prescriber
- **Assess for paradoxical bronchospasm:** dyspnea, wheezing; keep emergency resuscitative equipment nearby

**BLACK BOX WARNING: Assess for labor:** maternal heart rate, B/P, contractions, fetal heart rate; can inhibit uterine contractions, labor; monitor for hypoglycemia, do not use injectable product for prevention or treatment over 72 hr in preterm labor; do not use oral product for preterm labor, avoid in breastfeeding

### Patient/family education

- Advise patient not to use OTC medications; extra stimulation may occur; to use this medication before other medications and allow at least 5 min between each to prevent overstimulation
- Teach patient how to use inhaler; to avoid getting aerosol in eyes because blurring may result; to wash inhaler in warm water daily and dry; to avoid smoking, smoke-filled rooms, persons with respiratory infections; review package insert with patient
- Teach patient that paradoxical bronchospasm may occur; to stop product immediately and notify prescriber; to limit caffeine products such as chocolate, coffee, tea, and colas
- Instruct patient on administration of dose, not to use more than prescribed; serious side effects may occur; if taking PO regularly and dose is missed, take when remembered; space other doses on new time schedule

### Evaluation

**Positive therapeutic outcome**

- Absence of dyspnea, wheezing after 1 hr
- Improved airway exchange
- Improved ABGs

## TREATMENT OF OVERDOSE:

Administer a $\beta_2$-adrenergic blocker

## terconazole vaginal antifungal

*See Appendix B*

## teriflunomide

(ter'i-floo'noe-mide)

**Aubagio**

*Func. class.:* Multiple sclerosis agent

*Chem. class.:* Pyrimidine synthesis inhibitor

**ACTION:** Antiproliferative effects including peripheral T- and B-lymphocytes, might reduce inflammatory demyelination

**Therapeutic outcome:** Decreased symptoms of MS

**USES:** Reduction of the frequency of relapses or remitting MS

## CONTRAINDICATIONS

Hypersensitivity

**BLACK BOX WARNING:** Pregnancy:

**Precautions:** Breastfeeding, alcoholism, diabetes mellitus, eosinophilic pneumonia, hepatitis, jaundice, male-mediated teratogenicity, pneumonitis, pulmonary disease/fibrosis, sarcoidosis, TB, vaccination

**BLACK BOX WARNING:** Hepatic disease, contraception requirements, male medicated teratogenicity

## DOSAGE AND ROUTES

**Adult: PO** 7 or 14 mg/day

**Available forms:** Tabs 7, 14 mg

### Implementation

**PO route**

May be taken without regard to food

## ADVERSE EFFECTS

**CNS:** Anxiety, headache

**CV:** Palpitations, hypertension, MI

**EENT:** Blurred vision, conjunctivitis, sinusitis
**GI:** Nausea, vomiting, diarrhea, cystitis
**HEMA:** Leukopenia, lymphopenia, neutropenia
**INTEG:** Acne vulgaris, alopecia, pruritus
**META:** Weight loss
**MISC:** Infection, cystitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding >99% |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Median 18–19 days, peak 1–4 hr |

## INTERACTIONS

### Individual drugs

Do not use with leflunomide

CycloSPORINE, eltrombopag, gefitinib: increased teriflunomide effect

**BLACK BOX WARNING:** Methotrexate: increased hepatotoxicity

Zidovudine: increased hematologic toxicity
Repaglinide, pioglitazone, rosiglitazone, PACLitaxel, naproxen, topotecan, bosentan, furosemide: increased effect of each agent
Warfarin, alosetron, DULoxetine, theophylline, tiZANidine, quiNINE, tamoxifen, bendamustine, rasagiline, rOPINIRole, selegiline, propafenone, mexiletine, lidocaine, anagrelide, cloZAPine, cinacalcet, caffeine: decreased effect of each agent, monitor closely
Cholestyramine: decreased effect of teriflunomide

### Drug classifications

Do not use with live virus vaccines
HMG-CoA reductase inhibitors: Increase: hepatotoxicity
Oral contraceptives: increased effect of oral contraceptives

## NURSING CONSIDERATIONS

### Assessment

- CNS symptoms: assess for anxiety, confusion, vertigo
- GI status: assess for diarrhea, vomiting, abdominal pain
- Cardiac status: assess for tachycardia, palpitations, vasodilation, chest pain

**BLACK BOX WARNING:** Pregnancy/breastfeeding: Do not start treatment until pregnancy is ruled out, this product should not be used during or for 2 yr after discontinuing this product, those wishing to become pregnant must discontinue this product and undergo an accelerated elimination procedure, with verification of teriflunomide plasma level <0.02 mg/L, do not use in pregnancy, breastfeeding

### Patient/family education

- Teach patient that blurred vision can occur

**BLACK BOX WARNING:** Advise patient to notify prescriber if pregnancy is planned or suspected

- Inform patient not to change dosing or stop taking without advice of prescriber

### Evaluation

**Positive therapeutic outcome**

- Decreased symptoms of MS

## teriparatide (Rx)

(tah-ree-par'ah-tide)
**Forteo**
*Func. class.:* Parathyroid hormone (rDNA)
*Chem. class.:* Teriparatide

**ACTION:** Contains human recombinant parathyroid hormone, which stimulates new bone growth

**Therapeutic outcome:** Calcium levels at 9-10 mg/dl, decreased symptoms of hypocalcemia, hypoparathyroidism

**USES:** Postmenopausal women with osteoporosis, men with primary or hypogonadal osteoporosis who are at high risk for fracture, glucocorticoid-induced osteoporosis

## CONTRAINDICATIONS

Hypersensitivity, increased baseline risk of osteosarcoma (Paget's disease, open epiphyses, previous bone radiation), bone metastases, history of skeletal malignancies, other metabolic bone diseases, preexisting hypercalcemia

**Precautions:** Pregnancy, breastfeeding, children, urolithiasis, hypotension, use >2 yr

**BLACK BOX WARNING:** Secondary malignancy (osteogenic sarcoma)

## DOSAGE AND ROUTES

**Adult:** SUBCUT 20 mcg/day up to 2 yr (osteoporosis); use for years/lifetime is recommended (glucocorticoid-induced osteoporosis)

**Available forms:** Prefilled pen delivery device (delivers 20 mcg/day)

### Implementation

- Store refrigerated; do not freeze

**SUBCUT route**

- Give by SUBCUT only, rotate inj sites
- Protect from freezing, light; refrigerate pen

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, insomnia, depression, vertigo
**CV:** Hypertension, angina, syncope
**GI:** Nausea, diarrhea, dyspepsia, vomiting, constipation
**INTEG:** Rash, sweating
**MISC:** Pain, asthenia, hyperuricemia
**MS:** Arthralgia, leg cramps, back/leg pain, weakness, osteosarcoma (rare)
**RESP:** Rhinitis, cough, pharyngitis, pneumonia, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Extensively, rapidly |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | ½ hr |
| **Duration** | 3 hr |

## INTERACTIONS

### Individual drug

Digoxin: increased digoxin toxicity

### Drug/lab test

Increased: calcium, uric acid, urinary calcium
Decreased: magnesium, phosphorus

## NURSING CONSIDERATIONS

### Assessment

- **Secondary malignancy:** osteosarcoma depends on length of treatment, those at higher risk for osteosarcoma should not use this product
- Monitor uric acid, chloride, magnesium, electrolytes, urine pH, vit D, phosphate for normal serum levels; serum calcium may be transiently increased after dosing (max at 4-6 hr after dose)
- Assess for bone pain, headache, fatigue, changes in LOC, leg cramps
- Monitor for signs of persistent hypercalcemia: nausea, vomiting, constipation, lethargy, muscle weakness
- Assess nutritional status: diet for sources of vit D (milk, some seafood), calcium (dairy products, dark green vegetables), phosphates (dairy products)
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, not to be used in pregnancy or breastfeeding

### Patient/family education

- Advise patient of the symptoms of hypercalcemia
- Teach about foods rich in calcium
- Teach how to use delivery device, dispose of needles, not to share pen with others, use at same time of day
- Advise to sit or lie down if dizziness or fast heartbeat occurs after the first few doses
- Pen may be used for 28 days, store in refrigerator, teach how to use, not to share

### Evaluation

**Positive therapeutic outcome**

- Increased bone mineral density

# tesamorelin

(tes-a-moe-rel'in)
**Egrifta**
*Func. class.:* Pituitary hormone, growth hormone modifiers

**ACTION:** Binds to growth hormone releasing factor receptors on the pituitary somatotroph cells; binding stimulates the production, release of endogenous growth hormone (GH)

**Therapeutic outcome:** Decreasing lipodystrophy in HIV patients

**USES:** Treatment of excess abdominal fat in HIV-infected patients with lipodystrophy

## CONTRAINDICATIONS

Hypersensitivity to this product or mannitol, neoplastic disease, pregnancy, disruption of the hypothalamic-pituitary axis (hypothalamic-pituitary-adrenal [HPA] suppression) resulting from hypophysectomy, hypopituitarism, pituitary tumor/surgery, radiation therapy of the head, head trauma, IV/IM administration

**Precautions:** Breastfeeding, CABG, diabetes, diabetic retinopathy, edema, geriatrics, children, infants, adolescents

## DOSAGE AND ROUTES

**Adult:** SUBCUT 2 mg/day

**Available forms:** Powder for injection 1 mg

### Implementation

**SUBCUT route**

- Visually inspect parenteral products for particulate matter and discoloration before use whenever solution and container permit

• To reconstitute use 2, 1 mg vials, inject 2.1 ml sterile water for injection into the first 1-mg vial; use the syringe with the needle already attached. To avoid foaming, push the plunger in slowly with the needle at a slight angle so the sterile water goes down the inside wall of the vial; with the needle and syringe attached to the vial, keep the vial upright and gently roll the vial for 30 sec until mixed; do not shake; remove all contents and put in next 1 mg vial, roll; withdraw 2.1 ml of the reconstituted solution
• Take the syringe out of the vial, place the needle cap on its side against a clean, flat surface; do not touch needle; hold syringe and slide the needle into cap; push the cap all the way or until it snaps shut; do not touch cap until it covers the needle completely
• Remove needle and insert a ½″ 27-G safety injection needle onto the syringe; use immediately; throw away any unused product or used sterile water for injection
• Solution should be clear; do not use if discolored, cloudy, or has particles, but slight foaming is acceptable
• Inject subcut into abdomen; avoid scar tissues, bruises, or the navel; rotate injection sites in the abdomen; slowly push plunger down until all solution has been injected
• After removing the injection from the skin, flip back the needle shield until it snaps, covering the injection needle completely; keep pressing until you hear a click; that means the injection needle is protected
• Use a piece of sterile gauze to rub the injection site clean; if there is bleeding, apply pressure to the injection site with gauze for 30 seconds; if bleeding continues, apply a bandage to the site
• Properly dispose of used syringe, needles, vial, and sterile water for injection bottle in a sharps container

## ADVERSE EFFECTS

**CNS:** Depression, flushing, headache, hypoesthesia, insomnia, night sweats, peripheral neuropathy paresthesias, spasms
**CV:** Chest pain, edema, hypertension, palpitations, peripheral edema
**GI:** Diarrhea, dyspepsia, nausea, upper abdominal pain, vomiting
**INTEG:** Flushing, injection site reactions, pruritus, rash, urticaria
**MS:** Arthralgia, carpal tunnel syndrome, joint swelling, myalgias, stiffness
**RESP:** *Upper respiratory tract infection*
**SYST:** Secondary malignancy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 26 and 38 mins in healthy and HIV-infected patients, respectively, peak 0.15 hrs |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 0.15 hrs |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Cortisone, predniSONE, simvastatin, ritonavir: decreased effect of each specific product

## NURSING CONSIDERATIONS

### Assessment

• **Lipodystrophy:** Assess for sunken cheeks; thinning arms and legs; fat accumulation in the abdomen, jaws, and back of neck; after treatment these should lessen
• Monitor glycosylated hemoglobin A1C (HbA1C), serum IGF-1 concentrations, ophthalmologic exam
• **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding
• Teach patient that body fat distribution should change
• Teach patient that lab exams will be needed
• **Beers:** Avoid in older adults except as hormone replacement after pituitary gland removal, may cause edema, arthralgia

### Patient/family education

• Explain reason for product and expected result
• Teach patient to use contraception (pregnancy)

### Evaluation

**Positive therapeutic outcome**
• Decreasing lipodystrophy in HIV patients

**testosterone (Rx)**
(tess-toss′te-rone)
**testosterone enanthate (Rx)**
**Delatestryl**
**testosterone undecanoate**
**Aveed**
**testosterone cypionate (Rx)**
**Depo-Testosterone**

## testosterone pellets (Rx)
**Testopel**
## testosterone transdermal (Rx)
**Androderm**
## testosterone gel (Rx)
**AndroGel Fortesta, Testim**
## testosterone buccal (Rx)
**Striant**
## testosterone topical solution (Rx) gel
**Axiron, Vogelxo**
## testosterone nasal gel (Rx)
**Natesto**

*Func. class.:* Androgenic anabolic steroid
*Chem. class.:* Halogenated testosterone derivative
**Controlled substance schedule III**

**Do not confuse:** Testoderm/Testoderm TTS

**ACTION:** Increases weight by building body tissue; increases potassium, phosphorus, chloride, nitrogen levels; increases bone development; responsible for maintenance of secondary sex characteristics (male)

**Therapeutic outcome:** Increased hormone levels in eunuchoidism, decreased tumor growth in female breast cancer, onset of male puberty

**USES:** Female breast cancer, hypogonadism, eunuchoidism, male climacteric, oligospermia, impotence, vulvar dystrophies, low testosterone levels, delayed male puberty (inj)

## CONTRAINDICATIONS
Pregnancy, breastfeeding, severe renal/cardiac/hepatic disease, hypersensitivity, genital bleeding (rare), male breast/prostate cancer

**Precautions:** Diabetes mellitus, CV disease, MI, urinary tract disorders, prostate cancer, hypercalcemia

**BLACK BOX WARNING:** Children, accidental exposure, pulmonary oil microembolism, risk of serious hypersensitivity reactions or anaphylaxis

## DOSAGE AND ROUTES
### Replacement
**Adult: IM** (enanthate or cypionate) 50-400 mg q2-4wk; **TRANSDERMAL** (Testoderm) 4-6 mg applied q24hr; (Androderm, AndroGel) 5 mg applied q24hr; once daily (gel); **TOPICAL SOL** (Axiron) 60 mg (2 pump activations) each AM; **BUCCAL** 1 buccal system (30 mg) to the gum region q12hr before meals/PM
**Adult (male) and child: SUBCUT** (pellets) 150-450 mg (2-6 pellets) inserted q3-6mo

### Breast cancer
**Adult: IM** 50-100 mg 3 ×/wk (propionate) or 200-400 mg q2-4wk (cypionate or enanthate)

### Delayed male puberty
**Child >12 yr: IM** up to 100 mg/mo for up to 6 mo

**Available forms: Enanthate:** inj 200 mg/ml; **cypionate:** inj 100, 200 mg/ml; pellets 75 mg; **transdermal** 2, 4 mg/24 hr; **gel** 1%, 1.62%, 10 mg/actuation; **buccal system** 30 mg; **topical solution** 30 mg/actuation

### Implementation
- Administer diet with increased calories, protein; decreased sodium if edema occurs
- Administer supportive product if anemia occurs
- Give titrated dose; use lowest effective dose
- Give IM inj deep into upper outer quadrant of gluteal muscle; route can be painful

**Transdermal route**
- Apply Testoderm to skin of scrotum, Androderm to skin of back, upper arms, thighs, abdomen; area must be clean and dry, free of hair

**Gel route**
- Products are not interchangeable, dosage and administration for AndroGel 1% differs from AndroGel 1.62%
- Apply daily to clean dry area on shoulders, upper arms, or abdomen; women, children should not touch gel or treated skin

**Buccal system route**
- Do not chew or swallow buccal system
- Rotate sites; place above incisor tooth on either side of mouth
- Open packet; place rounded side of surface against gum and hold firmly in place with finger over lip for 30 sec; if product falls off, replace with new system; discard in trash can away from children or pets

**Topical solution**
- Using the provided applicator, apply the solution to clean, dry, intact skin of the axilla, preferably at the same time each morning. Do not apply to any other part of the body. Allow the solution to dry completely before dressing. If an antiperspirant or deodorant is used, apply at least 2 min before applying the solution. The pump must be primed before the first use by fully depressing the pump mechanism 3 times and discarding any solution that is released during the priming. To dispense the solution, position the nozzle over the applicator cup and carefully depress the pump once fully; the cup should be filled with no more than 1 pump actuation (30 mg). With the applicator upright,

T

place it up into the axilla and wipe steadily down and up into the axilla. Do not use fingers or hand to rub the solution. If multiple applications are necessary for the required dose, alternate application between the left and right axilla. When repeat application to the same axilla is necessary, allow the solution to dry completely before the next application. After use, rinse the applicator under running water and pat dry with tissue. Wash hands with soap and water

- Following application, allow the site to dry a few minutes before putting on clothing
- Direct contact of the medicated skin with the skin of another person can result in the transfer of residual testosterone and absorption by the other person. To reduce accidental transfer, the patient should cover the application site(s) with clothing (e.g., a T-shirt) after the solution has dried. The application site should be washed with soap and water prior to any skin-to-skin contact regardless of the length of time since application. In the case of direct contact, the other person should wash the area of contact with soap and water as soon as possible
- Patients should be advised that the topical solution is flammable; therefore, fire, flame, and smoking should be avoided during use
- Advise patients to avoid swimming or washing the application site until 2 hr following application of solution

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, fatigue, tremors, paresthesias, flushing, sweating, anxiety, lability, insomnia, carpal tunnel syndrome
**CV:** Increased B/P
**EENT:** Conjunctival edema, nasal congestion
**ENDO:** Abnormal GTT
**GI:** Nausea, vomiting, constipation, weight gain, cholestatic jaundice
**GU:** Hematuria, amenorrhea, vaginitis, decreased libido, decreased breast size, clitoral hypertrophy, testicular atrophy, gynecomastia, enlarged prostate
**HEMA:** Polycythemia
**INTEG:** Rash, acneiform lesions, oily hair and skin, flushing, sweating, acne vulgaris, alopecia, hirsutism
**MS:** Cramps, spasms

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well but slowly absorbed |
| **Distribution** | Crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 8 days (cypionate)<br>10-100 min (base) |

### Pharmacodynamics

| | IM (base) | IM (cypionate) | IM (enanthate) | IM (propionate) |
|---|---|---|---|---|
| **Onset** | Unknown | Unknown | Unknown | Unknown |
| **Peak** | Unknown | Unknown | Unknown | Unknown |
| **Duration** | 1-3 days | 2-4 wk | 2-4 wk | 1-3 days |

## INTERACTIONS

### Individual drugs

ACTH, buPROPion: increased edema
Insulin: decreased glucose levels may alter need for insulin
Oxyphenbutazone: increased effects of oxyphenbutazone

### Drug classifications

Adrenal steroids: increased edema
Anticoagulants: increased pro-time
Antidiabetics, oral: decreased need for oral antidiabetics

### Drug/lab test

Increased: serum cholesterol, blood glucose, urine glucose
Decreased: serum Ca, serum K, $T_4$, $T_3$, thyroid $^{131}I$ uptake test, urine 17-OHCS, 17-KS, PBI

## NURSING CONSIDERATIONS

### Assessment

- Monitor patient's weight daily; notify prescriber if weekly weight gain is >5 lb; assess I&O ratio; be alert for decreasing urinary output, increasing edema
- Monitor B/P q4hr, Hgb/Hct
- Assess growth rate, bone age in adolescent because growth rate may be uneven (linear/bone growth) if used for extended periods
- Monitor electrolytes: potassium, sodium, chloride, calcium; cholesterol
- Monitor liver function tests: ALT, AST, bilirubin
- Assess edema, hypertension, cardiac symptoms, jaundice
- Assess mental status: affect, mood, behavioral changes, aggression
- **Assess signs of masculinization** in female: increased libido, deepening of voice, decreased breast tissue, enlarged clitoris, menstrual irregularities; male: gynecomastia, impotence, testicular atrophy
- **Assess hypercalcemia:** lethargy, polyuria, polydipsia, nausea, vomiting, constipation; product may have to be decreased
- **Assess hypoglycemia** in diabetics because oral antidiabetic action is increased

**BLACK BOX WARNING:** Accidental exposure: In children have occurred with the topical product after contact with application site in adults, cover site in adult, cover site with clothing, wash hands with soap and water

**BLACK BOX WARNING:** Anaphylaxis: Usually with testosterone undecanoate (Aveed) oil for injection, may occur after any injection, observe for 30 min after each use, product is contraindicated in those with castor oil, benzyl/alcohol, benzoic acid hypersensitivity

**BLACK BOX WARNING:** Pulmonary embolism: Occurs immediately after 1000 mg IM of testosterone undecanoate, symptoms include cough, dyspnea, chest pain, dizziness, throat tightening and resolve after a few minutes or with supportive measure, some require emergency measures

- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding
- **Beers:** Avoid in older adults unless indicated for confirmed hypogonadism with clinical symptoms, potential for cardiac problems, do not use in prostate cancer

### Patient/family education

- Inform patient that product needs to be combined with complete health plan: diet, rest, exercise
- Caution patient to notify prescriber if therapeutic response decreases; not to discontinue this medication abruptly
- Inform women patients to report menstrual irregularities; about changes in sex characteristics, if pregnancy is planned or suspected
- Discuss that 1-3 mo course is necessary for response in breast cancer
- Inform patient about application of transdermal patches: Testoderm to skin of scrotum, Androderm to skin of back, upper arms, thighs, abdomen; area must be dry and free of hair; may be reapplied after bathing, swimming
- Teach about changes in sex characteristics: priapism, gynecomastia, increased libido

### Evaluation

**Positive therapeutic outcome**

- Decrease size of tumor in breast cancer
- Increased androgen levels

## tetracaine ophthalmic

*See Appendix B*

## tetracaine topical

*See Appendix B*

## tetracycline (Rx)

(tet-ra-sye'kleen)
*Func. class.:* Antiinfective—broad-spectrum
*Chem. class.:* Tetracycline

**ACTION:** Inhibits protein synthesis and phosphorylation in microorganisms; bacteriostatic

**Therapeutic outcome:** Bactericidal action against susceptible organisms: gram-positive pathogens *Bacillus anthracis, Clostridium perfringens, Clostridium tetani, Listeria monocytogenes, Nocardia, Propionibacterium acnes, Actinomyces israelii;* gram-negative pathogens *Haemophilus influenzae, Legionella pneumophila, Yersinia enterocolitica, Yersinia pestis, Neisseria gonorrhoeae, Neisseria meningitidis*

**USES:** Syphilis, *Chlamydia trachomatis,* gonorrhea, lymphogranuloma venereum, uncommon gram-positive, gram-negative organisms, rickettsial infections

### CONTRAINDICATIONS

Pregnancy, breastfeeding, children <8 yr, hypersensitivity to tetracyclines

**Precautions:** Renal/hepatic disease, UV exposure

### DOSAGE AND ROUTES

**Susceptible gram-positive/gram-negative infections**
**Adult:** PO 250-500 mg q6hr
**Child >8 yr:** PO 25-50 mg/kg/day in divided doses q6hr

***Chlamydia trachomatis***
**Adult:** PO 500 mg qid × 7 days

**Syphilis**
**Adult and adolescent:** PO 500 mg qid × 2 wk; if syphilis duration >1 yr, must treat 30 days

**Brucellosis**
**Adult:** PO 500 mg qid × 3 wk with 1 g of streptomycin IM 2 ×/day × 1 wk, and 1 ×/day the 2nd wk

**Urethral, endocervical, rectal infections *(C. trachomatis)***
**Adult:** PO 500 mg qid × 7 days

### Acne

**Adult and adolescent:** PO 250 mg q6hr, then 125-500 mg/day or every other day

### Renal dose

**Adult:** PO CCr 51-90 ml/min give dose q8-12hr, CCr 10-50 ml/min give dose q12-24hr, CCr <10 ml/min give dose q24hr

**Available forms:** Caps 250, 500 mg

### Implementation

**PO route**

- Give around the clock to maintain proper blood levels; give with food to increase absorption of product; do not give within 3 hr of other agents; product interactions may occur; take on an empty stomach (1 hr before or 2 hr after meals)
- Give with 8 oz of water
- Shake liquid preparation well before giving; use calibrated device for proper dosing
- Store in tight, light-resistant container at room temp

## ADVERSE EFFECTS

**CNS:** Fever, headache, paresthesia
**CV:** Pericarditis
**EENT:** Dysphagia, glossitis, decreased calcification (permanent discoloration) of deciduous teeth, oral candidiasis, oral ulcers
**GI:** *Nausea,* abdominal pain, *vomiting, diarrhea,* anorexia, enterocolitis, hepatotoxicity, flatulence, abdominal cramps, epigastric burning, stomatitis, hepatitis, pseudomembranous colitis
**GU:** *Increased BUN,* azotemia, acute renal failure
**HEMA:** Eosinophilia, neutropenia, thrombocytopenia, leukocytosis, hemolytic anemia
**INTEG:** *Rash, urticaria, photosensitivity, increased pigmentation,* exfoliative dermatitis, pruritus, angioedema, Stevens-Johnson syndrome
**MISC:** Increased intracranial pressure, candidiasis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 60%-80% (PO), lower (IM) |
| **Distribution** | Widely distributed, some in CSF; crosses placenta |
| **Metabolism** | Not metabolized |
| **Excretion** | Unchanged—kidneys |
| **Half-life** | 6-10 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 1-2 hr |
| **Peak** | 2-3 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Cimetidine, $NaHCO_3$: decreased tetracycline effect
Digoxin: increased digoxin effect
Iron: forms chelates, decreased absorption
Isotretinoin: Increase: Pseudotumor cerebi avoid concurrent use
Methoxyflurane: fatal nephrotoxicity, do not use together
Warfarin: increased warfarin effect

### Drug classifications

Alkali products, antacids: decreased tetracycline effect
Hormonal contraception: Decrease: possible, but unlikely, use additional contraception
Penicillins: decreased penicillin effect

### Drug/herb

Dong quai: increased photosensitivity

### Drug/food

Decreased: absorption with dairy products; forms insoluble chelate

### Drug/lab test

Increased: BUN, LFTs

## NURSING CONSIDERATIONS

### Assessment

- **Serious skin reactions:** angioedema, Stevens-Johnson syndrome, exfoliative dermatitis, report immediately after stopping product
- Assess patient for previous sensitivity reaction
- Assess patient for signs and symptoms of infection including characteristics of wounds, sputum, urine, stool, WBC >10,000/$mm^3$, temp; obtain baseline information before, during treatment
- Complete C&S testing before beginning product therapy to identify if correct treatment has been initiated
- **Assess for allergic reactions:** rash, urticaria, pruritus, chills, fever, joint pain; angioedema may occur a few days after therapy begins; EPINEPHrine, resuscitation equipment should be available for anaphylactic reaction
- Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); increased BUN, creatinine
- **Pseudomembranous colitis:** assess for diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC and low serum albumin; stop product and usually give either vancomycin or IV metroNIDAZOLE

- **Assess for superinfection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum if on prolonged therapy
- **Pregnancy/breastfeeding:** Do not use in pregnancy, toxic to fetus, do not breastfeed, excreted in breast milk

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to use sunscreen when outdoors to decrease photosensitivity reaction
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection; report itching, rash, pruritus, urticaria
- Teach patient to take 1 hr before bedtime to prevent esophageal ulceration
- Instruct patient to take all medication prescribed for the length of time ordered; product must be taken around the clock to maintain blood levels; do not give medication to others
- Teach patient to notify prescriber immediately of diarrhea with pus, mucus, fever, abdominal pain
- Teach patient to notify prescriber if pregnancy is planned or suspected
- Teach patient not to use outdated products, as Fanconi syndrome (nephrotoxicity) may occur
- Teach patient that tooth discoloration may occur, especially in children, do not use in child <8 yr, may cause bone formation abnormalities

### Evaluation

**Positive therapeutic outcome**

- Absence of signs/symptoms of infection (WBC <10,000/mm$^3$, temp WNL, absence of red, draining wounds)
- Reported improvement in symptoms of infection, resolution of infection, prevention of malaria

## tetrahydrozoline nasal agent

*See Appendix B*

## tetrahydrozoline ophthalmic

*See Appendix B*

## theophylline (Rx)

(thee-off'i-lin)

**Elixophyllin, Theo-24, Theochron, Uniphyl**

*Func. class.:* Spasmolytic, bronchodilator

*Chem. class.:* Xanthine, ethylenediamine

**ACTION:** Relaxes smooth muscle of respiratory system by blocking phosphodiesterase, which increases cyclic AMP, exact action unknown

**Therapeutic outcome:** Ability to breathe without difficulty

**USES:** Bronchial asthma, bronchospasm of COPD, chronic bronchitis, emphysema

## CONTRAINDICATIONS

Hypersensitivity to xanthines, tachydysrhythmias

**Precautions:** Pregnancy, children, geriatric, HF, cor pulmonale, hepatic disease, active peptic ulcer disease, diabetes mellitus, hyperthyroidism, hypertension, seizure disorder

## DOSAGE AND ROUTES-NTI

### Acute exacerbations of reversible airway obstructions

**Adult:** PO/**IV** 5 mg/kg loading dose over 20-30 min

### COPD, chronic bronchitis

**Adult:** **IV** 0.4 mg/kg/hr in nonsmokers or 0.7 mg/kg/hr in smokers

**Adult, child >45 kg:** Maintenance PO (regular release) 10 mg/kg/day, in divided doses q1-8hr; after 3 days increase dosage to 400 mg in divided doses q6-8hr; after 3 more days increase to 600 mg in divided doses q6-8hr; max 800 mg/day

### Apnea of prematurity

**Neonate:** **IV** 4 mg/kg over 20-30 min, then maintenance **IV**/PO neonate ≥24 days 1.5 mg/kg q12h

**Available forms:** Cap, ext rel 100, 200, 300, 400 mg; tab ext rel 100, 200, 400, 450, 600 mg; elixir 80 mg/15 ml; sol for inj 250 mg/10 ml, 500 mg/20 ml

### Implementation

**PO route**

- Do not crush or chew time release products
- Contents of bead-filled cap may be sprinkled over food for children's use
- Give PO with 8 oz water; to decrease GI symptoms; avoid food, absorption may be affected
- Store diluted sol for 24 hr if refrigerated

T

**IV route**
- Give loading dose over 20-30 min; max 20-25 mg/min; do not give by rapid **IV;** use only by cont inf

**Y-site compatibilities:** Acyclovir, ampicillin, aztreonam, ceFAZolin, cefoTEtan, cefTAZidime, cefTRIAXone, cimetidine, clindamycin, dexamethasone, diltiazem, DOBUTamine, DOPamine, doxycycline, erythromycin, famotidine, fluconazole, gentamicin, haloperidol, heparin, hydrocortisone, lidocaine, methyldopate, methylPREDNISolone, metroNIDAZOLE, midazolam, nafcillin, nitroglycerin, nitroprusside, penicillin G potassium, piperacillin, potassium chloride, ranitidine, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin

## ADVERSE EFFECTS

**CNS:** *Anxiety, restlessness, insomnia, dizziness, seizures,* headache, light-headedness, muscle twitching, tremors
**CV:** *Palpitations, sinus tachycardia,* hypotension, dysrhythmias, fluid retention with tachycardia
**ENDO:** Hyperglycemia
**GI:** *Nausea, vomiting, anorexia,* diarrhea, bitter taste, dyspepsia, gastric distress
**INTEG:** Flushing, urticaria
**MISC:** SIADH, urinary frequency
**RESP:** Increased rate, tachypnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO), slowly absorbed (ext rel) |
| **Distribution** | Crosses placenta, widely distributed |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 6.5-10.5 hr; increased in liver disease, HF, geriatric |

### Pharmacodynamics

| | PO | PO–TIME REL | IV |
|---|---|---|---|
| **Onset** | Rapid | Slow | Immediate |
| **Peak** | 1 hr | 4-8 hr | Inf end |
| **Duration** | 6 hr | 12-24 hr | 6-8 hr |

## INTERACTIONS

### Individual drugs

CarBAMazepine: decreased theophylline level
Cimetidine, disulfiram, erythromycin, fluvoxaMINE, influenza vaccine, mexiletine, propranolol: increased theophylline action
Lithium: decreased effect of lithium
PHENobarbital, phenytoin, rifampin: decreased theophylline
Increased: dysrhythmias: halothane

### Drug classifications

Anticoagulants: increased anticoagulant level
β-Adrenergic blockers: cardiotoxicity
Contraceptives (oral), corticosteroids, fluoroquinolones, interferons: increased theophylline action
Smoking: decreased theophylline level

### Drug/herb

Coffee, cola nut, guarana, ma huang (ephedra), tea (black, green), yerba maté: increased toxicity
St. John's wort: decreased theophylline level

## NURSING CONSIDERATIONS

### Assessment

- **Monitor theophylline blood levels** (therapeutic level is 10-20 mcg/ml); toxicity may occur with small increase above 20 mcg/ml, especially in geriatric patients
- Monitor I&O; diuresis occurs; dehydration may result in children or geriatric
- **Assess for signs of toxicity:** irritability, insomnia, restlessness, tremors, nausea, vomiting
- Monitor respiratory rate, rhythm, depth; auscultate lung fields bilaterally; notify prescriber of abnormalities
- **Assess for allergic reactions:** rash, urticaria; if these occur, product should be discontinued
- Obtain liver function studies periodically, lower doses may be required in those with moderate to severe hepatic disease
- **Pregnancy/breastfeeding:** If used, monitor and maintain theophylline level between 5 and 12 mcg, monitor levels carefully in breastfeeding
- **Beers:** Avoid in older adults, CNS stimulant effect

### Patient/family education

- Advise patient to check OTC medications, current prescription medications for ePHEDrine, which increases stimulation, and to avoid alcohol, caffeine
- Caution patient to avoid hazardous activities; dizziness may occur
- Inform patient that if GI upset occurs, to take product with 8 oz of water; avoid food; absorption may be decreased
- **Advise patient to notify prescriber of toxicity:** nausea, vomiting, anxiety, insomnia, seizures
- Advise patient to notify prescriber of change in smoking habit; dosage may have to be changed

### Evaluation

**Positive therapeutic outcome**
- Ability to breathe more easily

## thiamine (vitamin $B_1$) (PO, OTC; IV, IM, Rx)

**Betaxin, Betalin S, Biamine, Revitonus, Thiamilate**

*Func. class.:* Vitamin $B_1$
*Chem. class.:* Water soluble

**Do not confuse:** thiamine/Tenormin

**ACTION:** Needed for pyruvate metabolism, carbohydrate metabolism

**Therapeutic outcome:** Prevention and treatment of thiamine deficiency

**USES:** Vit $B_1$ deficiency or polyneuritis, cheilosis adjunct with thiamine beriberi, Wernicke-Korsakoff syndrome, pellagra, metabolic disorders, alcoholism

### CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy

### DOSAGE AND ROUTES
#### RDA
**Adult:** PO (Male) 1.2-1.5 mg; (female) 1.1 mg; (pregnancy) 1.4 mg; (breastfeeding) 1.4 mg
**Child 9-13 yr:** PO 0.9 mg
**Child 4-8 yr:** PO 0.6 mg
**Child 1-3 yr:** PO 0.5 mg
**Infant 6 mo-1 yr:** PO 0.3 mg
**Neonate and infant to 6 mo: PO 0.3 mg**

#### Beriberi
**Adult:** PO 5-30 mg qd or given in 3 divided doses × 1 month; IM/**IV** 5-30 mg qd or in 3 doses, then convert to PO
**Child/infant:** PO 10-50 mg qd × 2 wk, then 5-10 mg qd × 1 mo; **IV**/IM 10-25 mg/day × 2 wk, then 5-10 mg qd × 1 mo

**Available forms:** Tabs 50, 100, 250, 500 mg; inj 100 mg/ml; enteric-coated tabs 20 mg

### Implementation
**IM route**
- Give by IM inj; rotate sites if pain and inflammation occur; do not mix with alkaline sol; Z-track to minimize pain
- Application of cold compress may decrease pain
- Store in airtight, light-resistant container

**Direct IV route**
- **IV** undiluted given over 5 min

**Continuous IV infusion route**
- Dilute in compatible **IV** sol

**Y-site compatibilities:** Famotidine

### ADVERSE EFFECTS
**CNS:** Weakness, restlessness
**CV:** Collapse, pulmonary edema, hypotension
**EENT:** Tightness of throat
**GI:** Hemorrhage, *nausea, diarrhea*
**INTEG:** Angioneurotic edema, cyanosis, sweating, warmth
**SYST:** Anaphylaxis

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, IM), completely absorbed (**IV**) |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver |
| **Excretion** | Kidneys (unchanged—excess amounts) |
| **Half-life** | Unknown |

#### Pharmacodynamics
Unknown

### NURSING CONSIDERATIONS
#### Assessment
- **Anaphylaxis (IV only):** assess for swelling of face, eyes, lips, throat, wheezing
- **Thiamine deficiency:** assess for anorexia, weakness, pain, depression, confusion, blurred vision, tachycardia
- Assess nutritional status: yeast, beef, liver, whole or enriched grains, legumes
- Application of cold to help decrease pain at injection site
- **Pregnancy/breastfeeding:** Considered compatible with pregnancy, breastfeeding

#### Patient/family education
- Teach patient necessary foods to be included in diet: yeast, beef, liver, legumes, whole grains

#### Evaluation
**Positive therapeutic outcome**
- Absence of nausea, vomiting, anorexia, insomnia, tachycardia, paresthesias, depression, muscle weakness

**RARELY USED**

## thioridazine (Rx)

(thye-or-rid'a-zeen)
*Func. class.:* Antipsychotic (typical)
*Chem. class.:* Phenothiazine, piperidine

**USES:** Psychotic disorders, schizophrenia, behavioral problems in children, anxiety, major depressive disorders, organic brain syndrome

## CONTRAINDICATIONS
Children <2 yr, hypersensitivity, coma, CNS depression

**BLACK BOX WARNING:** QT prolongation, cardiac dysrhythmias

## DOSAGE AND ROUTES
### Psychosis
**Adult:** PO 25-100 mg tid, max dose 800 mg/day; dose is gradually increased to desired response, then reduced to minimum maintenance

### Depression/behavioral problems/organic brain syndrome
**Adult:** PO 25 tid, range from 10 mg bid-qid to 50 mg tid-qid; max 800 mg/day for short period
**Geriatric:** PO 10-25 mg daily-bid, increase 4-7 days by 10-25 mg to desired dose, max 300 mg/day for short period
**Child 2-12 yr:** PO 0.5-3 mg/kg/day in divided doses, max 3 mg/kg/day

**RARELY USED**

## thyroid USP (desiccated) (Rx)
(thye′roid)
**Armour Thyroid, Bio-Throid, Nature Thyroid, NP Thyroid**
*Func. class.:* Thyroid hormone
*Chem. class.:* Active thyroid hormone in natural state and ratio

**Therapeutic outcome:** Correction of lack of thyroid hormone

**USES:** Hypothyroidism, cretinism (juvenile hypothyroidism), myxedema

## CONTRAINDICATIONS
Adrenal insufficiency, MI, thyrotoxicosis, porcine protein hypersensitivity

**BLACK BOX WARNING:** Obesity treatment

## DOSAGE AND ROUTES
### Hypothyroidism
**Adult:** PO 60-65 mg/day, increased by 30 mg qmo until desired response; maintenance dose 65-120 mg/day
**Geriatric:** PO 7.5-15 mg/day, increase dose q6-8wk until desired response

### Cretinism/juvenile hypothyroidism
**Child:** PO 15 mg/day, then 30 mg/day after 2 wk, then 60 mg/day after another 2 wk; maintenance dose 60-180 mg/day

### Myxedema
**Adult:** PO 15 mg/day, double dose q2wk, maintenance 60-180 mg/day

**RARELY USED**

## tiaGABine (Rx)
(tie-ah-ga′been)
**Gabitril**
*Func. class.:* Anticonvulsant

**Do not confuse:** tiaGABine/tiZANidine

**ACTION:** Inhibits reuptake and metabolism of GABA; may increase seizure threshold, structurally similar to GABA; tiaGABine binding sites in neocortex, hippocampus

**USES:** Adjunct treatment of partial seizures in adults and children ≥12 yr

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, child <12 yr, geriatric, renal/hepatic disease, suicidal ideation/behavior, status epilepticus, mania, bipolar disorder, abrupt discontinuation, depression

## DOSAGE AND ROUTES
When not given with a CYP3A4 enzyme, effect of tiaGABine is doubled; lower dosages are indicated
**Adult:** PO (those on an enzyme-inducing antiepileptic) 4 mg/day in divided doses, may increase by 4-8 mg qwk until desired response, max 56 mg/day
**Child 12-18 yr:** PO 4 mg/day, may increase by 4 mg at beginning of wk 2, may increase by 4-8 mg qwk until desired response, max 32 mg/day

### Hepatic dose
**Adult:** PO reduce dose or increase dosing interval

**Available forms:** Tabs 2, 4, 12, 16 mg

### Implementation
- Store at room temperature away from heat and light
- Provide assistance with ambulation during early part of treatment; dizziness occurs
- Provide seizure precautions: padded side rails; move objects that may harm patient
- Use with food

## ADVERSE EFFECTS
**CNS:** *Dizziness, anxiety,* somnolence, ataxia, confusion, *asthenia,* unsteady gait, depression, suicidal ideation, seizures, tremor, hostility, EEG changes
**CV:** Vasodilatation, tachycardia, hypertension

**ENDO:** Goiter, hypothyroidism
**GI:** Nausea, diarrhea, vomiting, increased appetite
**INTEG:** Pruritus, rash, Stevens-Johnson syndrome, alopecia, hyperhidrosis
**MS:** Myalgia
**RESP:** Pharyngitis, coughing

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | >95% |
| **Distribution** | Protein binding 96% |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 7-9 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 45 min |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CarBAMazepine, PHENobarbital, phenytoin, primidone: decreased effect of these products
Sevelamer: decreased tiagabine effect
Valproate: lower dose of tiaGABine may be required

### Drug classifications

Alcohol, CNS depressants: increased CNS depression

### Drug/food

High-fat meal: decreased rate of absorption

## NURSING CONSIDERATIONS

### Assessment

- Monitor renal function tests: urinalysis, BUN, urine creatinine q3mo
- Monitor liver function tests: ALT, AST, bilirubin
- **Assess description of seizures:** location, duration, presence of aura; assess for weakness
- Withdraw gradually to prevent seizures
- May cause status epilepticus and unexplained death
- **Assess mental status:** mood, sensorium, affect, behavioral changes, suicidal thoughts; if mental status changes, notify prescriber, increased affect and hypomania may be present
- **Beers:** Avoid in older adults, unless safer alternatives are not available, may cause ataxia, impaired psychomotor function

### Patient/family education

- Advise patient to carry/wear emergency ID stating patient's name, products taken, condition, prescriber's name and phone number
- Advise patient to avoid driving, other activities that require alertness
- Teach patient not to discontinue medication quickly after long-term use
- Teach patient to notify prescriber if pregnancy is planned or suspected, avoid breastfeeding
- Teach patient to report suicidal thoughts, behaviors immediately

### Evaluation

**Positive therapeutic outcome**

- Decreased seizure activity; document on patient's chart

**⚠ HIGH ALERT**

## ticagrelor

(tye-ka'gre-lor)
**Brilinta**
*Func. class.:* Platelet inhibitor
*Chem. class.:* ADP receptor antagonist

**Do not confuse:** Brilinta/Brintellix

**ACTION:** Reversibly binds to the platelet receptor, preventing platelet activation

**Therapeutic outcome:** Prevention of thromboembolism

**USES:** Arterial thromboembolism prophylaxis in acute coronary syndrome (ACS) (unstable angina, acute MI), including in patients undergoing percutaneous coronary intervention (PCI)

## CONTRAINDICATIONS

Hypersensitivity, severe hepatic disease, bleeding

**Precautions:** Abrupt discontinuation, breastfeeding, children, infants, neonates, GI bleeding, hepatic disease, pregnancy C

**BLACK BOX WARNING:** Bleeding, intracranial bleeding

**BLACK BOX WARNING:** Coronary artery bypass graft (CABG) surgery, abrupt discontinuation, aspirin coadministration

## DOSAGE AND ROUTES

**Adult: PO** Loading dose 180 mg with aspirin (usually 325 mg PO); then, give 90 mg bid with aspirin 75-100 mg/day, do not give maintenance doses of aspirin >100 mg/day

**Available forms:** Tab 90 mg

### Implementation

**PO route**

- May be taken without regard to food
- Store at room temperature, in original container in dry place

• Discontinue 5-7 days before surgery
• May be crushed (90-mg tab) and mixed with purified water, 100 ml (PO), 50 ml (NG); ensure entire dose is given by flushing mortar, syringe, NG tube with 2 additional 50 ml of water

## ADVERSE EFFECTS

**CNS:** Dizziness, fatigue, headache
**CV:** Atrial fibrillation, bradyarrhythmias, chest pain, hypertension, hypotension, syncope, ventricular pauses
**GI:** Diarrhea, nausea
**HEMA:** Fatal bleeding
**MISC:** Back pain, gynecomastia, hyperuricemia
**RESP:** Cough, dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 36% |
| **Distribution** | Protein binding >99% |
| **Metabolism** | By CYP3A4 |
| **Excretion** | 26% (urine) |
| **Half-life** | 7 hr; 9 hr metabolite |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1.5 hr (product), 2.5 hr (metabolite) |
| **Duration** | ≥8 hr |

## INTERACTIONS

### Individual drugs

Simvastatin, lovastatin: increased effect
Digoxin: change in effect

### Drug classifications

**BLACK BOX WARNING:** Anticoagulants, NSAIDs, platelet inhibitors: increased bleeding risk

CYP3A4 inducers (carBAMazepine, dexamethasone, PHENobarbital, phenytoin, rifampin): decreased ticagrelor action

**BLACK BOX WARNING:** CYP3A4 inhibitors (atazanavir, clarithromycin, dalfopristin, delavirdine, indinavir, isoniazid, itraconazole, ketoconazole, lopinavir, nefazodone, nelfinavir, quinupristin, ritonavir, saquinavir, telithromycin, tipranavir, voriconazole): increased bleeding risk

### Drug/lab

Serum creatinine: increased

## NURSING CONSIDERATIONS

### Assessment

• **Thromboembolism:** Monitor CBC differential with platelet count baseline and periodically during treatment

**BLACK BOX WARNING:** Assess for bleeding that may occur when aspirin is combined with this product, some bleeding can be fatal, usually aspirin doses >100 mg/day; watch for frank bleeding, hypotension, avoid use with active bleeding, history of intracranial bleeding

**BLACK BOX WARNING:** **CABG:** Do not use in those undergoing CABG; discontinue ≥5 days before surgery

**BLACK BOX WARNING:** Abrupt discontinuation: Do not discontinue abruptly, may increase risk for MI, stent thrombosis, death

**BLACK BOX WARNING:** **Aspirin coadministration:** Use with 75-100 mg of aspirin/day, avoid higher doses, ticagrelor efficiency is decreased with aspirin >100 mg/day

• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, may be fetal toxic, do not breastfeed, excretion unknown

### Patient/family education

• Teach patient to take only as prescribed, do not skip or double doses, if a dose is missed, take next dose at scheduled time

**BLACK BOX WARNING:** Advise patient to notify prescriber of chills, fever, bruising, bleeding; not to use aspirin ≥100 mg/day

• Teach patient not to use any Rx, OTC products, herbs without approval of prescriber; products with aspirin, NSAIDs may cause bleeding
• Instruct patient to notify all health care providers of product use
• Advise patient that product can be taken without regard to meals
• Teach patient it may take longer for bleeding to stop
• Teach patient not to breastfeed

**BLACK BOX WARNING:** Advise patient to notify prescriber if pregnancy is planned or suspected

### Evaluation

**Positive therapeutic outcome**
• Prevention of thromboembolism

**⚠ HIGH ALERT**

**RARELY USED**

## ticlopidine (Rx)

(tye-cloe′pi-deen)

*Func. class.:* Platelet aggregation inhibitor

*Chem. class.:* Thienopyridine compound

**ACTION:** Irreversible inhibition of platelet aggregation through antagonism of ADP

**Therapeutic outcome:** Decreased stroke by decreasing platelet aggregation

**USES:** Reducing the risk of stroke in high-risk patients

**Unlabeled uses:** Intermittent claudication, chronic arterial occlusion, subarachnoid hemorrhage, uremic patients with AV shunts/fistulas, open heart surgery, coronary artery bypass grafts, primary glomerulonephritis, diabetic neuropathy

## CONTRAINDICATIONS

Hypersensitivity, severe liver disease, active bleeding, coagulopathy

**BLACK BOX WARNING:** Agranulocytosis, neutropenia, thrombocytopenia, thrombotic thrombocytopenic purpura (TTP)

**Precautions:** Pregnancy, breastfeeding, children, geriatric, past liver disease, renal disease, increased bleeding risk, peptic ulcer disease, surgery

**BLACK BOX WARNING:** Anemia, hematological disease

## DOSAGE AND ROUTES

**Adult:** PO 250 mg bid with food

**Available forms:** Tabs 250 mg

### Implementation

• Give with food or after eating to decrease GI effects; may use methylPREDNISolone **IV** 20 mg to provide normal bleeding time in 2 hr

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, weakness

**EENT:** Tinnitus, epistaxis

**GI:** Nausea, vomiting, diarrhea, GI discomfort, cholestatic jaundice, hepatitis, increased cholesterol LDL, VLDL, triglycerides

**GU:** Hematuria

**HEMA:** Bleeding (epistaxis, hematuria, conjunctival hemorrhage, GI bleeding), agranulocytosis, neutropenia, thrombocytopenia, thrombotic thrombocytopenic purpura

**INTEG:** Rash, pruritus

**META:** Hypercholesterolemia, hypertriglyceridemia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively; 98% protein binding |
| **Excretion** | Kidneys, unchanged product |
| **Half-life** | Increased with repeat dosing; 4-5 days (multiple doses) |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-3 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Abciximab, aspirin, eptifibatide, tirofiban: increased bleeding tendencies

Ambrisenten, fosphenytoin, phenytoin, theophylline: increased levels of each specific drug

Cimetidine: increased effects of ticlopidine

CycloSPORINE: decreased plasma levels of cycloSPORINE

Digoxin: decreased plasma levels of digoxin

### Drug classifications

Antacids: decreased plasma levels of ticlopidine

Anticoagulants, NSAIDs, salicylates, SSRIs, thrombin inhibitors, thrombolytics: increased bleeding risk

CYP2C19, CYP2DC substrates: increased levels of each specific drug

### Drug/herb

Ginger, ginkgo, garlic, feverfew, horse chestnut, green tea: increased bleeding risk

## NURSING CONSIDERATIONS

### Assessment

• Monitor liver function tests: AST, ALT, bilirubin, creatinine if patient is on long-term therapy (4 mo or more)

**BLACK BOX WARNING:** Blood dyscrasias, bone marrow depression, do not use in those with a history of these conditions; monitor blood tests: CBC, Hct, Hgb, pro-time if patient is on long-term therapy; CBC q2wk × 3 mo therapy; thrombocytopenia, neutropenia may occur

**BLACK BOX WARNING:** Monitor bleeding time baseline and throughout therapy, levels may be 2-5 × normal limit

T

• **Beers:** Avoid in older adults, safer alternatives are available

### Patient/family education

• Advise patient that blood studies are necessary during treatment

**BLACK BOX WARNING:** Advise patient to report any unusual bleeding to prescriber

• Instruct patient to take with food or just after eating to minimize GI discomfort, not to double missed dose

• Caution patient to report side effects such as diarrhea, skin rashes, subcutaneous bleeding, signs of cholestasis (yellow skin and sclera, dark urine, light-colored stools)

• Advise patient that product should be discontinued 10-14 days before surgery

• Advise there are many drug and herb interactions; to avoid all OTC products unless approved by prescriber

• To take with food

### Evaluation

**Positive therapeutic outcome**

• Absence of stroke

## tigecycline (Rx)

(tye-ge-sye'kleen)

**Tygacil**

*Func. class.:* Broad-spectrum antiinfective

*Chem. class.:* Glycylcyclines

**ACTION:** Inhibits protein synthesis and phosphorylation in microorganisms; bacteriostatic, structurally similar to the tetracyclines

**Therapeutic outcome:** Resolution of infection

**USES:** Complicated skin/skin structure infections: *Escherichia coli, Enterococcus faecalis* (vancomycin-susceptible only), *Staphylococcus aureus, Streptococcus agalactiae, S. anginosus* group, *S. pyogenes, Bacteroides fragilis;* complicated intraabdominal infections *(Citrobacter freundii), Enterobacter cloacae, Escherichia coli, Klebsiella oxytoca, K. pneumoniae, E. faecalis* (vancomycin-susceptible only), *S. aureus* (methicillin-susceptible only), *S. anginosus* group, *B. fragilis, Bacteroides thetaiotaomicron, B. uniformis, B. vulgatus, Clostridium perfringens, Peptostreptococcus micros,* community-acquired pneumonia

## CONTRAINDICATIONS

Pregnancy, breastfeeding, children <18 yr, hypersensitivity to tigecycline

**Precautions:** Renal/hepatic disease, hypersensitivity to tetracyclines, ventricular-associated hospital-acquired pneumonias

**BLACK BOX WARNING:** Infection

## DOSAGE AND ROUTES

**Adult: IV** 100 mg, then 50 mg q12hr, **IV** INF is given over 30 min to 60 min q12hr; given for 5-14 days depending on infection

### Hepatic dose (Child-Pugh C)

**Adult:** IV 100 mg, then 25 mg q12hr

**Available forms:** Powder for inj, lyophilized 50 mg

### Implementation

• Tigecycline allergy test before using, obtain C&S, do not begin treatment before results

**Intermittent IV infusion route**

• Reconstitute each vial with 5.3 ml of 0.9% NaCl, or $D_5W$ (10 mg/ml); swirl to dissolve; immediately withdraw 5 ml of the reconstituted sol and add to a 100-ml **IV** bag for inf (1 mg/ml); may be yellow or orange, if not, sol should be discarded; do not give if particulate matter is present, use a dedicated IV line or Y-site, flush with NS before and after use, give over ½ hr

• Store in tight, light-resistant container at room temperature, diluted sol at room temp for up to 24 hr, 6 hr in vial, and remaining time in IV bag, 48 hr refrigerated

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, argatroban, azithromycin, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, DOXOrubicin hydrochloride, DOXOrubicin liposome, droperidol, enalaprilat, EPINEPHrine, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone,

HYDROmorphone, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, lepirudin, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methyldopa, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, mitoXANtrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate/chloride/phosphate, procainamide, prochlorperazine, promethazine, propofol, propranolol, ranitidine, remifentanil, rocuronium, sodium acetate/bicarbonate/phosphate, streptozocin, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinBLAStine, vinCRIStine, vinorelbine, zidovudine, zoledronic acid

**Y-site incompatibilities:** Amiodarone, amphotericin B colloidal, bleomycin, chloramphenicol, chlorproMAZINE, dantrolene, DAUNOrubicin liposome, diazepam, epirubicin, hydrALAZINE, IDArubicin, niCARdipine, phenytoin, quinupristin/dalfopristin, verapamil

## ADVERSE EFFECTS

**CNS:** Headache, dizziness, insomnia
**CV:** Hypo/hypertension, phlebitis
**EENT:** Tooth discoloration
**GI:** *Nausea, vomiting, diarrhea,* anorexia, constipation, dyspepsia, hepatotoxicity, hepatic failure, pseudomembranous colitis
**HEMA:** Anemia, leukocytosis, thrombocytopenia
**INTEG:** *Rash,* pruritus, sweating, photosensitivity
**META:** Increased ALT, AST, BUN, lactic acid, alkaline phosphatase, amylase, hyperglycemia, hypokalemia, hypoproteinemia, bilirubinemia
**MISC:** Back pain, fever, abnormal healing, abdominal pain, abscess, asthenia, infection, pain, peripheral edema, local reactions
**RESP:** Cough, dyspnea
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 71%-89% |
| **Metabolism** | Not extensively |
| **Excretion** | 22% unchanged, urine; primarily biliarily excreted |
| **Half-life** | Terminal 42 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Warfarin: increased effect of tigecycline

### Drug classifications

Oral contraceptives: decreased effect of tigecycline

### Drug/lab test

Increased: amylase, LFTs, alk phos, BUN, creatinine, LDH, WBC, INR, PTT, PT
Decreased: potassium, calcium, sodium, Hgb/Hct, platelets

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Increased mortality risk: Use only with confirmed or strongly suspected bacterial infection; do not use as a prophylactic

- **Pseudomembranous colitis:** assess for diarrhea, abdominal pain, fever, fatigue, anorexia; possible anemia, elevated WBC, low serum albumin; stop product and usually give either vancomycin or IV metroNIDAZOLE
- Assess for signs of anemia: Hct, Hgb, fatigue
- Monitor blood tests: PT, CBC, AST, ALT, BUN creatinine
- **Assess for allergic reactions:** rash, itching, pruritus, angioedema, serious allergic skin reactions: assess for Stevens-Johnson syndrome, anaphylaxis
- Assess for nausea, vomiting, diarrhea; administer antiemetic, antacids as ordered
- **Assess for overgrowth of infection:** fever, malaise, redness, pain, swelling, drainage, perineal itching, diarrhea, changes in cough or sputum
- **Toxicity:** assess for pseudotumor cerebri, photosensitivity, anti-anabolic actions (azotemia, BUN, hypophosphatemia, metabolic acidosis): tigecycline is structurally similar to tetracycline
- **Assess for pancreatitis, hyperamylasemia:** may be fatal; if these occur, discontinue; improvement usually occurs after product is discontinued

T

• **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding, may cause fetal harm

### Patient/family education

• Teach patient to avoid sun exposure; sunscreen does not seem to decrease photosensitivity
• Teach patient to avoid pregnancy while taking this product; fetal harm may occur; to avoid breastfeeding
• Teach patient to report burning, pain at inj site
• Teach patient to report diarrhea, fatigue, abdominal pain, severe nausea, vomiting

### Evaluation

**Positive therapeutic outcome**
• Decreased temp, absence of lesions, negative C&S

**⚠ HIGH ALERT**

## timolol (Rx)

(tye'moe-lole)
**Apo-Timol, Novo-Timol**
*Func. class.:* Antihypertensive; antiglaucoma
*Chem. class.:* Nonselective β-blocker

**ACTION:** Competitively blocks stimulation of β-adrenergic receptor within vascular smooth muscle (decreases rate of SA node discharge, increases recovery time), slows conduction of AV node, decreases heart rate, which decreases $O_2$ consumption in myocardium; also decreases renin-aldosterone-angiotensin system; at high doses inhibits $\beta_2$ receptors in bronchial system

**Therapeutic outcome:** Decreased B/P, decreased arrhythmias, absence of death from MI, decreased aqueous humor in the eye, absence of migraine headaches

**USES:** Mild to moderate hypertension, migraine prophylaxis, to decrease mortality following MI

**Unlabeled uses:** Tremors, angina pectoris

## CONTRAINDICATIONS

Hypersensitivity to β-blockers, cardiogenic shock, heart block (2nd or 3rd degree), sinus bradycardia, HF, cardiac failure, severe COPD, asthma

**Precautions:** Pregnancy, breastfeeding, major surgery, diabetes mellitus, thyroid/renal/hepatic disease, COPD, well-compensated heart failure, nonallergic bronchospasm, peripheral vascular disease

**BLACK BOX WARNING:** Abrupt discontinuation

## DOSAGE AND ROUTES

### Hypertension

**Adult:** PO 10 mg bid, or 20 mg/day, may increase by 10 mg q7day, max 60 mg/day
**Geriatric:** PO Initiate dose cautiously

### Myocardial infarction

**Adult:** 10 mg bid beginning 1-4 wk after MI for ≥2 yr

### Glaucoma

**Adult:** Ophth 1 gtt daily or bid
**Child:** Ophth 1 gtt daily or bid (0.25% SOL only)

### Migraine headache prevention

**Adult:** PO 10 mg bid, or 20 mg/day; may increase to 30 mg/day, 20 mg in AM, 10 mg in PM; discontinue if not effective after 8 wk

**Available forms:** Tabs 5, 10, 20 mg

### Implementation

• Given before meals, at bedtime; tab may be crushed or swallowed whole; give with food to prevent GI upset; reduce dosage in renal dysfunction
• Store at room temp; do not freeze

## ADVERSE EFFECTS

**CNS:** *Insomnia, dizziness,* hallucinations, anxiety, fatigue, depression, headache
**CV:** Hypotension, bradycardia, HF, edema, chest pain, claudication, angina, AV block, ventricular dysrhythmias
**EENT:** *Vision changes,* sore throat, *double vision,* dry burning eyes
**GI:** *Nausea,* vomiting, ischemic colitis, diarrhea, *abdominal pain,* mesenteric arterial thrombosis, flatulence, constipation
**GU:** Impotence, urinary frequency
**HEMA:** Agranulocytosis, thrombocytopenia, purpura
**INTEG:** Rash, alopecia, pruritus, fever
**META:** Hypoglycemia
**MUSC:** *Joint pain, muscle pain*
**RESP:** Bronchospasm, dyspnea, cough, crackles, nasal stuffiness

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO), minimally absorbed (ophth) |
| **Distribution** | Protein binding <10% |
| **Metabolism** | Liver, extensively |
| **Excretion** | Breast milk |
| **Half-life** | 3 hr |

### Pharmacodynamics

| | PO |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-4 hr |
| **Duration** | 12-24 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased hypotension, bradycardia (large amounts)
HydrALAZINE, methyldopa, prazosin, reserpine: increased hypotension, bradycardia
Insulin: decreased hypoglycemia
Thyroid hormones: decreased antihypertensive effect

### Drug classifications

Anticholinergics, nitrates: increased hypotension, increased bradycardia
$\beta_2$-Adrenergic agonists: increased β-blocking effect
Calcium channel blockers: increased effects of calcium channel blockers
NSAIDs, salicylates, sympathomimetics: decreased antihypertensive effect
Sulfonylureas: decreased hypoglycemic effect
Theophyllines: decreased bronchodilatation

### Drug/lab test

Increased: renal, liver function tests, uric acid
Interference: glucose, insulin tolerance test

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Abrupt discontinuation:** may result in myocardial ischemia, MI, severe hypotension, ventricular dysrhythmias in those with preexisting cardiovascular disease

- Assess for headaches: location, severity, duration, frequency baseline, throughout treatment
- Monitor B/P during beginning treatment, periodically thereafter; pulse q4hr; note rate, rhythm, quality: apical/radial pulse before administration; notify prescriber of any significant changes (pulse <50 bpm)
- Check baselines in renal, liver function tests before therapy begins
- Assess for edema in feet, legs daily, monitor I&O ratio, daily weight; check for jugular vein distention, crackles bilaterally, dyspnea (HF)
- Monitor skin turgor, dryness of mucous membranes for hydration status, especially geriatric
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excreted in breast milk

### Patient/family education

**BLACK BOX WARNING:** Teach patient not to discontinue product abruptly; taper over 2 wk; may precipitate angina if stopped abruptly

- Advise patient not to use OTC products containing α-adrenergic stimulants (nasal decongestants, cold preparations); to avoid alcohol, smoking; to limit sodium intake as prescribed
- Teach patient how to take pulse and B/P at home; advise patient when to notify prescriber
- Instruct patient to comply with weight control, dietary adjustments, modified exercise program
- Advise patient to carry/wear emergency ID to identify product being taken, any allergies; tell patient product controls symptoms but does not cure
- Caution patient to avoid hazardous activities if dizziness, drowsiness are present
- Teach patient to report symptoms of HF; difficult breathing, especially on exertion or when lying down; night cough; swelling of extremities or bradycardia; dizziness; confusion; depression; fever
- Teach patient to take product as prescribed, not to double dose, skip doses; take any missed doses as soon as remembered if at least 4 hr until next dose
- Product masks hypoglycemia; monitor blood sugar

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P in hypertension (after 1-2 wk)
- Absence of dysrhythmias

## TREATMENT OF OVERDOSE:

Lavage, **IV** atropine for bradycardia, **IV** theophylline for bronchospasm, digoxin, $O_2$, diuretic for cardiac failure, hemodialysis, **IV** glucose for hyperglycemia, **IV** diazepam (or phenytoin) for seizures

## timolol ophthalmic

*See Appendix B*

**⚠ HIGH ALERT**

## tinidazole (Rx)

(tye-ni′da-zole)
**Tindamax**
*Func. class.:* Antiprotozoal
*Chem. class.:* Nitroimidazole derivative

**ACTION:** Interferes with DNA/RNA synthesis in protozoa

**Therapeutic outcome:** Decrease in infection

**USES:** Amebiasis, giardiasis, trichomoniasis

## CONTRAINDICATIONS

Breastfeeding, hypersensitivity to this product or nitroimidazole derivative, pregnancy

**Precautions:** Pregnancy, children, geriatric, hepatic disease, CNS depression, blood dyscrasias, candidiasis, seizures, viral infection, alcoholism

**BLACK BOX WARNING:** Secondary malignancy

## DOSAGE AND ROUTES

### Intestinal amebiasis

**Adult:** PO 2 g/day × 3 days
**Adolescent/child ≥3 yr:** PO 50 mg/kg/day × 3 days, max 2 g/day

### Amebic involvement (liver)

**Adult:** PO 2 g/day × 3-5 days
**Child ≥3 yr:** PO 50 mg/kg/day × 3-5 days, max 2 g

### Giardiasis

**Adult:** PO 2 g as a single dose
**Child ≥3 yr:** PO 50 mg/kg as a single dose, max 2 g

### Trichomoniasis

**Adult:** PO 2 g as a single dose

### Bacterial vaginosis

**Adult (not pregnant):** PO 2 g/day × 2 days with food or 1 g/day × 5 days with food

### Available forms:

Tabs 250, 500 mg

### Implementation

- Administer to those >3 yr old
- Give with food; tabs can be crushed and mixed with artificial cherry syrup

## ADVERSE EFFECTS

**CNS:** *Dizziness, headache,* seizures, *peripheral neuropathy,* malaise, fatigue
**GI:** *Nausea, vomiting,* anorexia, increased AST and ALT, constipation, abdominal pain, indigestion, altered taste
**HEMA:** Leukopenia, neutropenia
**INTEG:** Pruritus, urticaria, *rash,* oral candidiasis
**SYST:** Angioedema, cramping

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Crosses blood-brain barrier |
| **Metabolism** | Extensively in the liver |
| **Excretion** | Unchanged (20%-25%) in urine, (12%) feces |
| **Half-life** | 12-14 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Do not use within 2 wk of taking disulfiram
Cholestyramine, oxytetracycline: decreased action of tinidazole
CycloSPORINE, fluorouracil, lithium, tacrolimus: increased action

### Drug classifications

Anticoagulants, hydantoins: increased action
CYP3A4 inducers (phenobarbital, phenytoin, rifampin): decreased action of tinidazole
CYP3A4 inhibitors (cimetidine, ketoconazole): increased action of tinidazole

### Drug/herb

St. John's wort: increased or decreased tinidazole level

### Drug/lab test

Increase: triglycerides, LDH, AST/ALT, glucose
Decrease: WBCs

## NURSING CONSIDERATIONS

### Assessment

- Giardiasis: obtain 3 stool samples several days apart beginning q3-4wk after treatment
- **Assess for amebic liver abscess:** monitor CBC, ESR, amebic gel diffusion test, ultrasound, total and differential leukocyte count
- Assess for signs of infection, anemia
- Assess bowel pattern before, during treatment

**BLACK BOX WARNING: Secondary malignancy:** Avoid unnecessary use

- **Pregnancy/breastfeeding:** Contraindicated during first trimester, do not breastfeed

### Patient/family education

- Instruct patient to take with food to increase plasma concentrations, minimize epigastric distress and other GI effects; not to use alcoholic beverages during or for 3 days afterward
- **Trichomoniasis:** Advise patient that all, partners should be notified and treated at the same time
- Teach patient to avoid alcohol, may cause disulfiram reaction
- Teach patient to avoid doing hazardous activities until reaction is known
- Teach patient that product causes taste change
- Teach patient not to use OTC, Rx or herbal products unless approved by prescriber

### Evaluation

#### Positive therapeutic outcome

- Decrease in infection as evidenced by negative culture

## tioconazole vaginal antifungal

*See Appendix B*

## tiotropium (Rx)

(ty-oh'tro-pee-um)

**HandiHaler, Spiriva, Spiriva Respimat**

*Func. class.:* Anticholinergic, bronchodilator

*Chem. class.:* Synthetic quaternary ammonium compound

**Do not confuse:** Spiriva/Inspra/Apidra

**ACTION:** Inhibits interaction of acetylcholine at receptor sites on the bronchial smooth muscle, resulting in decreased cGMP and bronchodilatation

**Therapeutic outcome:** Improved breathing

**USES:** COPD, for long-term treatment, once daily maintenance of bronchospasm, associated with COPD including chronic bronchitis and emphysema

## CONTRAINDICATIONS

Hypersensitivity to this product, atropine, or its derivatives

**Precautions:** Pregnancy, breastfeeding, children, geriatric, closed-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, renal disease

## DOSAGE AND ROUTES

**Adult:** INH content of 1 cap/day (18 mcg) using HandiHaler inhalation device or 2 inh (spray) (2.5 mcg each) qday

**Available forms:** Powder for inhalation 18 mcg in blister packs containing 6 caps with inhaler; 30 caps with inhaler; spray inhaler (Respimat) 2.5 mcg/spray

### Implementation

**Inhalation route**

- Caps are for INH only; do not swallow
- Immediately before administration, peel back foil until cap is visible (until "stop" line); open dust cap of HandiHaler by pulling upward, then open mouthpiece
- Place cap in center chamber; firmly close mouthpiece until it clicks, leaving dust cap open
- Hold HandiHaler with mouthpiece upward; press button in once, completely, and release; this allows medication to be released
- Breathe out completely; do not breathe into mouthpiece at any time
- Raise device to mouth and close lips tightly around mouthpiece
- With head upright, breathe in slowly/deeply, but allowing the cap to vibrate; breathe until lungs fill; hold breath and remove mouthpiece; resume normal breathing
- Repeat
- Remove used capsule and discard; close the mouthpiece and dust cap; store

**Inhalation route (spray)**

- Insert cartridge into inhaler; prime inhaler; must reprime once if not used for >3 days; if not used for >21 days, prime until aerosol is visible and 3 more times

## ADVERSE EFFECTS

**CNS:** Depression, paresthesia
**CV:** Chest pain, increased heart rate
**EENT:** Dry mouth, blurred vision, glaucoma
**GI:** *Vomiting,* abdominal pain, constipation, dyspepsia
**GU:** Urinary difficulty, urinary retention, UTI
**INTEG:** Rash, angioedema
**MISC:** Candidiasis, flulike syndrome, herpes zoster, infections, angina pectoris
**MS:** Arthritis, myalgic leg/skeletal pain
**RESP:** *Cough, worsening of symptoms,* sinusitis, URI, epistaxis, pharyngitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Does not cross blood-brain barrier |
| **Metabolism** | Very little metabolized in the liver |
| **Excretion** | Excreted in urine, 72% protein binding |
| **Half-life** | 5-6 days in animals |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug classifications

Anticholinergics: avoid use with other anticholinergics

### Drug/lab test

Increased: cholesterol, glucose

## NURSING CONSIDERATIONS

### Assessment

- For tolerance over long-term therapy; dose may have to be increased or changed
- **Respiratory status:** assess for dyspnea, rate, breath sounds before and during treatment; pulmonary function tests baseline and periodically; upper respiratory infection, cough, sinusitis
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in

T

breastfeeding, unlikely to cause harm in the infant

### Patient/family education

- Teach patient how to use HandiHaler
- Teach patient signs of closed-angle glaucoma (eye pain, blurred vision, visual halos)
- Advise patient that product is used for long-term maintenance, not for immediate relief of breathing problems
- Caution patient to avoid getting the powder in the eyes; may cause blurred vision and pupil dilatation
- Teach patient to hold hand/haler with mouthpiece upward; to press button in once, completely; and release; this allows for medication to be released
- Teach patient to breathe out completely; not to breathe into mouthpiece at any time
- Teach patient to raise device to mouth and close lips tightly around mouthpiece
- Teach patient to rinse mouth after use; to use hard candy or regular oral hygiene to reduce dry mouth
- With head upright, to breathe in slowly and deeply, but allow the cap to vibrate; to breathe until the lungs fill; to hold breathe and remove mouthpiece; to resume normal breathing
- Teach patient to report immediately blurred vision, eye pain, halos
- Teach patient to keep caps in sealed blisters before use, store at room temperature

### Evaluation

**Positive therapeutic outcome**

- Ability to breathe easier

## tipranavir (Rx)

(ti-pran'a-veer)

**Aptivus**

*Func. class.:* Antiretroviral

*Chem. class.:* Protease inhibitor

**ACTION:** Inhibits HIV protease; this prevents the maturation of virus

**Therapeutic outcome:** Prevention of worsening of HIV

**USES:** HIV in combination with other antiretrovirals

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, renal disease, history of renal stones, sulfa allergy, hemophilia, diabetes mellitus, pancreatitis, alcoholism, immune reconstitution syndrome, surgery, trauma, infection

**BLACK BOX WARNING:** Intracranial bleeding, hepatitis, hepatic disease (Child-Pugh B to C)

## DOSAGE AND ROUTES

Reduce dosage in mild or moderate hepatic impairment and ketoconazole coadministration

**Adult:** PO 500 mg coadministered with ritonavir 200 mg bid with food

**Adolescent and child ≥2 yr:** PO 14 mg/kg given with ritonavir 6 mg/kg bid or 375 mg/m$^2$ given with ritonavir 150 mg/m$^2$ bid; max 500 mg with ritonavir 200 mg bid

**Available forms:** Caps 250 mg

### Implementation

- Not to be used in those who are treatment naive
- Swallow cap whole; do not break, crush, or chew
- Store caps in refrigerator before use; after opening, store at room temp; use within 60 days
- Give after meals
- Give in equal intervals around the clock to maintain blood levels

## ADVERSE EFFECTS

**CNS:** *Headache, insomnia,* dizziness, somnolence, fatigue, *fever,* intracranial bleeding

**GI:** *Diarrhea, abdominal pain, nausea, vomiting,* anorexia, dry mouth, hepatitis B or C, fatalities when given with ritonavir, pancreatitis

**GU:** Nephrolithiasis

**INTEG:** *Rash,* urticaria, lipodystrophy, serious rash

**MS:** Pain

**OTHER:** Asthenia, insulin-resistant hyperglycemia, *hyperlipidemia,* ketoacidosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding, 99.9%, steady state 7-10 days |
| **Metabolism** | CYP3A4 |
| **Excretion** | 80% feces |
| **Half-life** | Terminal 6 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

- Amiodarone, astemizole, cisapride, flecainide, midazolam, pimozide, propafenone, quiNIDine, rifabutin, rifampin, terfenadine, triazolam: life-threatening dysrhythmias

Clarithromycin, zidovudine: increased levels of both products
Delavirdine, itraconazole, ketoconazole: increased tipranavir levels
Efavirenz, fluconazole, nevirapine: decreased tipranavir levels
Lovastatin, simvastatin: increased myopathy, rhabdomyolysis

### Drug classifications

• **Ergots:** life-threatening dysrhythmias
Oral contraceptives: increased levels of tipranavir
Rifamycins: decreased tipranavir levels

### Drug/herb

St. John's wort: decreased tipranavir levels; avoid concurrent use

### Drug/food

Grapefruit juice, high-fat, high-protein foods: decreased tipranavir absorption

### Drug/lab test

Increased: AST, ALT, cholesterol, blood glucose, amylase, lipase, triglycerides

## NURSING CONSIDERATIONS

### Assessment

• Assess for signs of infection, anemia, the presence of other STDs

**BLACK BOX WARNING: Hepatitis/pancreatitis:** ALT, AST; total bilirubin, amylase, all may be elevated, discontinue in those with hepatic insufficiency or hepatitis or AST/ALT 10× upper limit or AST/ALT 5-10× ULN and total bilirubin 2.5× ULN; assess for anorexia, nausea, jaundice, hepatomegaly, clay-colored stools

• **HIV:** Monitor viral load, CD4, plasma HIV RNA, serum cholesterol/triglycerides during treatment
• Monitor bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, product should be discontinued; monitor hydration
• **Immune reconstitution syndrome:** has been reported with combination antiretroviral therapy; patients may develop pain (MAC, CMV, PcP, TB) and autoimmune disease months after treatment

**BLACK BOX WARNING: Intracranial bleeding:** more common in those with trauma or surgery, or those taking antiplatelets or anticoagulants; assess for headache, nausea, vomiting, seizures, confusion, inability to speak; can be fatal

• **Cushingoid symptoms:** assess for buffalo hump, facial/peripheral wasting, breast enlargement, central obesity
• **Serious rash:** if a serious rash occurs, product should be discontinued
• Assess for allergies before treatment, reaction of each medication; place allergies on chart
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, enroll pregnant patient in the Antiretroviral Pregnancy Registry 800-258-4263, do not breastfeed

### Patient/family education

• Teach patient to take as prescribed; if dose is missed, take as soon as remembered up to 1 hr before next dose; do not double dose, that this product must be taken with other antiretrovirals
• Teach patient that product must be taken in equal intervals around the clock to maintain blood levels for duration of therapy
• Advise that hyperglycemia may occur; watch for increased thirst, weight loss, hunger, dry, itchy skin; notify prescriber
• Advise patient that product does not cure AIDS, only controls symptoms; not to donate blood
• Teach patient not to breastfeed
• Advise patient that redistribution of body fat may occur
• Teach patient not to use with other products unless approved by prescriber, many drug interactions
• Inform patient that product must be taken in combination with ritonavir
• Teach patient to stop product and notify prescriber if anorexia, nausea, vomiting, yellowing of skin or eyes, clay-colored stools, fatigue, pain in upper abdomen occur

### Evaluation

**Positive therapeutic outcome**
• Prevention of viral replication

**⚠ HIGH ALERT**

## tirofiban (Rx)

(tie-roh-fee'ban)
**Aggrastat**
*Func. class.:* Antiplatelet
*Chem. class.:* Glycoprotein IIb/IIIa inhibitor

**Do not confuse:** Aggrastat/argatroban

**ACTION:** Antagonist of platelet glycoprotein (GP) IIb/IIIa receptor that leads to binding of fibrinogen and von Willebrand's factor, which inhibits platelet aggregation

**Therapeutic outcome:** Decreased platelet count

## USES: Acute coronary syndrome in combination with heparin

## CONTRAINDICATIONS

Hypersensitivity, active internal bleeding, stroke, major surgery, severe trauma within 30 days, intracranial neoplasm, aneurysm, hemorrhage, acute pericarditis, platelets $<100{,}000/mm^3$, history of thrombocytopenia, coagulopathy, systolic B/P >180 mm Hg or diastolic B/P >110 mm Hg

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal disease, bleeding tendencies, hypertension, platelets $<150{,}000/mm^3$

## DOSAGE AND ROUTES

**Adult: IV** 0.4 mcg/kg/min × 30 min, then 0.1 mcg/kg/min for 12-24 hr after angioplasty or atherectomy

### Renal dose

**Adult:** IV CCr <30 ml/min 0.2 mcg/kg/min × 30 min, then 0.05 mcg/kg/min, during angiography and for up to 12-24 hr after angioplasty

**Available forms:** Inj 50 ml vials; inj premixed bag 50 mcg/ml in 100, 250 ml

### Implementation

#### Intermittent IV infusion route

- Discontinue no less than 2-4 hrs before CABG
- Dilute inj: withdraw and discard 100 ml from a 500-ml bag of sterile 0.9% NaCl or $D_5$ and replace this vol with 100 ml of tirofiban inj from two vials
- Tirofiban inj for sol is premixed in containers of 500 ml 0.9% NaCl (50 mg/ml), give over 30 min
- Minimize other arterial/venous punctures, IM inj, catheter use, intubation to reduce bleeding risks
- Do not use if particulates are present
- Discard unused solution after 24 hr from start of infusion

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, capreomycin, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefepime, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, DOXOrubicin, DOXOrubicin liposome, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, IDArubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methylhexital, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoXANtrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, PEMEtrexed, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate/chloride/phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate/bicarbonate, streptozocin, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

**Y-site incompatibilities:** Amphotericin B colloidal, amphotericin B liposome, dantrolene, diazepam, phenytoin

## ADVERSE EFFECTS

**CNS:** Dizziness, headache
**CV:** Bradycardia, hypotension
**GI:** Nausea, vomiting
**HEMA:** Bleeding, thrombocytopenia
**INTEG:** *Rash*
**MISC:** Dissection, edema, pain in legs/pelvis, sweating
**SYST:** Anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Plasma clearance 20%-25% |
| **Metabolism** | Liver |
| **Excretion** | Urine/feces |
| **Half-life** | 2 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Abciximab, aspirin, cefamandole, cefoperazone, cefoTEtan, clopidogrel, dipyridamole, eptifibatide, heparin, ticlopidine, valproic acid: increased bleeding risk

### Drug classifications

Heparins, NSAIDs, SNRIs, SSRIs, thrombin inhibitors: increased bleeding risk

Increase: Tirofiban clearance: levothyroxine, omeprazole

### Drug/lab

Decrease: Platelets, Hct, Hgb

## NURSING CONSIDERATIONS

### Assessment

- **Bleeding:** Monitor platelet counts, Hct, Hgb before treatment, within 6 hr of loading dose and at least daily thereafter; watch for bleeding from puncture sites, catheters, or in stools, urine
- Assess for contraindications to therapy; recent major surgery, active bleeding trauma within 30 days
- **Pregnancy/breastfeeding:** Do not use unless clearly needed, do not breastfeed, excretion unknown

### Patient/family education

- Advise patient that it is necessary to quit smoking to prevent excessive vasoconstriction
- Teach signs/symptoms of bleeding, low platelets
- Advise that there are many drug and herb interactions, do not use unless approved by prescriber

### Evaluation

**Positive therapeutic outcome**

- Treatment of acute coronary syndrome

## tiZANidine (Rx)

(tye-za′na-deen)

**Zanaflex**

*Func. class.:* Skeletal muscle relaxant, central acting

*Chem. class.:* Imidazole

**Do not confuse:** tiZANidine/tiaGABine

**ACTION:** Increases presynaptic inhibition of motor neurons and reduces spasticity by $\alpha_2$-adrenergic agonism

**Therapeutic outcome:** Decreased pain/spasticity in multiple sclerosis

**USES:** Acute/intermittent management of increased muscle tone associated with spasticity, symptoms of MS

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatric, renal/hepatic disease, hypotension

## DOSAGE AND ROUTES

**Adult:** PO 8 mg q6-8hr; max 36 mg/24 hr

### Renal dose

**Adult:** PO CCr <25 ml/min, start with lower dosage

**Available forms:** Tabs 2, 4 mg; caps 2, 4, 6 mg

### Implementation

- Store in airtight container at room temperature
- Give consistently either with or without food; food may affect absorption
- Titrate dose carefully
- Avoid use with other CNS depressants
- Caps, tabs are equivalent if used on empty stomach

## ADVERSE EFFECTS

**CNS:** *Dizziness,* somnolence, speech disorder, dyskinesia, nervousness, hallucination, psychosis

**CV:** Hypotension, bradycardia

**GI:** *Constipation, vomiting, dry mouth,* increased ALT, abnormal liver function tests

**GU:** Urinary frequency

**OTHER:** Blurred vision, pharyngitis, rhinitis, tremor, rash, muscle weakness

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Completely absorbed |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, feces |
| **Half-life** | 2½ hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 hr |
| **Duration** | 3-6 hr |

T

## INTERACTIONS

### Individual drugs

Acyclovir, alcohol, amiodarone, ciprofloxacin, enoxacin, famotidine, fluvoxaMINE, norfloxacin, propafenone, tacrine, verapamil, zileuton: increased tizanidine levels; avoid concurrent use

Acetaminophen: Decreased acetaminophen absorption, monitor effect

Rasagiline: increased effect of rasagiline

### Drug classifications

Antihypertensive: increased hypotension

CNS depressants, opioids: increased CNS depression, do not use together unless absolutely needed

### Drug/herb

Kava, St. John's wort: increased CNS depression

### Drug/lab test

Increased: AST, alkaline phosphatase, ALT, serum glucose

## NURSING CONSIDERATIONS

### Assessment

- Assess for muscle spasticity baseline and throughout treatment
- Monitor B/P, heart rate
- Perform neurologic exam in spasticity: deep tendon reflexes, muscle tone, clonus, sensory function
- Monitor renal/liver function tests, electrolytes, CBC with differential during long-term treatment
- Assess for allergic reactions: rash, fever, respiratory distress; severe weakness, numbness in extremities
- Assess CNS depression: dizziness, drowsiness, psychiatric symptoms
- Check dosage, because individual titration is required
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, no well-controlled studies, caution use in breastfeeding, excretion unknown
- **Beers:** Avoid in older men, may cause urinary retention

### Patient/family education

- Advise patient not to discontinue medication quickly; spasticity will occur; product should be tapered off over 1-2 wk
- Advise patient not to take with alcohol, other CNS depressants; take as directed; if dose is missed, take as soon as remembered, unless it is almost time for next dose
- Caution patient to avoid altering activities while taking this product; to avoid hazardous activities if drowsiness or dizziness occurs; to rise from sitting or lying slowly to prevent fainting
- Teach patient to use gum, frequent sips of water for dry mouth
- Advise patient to avoid using OTC medications (cough preparations, antihistamines) unless directed by prescriber
- Notify prescriber if fainting, hallucinations, dark urine, stomach pain, yellowing of skin/eyes occurs
- Advise patient to rise slowly from lying or sitting to upright position to prevent orthostatic hypotension
- Teach patient to avoid hazardous activities until reaction is known
- Teach patient not to use other products unless approved by prescriber, avoid use with other CNS depressants, opioids, if adverse reactions occur, seek medical assistance
- Teach patient to use gum, lozenges for dry mouth
- Advise patient to report immediately vision changes, hallucinations
- Teach patient to always take either with or without food consistently, effects may be altered if taking differently

### Evaluation

**Positive therapeutic outcome**

- Decreased pain, spasticity

## tobramycin (Rx)

(toe-bra-mye'sin)

**Aktob, Bethkis, Kitabis, TOBI, TOBI Podhaler**

*Func. class.:* Antiinfective

*Chem. class.:* Aminoglycoside

**ACTION:** Interferes with protein synthesis in bacterial cell by binding to ribosomal subunit, causing inaccurate peptide sequence to form in protein chain, causing bacterial death

**Therapeutic outcome:** Bactericidal effects for the following organisms: *Pseudomonas aeruginosa, Enterobacter, Escherichia coli, Providencia, Citrobacter, Staphylococcus, Proteus, Klebsiella, Serratia*

**USES:** Severe systemic infections of CNS, respiratory, GI, urinary tract, bone, skin, soft tissues, cystic fibrosis (nebulizer), *Acinetobacter calcoaceticus, Citrobacter, Enterobacter, Enterococcus, Escherichia coli, Haemophilus aegyptius, Haemophilus influenzae* (beta-lactamase negative), *Haemophilus influenzae* (beta-lactamase positive), *Klebsiella, Moraxella lacunata, Morganella morganii, Neisseria, Proteus mirabilis, Proteus vulgaris, Providencia, Pseudomonas aeruginosa, Serratia,*

*Staphylococcus aureus* (MSSA), *Staphylococcus epidermidis, Staphylococcus, Streptococcus;* **may also be used for the following:** *Acinetobacter, Aeromonas, Bacillus anthracis, Salmonella, Shigella*

## CONTRAINDICATIONS

Hypersensitivity to aminoglycosides

**BLACK BOX WARNING:** Pregnancy, severe renal disease

**Precautions:** Breastfeeding, geriatric, neonates, mild renal disease, myasthenia gravis, Parkinson's disease

**BLACK BOX WARNING:** Hearing deficits, neuromuscular disease

## DOSAGE AND ROUTES

**Adult:** IM/**IV** 3 mg/kg/day in divided doses q8hr; may give up to 6 mg/kg/day in divided doses q8-12hr; once-daily dosing (pulse dosing) (unlabeled) **IV** 5-7 mg/kg; dosing intervals are determined using a nomogram and are based on random levels drawn 8-12 hr after first dose

**Child:** IM/**IV** 6-7.5 mg/kg/day in 3-4 equal divided doses

**Neonate <1 wk:** IM/**IV** ≤4 mg/kg/day divided q12hr

Conventional dosing: Multiply the serum creatinine (mg/100 ml) by 6 to determine the dosing; to decrease the dose, divide the standard dose by the serum creatinine (mg/100 ml) to determine the lower recommended dose

Interval adjustment of extended-interval dosing of 5 or 7 mg/kg (unlabeled): Adjust doses based on serum concentrations and organism MIC; CCr 40-59 ml/min: 5 or 7 mg/kg IV q36hr; CCr 20-39 ml/min: 5 or 7 mg/kg IV q48hr; CCr <20 ml/min: 5 or 7 mg/kg IV once, then follow serial levels to determine time of next dose (serum concentration <1 mcg/ml)

**Dose adjustment of extended dosing of 5 mg/kg (unlabeled):** Adjust doses based on serum concentrations and organism MIC; CCr >80 ml/min: no dosage adjustment is needed; CCr 60-79 ml/min: 4 mg/kg **IV** q24hr; CCr 50 ml/min: 3.5 mg/kg **IV** q24hr CrCl 40 ml/min: 2.5 mg/kg **IV** q24hr; CrCl <30 ml/min: Use traditional dosing

### Cystic fibrosis with *Pseudomonas aeruginosa*

**Child 6 yr:** NEB 300 mg bid in repeating cycles of 28 days on/28 days off; give inh over 10-15 min using a hand-held PARI LC PLUS reusable nebulizer with a DeVilbiss Pulmo-Aid compressor

**Available forms:** Inj 10, 40 mg/ml; powder for inj 1.2 g; neb sol 300 mg/5 ml; powder for inh 28 mg

### Implementation

**IM route**

- Give inj deeply in large muscle mass, aspirate
- Draw peak 1 hr after dose, trough right before next dose; absorption erratic

**Nebulizer route**

- The solution for nebulization is for inhalation only; use over 10-15 min

**Inhalation route (TOBI Podhaler)**

- Use with Podhaler device, do not swallow caps, use device for 7 days then discard
- Keep caps in blister pack until ready to use, administer other inhaled products or chest physiotherapy before
- While holding base of Podhaler device, unscrew lid, stand upright, unscrew mouthpiece; while holding body, tear blister card in half lengthwise along precut lines; peel back foil, place cap in chamber at top of device, reattach mouthpiece, and tighten; with mouthpiece pointed down, press blue button down with thumb, release; exhale completely, place mouth over mouthpiece, close lips, inhale with single breath, hold 5 sec, and exhale normally away from device; after a few normal breaths, repeat, unscrew mouthpiece, and remove cap: cap should be empty; repeat process 3 more times (total 4 caps); after use reattach mouthpiece and wipe with clean, dry cloth

**Intermittent IV infusion route**

- Visually inspect solution; do not use if discolored or if particulate is present
- ADD-Vantage vials are for IV only and only for exactly 60 or 80 mg
- Give **IV** diluted in 50-100 ml of 0.9% NaCl, $D_{10}W$, $D_5$/0.9% NaCl, 0.9% NaCl, Ringer's, LR, $D_5W$ (adult), inf over 20-60 min, volume for pediatric patients needs and should be sufficient to allow for 20-60 min infusion
- Flush after inf with $D_5W$, 0.9% NaCl
- Separate aminoglycosides and penicillins by ≥1 hr

**Y-site compatibilities:** Acyclovir, aldesleukin, alfentanil, alprostadil, amifostine, aminophylline, amiodarone, amsacrine, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel,

DOPamine, doripenem, doxacurium, DOXOrubicin hydrochloride, DOXOrubicin liposome, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, HYDROmorphone, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, minocycline, mitoXANtrone, morphine, moxalactam, multiple vitamins, nafcillin, nalbuphine, naloxone, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pantoprazole, papaverine, penicillin G, pentazocine, perphenazine, PHENobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanil, riTUXimab, rocuronium, sodium acetate/bicarbonate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tolazoline, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinCRISTine, vinorelbine, voriconazole, zidovudine

**Y-site incompatibilities:** Allopurinol, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, azaTHIOprine, azithromycin, ceFAZolin, cefoperazone, cefoTEtan, cefTRIAXone, dantrolene, dexamethasone, diazepam, diazoxide, drotrecogin, folic acid, ganciclovir, heparin, indomethacin, oxacillin, PEMEtrexed, pentamidine, PENTobarbital, phenytoin, piperacillin/tazobactam, propofol, sargramostim, trimethoprim/sulfamethoxazole

## ADVERSE EFFECTS

**CNS:** Confusion, depression, numbness, tremors, seizures, muscle twitching, neurotoxicity, dizziness, vertigo

**CV:** Hypo/hypertension, palpitations

**EENT:** *Ototoxicity,* deafness, visual disturbances, tinnitus

**GI:** *Nausea, vomiting, anorexia,* increased ALT, AST, bilirubin, hepatomegaly, hepatic necrosis, splenomegaly

**GU:** Oliguria, hematuria, renal damage, azotemia, renal failure, nephrotoxicity

**HEMA:** Agranulocytosis, thrombocytopenia, leukopenia, eosinophilia, anemia

**INTEG:** *Rash,* burning, urticaria, dermatitis, alopecia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (IM), completely absorbed (**IV**) |
| **Distribution** | Widely distributed in extracellular fluids |
| **Metabolism** | Minimal liver |
| **Excretion** | Mostly unchanged (>90%) kidneys |
| **Half-life** | 2-3 hr, increased in renal disease, neonates |

### Pharmacodynamics

| | IM | IV | OPHTH |
|---|---|---|---|
| **Onset** | Rapid | Rapid | Rapid |
| **Peak** | 1 hr | Inf end | Unknown |
| **Duration** | Unknown | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

Acyclovir, amphotericin B, bacitracin, cidofovir, CISplatin, ethacrynic acid, furosemide, mannitol, methoxyflurane, polymyxin, vancomycin: increased ototoxicity, neurotoxicity, nephrotoxicity

### Drug classifications

**BLACK BOX WARNING: Aminoglycosides,** cephalosporins, penicillins: increased otoxicity, neurotoxicity, nephrotoxicity

## NURSING CONSIDERATIONS

### Assessment

- Assess patient for previous sensitivity reaction

**Systemic route**

- Assess patient for signs and symptoms of infection including characteristics of wounds, sputum, urine, stool, WBC >10,000/mm$^3$, temp baseline, during treatment
- Complete C&S testing before beginning product therapy to identify if correct treatment has been initiated
- Assess for allergic reactions: rash, urticaria, pruritus, chills, fever, joint pain

**BLACK BOX WARNING: Renal disease:** Identify urine output; if decreasing, notify prescriber (may indicate nephrotoxicity); also, obtain BUN, creatinine, urine CCr (<80 ml/min) values; urinalysis daily for proteinuria, cells, casts; report sudden change in urine output

**BLACK BOX WARNING: Pregnancy:** identify if pregnancy is planned or suspected; do not use in pregnancy, breastfeeding

**BLACK BOX WARNING:** Serum aminoglycoside concentration: Serum peak drawn at 30-60 min after IV infusion or 60 min after IM inj; trough drawn just before next dose, peak 4-10 mcg/ml, trough 0.5-2 mcg/ml, increased level may lead to serious toxicity

**BLACK BOX WARNING:** Deafness by audiometric testing; ringing, roaring in ears; vertigo; assess hearing before, during, after treatment

- Monitor blood studies: AST, ALT, CBC, Hct, bilirubin, LDH, alkaline phosphatase, Coombs' test monthly if patient is on long-term therapy
- Monitor electrolytes: potassium, sodium, chloride, magnesium monthly if patient is on long-term therapy
- Monitor for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily if patient is on long-term therapy
- **Assess for overgrowth of infection:** perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum
- Obtain weight before treatment; calculation of dosage is usually based on ideal body weight but may be calculated on actual body weight
- Monitor VS during inf, watch for hypotension, change in pulse
- Assess **IV** site for thrombophlebitis including pain, redness, swelling q30min; change site if needed; apply warm compresses to discontinued site

**BLACK BOX WARNING:** Obtain serum peak, drawn at 30-60 min after **IV** inf or 60 min after IM inj, trough level drawn just before next dose; peak 4-12 mcg/ml, trough 1-2 mcg/ml, increased level may lead to serious toxicity

**BLACK BOX WARNING: Monitor for deafness by audiometric testing,** ringing, roaring in ears, vertigo; assess hearing before, during, after treatment, promptly

### Patient/family education

- Teach patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)
- Advise patient to contact prescriber if vaginal itching, loose foul-smelling stools, furry tongue occur; may indicate superinfection

**BLACK BOX WARNING:** Advise patient to notify prescriber if pregnancy is planned or suspected, not to use in pregnancy, breastfeeding

- Advise patient to notify prescriber of diarrhea with blood or pus; may indicate pseudomembranous colitis
- Teach patient to avoid hazardous activities until response is known

**Nebulizer route**

- Advise patient to use multiple therapies first, then tobramycin, not to use if cloudy or contains particulates

### Evaluation

**Positive therapeutic outcome**

- Absence of signs/symptoms of infection (WBC $<10{,}000/mm^3$, temp WNL, absence of red, draining wounds)
- Reported improvement in symptoms of infection

**TREATMENT OF OVERDOSE:** Withdraw product, hemodialysis, exchange transfusion in the newborn, monitor serum levels of product, may give ticarcillin or carbenicillin

## tobramycin ophthalmic

*See Appendix B*

## tocilizumab (Rx)

(toe'si-liz'oo-mab)

**Actemra**

*Func. class.:* DMARDs (Disease modifying anti-rheumatoid drugs)/tumor necrosis factor (TNF) modifier

**ACTION:** Interleukin- 6 (IL-6) receptor inhibiting monoclonal antibody

**Therapeutic outcome:** Ability to move more easily with less pain

**USES:** Rheumatoid arthritis, active systemic juvenile idiopathic arthritis

**CONTRAINDICATIONS**

Hypersensitivity

**Precautions:** Breastfeeding, pregnancy, risk for GI perforation, active hepatic disease, severe neutropenia/thrombocytopenia, demyelinating disorders

**BLACK BOX WARNING:** Invasive fungal infection, active TB

## DOSAGE AND ROUTES

### Monotherapy with or without methotrexate or other DMARDs, moderate-severe rheumatoid arthritis

**Adult: IV** 4 mg/kg over 1 hr q4wk, may increase to 8 mg/kg q4wk based on clinical response, max dose 800 mg/inf; do not initiate if ANC is >2000 and platelets are <100,000/mm$^3$.

### Juvenile idiopathic arthritis

**Child ≥2 yr/adolescent ≥30 kg: IV** 8 mg/kg over 1 hr q2wk

**Child ≥2 yr/adolescent <30 kg: IV** 10 mg/kg over 1 hr q2wk

### Therapeutic drug monitoring

**Before initiation of treatment:** Check the ANC, platelet count, and liver function tests (ALT/AST concentrations) before use. In adults, it is not recommended for those with an ANC, 2000/mm$^3$, a platelet count < 00,000/mm$^3$, or ALT or AST 1.5 × ULN

**Dosage modifications for adult patients with rheumatoid arthritis or giant cell arteritis**

**Absolute neutrophil count (ANC) 500 to 1,000 cells/mm$^3$:** Hold and restart when ANC >1000 cells/mm$^3$ with IV dosing at 4 mg/kg with an increase to 8 mg/kg as clinically appropriate or SUBCUT every other week with an increase to weekly as appropriate

**Absolute neutrophil count (ANC) less than 500 cells/mm$^3$:** Discontinue

**Platelet count 50,000 to 100,000 cells/mm$^3$:** Hold and restart when platelet count >100,000/mm$^3$ with IV dosing at 4 mg/kg with an increase to 8 mg/kg as appropriate or SUBCUT every other week with an increase to weekly as appropriate

**Platelet count less than 50,000 cells/mm$^3$:** Discontinue

**Hepatic enzyme abnormalities:** May need to interrupt or modify based on the degree of AST/ALT elevations above the upper limit of normal (ULN)

**Pediatric patients:** Dose interruptions are needed for low neutrophil counts and low platelet counts in patients with SJIA or PJIA at levels similar to what is outlined for adult patients with rheumatoid arthritis. If appropriate, concomitant methotrexate and/or other medications should be dose modified or stopped and tocilizumab dosing interrupted until the situation has been evaluated. In SJIA and PJIA, base the decision to discontinue tocilizumab due to a laboratory abnormality upon the medical assessment of the individual

### Maximum dosage limits

**Adult**

**Rheumatoid arthritis, weight more than 100 kg:** 800 mg/dose IV and 162 mg/dose SUBCUT

**Rheumatoid arthritis and giant cell arteritis, weight 100 kg or less:** 8 mg/kg/dose IV and 162 mg/dose SUBCUT

**Cytokine release syndrome (CRS), weight 30 kg or more:** 800 mg/dose IV

**CRS, weight less than 30 kg:** 12 mg/kg IV

**Geriatric**

**Rheumatoid arthritis, weight more than 100 kg:** 800 mg/dose IV and 162 mg/dose SUBCUT

**Rheumatoid arthritis and giant cell arteritis, weight 100 kg or less:** 8 mg/kg/dose IV and 162 mg/dose SUBCUT

**Cytokine release syndrome (CRS), 30 kg or more:** 800 mg/dose IV

**CRS, less than 30 kg:** 12 mg/kg IV

**Adolescent**

**Weight 30 kg or more:** 8 mg/kg/dose IV

**Weight less than 30 kg:** 12 mg/kg/dose IV for systemic juvenile idiopathic arthritis and cytokine release syndrome (CRS); 10 mg/kg/dose IV for polyarticular juvenile idiopathic arthritis

**Child**

**2 years and older and weight 30 kg or more:** 8 mg/kg/dose IV

**2 years and older and weight less than 30 kg:** 12 mg/kg/dose IV for systemic juvenile idiopathic arthritis and cytokine release syndrome (CRS); 10 mg/kg/dose IV for polyarticular juvenile idiopathic arthritis

**Less than 2 years:** Safe and effective use has not been established

**Infant**

Safe and effective use has not been established

### Patients with hepatic impairment dosing

**Adult patients with rheumatoid arthritis or giant cell arteritis with hepatic impairment**

**Before initiating treatment:** Do not initiate treatment with tocilizumab if baseline AST/ALT is more than 1.5 times the upper limit of normal (ULN). However, patients with severe or life-threatening cytokine release syndrome (CRS) frequently have elevated ALT or AST; the decision to administer tocilizumab should take into account the potential benefit of treating the CRS versus the risks of short-term treatment with tocilizumab

**Hepatic enzyme elevations occurring during treatment:**

AST and/or ALT from 1 to 3 times the ULN: Dose-modify concomitant DMARDs, if appropriate. For persistent increases of transaminases in this range, reduce IV tocilizumab dose to 4 mg/kg or reduce subcutaneous dosing interval to every other week, or interrupt tocilizumab dosing until AST/ALT have normalized. For subcutaneous dosing, once ALT/AST have normalized, resume at every-other-week dosing and increase to once weekly as clinically appropriate

AST and/or ALT greater than 3 times and up to 5 times the ULN, confirmed by repeat testing: Interrupt tocilizumab dosing until AST/ALT is less than 3 times the ULN. Then, if appropriate, dose-modify concomitant DMARDs. For persistent increases of transaminases 3 times the ULN or less, reduce IV tocilizumab dose to 4 mg/kg, or reduce subcutaneous dosing interval to every other week, or interrupt tocilizumab until AST/ALT have normalized. For subcutaneous dosing, once ALT/AST have normalized, resume at every-other-week dosing and increase to once weekly as clinically appropriate. For persistent increases more than 3 times the ULN, discontinue tocilizumab

AST and/or ALT greater than 5 times the ULN: Discontinue tocilizumab

**Pediatric patients**

Tocilizumab dose reduction has not been studied in the systemic juvenile idiopathic arthritis (SJIA) or polyarticular juvenile idiopathic arthritis (PJIA) population. Tocilizumab dose interruptions are recommended for liver enzyme abnormalities in patients with SJIA or PJIA at levels similar to what is outlined for adult patients with rheumatoid arthritis. If appropriate, concomitant methotrexate and/or other medications should be dose-modified or stopped and tocilizumab dosing interrupted until the clinical situation has been evaluated. In SJIA and PJIA, base the decision to discontinue tocilizumab upon the medical assessment of the individual patient and the laboratory abnormality involved.

**Available forms:** Sol for inj 80 mg/4 ml, 200 mg/10 ml, 400 mg/20 ml

### Polyarticular juvenile idiopathic arthritis (PJIA) monotherapy/ combination with methotrexate

**Child ≥ 2 yr and ≥ 30 kg IV infusion:** 8 mg/kg over 1 hr, q4wk Child ≥ 2 yr and <30 kg: IV infusion 10 mg/kg over 1 hr q4wk

## Implementation

**SUBCUT route**

- Remove syringe from the refrigerator and allow to warm for 30 min at room temperature. Do not warm in any other way
- Use injection site such as the front of a thigh, outer area of an upper arm, or the abdomen except for the 2-inch area around the navel. Do not inject into moles, scars, or areas where the skin is tender, bruised, red, hard, or not intact. Rotate injection sites with each injection. Inject at >1 inch from the last area injected
- Remove the needle cap immediately before injection, and gently pinch a cleaned area of skin. Using a dartlike motion, insert the needle at a 45- or 90-degree angle to the skin. Release the pinched skin, and gently push the plunger all the way down to inject the full amount in the prefilled syringe (0.9 ml), which provides 162 mg of product
- The prefilled syringe is single-use only, as it does not have a preservative
- Remove the needle from the skin while continuing to depress the plunger. After the needle is completely removed, release the plunger, which will allow the needle-shield to protect the needle. Do not rub the site

**Intermittent IV route**

- Visually inspect for particulate matter and discoloration before administration should be colorless to pale yellow liquid
- From a 100-ml infusion bag or bottle, withdraw a volume of 0.9% NaCl for inj equal to the volume of the tocilizumab solution required for the patient's dose
- Slowly add tocilizumab from each vial into the infusion bag or bottle. Gently invert the bag to avoid foaming. Fully diluted solutions are compatible with polypropylene, polyethylene, and polyvinyl chloride infusion bags and polypropylene, polyethylene, and glass infusion bottles
- The fully diluted sol for inf may be stored refrigerated or at room temp for up to 24 hours and should be protected from light. Do not use unused product remaining in vials; no preservatives
- Allow the fully diluted solution to reach room temp before infusing
- Give over 60 min with an infusion set. Do not administer as an **IV** push or bolus
- Do not infuse concomitantly in the same intravenous line with other drugs

## ADVERSE EFFECTS

**CNS:** Headache, dizziness
**CV:** Hypertension

**GI:** Perforation, abdominal pain, gastritis, mouth ulcerations
**HEMA:** Neutropenia, thrombocytopenia
**INTEG:** Rash, infusion reactions
**RESP:** Upper respiratory infections, nasopharyngitis, bronchitis
**SYST:** Serious infections, anaphylaxis, infusion-related reactions, anti-tocilizumab antibody formation, secondary malignancy

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | ~6 days with a single dose and ~11 days with multiple (steady state) doses |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

CycloSPORINE, theophylline, warfarin: decreased product level

### Drug classifications

CYP3A4 substrates (hormonal contraceptives, omeprazole, atorvastatin, simvastatin): decreased levels of these products
Live virus vaccines: Do not use together
TNF modifiers, DMARDs, immunosuppressives: avoid use due to increased risk of infection

## NURSING CONSIDERATIONS

### Assessment

- **Rheumatoid arthritis:** assess ROM, pain, stiffness baseline q1-2wk
- Monitor blood studies: CBC with differential, LFTs, platelet count, serum lipid profile, baseline and periodically

**BLACK BOX WARNING:** Infection: Before treatment and periodically; obtain TB screening before beginning treatment, invasive fungal infections; discontinue if infection occurs during administration; may use antituberculosis therapy before tocilizumab in past history of latent or active TB when adequate course of treatment cannot be confirmed and those with a negative TB with risk factors for infections

- Secondary malignancy: Assess for malignancy periodically
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, pregnant patients should enroll in the Mother To Baby Autoimmune Disease Pregnancy Registry, do not breastfeed, excretion unknown

### Patient/family education

- Teach patient that this treatment must continue unless safety or effectiveness is an issue; reason for use and expected result

**BLACK BOX WARNING:** Advise patient to avoid use of live vaccines, bring immunizations up to date before treatment

**BLACK BOX WARNING:** Instruct patient to report signs/symptoms of infection (including TB and Hepatitis B), invasive fungal infections, discontinue if infection occurs during administration; may use antituberculosis therapy prior to tocilizumab in past history of latent or active TB when adequate course of treatment cannot be confirmed and those with a negative TB with risk factors for infections, to avoid others with infections

- Teach patient to notify prescriber if pregnancy is planned or suspected, pregnancy (C); do not use if breastfeeding, consider using a nonhormonal contraceptive because contraception may be decreased
- **Secondary malignancy:** assess for malignancy periodically

### Evaluation

**Positive therapeutic outcome**

- Ability to move more easily with less pain

## tofacitinib

(toe'fa-sye'ti-nib)
**Xeljanz**
*Func. class.:* antirheumatic agent (disease modifying), immunomodulator/biologic DMARD
*Chem. class.:* Janus kinase inhibitor

**ACTION:** Affects the signaling pathway of Janus kinase

**Therapeutic outcome:** Decreased inflammation, pain in joints, decreased joint destruction

**USES:** Rheumatoid arthritis (moderately to severely active) in those who have taken methotrexate with inadequate response or intolerance

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, neonates, infants, children, geriatric patients, neoplastic disease, ulcerative colitis, neutropenia,

peptic ulcer disease, active infections, risk of lymphomas/leukemias, TB, posttransplant lymphoproliferative disorder (PTLD), kidney disease, diabetes mellitus, HIV, hypercholesterolemia, herpes virus infection reactivation, patients of Asian descent

**BLACK BOX WARNING:** Infection, secondary malignancy

## DOSAGE AND ROUTES

**Adult: PO** 5 mg/day with or without methotrexate or other nonbiologic DMARDs

**Available forms:** Tabs 5 mg

### Implementation

**PO route**

Give without regard to food

## ADVERSE EFFECTS

**CNS:** Headache, paresthesias, insomnia, fatigue
**CV:** Hypertension
**GI:** Abdominal pain, nausea, liver damage, dyspepsia, vomiting, diarrhea, gastritis, GI perforation, steatosis
**HEMA:** Anemia, lymphocytosis, lymphopenia, neutropenia
**INTEG:** Rash, pruritus
**MISC:** Increased cancer risk, risk of infection (TB, invasive fungal infections, other opportunistic infections), may be fatal, posttransplant lymphoproliferative disorder (PTLD)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Bioavailability 70% |
| **Distribution** | Protein binding 40% (albumin) |
| **Metabolism** | Mediated by CYP3A4 |
| **Excretion** | Unknown |
| **Half-life** | 3 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 0.5–1 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

**BLACK BOX WARNING:** Do not use with TNF modifiers, vaccines, potent immunosuppressants, other biologic DMARDS, serious infection may occur

CYP3A4 inhibitors (amprenavir, boceprevir, delavirdine, ketoconazole, indinavir, itraconazole, dalfopristin/quinupristin, ritonavir, tipranavir, fluconazole, isoniazid, miconazole): increased tofacitinib effect

CYP3A4 inducers (rifampin, rifapentine, rifabutin, primidone, phenytoin, PHENobarbital, nevirapine, nafcillin, modafinil, griseofulvin, etravirine, efavirenz, barbiturates, bexarotene, bosentan, carBAMazepine, enzalutamide, dexamethasone): decreased tofacitinib effect

### Drug/lab test

Increase: LFTs, cholesterol
Decrease: neutrophils, lymphocytes, Hct, Hgb

## NURSING CONSIDERATIONS

### Assessment

- Monitor lipid profile, Hct/Hgb WBC, LFTs
- RA: assess for pain, stiffness, ROM, swelling of joints before, during treatment

**BLACK BOX WARNING: Active infection, including localized infection:** evaluate and test patients for latent or active TB before use; treat with antimycobacterials before use of product; this product increases the risk of serious illness including fatal infections (pulmonary or extrapulmonary TB; invasive fungal infections; and bacterial, viral, and opportunistic infections); during and after use, monitor for infection including TB in those who tested negative for latent TB before use; if a serious infection develops, interrupt receipt until the infection is controlled, reactivation or viral infections is higher in those of Asian descent

**BLACK BOX WARNING: Secondary malignancy:** lymphoma and other malignancies have been noted with product use

- **Epstein–Barr virus–associated post transplant lymphoproliferative disorder (PTLD):** in kidney transplant patients when used with this product and immunosuppressives
- **Liver disease**: not recommended in severe liver disease, impairment; dose modification is needed with moderate liver impairment, monitor LFTs
- **GI perforation:** assess in those with diverticulitis, peptic ulcer disease, or ulcerative colitis

**BLACK BOX WARNING:** Immunosuppression: obtain neutrophil and lymphocyte counts before use, do not start the product in lymphocyte count $< 500$ cells/mm$^3$ or $<$ ANC 1000 cells/mm$^3$; for ANC $>1000$ cells/mm$^3$, monitor neutrophil counts after 4-8 wk and every 3 mo thereafter; lymphocyte count $> 500$ cells/ mm$^3$, monitor lymphocyte counts every 3 mo

T

- **Anemia:** determine Hgb, do not start in Hgb 9 g/dl; in Hgb 9 g/dl, monitor Hgb after 4-8 wk and every 3 mo thereafter
- **Pregnancy (C)/breastfeeding:** use during pregnancy only if the potential benefit justifies the potential risk to the fetus; if pregnancy occurs, enrollment in the pregnancy registry is encouraged by calling 877–311–8972; discontinue product or breastfeeding, serious adverse reactions can occur in nursing infants

**BLACK BOX WARNING: Neoplastic disease** (lymphomas/leukemias)

### Patient/family education

- Teach patient not to have vaccines while taking this product
- Advise patient not to take any live virus vaccines during treatment, vaccinations should be brought up to date before starting treatment
- Inform patient to report signs of infection, allergic reaction
- **Pregnancy:** teach patient to report if pregnancy is planned or suspected, do not breastfeed

### Evaluation

**Positive therapeutic outcome**

- Decreased inflammation, pain in joints, decreased joint destruction

## tolcapone (Rx)

(toll′cah-pone)

**Tasmar**

*Func. class.:* Antiparkinson agent

*Chem. class.:* Catecholamine inhibitor (COMT)

**ACTION:** Selective, reversible inhibitor of catecholamine; used as adjunct to levodopa/carbidopa therapy

**Therapeutic outcome:** Increased ability to move and speak

**USES:** Parkinsonism

## CONTRAINDICATIONS

Hypersensitivity, rhabdomyolysis

**Precautions:** Pregnancy, breastfeeding, cardiac/renal disease, hypertension, asthma, history of rhabdomyolysis, hepatic disease

## DOSAGE AND ROUTES

**Adult:** PO 100-200 mg tid, with levodopa/carbidopa therapy; max 600 mg/day; discontinue if no benefit in 3 wk

**Available forms:** Tabs 100, 200 mg

### Implementation

- Administer tid with levodopa/carbidopa therapy
- Provide assistance with ambulation during beginning therapy
- Give without regard to food

## ADVERSE EFFECTS

**CNS:** Dystonia, dyskinesia, dreaming, *fatigue, headache, confusion,* psychosis, hallucination, dizziness, sleep disorders

**CV:** *Orthostatic hypotension,* chest pain, hypotension

**EENT:** Cataract, eye inflammation

**GI:** *Nausea, vomiting, abdominal distress,* diarrhea, constipation, fatal liver failure, elevated liver function tests

**GU:** UTI, urine discoloration, uterine tumor, micturition disorder, hematuria

**HEMA:** Hemolytic anemia, leukopenia, agranulocytosis

**INTEG:** Sweating, alopecia

**MS:** Rhabdomyolysis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Protein binding 99% |
| **Metabolism** | Liver, extensively |
| **Excretion** | Urine (60%), feces (40%) |
| **Half-life** | 2-3 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Apomorphine, DOBUTamine, isoproterenol, α-methyldopa: may influence pharmacokinetics

### Drug classifications

CNS depressants: increased CNS depression

MAOIs: decreased normal catecholamine metabolism; MAO-B inhibitor may be used

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Hepatic disease:** monitor liver function tests: AST, ALT, alkaline phosphatase, LDH, bilirubin, CBC; monitor ALT, AST q2wk x 1 yr, then q4wk x 6 mo, then q8wk thereafter; if LFTs are elevated product should not be used, if no improvement in 3 wk, discontinue, do not use in hepatic disease

- Assess involuntary movements in parkinsonism: akinesia, tremors, staggering gait, muscle rigidity, drooling

- Monitor B/P, respiration during initial treatment; hypo/hypertension should be reported
- Monitor mental status: affect, mood, behavioral changes, avoid use in those with dystonia

### Patient/family education

- Advise patient to change positions slowly to prevent orthostatic hypotension
- Advise patient that urine, sweat may change color
- Teach patient to notify prescriber if pregnancy is planned or suspected, pregnancy
- Teach patient that CNS changes may occur, hallucinations, involuntary movement
- Teach patient to avoid hazardous activities until reaction is known, dizziness occurs
- Teach patient to report poor impulse control, urges to gamble, spend wildly (rare)

**BLACK BOX WARNING:** Advise patient to report signs of hepatic injury: clay-colored stools, jaundice, fatigue, appetite loss, lethargy, fatigue, itching, right upper abdominal pain

- Teach patient to report nausea, vomiting, anorexia, diarrhea
- May be taken without regard to food

### Evaluation

**Positive therapeutic outcome**

- Decrease in akathisia, improved mood

## tolnaftate topical

*See Appendix B*

## tolterodine (Rx)

(tol-tehr′oh-deen)

**Detrol, Detrol LA**

*Func. class.:* Overactive bladder product

*Chem. class.:* Muscarinic receptor antagonist

**ACTION:** Relaxes smooth muscles in urinary tract by inhibiting acetylcholine at postganglionic sites

**Therapeutic outcome:** Decreased symptoms of overactive bladder

**USES:** Overactive bladder (frequency, urgency), urinary incontinence

## CONTRAINDICATIONS

Hypersensitivity, uncontrolled closed-angle glaucoma, urinary retention, gastric retention

**Precautions:** Pregnancy, breastfeeding, children, renal/hepatic disease, controlled closed-angle glaucoma, bladder obstruction, QT prolongation, decreased GI motility

## DOSAGE AND ROUTES

### Overactive bladder

**Adult and geriatric:** PO 2 mg bid, may decrease to 1 mg bid; EXT REL 4 mg/day, may decrease to 2 mg if needed, max 4 mg/day

### Hepatic disease

**Adult:** PO 1 mg bid (50% dose) or EXT REL 2 mg/day

### Renal dose

**Adult:** PO CCr ≤30 ml/min reduce by 50%

### CYP3A4 inhibitor dose

**Adult:** PO 1 mg bid; extended-release 2 mg qday if using with CYP3A4 inhibitor

**Available forms:** Tabs 1, 2 mg; ext rel caps 2, 4 mg

### Implementation

- Swallow whole; give with liquids

## ADVERSE EFFECTS

**CNS:** *Anxiety,* paresthesia, fatigue, *dizziness,* headache, increasing dementia, memory impairment

**CV:** Chest pain, hypertension, QT prolongation

**EENT:** Vision abnormalities, xerophthalmia

**GI:** *Nausea, vomiting, anorexia,* abdominal pain, constipation, dry mouth, dyspepsia

**GU:** Dysuria, retention, frequency, UTI

**INTEG:** Rash, pruritus

**RESP:** Bronchitis, cough, pharyngitis, upper respiratory tract infection

**SYST:** Angioedema, Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Highly protein bound |
| **Metabolism** | Liver, extensively by CYP2D6, a portion of the population may be poor metabolizers |
| **Excretion** | Urine/feces |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Chloroquine, clarithromycin, droperidol, erythromycin, grepafloxacin, halofantrine, haloperidol, methadone, pentamidine: increased QT prolongation

Fesoterodine: do not use in those with known hypersensitivity

T

### Drug classifications
Antibiotics (macrolide), antifungal agents, antiretroviral protease inhibitors: increased action of tolterodine
Antimuscarinics: increased anticholinergic effect
β-agonists, class IA/III antidysrhythmics, local anesthetics, some phenothiazines, tricyclics: increased QT prolongation
Diuretics: increased urinary frequency

### Drug/food
Increased: bioavailability of tolterodine

### Drug/lab test
Increased: LFTs, bilirubin

## NURSING CONSIDERATIONS
### Assessment
- **Assess urinary patterns:** distention, nocturia, frequency, urgency, incontinence, residual urine
- **Serious skin disorders:** assess for angioedema, Stevens-Johnson syndrome; assess allergic reactions: rash; if this occurs, product should be discontinued
- **QT prolongation:** ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea, may be compounded in those taking Class IA/III dysrythmics
- **Beers:** Avoid in older adults with or at high risk for delirium, monitor for confusion, delirium frequency

**BLACK BOX WARNING:** Fatal hepatic injury: increased LFTs, bilirubin during first 18 mo of therapy in those with autosomal dominant polycystic kidney disease; assess for fatigue, anorexia, right upper abdominal pain, dark urine, jaundice; if these occur, discontinue product and do not restart if cause is liver injury

- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, no well-controlled studies, do not breastfeed, excretion unknown

### Patient/family education
- Advise patient to avoid hazardous activities; dizziness may occur, shortness of breath, urinary retention
- Advise patient not to drink liquids before bedtime, to swallow extended-release product whole
- Teach patient importance of bladder maintenance
- Teach patient to take with liquids; swallow whole
- Notify prescriber if pregnancy is planned or suspected

### Evaluation
**Positive therapeutic outcome**
- Decreased urinary frequency, urgency

## tolvaptan (Rx)
(tole-vap'tan)
**Samsca**
*Func. class.:* Antihypertensive
*Chem. class.:* Vasopressin receptor antagonist, V2

**ACTION:** Arginine vasopressin (AVP) antagonist with affinity for $V_2$ receptors; level of circulating AVP in circulating blood is critical for regulation of water, electrolyte balance and is usually elevated in euvolemic/hypervolemic hyponatremia

**Therapeutic outcome:** Normal serum sodium level

**USES:** Hypervolemic/euvolemic hyponatremia in heart failure, cirrhosis, SIADH

## CONTRAINDICATIONS
Hypersensitivity, hypovolemia, anuria

**Precautions:** Pregnancy, breastfeeding, children, dehydration, geriatric patients, hyperkalemia, autosomal dominant PKD, malnutrition, alcoholism, hepatic disease

**BLACK BOX WARNING:** Osmotic demyelination syndrome, requires a specialized care setting

## DOSAGE AND ROUTES
**Adult:** PO 15 mg qd; after 24 hr, may increase to 30 mg qd; max 60 mg/day for ≤30 days

**Available forms:** Tab 15, 30 mg

### Implementation
- Give PO with or without food
- Avoid fluid restriction the first 24 hr
- Initiate in hospital setting
- Do not use with grapefruit or grapefruit juice

## ADVERSE EFFECTS
**CNS:** Fever, dizziness
**CV:** Ventricular fibrillation, DIC, stroke, thrombosis
**GI:** *Nausea,* vomiting, *constipation,* colitis, hepatic injury
**GU:** Polyuria
**HEMA:** Bleeding
**META:** *Dehydration, hyperglycemia,* hyperkalemia, hypernatremia
**MS:** Rhabdomyolysis
**RESP:** Respiratory depression, pulmonary embolism

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 99% |
| **Metabolism** | CYP3A4 |
| **Excretion** | Unknown |
| **Half-life** | Terminal 12 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

CYP3A4 inducers (carBAMazepine, dexamethasone, etravirine, flutamide, griseofulvin, metyrapone, modafinil, nafcillin, nevirapine, OXcarbazepine, phenytoin, rifampin, rifabutin, rifapentine, topiramate): decreased concentrations of tolvaptan

CYP3A4 inhibitors (efavirenz, fosamprenavir, quiNINE), P-gp inhibitors (azithromycin, cycloSPORINE, mefloquine, paliperidone, propafenone, quiNIDine, testosterone): increased concentrations of tolvaptan

### Drug/herb

St. John's wort: decreased tolvaptan effect

### Drug/food

Grapefruit/grapefruit juice: do not use together

## NURSING CONSIDERATIONS

### Assessment

- Assess renal, hepatic function

**BLACK BOX WARNING:** Osmotic demyelination syndrome, frequent sodium volume status; overly rapid correction of sodium concentration (>12 mEq/L per 24 hr) may occur in alcoholism, severe malnutrition, advanced liver disease, SIADH, correct sodium levels slowly, may result in dysarthria, mutism, dysphagia, coma, seizures, death

- Assess CV status: ventricular fibrillation, hypertension, monitor B/P, pulse
- Monitor electrolytes (sodium, potassium)

**BLACK BOX WARNING:** Specialized care setting needed so neurologic status, sodium levels can be monitored

- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed

### Patient/family education

- Teach patient to avoid pregnancy, breastfeeding while taking this product
- Advise of administration procedure and expected result
- Teach patient to report difficulty swallowing or speaking, seizures, dizziness, drowsiness: embolism may be the cause
- Teach patient to drink fluid in response to thirst
- Teach patient to not use grapefruit juice
- Teach patient to notify prescriber before using other products
- Teach patient to report upper-right abdominal pain, nausea, vomiting, anorexia, dark urine, yellowing of skin/eyes (hepatic injury)

### Evaluation

**Positive therapeutic outcome**

- Correction of serum sodium levels

## topiramate (Rx)

(toh-pire'a-mate)

**Topamax, Topamax Sprinkle, Trokendi XR, Qudexy XR**

*Func. class.:* Anticonvulsant—miscellaneous

*Chem. class.:* Monosaccharide derivative

**Do not confuse:** Topamax/Toprol XL

**ACTION:** Increased GABA activity; may prevent seizure spread as opposed to an elevation of seizure threshold

**Therapeutic outcome:** Absence of seizures

**USES:** Partial seizures in adults and children 2-16 yr old; tonic-clonic seizures; seizures in Lennox-Gastaut syndrome, migraine prophylaxis

**Unlabeled uses:** Infantile spasms, bulimia nervosa

## CONTRAINDICATIONS

Hypersensitivity, metabolic acidosis, pregnancy

**Precautions:** Breastfeeding, children, renal/hepatic disease, acute myopia, secondary closed-angle glaucoma, behavioral disorders, COPD, dialysis, encephalopathy, status asthmaticus, status epilepticus, surgery, paresthesias, maculopathy, nephrolithiasis

## DOSAGE AND ROUTES

### Adjunctive therapy

**Adult/adolescent/child ≥10 yr:** PO 25-50 mg/day initially, titrate by 25-50 mg/wk, up to 200-400 mg/day in 2 divided doses

**Adult/adolescent/child ≥10 yr:** PO (Qudexy XR, Trokendi XR) 50 mg qday; increase by 50 mg qwk during wk 2, 3, 4; increase by 100 mg qwk, wk 5, 6; final dose 400 mg qday

**Child 2-9 yr:** PO week 1 25 mg q PM, then 25 mg bid if tolerated (week 2), then increase by 25-50 mg/day each week as tolerated over 5-7 wk titration period, maintenance given in 2 divided doses; <11 kg minimum 150 mg/day, max 250 mg/day; 12-22 kg minimum 200 mg/day, max 300 mg/day; 23-31 kg minimum 200 mg, max 350 mg/day, 32-38 kg minimum 250 mg/kg, max 350 mg/day; >38 kg minimum 250 mg/day, max 400 mg/day; Qudexy XR 25 mg qday at night; may increase to 50 mg wk 2, if tolerated; increase by 25-50 mg each wk over 5-7 wk titration period; max dose based on weight

### Migraine prophylaxis

**Child ≤11 kg:** PO Qudexy XR minimum 150 mg daily, max 250 mg daily; 12-22 kg minimum 200 mg daily, max 300 mg daily; 23-31 kg minimum 200 mg daily, max 350 mg daily; 32-38 kg minimum 250 mg daily, max 350 mg daily; >38 kg minimum 250 mg daily, max 400 mg daily
**Adult:** PO 25 mg/day initially, increase by 25 mg/day qwk up to 100 mg/day in 2 divided doses

### Renal dose

**Adult:** PO CCr <70 ml/min ½ dose

**Available forms:** Tabs 25, 50, 100, 200 mg; sprinkle caps 15, 25 mg; ext rel caps 25, 50, 100, 200 mg; ext rel cap (sprinkles 24 hr) 25, 50, 100, 150, 200 mg

### Implementation

- Do not break, crush, or chew tabs; very bitter
- May take without regard to meals
- Sprinkle cap can be given whole or opened and sprinkled on soft food; do not chew, drink water after sprinkle
- Store at room temp away from heat, light

**Trokendi XR:** swallow whole; do not sprinkle on food, crush, chew; not recommended for child <6 yr
**Qudexy XR:** may swallow whole or sprinkle on food (teaspoon); swallow immediately; do not crush, chew

## ADVERSE EFFECTS

**CNS:** Dizziness, fatigue, cognitive disorder, *insomnia,* anxiety, depression, paresthesia, motor retardation, suicidal ideation, memory loss, tremor, poor balance, ataxia
**CV:** Flushing, chest pain
**EENT:** Diplopia, vision abnormality
**GI:** *Diarrhea, anorexia,* nausea, dyspepsia, abdominal pain, constipation, dry mouth, pancreatitis
**GU:** Breast pain, dysmenorrhea, menstrual disorder
**INTEG:** Rash, alopecia
**MISC:** Weight loss, leukopenia, metabolic acidosis, increased body temperature, unexplained death (epilepsy)
**RESP:** Upper respiratory tract infection, pharyngitis, sinusitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Crosses placenta, plasma protein binding (9%-17%), steady state 4 days |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys unchanged 55%-97% |
| **Half-life** | 19-25 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Amitriptyline: increased effect of amitriptyline
CarBAMazepine, phenytoin, probenecid: decreased levels of topiramate
Digoxin: decreased levels of digoxin
Estrogen: decreased levels of estrogen
Hydrochlorothiazide, lamoTRIgine, metformin: increased topiramate levels
Lithium: decreased levels of lithium
RisperiDONE: decreased levels of risperidone
Valproic acid: decreased levels of both products

### Drug classifications

Carbonic anhydrase inhibitors: increased kidney stone formation
CNS depressants: increased CNS depression
hormonal contraceptives: decreased level of oral contraceptives

## NURSING CONSIDERATIONS

### Assessment

- **Bipolar disorder:** assess mood, behavior
- **Assess mental status:** mood, sensorium, affect, memory (long, short), especially in geriatric; suicidal thoughts/behavior
- Assess for blood dyscrasias: fever, sore throat, bruising, rash, jaundice, epistaxis (long-term treatment only)
- **Assess seizure activity** including type, location, duration, and character; provide seizure precaution
- Monitor CBC during long-term therapy; serum bicarbonate

• Assess body weight, perception of body image, eating disorders may occur or be exacerbated especially in adolescents; and evidence of cognitive disorder
• **Beers:** Avoid in older adults unless safer alternative is not available, may cause ataxia, impaired psychomotor function
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, birth defects have occurred, pregnant patients should register with the Antiepileptic Drug Pregnancy Registry 888-233-2334, may decrease hormonal contraceptives, caution use in breastfeeding, excretion unknown

### Patient/family education

• Teach patient to carry/wear emergency ID stating name, products taken, condition, prescriber's name and phone number
• Advise patient to avoid driving, other activities that require alertness, until response is known
• Teach patient not to discontinue medication abruptly after long-term use, do not restart if several doses are missed without close supervision, to follow prescriber's directions closely
• Advise patient to use nonhormonal contraceptive; effect of oral contraceptives is decreased, pregnancy
• Teach patient to drink plenty of fluids to prevent kidney stones, vision loss may occur
• Teach patient that increased dietary intake might be necessary, weight loss may occur
• Teach patient to swallow extended-release product whole
• Teach patient minor hair loss may occur, report to provider if severe

### Evaluation

**Positive therapeutic outcome**
• Decreased seizure activity

## TREATMENT OF OVERDOSE:

Lavage, VS

**⚠ HIGH ALERT**

## topotecan (Rx)

(to-poe'ti-kan)
**Hycamtin**
*Func. class:* Antineoplastic natural; topoisomerase inhibitor
*Chem. class.:* Camptothecin analog

## ACTION:

Antitumor product with topoisomerase I–inhibitory activity; topoisomerase I relieves torsional strain in DNA by causing single-strand breaks; causes double-strand DNA damage

**Therapeutic outcome:** Decreased tumor size

## USES:

Metastatic ovarian cancer after failure of traditional chemotherapy, relapsed small cell lung cancer, cervical cancer

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, severe bone marrow depression

**BLACK BOX WARNING:** Neutropenia, bone marrow supression

**Precautions:** Children, renal disease, gelatin hypersensitivity, anemia, contraceptive requirements, dehydration, diarrhea, extravasation, herpes, infertility, neutropenia, pulmonary fibrosis, varicella

## DOSAGE AND ROUTES

### Metastatic carcinoma of the ovary after failure of first or subsequent chemotherapy; SCLC-sensitive disease after failure of first-line therapy

**Adult: IV** INF 1.5 mg/m$^2$ over 30 min/day × 5 days starting on day 1 of a 21-day course × 4 courses; may be reduced to 0.25 mg/m$^2$ for subsequent courses if severe neutropenia occurs

### With CISplatin stage IVB recurrent or persistent cervical cancer unresponsive to surgery or radiation

**Adult:** IV infusion 0.75 mg/m$^2$ on days 1, 2, 3 then 50 mg/m$^2$ CISplatin IV on day 1 then repeat q21day, adjust for toxicity

### Relapsed small-cell lung cancer (SCLC) in those with a prior complete or partial response, 45 days from end of first-line treatment

**Adult:** PO 2.3 mg/m$^2$/day on days 1-5 of a 21-day course

### Therapeutic drug monitoring

**Dosage adjustments for treatment-related toxicities:**
***Hematologic toxicity:*** Do not administer subsequent courses until neutrophils recover to >1000 cells/mm$^3$, platelets to > 100,000 cells/mm$^3$, and hemoglobin to > 9 g/dl
**Neutropenia:**
• ***Single agent (IV) (ANC <500 cells/mm$^3$):*** Reduce the dose of topotecan to 1.25 mg/m$^2$. Alternatively, granulocyte-colony stimulating factor (G-CSF) may be administered, starting at least 24 hr after the last dose of topotecan

• ***Single agent (oral) (ANC <500 cells/mm³ for ≥ 7 days, or ANC 500-1000 cells/mm³ lasting beyond day 21):*** Reduce the dose of topotecan to 1.9 mg/m²/day, with subsequent dose reductions by 0.4 mg/m2/day if necessary

**Thrombocytopenia:**

• ***Single agent (IV) (platelets <25,000 cells/mm³ in the previous cycle):*** Reduce dose to 1.25 mg/m²

• ***Single agent (oral) (platelets <25,000 cells/mm³):*** Reduce dose to 1.9 mg/m²/day, with subsequent dose reductions by 0.4 mg/m²/day if necessary

• ***In combination with cisplatin (IV) (platelets <25,000 cells/mm³ in the previous cycle):*** Reduce dose to 0.6 mg/m² and further to 0.45 mg/m² if necessary

**Neutropenic fever:**

• ***Single agent (oral) (ANC <500 cells/mm³ associated with fever or infection):*** Reduce to 1.9 mg/m²/day, with subsequent dose reductions by 0.4 mg/m²/day if necessary

• ***In combination with cisplatin (IV) (ANC <1000 cells/mm³ with temperature ≥ 38° C or 100.4° F):*** Reduce dose to 0.6 mg/m² and further to 0.45 mg/m² if necessary. Alternatively, G-CSF may be given, starting at least 24 hr after the last dose

**Diarrhea (grade 3 or 4):**

• ***Single agent (oral):*** Hold, when diarrhea resolves to grade ≤1, resume at 1.9 mg/m²/day, with subsequent dose reductions by 0.4 mg/m²/day if necessary

### Renal dose

**Adult: PO: CCr:** 50-80ml/min No change; **CCr 30-49 ml/min:** Reduce dose to 1.5 mg/m²/day; dose may be increased by 0.4 mg/m²/day after the first course if no severe hematologic or gastrointestinal toxicities occur; **CCr <30 ml/min:** Reduce dose to 0.6 mg/m²/day; dose may be increased by 0.4 mg/m²/day after the first course if no severe hematologic or gastrointestinal toxicities occur

**Adult: IV: CCr 40-60 ml/min:** No change; **CCr 20-39 ml/ min:** Reduce dose to 0.75 mg/m²; **CCr <20 ml/min:** unknown

**Available forms:** Lyophilized powder for inj 4 mg; cap 0.25, 1 mg

### Implementation

• Provide increased fluid intake to 2-3 L/day to prevent dehydration, unless contraindicated

• Change **IV** site q48hr

• Store caps in refrigerator; IV INF unopened at room temperature; protect both from light

**Intermittent IV infusion route**

• Visually inspect for particulate matter and discoloration prior to use

• Reconstitute each 4-mg vial with 4 ml sterile water for injection; use immediately, no preservative

• Withdraw the appropriate volume of the reconstituted solution; dilute further in 0.9% NaCl or $D_5W$ prior to administration

• The reconstituted solution is yellow or yellow-green

• Topotecan injection diluted for infusion is stable at room temperature with normal light for 24 hr

• Infuse over 30 min

## ADVERSE EFFECTS

**CNS:** Arthralgia, *asthenia, headache,* myalgia, *pain,* weakness

**GI:** *Abdominal pain, constipation,* diarrhea, obstruction, *nausea,* stomatitis, *vomiting,* increased ALT, AST, anorexia

**HEMA:** Neutropenia, leukopenia, thrombocytopenia, anemia, sepsis

**INTEG:** *Total alopecia*

**RESP:** Dyspnea, cough, interstitial lung disease

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly, completely absorbed |
| **Distribution** | 7%-35% protein binding |
| **Metabolism** | Liver |
| **Excretion** | Urine, feces to metabolites |
| **Half-life** | 2.8 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

CISplatin: increased myelosuppression

Itraconazole, mefloquine, niCARdipine, quiNIDine, RU-486, tamoxifen, testosterone, verapamil: avoid giving together

### Drug classifications

Anticoagulants, NSAIDs, platelet inhibitors, thrombolytics: increased bleeding risk

P-glycoprotein, breast cancer resistance protein inhibitors (amiodarone, clarithromycin, diltiazem, erythromycin, indinavir vaccines, toxoids: avoid using together

### Drug/food

Grapefruit juice: avoid use

## NURSING CONSIDERATIONS

### Assessment

• Monitor liver function tests: AST, ALT, alkaline phosphatase, which may be elevated; creatinine, BUN

**BLACK BOX WARNING: Bone marrow suppression:** Monitor CBC, differential, platelet count weekly; withhold product if WBC is <3500/mm$^3$ or platelet count is <100,000/mm$^3$; notify prescriber of these results; product should be discontinued

- Assess buccal cavity for dryness, sores or ulceration, white patches, oral pain, bleeding, dysphagia
- **Interstitial lung disease (ILD):** assess for fever, cough, dyspnea, hypoxia, may be fatal
- **Pregnancy/breastfeeding:** Do not use in pregnancy or breastfeeding, can cause fetal harm, use contraception during and for ≥ 1 mo after final dose (female), during and for 3 mo after final dose (males), may cause infertility in both males/females

### Patient/family education

- Advise patient to avoid foods with citric acid or hot flavor or rough texture if stomatitis is present; to drink adequate fluids
- Advise patient that total alopecia may occur; hair grows back but may be different in color and texture
- Advise patient to report stomatitis; any bleeding, white spots, ulcerations in mouth; tell patient to examine mouth daily; report symptoms

**BLACK BOX WARNING:** Teach patient to report signs of anemia; fatigue, headache, faintness, shortness of breath, irritability

- Teach patient to rinse mouth tid-qid with water, club soda; brush teeth bid-tid with soft brush or cotton-tipped applicator for stomatitis; use unwaxed dental floss
- Teach patient to use effective contraception during treatment and at least 1 mo after, males should use contraception during and for 3 mo after final dose, not to breastfeeding
- Advise patient to avoid OTC products without approval of prescriber
- Advise to avoid driving or other activities requiring alertness
- Advise to avoid vaccines, toxoids
- Teach patient not to crush or chew capsules
- Advise patient not to retake dose if vomiting occurs, notify provider

### Evaluation

**Positive therapeutic outcome**

- Decreased tumor size, spread of malignancy

**RARELY USED**

## toremifene (Rx)

(tor-em'ih-feen)

**Fareston**

*Func. class.:* Antineoplastic

*Chem. class.:* Antiestrogen hormone

**Therapeutic outcome:** Prevention of rapidly growing malignant cells

**USES:** Advanced breast carcinoma that has not responded to other therapy in estrogen-receptor-positive patients (usually postmenopausal)

### CONTRAINDICATIONS

Pregnancy, hypersensitivity, history of thromboembolism

**BLACK BOX WARNING:** QT prolongation

### DOSAGE AND ROUTES

**Adult:** PO 60 mg/day

**Available forms:** Tabs 60 mg

**⚠ HIGH ALERT**

## traMADol (Rx)

(trah'mah-dol)

**ConZip, Ultram, Ultram ER, Zytram** 🍁

*Func. class.:* Analgesic, miscellaneous

**Controlled Substance IV**

**Do not confuse:** traMADol/traZODone Ultram/lithium

**ACTION:** Binds to μ-opioid receptors and inhibits reuptake of norepinephrine, serotonin

**Therapeutic outcome:** Relief of pain

**USES:** Management of moderate to severe pain, chronic pain, headache, osteoarthritis

### CONTRAINDICATIONS

Hypersensitivity, acute intoxication with any CNS depressant, alcohol, asthma, children, adenoidectomy, GI obstruction, ileus, MAOIs

**BLACK BOX WARNING:** Respiratory depression

**Precautions:** Pregnancy, breastfeeding, children, geriatric, seizure disorder, renal/hepatic disease, head trauma, increased ICP, acute abdominal condition, product abuse, depression, suicidal ideation, abrupt discontinuation, constipation

**BLACK BOX WARNING:** Coadministration with other CNS depressants, neonatal opioid withdrawal syndrome

T

## DOSAGE AND ROUTES

### Mild to moderate pain

**Adult:** PO 25 mg qd, titrate by 25 mg ≥3 days to 100 mg/day (25 mg qid), then may increase by 50 mg ≥3 days to 200 mg (50 mg qid), then 50-100 mg q4-6hr, max 400 mg/day; use caution in elderly
**Geriatric >75 yr:** PO <300 mg/day in divided dose

### Hepatic dose

**Adult:** PO 50 mg q12hr

### Renal dose

**Adult (Child-Pugh C):** PO CCr <30 ml/min q12hr, max 200 mg/day; do not use ext rel tabs

### Moderate to severe chronic pain

**Adult:** PO-ER (Ultram ER) 100 mg daily, titrate upward q5day by 100 mg, max 300 mg/day; (Ryzolt) 100 mg, titrate upward q2-3day in 100-mg increments; max 300 mg/day; products are not interchangeable

**Available forms:** Tabs 50 mg; ext rel tab 100, 200, 300 mg; orally disintegrating tab 50 mg

### Implementation

- Do not break, crush, or chew ext rel product
- Give with antiemetic for nausea, vomiting
- Administer when pain is beginning to return; determine dosage interval by patient response
- Store in cool environment, protect from sunlight
- Give with or without food; ext rel: always give with food, or always give on empty stomach

## ADVERSE EFFECTS

**CNS:** Dizziness, CNS stimulation, somnolence, headache, anxiety, confusion, euphoria, seizures, hallucinations, sedation, neuroleptic malignant syndrome–like reactions
**CV:** Vasodilatation, orthostatic hypotension, tachycardia, hypertension, abnormal ECG
**EENT:** Visual disturbances
**GI:** Nausea, constipation, vomiting, dry mouth, diarrhea, abdominal pain, anorexia, flatulence, GI bleeding
**GU:** Urinary retention/frequency, menopausal symptoms, dysuria, menstrual disorder
**INTEG:** Pruritus, rash, urticaria, vesicles, flushing
**SYST:** Anaphylaxis, Stevens-Johnson syndrome, toxic epidermal necrolysis, serotonin syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly, almost completely absorbed |
| **Distribution** | Steady state 2 days |
| **Metabolism** | Extensively in liver, may cross blood-brain barrier |
| **Excretion** | Unchanged product 30% in urine, protein binding 20% |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

**BLACK BOX WARNING:** Alcohol: increased CNS depression

CarBAMazepine: decreased tramadol level

### Drug classifications

CYP3A4 inducers (barbiturates, bosentan, carBAMazepine, efavirenz, nevirapine, phenytoin, rifabutin, rifampin): decreased tramadol effect
CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, FLUoxetine, fluvoxaMINE, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole): increased traMADol levels
MAOIs: inhibition of norepinephrine and serotonin reuptake; use together with caution
Opiates, sedative/hypnotics: increased CNS depression
SSRIs, SNRIs, serotonin-receptor agonists: increased serotonin syndrome

### Drug/herb

Chamomile, hops, kava, skullcap, valerian: increased CNS depression
St. John's wort: avoid use

### Drug/lab test

Increased: creatinine, liver enzymes
Decreased: Hgb

## NURSING CONSIDERATIONS

### Assessment

- **Pain:** assess location, type, character; give before pain becomes extreme
- Assess for increased side effects in renal/hepatic disease

**BLACK BOX WARNING: Respiratory depression:** withhold if respirations ,12/min, may be compounded with use of other CNS depressants

• Monitor I&O ratio: check for decreasing output; may indicate urinary retention
• Assess need for product
• Assess for constipation and bowel pattern; increase fluids, bulk in diet
• **Hypersensitivity:** usually after beginning treatment
• **Beers:** Avoid in older adults, lowers seizure threshold, monitor for seizures frequently in those with a seizure disorder

**BLACK BOX WARNING:** Monitor CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction

• Determine allergic reactions: rash, urticaria
• **Serotonin syndrome, neuroleptic malignant syndrome:** assess for increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer a serotonin antagonist if needed

**BLACK BOX WARNING:** Neonatal opioid withdrawal syndrome: Prolonged use of opioids in the mother may result in withdrawal effects in the neonate, can be fatal, assess for irritability, hyperactivity, abnormal sleep pattern, high-pitched cry, tremor, vomiting, diarrhea, failure to gain weight in the neonate

• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, no well-controlled studies, do not use in labor/delivery, do not breastfeed

### Patient/family education

• Before taking, to tell health care provider if history of head injury, seizures, liver, kidney, thyroid problems, problems urinating, pancreas or gallbladder problems, abuse of street or prescription drugs, alcohol addiction, or mental health problems
• To tell health care provider if pregnant or planning to become pregnant. Prolonged use during pregnancy can cause withdrawal symptoms in the newborn baby that could be life-threatening if not recognized and treated. Do not breastfeed
• Not to take prescription, OTC products, vitamins, or herbal supplements without health care provider's approval
• Do not change dose, take exactly as prescribed by health care provider. Do not take more than prescribed dose and do not take more than 8 tablets per day. If a dose is missed, take next dose at usual time
• Notify health care provider if the dose does not control pain
• Do not stop taking product abruptly if taking regularly without talking to health care provider
• Do not drive or operate heavy machinery until affect is known, product may cause dizziness or lightheadedness
• Do not drink alcohol or use prescription or OTC products that contain alcohol
• Notify health care provider of severe constipation, nausea, sleepiness, vomiting, tiredness, headache, dizziness, abdominal pain
• Get emergency medical help if there is trouble breathing, shortness of breath, fast heartbeat, chest pain, swelling of face, tongue, or throat, extreme drowsiness, lightheadedness when changing positions, feeling faint, agitation, high body temperature, trouble walking, stiff muscles, or mental changes such as confusion

### Evaluation

**Positive therapeutic outcome**
• Decreased pain

**⚠ HIGH ALERT**
**RARELY USED**

## trametinib

(tra-me'ti-nib)
**MeKinist**
*Func. class.:* Antineoplastic biologic response modifier
*Chem. class.:* Signal transduction inhibitor (STI), tyrosine kinase inhibitor

**ACTION:** Inhibits MEK-1, MEK-2 tyrosine kinase created in patients with malignant melanoma

**Therapeutic outcome:** Decrease in progression of disease

**USES:** Unresectable or metastatic BRAD V600E or BRAF V600K mutated malignant melanoma

### CONTRAINDICATIONS

Pregnancy, hypersensitivity

**Precautions:** Breastfeeding, children, diarrhea, geriatric patients, hepatic disease, bone marrow suppression, infection, thrombocytopenia, neutropenia, immunosuppression

### DOSAGE AND ROUTES

**Adult: PO** 2 mg/day, may be used in combination with dacarbazine or PACLitaxel in those with BRAF V600E

#### Management of treatment-related toxicity

**Cutaneous toxicity**
• **Grade 2 rash:** reduce dose by 0.5 mg (e.g., 2 mg/day to 1.5 mg/day) or discontinue in patients who are receiving trametinib 1 mg/day.

In patients with an intolerable grade 2 rash that does not improve within 3 wk of a dosage reduction, withhold trametinib for up to 3 wk. If the rash is improved within 3 wk, resume therapy at a lower dose (reduce the previous dose by 0.5 mg). If the rash does not improve within 3 wk, permanently discontinue.

- **Grade 3 or 4 rash:** withhold for up to 3 wk. If the rash is improved within 3 wk, resume at a lower dose (reduce the previous dose by 0.5 mg); discontinue in patients who are receiving trametinib 1 mg/day. If the rash does not improve within 3 wk, permanently discontinue.

**Cardiac toxicity**

- **Asymptomatic cardiac toxicity and an absolute decrease in LVEF of ≥10% from baseline and below institutional lower limits of normal (LLN) from pretreatment value:** withhold for up to 4 wk. If the LVEF is improved within 4 wk, resume at a lower dose (reduce the previous dose by 0.5 mg); discontinue in patients who are receiving 1 mg/day. If the LVEF does not improve to normal within 4 wk, permanently discontinue.
- Symptomatic HF or an absolute decrease in LVEF of >20% from baseline and below institutional LLN: permanently discontinue

**Ocular toxicity**

- **Grade 2 or 3 retinal pigment epithelial detachment (RPED):** withhold for up to 3 wk. If the RPED improves to grade 1 or less within 3 wk, resume at a lower dose (reduce the previous dose by 0.5 mg); discontinue therapy in patients who are receiving 1 mg/day. If the RPED does not improve to at least grade 1 within 3 wk, permanently discontinue.
- **Retinal vein occlusion:** permanently discontinue therapy

**Pulmonary toxicity**

- **Interstitial lung disease/pneumonitis:** permanently discontinue

**Other toxicity**

- **Grade 3 toxicity:** withhold for up to 3 wk. If the toxicity improves to grade 1 or less within 3 wk, resume at a lower dose (reduce the previous dose by 0.5 mg); discontinue in patients who are receiving 1 mg/day. If the toxicity does not improve to at least grade 1 within 3 wk, permanently discontinue.
- **Grade 4 toxicity:** permanently discontinue

**Available forms:** Tabs 0.5, 2 mg

### Implementation

- Give 1 hr before or 2 hr after a meal
- If dose is missed, take within 12 hr of missed dose; if >12 hr have passed, skip dose
- Follow cytotoxic handling procedures

## ADVERSE EFFECTS

**CNS:** Dizziness
**CV:** Heart failure, hypertension, cardiomyopathy
**EENT:** Ocular hemorrhage, retinal detachment, blurred vision
**GI:** Diarrhea, nausea, vomiting, abdominal pain, stomatitis
**GU:** Hematuria
**INTEG:** Rash, pruritus, acne, folliculitis, erythema
**MISC:** Elevated LFTs, hand-foot syndrome
**MS:** Rhabdomyolysis
**RESP:** Cough, dyspnea, pleural effusion, pneumonitis, edema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 97.4% |
| **Metabolism** | Unknown |
| **Excretion** | In feces |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1.5 hr |
| **Duration** | Unknown |

## INTERACTIONS

None known

## NURSING CONSIDERATIONS

### Assessment

- Monitor LFTs every mo × 3 mo, then as clinically indicated

### Patient/family education

- Teach patient to report adverse reactions immediately, bleeding
- Teach patient about reason for treatment, expected results
- Teach patient to use effective contraception during treatment and up to 30 days after discontinuing treatment

### Evaluation

**Positive therapeutic outcome**

- Decrease in progression of disease

**RARELY USED**

## trandolapril (Rx)

(tran-doe'la-prill)
**Mavik**
*Func. class.:* Antihypertensive
*Chem. class.:* Angiotensin-converting enzyme (ACE) inhibitor

**ACTION:** Selectively suppresses renin-angiotensin-aldosterone system; inhibits ACE;

prevents conversion of angiotensin I to angiotensin II, resulting in dilatation of arterial and venous vessels and lowered B/P

**Therapeutic outcome:** Decreased B/P in hypertension

## USES:
Hypertension alone or in combination, heart failure, after MI, LV dysfunction after MI

## CONTRAINDICATIONS
Breastfeeding, hypersensitivity, history of angioedema

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Geriatric, hyperkalemia, hepatic disease, bilateral renal stenosis, after kidney transplant, aortal/mitral valve stenosis, cirrhosis, severe renal disease, untreated HF, autoimmune diseases, cough

## DOSAGE AND ROUTES
### Hypertension
**Adult:** PO 1 mg/day, 2 mg/day in African Americans, make dosage adjustment ≥1 wk; up to 8 mg/day

### Heart failure (after MI/left ventricular dysfunction)
**Adult:** PO 1 mg/day, titrate upward to 4 mg/day if tolerated, for 2-4 yr

### Renal dose/hepatic dose
**Adult:** PO CCr <30 ml/min or hepatic disease 0.5 mg/day

**Available forms:** Tabs 1, 2, 4 mg

### Implementation
- Store in airtight container at ≤77° F (≤25° C) or less
- Give without regard to food
- Space antacids by 2 hr after dose

## ADVERSE EFFECTS
**CNS:** *Dizziness,* paresthesias, headache, *syncope,* fatigue, drowsiness, depression, sleep disturbances, anxiety, syncope
**CV:** *Hypotension,* MI, palpitations, angina, TIAs, stroke, bradycardia, dysrhythmias
**GI:** Nausea, vomiting, cramps, diarrhea, constipation, pancreatitis, *dyspepsia*
**GU:** Proteinuria, renal failure
**HEMA:** Agranulocytosis, neutropenia, leukopenia, anemia
**INTEG:** Rash, purpura, pruritus, angioedema
**MISC:** Hyperkalemia, hyponatremia, impotence, *myalgia,* angioedema, muscle cramps, asthenia, hypocalcemia, gout
**RESP:** Dyspnea, cough

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 40%-60% |
| **Distribution** | Unknown |
| **Metabolism** | Liver |
| **Excretion** | Kidneys (33%), feces (66%) |
| **Half-life** | 0.6-1.1 hr, 16-24 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | ½ hr |
| **Peak** | 4-10 hr |
| **Duration** | >8 days |

## INTERACTIONS
### Individual drugs
Levodopa, lithium, reserpine: increased effect of each specific product

### Drug classifications
Antacids, NSAIDs, salicylates: decreased effect of trandolapril
Antihypertensives, diuretics: increased severe hypotension
Barbiturates, ergots, hypoglycemics, neuromuscular blocking agents: increased effects of each specific product
Diuretics (potassium-sparing): increased potassium levels
Phenothiazines: increased antihypertensive effects
Potassium supplements: increased potassium levels
Salt substitutes: increased potassium levels

### Drug/lab test
Increased: potassium, LFTs, BUN, creatinine
Decreased: sodium, WBC

## NURSING CONSIDERATIONS
### Assessment
- Monitor blood tests: neutrophils, decreased platelets
- Monitor B/P, orthostatic hypotension, syncope; if changes occur dosage change may be required
- Monitor renal studies: protein, BUN, creatinine; increased levels may indicate nephrotic syndrome and renal failure
- Monitor renal symptoms: polyuria, oliguria, frequency, dysuria
- Establish baselines in renal, liver function tests before therapy begins
- Check potassium levels throughout treatment, although hyperkalemia rarely occurs
- Check for edema in feet, legs daily
- Assess for allergic reactions: rash, fever, pruritus, urticaria; product should be discontinued if antihistamines fail to help

T

**BLACK BOX WARNING:** Pregnancy: Identify if pregnancy is planned or suspected; pregnancy

- **Hepatotoxicity (rare):** assess for increased LFTs, jaundice, fulminating hepatic necrosis; if jaundice occurs, discontinue product
- **Angioedema:** of the face, edema of the extremities, mucus membranes, may need to discontinue
- **Hyperkalemia:** monitor electrolytes, check potassium

### Patient/family education

- Advise patient not to discontinue product abruptly; advise patient to tell all persons associated with health care
- Teach patient not to use OTC products (cough, cold, allergy) unless directed by physician; serious side effects can occur; xanthines, such as coffee, tea, chocolate, cola, can prevent action of product
- Instruct patient on the importance of complying with dosage schedule, even if feeling better; to continue with medical regimen to decrease B/P: exercise, cessation of smoking, decreasing stress, diet modifications
- Emphasize the need to rise slowly to sitting or standing position to minimize orthostatic hypotension; not to exercise in hot weather, which can cause increased hypotension
- Advise patient to notify prescriber of mouth sores, sore throat, fever, swelling of hands or feet, irregular heartbeat, chest pain, coughing, shortness of breath
- Caution patient to report excessive perspiration, dehydration, vomiting, diarrhea; may lead to fall in B/P
- Caution patient that product may cause dizziness, fainting, light-headedness; may occur during 1st few days of therapy; to avoid activities that may be hazardous
- Teach patient how to take B/P and normal readings for age group

**BLACK BOX WARNING:** Teach patient to notify prescriber if pregnancy is suspected or planned, pregnancy

### Evaluation

**Positive therapeutic outcome**

- Decreased B/P in hypertension

## TREATMENT OF OVERDOSE:

Lavage, **IV** atropine for bradycardia, **IV** theophylline for bronchospasm, digoxin, $O_2$, diuretic for cardiac failure, hemodialysis

**⚠ HIGH ALERT**

## trastuzumab (Rx)

(tras-tuz′uh-mab)

**Herceptin**

*Func. class.:* Antineoplastic—miscellaneous

*Chem. class.:* Humanized monoclonal antibody

**ACTION:** DNA-derived monoclonal antibody selectively binds to extracellular portion of human epidermal growth factor receptor 2 (HER2); it inhibits proliferation of cancer cells

**Therapeutic outcome:** Decreasing symptoms of breast cancer

**USES:** Metastatic breast cancer with overexpression of HER2, early breast cancer (adjuvant, neoadjuvant), gastric cancer; previously untreated HER2 overexpressing metastatic gastric or gastroesophageal junction adenocarcinoma with CISplatin, 5-fluorouracil or capecitabine

## CONTRAINDICATIONS

Hypersensitivity to this product, Chinese hamster ovary cell protein

**Precautions:** Breastfeeding, children, geriatric, pulmonary disease, anemia, leukopenia

**BLACK BOX WARNING:** Cardiac disease, respiratory distress syndrome, respiratory insufficiency, infusion-related reactions, cardiomyopathy, pregnancy, pulmonary toxicity, contraception requirement

## DOSAGE AND ROUTES

**For adjuvant treatment of HER2-positive, node-positive, or node-negative (ER/PR negative or with one high-risk feature) breast cancer in combination with PACLitaxel, after completion of DOXOrubicin and cyclophosphamide chemotherapy (AC-TH)**

**Adult:** IV 4 mg/kg over 90 min on day 1, then 2 mg/kg over 30 min qwk for a total of 12 wk, with PACLitaxel (either 80 mg/m$^2$ IV wk or 175 mg/m$^2$ q3wk) beginning on day 1 for a total of 4 cycles (12 wk). On week 13, begin trastuzumab 6 mg/kg over 30 to 90 min q3wk as monotherapy for a total of 52 wk of trastuzumab therapy; begin PACLitaxel plus trastuzumab after the completion of 4 cycles of AC chemotherapy (DOXOrubicin 60 mg/m$^2$ IV and cyclophosphamide 600 mg/m$^2$ IV q21days)

**For adjuvant treatment of HER2-positive, node-positive, or node-negative (ER/PR negative or with one high-risk feature) breast cancer in combination with docetaxel after completion of DOXOrubicin and cyclophosphamide chemotherapy (AC-TH)**

**Adult:** IV 4 mg/kg IV over 90 min on day 1, then 2 mg/kg over 30 min qwk (total of 12 wk), with docetaxel 100 mg/m$^2$ IV q21days beginning on day 1 for a total of 4 cycles (12 wk). On week 13, begin trastuzumab 6 mg/kg IV over 30 to 90 min q3wk as monotherapy for a total of 52 wk of trastuzumab therapy. Begin docetaxel plus trastuzumab after the completion of 4 cycles of AC chemotherapy (DOXOrubicin 60 mg/m$^2$ IV and cyclophosphamide 600 mg/m$^2$ IV q21days)

**For adjuvant treatment of HER2-positive, node-positive, or node negative (ER/PR negative or with one high-risk feature) breast cancer in combination with carboplatin and docetaxel (TCH)**

**Adult:** IV 4 mg/kg over 90 min on day 1, then 2 mg/kg over 30 min wk (total of 18 wk), with docetaxel 75 mg/m$^2$ IV followed by carboplatin AUC 6 IV over 30 to 60 min beginning on day 1, q3wk, for a total of 6 cycles (18 wk). On week 19, begin trastuzumab 6 mg/kg IV over 30 to 90 min q3wk as monotherapy (52 wk of trastuzumab)

**For adjuvant treatment of HER2-positive, node-positive, or node-negative (ER/PR negative or with one high-risk feature) breast cancer as monotherapy after multimodality anthracycline-based chemotherapy**

**Adult:** IV 8 mg/kg over 90 min on day 1, followed by 6 mg/kg IV over 30 to 90 min q21days (total of 52 wk)

**For the first-line treatment of HER2-positive metastatic breast cancer in combination with PACLitaxel**

**Adult:** IV 4 mg/kg over 90 min on day 1, then 2 mg/kg IV over 30 min qwk until disease progression in combination with PACLitaxel 175 mg/m$^2$ IV over 3 hr on day 1, q21days for ≥6 cycles. Continue PACLitaxel 175 mg/m2 IV over 3 hr q21days for ≥6 cycles

**For the treatment of HER2-positive metastatic breast cancer as a single agent in patients who have failed one or more chemotherapy regimens for metastatic disease**

**Adult:** IV 4 mg/kg over 90 min on day 1, followed by 2 mg/kg IV over 30 min wk until disease progression

## Therapeutic drug monitoring

**Dosage adjustments for cardiotoxicity**

- ***First, second, or third occurrence, ≥16% absolute decrease in left ventricular ejection fraction (LVEF) from baseline, or LVEF below institutional limit of normal with ≥10% absolute decrease in LVEF from baseline:*** Hold for 4 to 8 wk and monitor ejection fraction with a MUGA scan or echocardiogram q4wk. If LVEF returns to normal limits with an absolute decrease from baseline of ≤15% within 4-8 weeks, resume, if decrease in LVEF persists >8 wk, permanently discontinue
- ***Fourth occurrence, ≥16% absolute decrease in left ventricular ejection fraction (LVEF) from baseline, or LVEF below institutional limit of normal with ≥10% absolute decrease in LVEF from baseline:*** Permanently discontinue

**Available forms:** Lyophilized powder 150, 440 mg

### Implementation

- Give acetaminophen as ordered to alleviate fever and headache
- Increase fluid intake to 2-3 L/day

**Intermittent IV infusion route**

- Use cytotoxic handling procedures, avoid treatment over 1 yr
- Administer after reconstituting vial with 20 ml of bacteriostatic water for inj, 1.1% benzyl alcohol preserved (supplied) to yield 21 mg/ml, mark date on vial 28 days from reconstitution date; if patient is allergic to benzyl alcohol, reconstitute with sterile water for inj; use immediately; inf over 90 min; q3wk give 8 mg/kg loading dose over 90 min; subsequent doses 6 mg/kg may be given over 30-60 min
- Do not mix or dilute with other products or dextrose sol

## ADVERSE EFFECTS

**CNS:** *Dizziness, numbness, paresthesias,* depression, *insomnia,* neuropathy, peripheral neuritis
**CV:** Tachycardia, HF
**GI:** Nausea, vomiting, *anorexia, diarrhea,* abdominal pain, hepatotoxicity, dysgeusia
**HEMA:** *Anemia,* leukopenia
**INTEG:** *Rash,* acne, herpes simplex
**META:** Edema, peripheral edema
**MISC:** *Flulike symptoms; fever, headache, chills*
**MS:** Arthralgia, *bone pain*

T

**RESP:** *Cough, dyspnea, pharyngitis, rhinitis,* sinusitis, pneumonia, pulmonary edema/fibrosis, acute respiratory distress syndrome (ARDS)
**SYST:** Anaphylaxis, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 1-32 days, 97% of washout by 7 mo after end of treatment |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Cyclophosphamide: increased cardiomyopathy risk; avoid use
Warfarin: increased bleeding risk

### Drug classifications

Anthracyclines: increased cardiomyopathy risk
Vaccines/toxoids: decreased immune response

### Drug/lab

Decrease: WBC, RBC

## NURSING CONSIDERATIONS

### Assessment

- Monitor CBC, HER2 overexpression
- Assess for symptoms of infection; may be masked by product
- Assess CNS reaction: LOC, mental status, dizziness, confusion

**BLACK BOX WARNING: HF and other cardiac symptoms:** assess for dyspnea, coughing, gallop; obtain a full cardiac workup including before and q3mo during treatment and q6mo for ≥ 2 yr after adjuvant treatment (LVEF, MUGA, or ECHO, monitor for clinical deterioration in those with decreased LEVF)

- Hypersensitivity reactions, anaphylaxis

**BLACK BOX WARNING: Potentially fatal infusion reactions:** assess for fever, chills, nausea, vomiting, pain, headache, dizziness, hypotension; discontinue product

- **Pulmonary toxicity:** assess for dyspnea, interstitial pneumonitis, pulmonary hypertension, ARDS; can occur after infusion reaction, those with lung disease may have more severe toxicity
- **Benzyl alcohol hypersensitivity:** Reconstitute with sterile water for injection, USP. Discard any unused portion
- **Hamster protein hypersensitivity (Chinese hamster ovary cell hypersensitivity):** Assess for hypersensitivity due to increased risk of severe allergic reactions

**BLACK BOX WARNING: Pregnancy/breastfeeding:** Fetal harm may occur if given during pregnancy or within 7 mo of conception; monitoring for oligohydramnios is recommended. If oligohydramnios occurs, fetal testing should be done that is appropriate for gestational age. Encourage these women to enroll in the MotHER Pregnancy Registry by contacting 800-690-6720 or visiting http://www.motherpregnancyregistry.com. Counsel patients about the reproductive risk and contraception requirements during trastuzumab treatment. Trastuzumab can be teratogenic if taken by the mother during pregnancy or within 7 mo before conception. Effective contraception should be used during and for at least 7 mo after treatment Females of reproductive potential should undergo pregnancy testing before use. Women who become pregnant while receiving or within 7 mo of the last dose should be apprised of the potential hazard to the fetus. It is not known whether the product is excreted into human milk, advise women to discontinue breastfeeding during treatment and for 7 mo after the last dose

### Patient/family education

- Advise patient to take acetaminophen for fever
- Teach patient to avoid hazardous tasks, since confusion, dizziness may occur
- Teach patient to report signs of infection: sore throat, fever, diarrhea, vomiting
- Inform patient that emotional lability is common; instruct patient to notify prescriber if severe or incapacitating

**BLACK BOX WARNING:** Advise patient to use contraception while taking this product or within 7 mo of pregnancy; not to breastfeeding

**BLACK BOX WARNING:** Teach patient to report pain at infusion site, usually with first dose

**BLACK BOX WARNING:** Cardiomyopathy: Teach patient to report cough, swelling in extremities, shortness of breath, may occur during or after completion of treatment

### Evaluation

**Positive therapeutic outcome**
- Decrease in size of tumors

## travoprost ophthalmic

*See Appendix B*

## traZODone (Rx)

(tray′zoe-done)
**Oleptro**
*Func. class.:* Antidepressant—miscellaneous
*Chem. class.:* Triazolopyridine

**ACTION:** Selectively inhibits serotonin, norepinephrine uptake by brain, potentiates behavioral changes

**Therapeutic outcome:** Decreased symptoms of depression after 2-3 wk

**USES:** Depression

## CONTRAINDICATIONS

Hypersensitivity to tricyclics

**Precautions:** Pregnancy, suicidal patients, severe depression, increased intraocular pressure, closed-angle glaucoma, urinary retention, cardiac/hepatic disease, hyperthyroidism, electroshock therapy, elective surgery, bleeding, abrupt discontinuation, bipolar disorder, breastfeeding, dehydration, hyponatremia, hypovolemia, recovery phase of MI, seizure disorders, prostatic hypertrophy, family history of long QT

**BLACK BOX WARNING:** Suicidal ideation in children/adolescents

## DOSAGE AND ROUTES

### Depression

**Adult:** PO 150 mg/day in divided doses; may increase by 50 mg/day q3-4day, max 400 mg/day (outpatient), 600 mg/day (inpatient); EXT REL 150 mg/day in the evening, may increase gradually by 75 mg/day at 3 day intervals, max 375 mg/day
**Geriatric:** PO 25-50 at bedtime, increase by 25-50 mg q3-7day to desired dose, usual 75-150 mg/day
**Child 6-18 yr (unlabeled):** PO 1.5-2 mg/kg/day in divided doses, may increase q3-4day up to 6 mg/kg/day or 400 mg/day in divided doses, whichever is less

**Available forms:** Tabs 50, 100, 150, 300 mg; ext rel tabs 150, 300 mg

### Implementation

- Give with food or milk for GI symptoms; crush if patient is unable to swallow medication whole
- Give dose at bedtime if oversedation occurs during day; may take entire dose at bedtime; geriatric may not tolerate once/day dosing
- Store in tight, light-resistant container at room temp; do not freeze

## ADVERSE EFFECTS

**CNS:** *Dizziness, drowsiness,* confusion, headache, anxiety, tremors, stimulation, weakness, insomnia, nightmares, EPS (geriatric), increase in psychiatric symptoms, suicide in children/adolescents
**CV:** *Orthostatic hypotension, ECG changes, tachycardia,* hypertension, palpitations
**EENT:** *Blurred vision,* tinnitus, mydriasis
**GI:** *Diarrhea, dry mouth,* nausea, vomiting, paralytic ileus, increased appetite, cramps, epigastric distress, jaundice, hepatitis, stomatitis, constipation
**GU:** *Retention,* acute renal failure, priapism
**HEMA:** Agranulocytosis, thrombocytopenia, eosinophilia, leukopenia
**INTEG:** Rash, urticaria, sweating, pruritus, photosensitivity

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, minimally unchanged |
| **Half-life** | 4½-7½ hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr without food, 2 hr with food |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol, carBAMazepine, digoxin, phenytoin: increased effect of each product
FLUoxetine, nefazodone: increased levels, increased toxicity, serotonin syndrome
Guanethidine, cloNIDine: decreased effects of each product
Warfarin: increased or decreased effects of warfarin

### Drug classifications

Barbiturates, benzodiazepines, CNS depressants: increased effects
CYP3A4, 2D6 inhibitors (phenothiazines, protease inhibitors, azole antifungals): increased effects of trazodone

T

MAOIs: increased hyperpyretic crisis, seizures, hypertensive episode, do not use within 14 days
SNRIs, SSRIs: increased toxicity, serotonin syndrome
Sympathomimetics (direct-acting): increased sympathomimetic effects
Sympathomimetics (indirect-acting): decreased effects

### Drug/herb

Hops, kava, lavender, valerian: increased CNS depression
SAM-e, St. John's wort: increased serotonin syndrome

### Drug/lab test

Increased: LFTs
Decreased: Hgb

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P (lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg hold product, notify prescriber; take vital signs q4hr in patients with CV disease
- Monitor blood tests: CBC, leukocytes, differential
- Monitor liver function tests: AST, ALT, bilirubin
- Check weight qwk; appetite may increase with product
- Assess ECG for flattening of T wave, bundle branch block, AV block, dysrhythmias in cardiac patients
- Assess for EPS primarily in geriatric: rigidity, dystonia, akathisia

**BLACK BOX WARNING:** Assess mental status: mood, sensorium, affect, suicidal tendencies in children/adolescents; increase in psychiatric symptoms: depression, panic, not approved for children, if worsening depression occurs, product may need to be tapered as rapidly as possible without abrupt discontinuation

- Monitor urinary retention, constipation; constipation is more likely to occur in children or geriatric
- **Withdrawal symptoms:** assess for headache, nausea, vomiting, muscle pain, weakness; do not usually occur unless product was discontinued abruptly
- Identify alcohol consumption; if alcohol is consumed, hold dose until AM
- **Serotonin syndrome, neuroleptic malignant syndrome:** assess for increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer a serotonin antagonist if needed
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, no well-controlled studies, cautious use in breastfeeding, excreted in breast milk

### Patient/family education

- Teach patient that therapeutic effects may take 2-3 wk
- Teach patient to use caution in driving or other activities requiring alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting to standing, especially geriatric
- Teach patient not to crush, chew ext rel product
- Caution patient to avoid alcohol ingestion, other CNS depressants
- Teach patient not to discontinue medication quickly after long-term use: may cause nausea, headache, malaise
- Advise patient to wear sunscreen or large hat because photosensitivity occurs
- Teach patient to increase fluids, bulk in diet if constipation, urinary retention occur, especially geriatric
- Advise patient to take gum, hard sugarless candy, or frequent sips of water for dry mouth
- Advise patient to rise slowly to prevent dizziness

**BLACK BOX WARNING:** Teach family to watch for suicidal ideation or tendencies, usually in children/adolescents, to notify provider if there is an increase in depression, agitation

- Teach patient to notify prescriber if pregnancy is planned or suspected, pregnancy (C), avoid breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Decrease in depression
- Absence of suicidal thoughts

## TREATMENT OF OVERDOSE:

ECG monitoring, induce emesis, lavage, administer anticonvulsant

## treprostinil (Rx)

(treh-prah'stin-ill)
**Orenitram, Remodulin, Tyvaso**
*Func. class.:* Antihypertensive vasodilator
*Chem. class.:* Tricyclic benzidine prostacyclin analog

**ACTION:** Direct vasodilatation of pulmonary, systemic arterial vascular beds, inhibition of platelet aggregation

**Therapeutic outcome:** Decreased pulmonary arterial hypertension (PAH)

**USES:** PAH, NYHA class II through IV

## CONTRAINDICATIONS

Hypersensitivity to this product or other prostacyclin analogs

**Precautions:** Pregnancy, breastfeeding, children, geriatric, past hepatic disease, renal/thromboembolic disease, abrupt discontinuation, **IV** administration

## DOSAGE AND ROUTES

### For the treatment of pulmonary arterial hypertension (WHO Group 1) to diminish symptoms associated with exercise

**Adult: SUBCUT CONT INF /IV CONT INF** 1.25 ng/kg/min initially. If not tolerated, reduce to 0.625 ng/kg/min. Increase dose by increments ≤ 1.25 ng/kg/min per wk × first 4 wk, then no more than 2.5 ng/kg/min per wk for the remaining duration of infusion, depending on response; if tolerated, the dose may be adjusted more frequently; **ORAL INH:** Initially, 3 breaths (18 mcg) inhaled via the Tyvaso Inhalation System qid 4 hr apart during waking hours; the patient should take 3 breaths during each treatment session. If 3 breaths are not tolerated, reduce to 1 or 2 breaths and subsequently increase to 3 breaths, as tolerated. Increase dose by an additional 3 breaths at approximately 1 to 2 wk intervals, if tolerated, until the target dose of 9 breaths (54 mcg)/treatment session is reached. If target dose cannot be reached due to adverse effects, continue at the highest tolerated dose; **PO:** 0.25 mg q12hr or 0.125 mg q8hr, increase by 0.25 or 0.5 mg bid or 0.125 mg tid q3 to q4 days as tolerated

**Adults taking gemfibrozil (or other strong CYP2C8 inhibitors):** PO 0.125 mg q12hr, increase by 0.125 mg bid q3 to q4 days, as tolerated

### For patients transitioning from IV or SUBCUT to PO

**Adult:** PO For patients already receiving IV or SUBCUT, use the following equation to estimate a comparable total daily dose of POI: Total Daily PO Dose = 0.0072 × IV or SUBCUT Dose (ng/kg/minute) × Weight (kg). Reduce the dose of IV or SUBCUT by up to 30 ng/kg/min per day while simultaneously increasing the dose of PO up to 6 mg/day (2 mg PO tid), if tolerated

### For temporary SUBCUT/IV infusion in those unable to take PO due to a planned, short-term treatment interruption

**Adult: IV/SUBCUT CONT INF:** For those receiving PO product, use the following equation to calculate the parenteral dose: IV/SUBCUT (ng/kg/min) = 139 × Total Daily POI Dose (mg)/Weight (kg)

### For patients transitioning from epoprostenol to IV/SUBCUT

The transition from epoprostenol to treprostinil should take place in a hospital with continuous observation to response (walking distance and signs and symptoms of disease progression)

**Adult: IV/SUBCUT INF:** To transition from epoprostenol to treprostinil, initiate the infusion of treprostinil and increase it while reducing the dose of IV epoprostenol. In the following stepwise approach, the initial epoprostenol dose is defined as the dose the patient was receiving at the beginning of the conversion to treprostinil. **Step 1:** Initiate an infusion of treprostinil that is 10% of the current epoprostenol dose; continue with the same epoprostenol dose; **Step 2:** Increase the treprostinil dose to 30% of the initial epoprostenol dose; reduce the epoprostenol dose to 80% of the initial dose; **Step 3:** Increase the treprostinil dose to 50% of the initial epoprostenol dose; reduce the epoprostenol dose to 60% of the initial dose; **Step 4:** Increase the treprostinil dose to 70% of the initial epoprostenol dose; reduce the epoprostenol dose to 40% of the initial dose; **Step 5:** Increase the treprostinil dose to 90% of the initial epoprostenol dose; reduce the epoprostenol dose to 20% of the initial dose; **Step 6:** Increase the treprostinil dose to 110% of the initial epoprostenol dose; reduce the epoprostenol dose to 5% of the initial dose; **Step 7:** Increase the treprostinil dose by 5% to 10% increments as needed; discontinue epoprostenol. Individually titrate the dose of treprostinil in a manner that balances prostacyclin-limiting adverse events. During the transition, increases in PAH symptoms (e.g., fatigue, dyspnea, chest pain, and pallor) should first be managed by increasing the dose of treprostinil; symptoms associated with prostacyclin and prostacyclin analogs (e.g., facial flush, headache, jaw pain, abdominal cramping, diarrhea, and hypotension) should first be managed by decreasing the dose of epoprostenol

### Hepatic dose

**Adult:** SUBCUT INF 0.625 ng/kg ideal body weight/min and increase cautiously

**Available forms:** Inj 1, 2.5, 5, 10 mg/ml; neb sol 1.74 mg/2.9 ml; ER tabs 0.125, 0.25, 2.5 mg

### Implementation

#### PO route

- Give with food, swallow tablets whole, and use only intact tablets

**INJ route**
• Visually inspect for particulate matter and discoloration before use
• Administer the injection by continuous SUBCUT infusion as the preferred route. May be administered by continuous IV infusion in those who do not tolerate continuous SUBCUT (severe injection site pain or reaction)
• Have immediate access to a backup infusion pump and infusion sets. Avoid abrupt discontinuation of the infusion. If temporary cessation is necessary for less than a few hours, the infusion can be restarted at the previously used dose and rate; if the infusion is stopped for longer than a few hours, retitration may be necessary
• The infusion pump used should be small and lightweight; adjustable to approximately 0.002 ml/hr; have alarms for occlusion, end of infusion and low battery, programming error, and motor malfunctions; accurate to +/- 6% of the programmed rate; and positive-pressure driven. The reservoir should be made of polyvinyl chloride, polypropylene, or glass
• ***Opened vials:*** A single vial should be used ≤ 30 days after the initial entry into the vial

**CONT IV route**
• Give via a surgically placed central venous catheter via an ambulatory infusion pump. A peripheral IV cannula, placed into a large vein, may be used temporarily; use of a peripheral vein for more than a few hours may increase the risk of thrombophlebitis
• Infusion sets with an inline 0.22- or 0.2-micron pore size filter should be used

**IV infusion preparation:**
• May be diluted with Remodulin sterile diluent for injection or similar approved high-pH glycine diluents (sterile diluent for Flolan or sterile diluent for epoprostenol sodium), sterile water for injection, or 0.9% NaCl for injection
• The concentration of diluted treprostinil should be calculated using the following formula:

$$\text{diluted concentration} = \frac{[\text{dose (ng/kg/min)} \times \text{weight (kg)} \times 0.00006]}{\text{IV infusion rare (ml/hr)}}$$

• Typical ambulatory infusion pump reservoirs have volumes of 50 or 100 ml. The IV infusion rate is predetermined based on the volume of the reservoir, with a desired infusion length of 48 hr (i.e., for a 50-ml reservoir, the infusion rate would be 1 ml/hr; for a 100-ml reservoir, the infusion rate would be 2 ml/hr)
• The amount of treprostinil needed to make the required concentration for the given reservoir can be calculated using the following formula:

$$\text{ml of treprostinil injection} = \frac{[\text{diluted concentration (mg/ml)}}{\text{treprostinil vial strength (mg/ml)}]} \times \text{total volume of diluted treprostinil solution in reservoir (ml)}$$

• The reservoir should be filled with the calculated volume and a sufficient amount of diluent to achieve the total volume of the reservoir
• Once diluted with any diluent, may be given for 48 hr at 40° C
• ***Store:*** If diluted with sterile water for injection or 0.9% NaCl, store up to 4 hr at room temperature or 24 hr if refrigerated. If diluted with an approved high-pH glycine diluent (sterile diluent for Remodulin, Flolan, or epoprostenol sodium), it may be stored for 14 days at room temperature at concentrations as low as 0.004 mg/ml

**SUBCUT CONT INF route**
• Give via a self-inserted SUBCUT catheter using an ambulatory infusion pump designed for subcutaneous drug delivery

**SUBCUT infusion preparation:**
• Further dilution is NOT required before continuous SUBCUT use
• Do not mix or coinfuse with other medications
• The SUBCUT infusion rate can be calculated using the following formula:

$$\text{Subcutaneous infusion rate} = \frac{[\text{dose (ng/kg/min)} \times \text{weight (kg)} \times 0.00006]}{\text{treprostinil vial strength (mg/ml)}}$$

• During SUBCUT use, a single reservoir (syringe) of product can be given ≤ 72 h at a max temperature of 37° C (98.6° F)

**Oral inhalation administration**
• Must be used only with the Tyvaso Inhalation System
• Avoid skin or eye contact with solution. Do not take PO
• Have access to a backup Opti-Neb-ir device to avoid interruptions in therapy
• Do not mix with other medications in the Opti-Neb-ir device
• One ampule contains a volume for all four treatment sessions in a single day

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, syncope
**CV:** Vasodilatation, *hypotension, edema,* right ventricular heart failure

**GI:** Nausea, *diarrhea*
**INTEG:** *Rash,* pruritus
**OTHER:** Jaw pain, cough, throat irritation
**SYST:** Infusion site reactions, inf site pain, increased risk of infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver, 90% protein binding |
| **Excretion** | Urine, feces |
| **Half-life** | 2-4 hr, terminal |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drug

Aspirin: increased risk of bleeding

### Drug classifications

Anticoagulants, NSAIDs, SSRIs, thrombin inhibitors: increased risk of bleeding
Antihypertensives, β-blockers, calcium channel blockers, diuretics, MAOIs, vasodilators: increased hypotension

## NURSING CONSIDERATIONS

### Assessment

- **Hypertension:** monitor B/P baseline and periodically
- Monitor liver function tests: AST, ALT, bilirubin, creatinine (long-term therapy)
- **Monitor blood tests:** CBC; CBC q2wk × 3 mo, Hct, Hgb, pro-time (long-term therapy), ABGs
- Monitor bleed time baseline and throughout; levels may be 2-5 × normal limit
- **Pregnancy/breastfeeding:** Use only if clearly needed, no well-controlled studies, cautious use in breastfeeding, excretion unknown
- **Beers:** Use with caution in older adults may exacerbate episodes of syncope, monitor frequently

### Patient/family education

- Teach patient that blood work will be necessary during treatment
- Teach patient to report side effects such as diarrhea, skin rashes
- Teach patient that therapy will be needed for prolonged periods of time, sometimes years
- Advise patient that aseptic technique must be used in preparing and administering to prevent infection
- Teach that there are many drug and herb interactions
- Teach signs/symptoms of bleeding: blood in urine, stools
- Teach patient to avoid abrupt discontinuation
- Teach patient how to use inhaled solution and how to care for equipment

### Evaluation

**Positive therapeutic outcome**
- Decreased pulmonary arterial hypertension

## tretinoin (vitamin A acid, retinoic acid) (Rx)

(tret'i-noyn)
**Avita, Renova, Retin-A, Retin-A Micro, Stieva-A** 🍁
*Func. class.:* Vitamin A acid/acne product, antineoplastic—miscellaneous
*Chem. class.:* Tretinoin derivative

**ACTION:** (Topical) Decreases cohesiveness of follicular epithelium, decreases microcomedone formation; (PO) induces maturation of acute promyelocytic leukemia, exact action is unknown

**Therapeutic outcome:** Decreased signs/symptoms of leukemia

**USES:** (Topical) Acne vulgaris (grades 1-3); (PO) acute promyelocytic leukemia, facial wrinkles, photoaging

## CONTRAINDICATIONS

Hypersensitivity to retinoids or sensitivity to parabens

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Pregnancy (topical), breastfeeding, eczema, sunburn, sun exposure

**BLACK BOX WARNING:** Rapid-evolving leukocytosis, respiratory compromise, acute promyelocytic leukemia differentiation syndrome, requires a specialized care setting, experienced clinician

## DOSAGE AND ROUTES

**Adult and child:** TOP cleanse area, apply 0.025%-0.1% cream or 0.05% liquid at bedtime; cover lightly

### Promyelocytic leukemia

**Adult:** PO 45 mg/m$^2$/day given as 2 evenly divided doses until remission; discontinue treatment 30 days after remission or after 90 days of treatment, whichever is first

**Available forms:** Topical cream 0.01%, 0.02%, 0.025%, 0.05%, 0.1%; topical gel 0.025%, 0.04%, 0.05%, 0.1%; topical liquid 0.05%; caps 10 mg

### Implementation
**Topical route**
- Apply using gloves or cotton, once daily before bedtime; cover area lightly using gauze
- Store at room temperature
- Wash hands after application
- Apply only to affected areas

## ADVERSE EFFECTS
### PO route
**CNS:** Headache, fever, sweating, fatigue
**CV:** Cardiac dysrhythmias, pericardial effusion
**GI:** Nausea, vomiting, hemorrhage, abdominal pain, diarrhea, constipation, dyspepsia, distention, hepatitis
**META:** Hypercholesterolemia, hypertriglyceridemia
**RESP:** Pneumonia, upper respiratory tract disease

### Topical route
**INTEG:** Rash, stinging, warmth, redness, erythema, blistering, crusting, peeling, contact dermatitis, hypo/hyperpigmentation, dry skin, pruritus, scaly skin, retinoic acid syndrome (RAS)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Small amounts |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Individual drugs
Aminocaproic acid, aprotinin, tranexamic acid: increased thrombotic complications
Benzoyl peroxide, resorcinol, salicylic acid (topical), sulfur: increased peeling
Ketoconazole: increased plasma concentrations of tretinoin (oral)

### Drug classifications
Alcohol, astringents, cleansers with drying effect, medicated, abrasive soaps: use with caution (topical)
Diuretics (thiazide), phenothiazines, quinolones, retinoids, sulfonamides, sulfonylureas: increased photosensitivity
Tetracyclines: increased ICP, risk of pseudotumor cerebri; do not use together

### Drug/lab test
Increased: AST, ALT

## NURSING CONSIDERATIONS
### Assessment
**Topical route**
- Assess part of body involved, including time involved, what helps or aggravates condition, cysts, dryness, itching; lesions may become worse at beginning of treatment

**PO route**
- Monitor hepatic function, coagulation, hematologic parameters, also cholesterol, triglycerides
- **Pregnancy/breastfeeding:** Do not use in pregnancy/breastfeeding (PO)

### Patient/family education
**Topical route**
- Instruct patient to avoid application on normal skin, to avoid getting cream in eyes, nose, other mucous membranes
- Advise patient to avoid sunlight, sunlamps or to use protective clothing or sunscreen to prevent burns
- Advise patient that treatment may cause warmth, stinging; dryness, peeling will occur
- Inform patient that cosmetics may be used over product; not to use shaving lotions
- Inform patient that rash may occur during first 1-3 wk of therapy
- Caution patient that product does not cure condition, only relieves symptoms; that therapeutic results may be seen in 2-3 wk but may not be optimal until after 6 wk

**PO route**

**BLACK BOX WARNING:** Advise patient to report to prescriber if pregnancy is planned or suspected, pregnancy (PO)

### Evaluation
**Positive therapeutic outcome**
- Decrease in size and number of lesions

**tretinoin topical**
*See Appendix B*

## triamcinolone (Rx)
(trye-am-sin'oh-lone)
**Aristospan, Kenalog-10, Kenalog-40, Tac-3, Tac-40, Triesence**
*Func. class.:* Corticosteroid, synthetic; antiinflammatory
*Chem. class.:* Glucocorticoid, intermediate-acting

**ACTION:** Decreases inflammation by suppressing migration of polymorphonuclear

leukocytes, fibroblasts, reversal of increased capillary permeability and lysosomal stabilization

**Therapeutic outcome:** Decreased inflammation, normal immune response

## USES:

Severe inflammation, immunosuppression, neoplasms, asthma (steroid dependent), collagen, respiratory, dermatologic disorders, rheumatic disorders

## CONTRAINDICATIONS

Hypersensitivity, neonatal prematurity, epidural/intrathecal administration (triamcinolone acetonide injections [Kenalog]), systemic fungal infections

**Precautions:** Pregnancy, breastfeeding, diabetes mellitus, glaucoma, osteoporosis, seizure disorders, ulcerative colitis, HF, myasthenia gravis, renal disease, esophagitis, peptic ulcer, acne, cataracts, coagulopathy, head trauma, children <2 yr, psychosis, idiopathic thrombocytopenia, acute glomerulonephritis, amebiasis, fungal infections, nonasthmatic bronchial disease, AIDS, TB, adrenal insufficiency, acute bronchospasm, acne rosacea, Cushing's syndrome, acute MI, thromboembolism

## DOSAGE AND ROUTES

**Adult:** IM 40 mg qwk (acetonide), 5-48 mg into neoplasms (acetonide), 2-40 mg into joint or soft tissue (hexacetonide), 0.5 mg/sq in of affected intralesional skin (hexacetonide), 2-20 mg into joint or soft tissue (hexacetonide)

### Severe/incapacitating allergic conditions such as asthma

**Adult:** IM (Trivaris) 60 mg, titrate; usual range 40-80 mg

**Child:** IM (Trivaris) 0.11-1.6 mg/kg/day (3.2-48 mg/m$^2$/day) given in 3-4 divided doses

**Available forms:** Inj 3, 10, 40 mg/ml acetonide; inj 5, 20 mg/ml hexacetonide; inh 100 mcg/spray

### Implementation

**PO route**

- Give with food or milk to decrease GI symptoms; tablet may be crushed

**IM route**

- Give IM inj deeply in large muscle mass; rotate sites; avoid deltoid; use 21-G needle
- Avoid SUBCUT administration, may damage tissue

**Inhalation route**

- Use spacer device for geriatric
- Give inh with water to decrease possibility of fungal infections; titrated dose, use lowest effective dose
- Give after cleaning aerosol top daily with warm water, dry thoroughly
- Store in cool environment; do not puncture or incinerate container

**Topical route**

- Apply only to affected areas; do not get in eyes
- Apply medication, then cover with occlusive dressing (only if prescribed), seal to normal skin, change q12hr; systemic absorption may occur
- Apply only to dermatoses; do not use on weeping, denuded, or infected areas
- Cleanse skin before applying product
- Continue treatment for a few days after area has cleared
- Store at room temperature

**Nasal route**

- Have patient clear nasal passages before administration; use decongestant if needed; shake inhaler, invert, tilt head backward, insert nozzle into nostril, away from septum; hold other nostril closed and depress activator, inhale through nose, exhale through mouth

## ADVERSE EFFECTS

**CNS:** *Depression,* headache, mood changes
**CV:** *Hypertension,* circulatory collapse, embolism, tachycardia, edema
**EENT:** Fungal infections, increased intraocular pressure, blurred vision
**GI:** *Diarrhea, nausea, abdominal distention,* GI hemorrhage, *increased appetite,* pancreatitis
**HEMA:** Thrombocytopenia
**INTEG:** Acne, poor wound healing, ecchymosis, petechiae
**MS:** Fractures, osteoporosis, weakness

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO, IM) |
| **Distribution** | Crosses placenta, widely distributed |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidney, breast milk |
| **Half-life** | 2-5 hr, adrenal suppression 3-4 days |

### Pharmacodynamics

| | PO | IM | TOPICAL | INH | INTRANASAL |
|---|---|---|---|---|---|
| **Onset** | Unknown | Unknown | Min to hr | 1-2 wk | Unknown |
| **Peak** | 1-2 hr | 1-2 hr | Hr to days | Unknown | 2-3 wk |
| **Duration** | 3 days | Unknown | Hr to days | Unknown | Unknown |

T

## INTERACTIONS

### Individual drugs

Alcohol, amphotericin B, cycloSPORINE, digoxin, indomethacin, quinolones: increased side effects

Ambenonium, isoniazid, neostigmine, somatrem: decreased effects of each specific product

Cholestyramine, colestipol, ePHEDrine, phenytoin, rifampin, theophylline: decreased action of triamcinolone

Indomethacin, ketoconazole: increased action of triamcinolone

### Drug classifications

Anticholinesterases, anticoagulants, anticonvulsants, antidiabetics, salicylates: decreased effects of each specific product

Antidiabetic agents: increased need for antidiabetic agents

Antiinfectives (macrolide), carBAMazepine, contraceptives (oral), estrogens, salicylates: increased action of triamcinolone

Barbiturates: decreased action of triamcinolone

Diuretics, salicylates: increased side effects

Toxoids, vaccines: decreased effects of toxoids, vaccines

### Drug/herb

Aloe, cascara sagrada, senna: increased hypokalemia

### Drug/lab test

Increased: cholesterol, sodium, blood glucose, uric acid, calcium, urine glucose

Decreased: calcium, potassium, $T_4$, $T_3$, thyroid $^{131}I$ uptake test, urine 17-OHCS, 17-KS

False negative: skin allergy tests

## NURSING CONSIDERATIONS

### Assessment

- Monitor potassium, blood glucose, urine glucose while on long-term therapy; hypokalemia and hyperglycemia
- Monitor weight daily; notify prescriber of weekly gain >5 lb; I&O ratio; be alert for decreasing urinary output and increasing edema
- Monitor B/P q4hr, pulse; notify prescriber if chest pain occurs
- Monitor plasma cortisol levels during long-term therapy (normal level 138-635 nmol/L [SI units] when measured at 8 AM); adrenal function periodically for hypothalamic-pituitary-adrenal axis suppression
- Assess for infection: increased temp, WBC even after withdrawal of medication; product masks infection symptoms
- Assess for potassium depletion: paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness
- Assess mental status: affect, mood, behavioral changes, aggression
- Assess nasal passages during long-term treatment for changes in mucus (nasal)
- Monitor temp; if fever develops, product should be discontinued
- Assess for systemic absorption: increased temp, inflammation, irritation (topical)
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cleft lip/palate has occurred (1st trimester), cautious use in breastfeeding, excreted in breast milk
- **Beers:** Avoid in older adults with or at high risk of delirium, monitor for confusion, delirium

### Patient/family education

- Advise patient that emergency ID as corticosteroid user should be carried/worn; not to discontinue abruptly, taper dose
- Instruct patient to notify prescriber if therapeutic response decreases; dosage adjustment may be needed
- Caution patient to avoid OTC products: salicylates, alcohol in cough products, cold preparations unless directed by prescriber; to avoid live vaccines
- Advise patient on all aspects of product use including cushingoid symptoms
- Teach patient symptoms of adrenal insufficiency: nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain
- Teach patient that long-term therapy may be needed to clear infection (1-2 mo depending on type of infection)

**Inhalation route**

- Teach patient proper administration technique; to wash inhaler with warm water and dry after each use
- Teach patient all aspects of product use including cushingoid symptoms

**Topical route**

- Instruct patient to avoid sunlight on affected area; burns may occur

**Nasal route**

- Instruct patient to clear nasal passages if sneezing attack occurs, repeat dose
- Advise patient to continue using product even if mild nasal bleeding occurs; is usually transient
- Teach patient method of instillation after providing written instruction from manufacturer

### Evaluation

**Positive therapeutic outcome**

- Decrease in runny nose (nasal)
- Decreased dyspnea, wheezing, dry crackles on auscultation (inh)
- Ease of respirations, decreased inflammation

• Absence of severe itching, patches on skin, flaking (topical)

## triamcinolone nasal agent

*See Appendix B*

## triamcinolone topical

*See Appendix B*

**⚠ HIGH ALERT**

## triazolam (Rx)

(trye-az′oh-lam)

**Apo-Triazo ✱, Gen-Triazolam ✱, Halcion**

*Func. class.:* Sedative-hypnotic, antianxiety

*Chem. class.:* Benzodiazepine, short acting

**Controlled substance schedule IV (USA), targeted (CDSA IV) (Canada)**

**Do not confuse:** Halcion/Haldol/halcinonide

**ACTION:** Produces CNS depression at limbic, thalamic, hypothalamic levels of CNS; may be mediated by neurotransmitter; γ-aminobutyric acid (GABA); results are sedation, hypnosis, skeletal muscle relaxation, anticonvulsant activity, anxiolytic action

**Therapeutic outcome:** Decreased anxiety, insomnia

**USES:** Insomnia (short-term), sedative/hypnotic

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity to benzodiazepines

**Precautions:** Children <15 yr, geriatric, anemia, renal/hepatic disease, suicidal individuals, product abuse, psychosis, acute closed-angle glaucoma, seizure disorders, angioedema, respiratory disease, depression, sleep-related behaviors (sleep walking), intermittent porphyria, myasthenia gravis, Parkinson's disease

**BLACK BOX WARNING:** Coadministration with other CNS depressants, respiratory depression

## DOSAGE AND ROUTES

**Adult:** PO 0.125-0.5 mg at bedtime, max 0.5 mg/day

**Geriatric:** PO 0.0625-0.125 mg at bedtime, max 0.25 mg/day

**Available forms:** Tabs 0.125, 0.25 mg

### Implementation

• Give with food or milk to decrease GI symptoms; if patient is unable to swallow medication whole, tab may be crushed and mixed with food or fluid

• Give sugarless gum, hard candy, frequent sips of water for dry mouth

## ADVERSE EFFECTS

**CNS:** *Headache, lethargy, drowsiness, daytime sedation,* dizziness, confusion, light-headedness, anxiety, irritability, amnesia, poor coordination, complex sleep-related reactions (sleep driving, sleep eating)

**CV:** Chest pain, pulse changes, ECG changes

**GI:** Nausea, vomiting, diarrhea, heartburn, abdominal pain, constipation, hepatic injury

**SYST:** Severe allergic reactions

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed, crosses placenta, crosses blood-brain barrier |
| **Metabolism** | Liver |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 1.5-5.5 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 15-30 min |
| **Peak** | Unknown |
| **Duration** | 6-8 hr |

## INTERACTIONS

### Individual drugs

**BLACK BOX WARNING:** Alcohol: increased action of both products

Cimetidine, clarithromycin, disulfiram, erythromycin, isoniazid, probenecid: increased effects; do not use concurrently

Rifampin: decreased action of rifampin

Theophylline: decreased effects of theophylline

### Drug classifications

Antacids: decreased effects of antacids

Antiinfectives (clarithromycin): increased effects

CNS depressants: increased effects of both products

Contraceptives (oral): increased effects; do not use concurrently

CYP3A4 inhibitors, protease inhibitors: increased triazolam levels

Smoking: decreased hypnotic effects

### Drug/food

Grapefruit may increase action, avoid concurrent use

T

### Drug/herb
Chamomile, hops, kava, lavender, valerian: increased CNS depression

### Drug/lab test
Increased: AST, ALT, serum bilirubin
Decreased: radioactive iodine uptake
False increase: 17-OHCS

## NURSING CONSIDERATIONS
### Assessment
• Assess patient's mental status: mood, sensorium, anxiety, affect, sleeping pattern, drowsiness, dizziness, especially geriatric; physical dependency, withdrawal symptoms: anxiety, panic attacks, agitation, seizures, headache, nausea, vomiting, muscle pain, weakness; suicidal tendencies; for indications of increasing tolerance and abuse
• Monitor patient's B/P (lying, standing), pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber
• Monitor blood tests: CBC during long-term therapy; blood dyscrasias have occurred rarely; decreased hematocrit, neutropenia may occur
• Monitor liver function tests: AST, ALT, bilirubin, creatinine LDH, alkaline phosphatase
• Monitor I&O ratio; indicate renal dysfunction
• **Beers:** Avoid use in older adults, increased sensitivity to benzodiazepine and decreased metabolism, may cause or worsen delirium
• Severe allergic reactions: May occur any time during use

**BLACK BOX WARNING:** Respiratory depression: May occur more frequently with coadministration of other CNS depressants, monitor respirations often

• **Pregnancy/breastfeeding:** Do not use in pregnancy, not recommended in breastfeeding

### Patient/family education
• Advise patient that product may be taken with food or fluids, and tab may be crushed or swallowed whole
• Caution patient not to use for everyday stress or longer than 3 mo unless directed by prescriber; not to take more than prescribed amount; may be habit forming; not to double doses or skip doses

**BLACK BOX WARNING:** Instruct patient to avoid OTC preparations unless approved by prescriber; alcohol and CNS, sedatives, hypnotics depressants will increase CNS depression

• Caution patient to avoid driving, activities that require alertness because drowsiness may occur; to avoid alcohol ingestion or other psychotropic medications; to rise slowly or fainting may occur, especially geriatric; that drowsiness may worsen at beginning of treatment
• Teach patient to use reliable contraception
• Teach patient that complex sleep-related behaviors (sleep eating/driving) may occur
• Advise patient not to discontinue medication abruptly after long-term use; withdrawal symptoms include vomiting, cramping, tremors, seizures; decrease dosage by 50% q2nights until 0.125 mg for 2 nights, then stop

### Evaluation
**Positive therapeutic outcome**
• Decreased anxiety, restlessness, sleeplessness (short-term treatment only)

## TREATMENT OF OVERDOSE:
Lavage, VS, supportive care

## trifluridine ophthalmic
*See Appendix B*

**RARELY USED**

## trimethobenzamide (Rx)
(trye-meth-oh-ben'za-mide)
**Tigan**
*Func. class.:* Antiemetic, anticholinergic
*Chem. class.:* Ethanolamine derivative

**ACTION:** Acts centrally by blocking chemoreceptor trigger zone, which in turn acts on vomiting center

**Therapeutic outcome:** Absence of nausea and vomiting

**USES:** Nausea, vomiting, prevention of postoperative vomiting

## CONTRAINDICATIONS
Children (parenterally), hypersensitivity to opioids, shock

**Precautions:** Pregnancy, children, geriatric, cardiac dysrhythmias, acute febrile illness, encephalitis, gastroenteritis, dehydration, electrolyte imbalances, Reye's syndrome

## DOSAGE AND ROUTES
### Postoperative vomiting
**Adult:** IM 200 mg followed by a second dose 1 hr later

### Nausea/vomiting
**Adult:** PO 300 mg tid-qid; IM 200 mg tid-qid

### Renal dose
**Adult:** IM CCr 15-30 ml/min give 50% of dose

**Available forms:** Caps 300 mg; inj 100 mg/ml

### Implementation

**PO route**

• Cap may be swallowed whole or opened and mixed with food or fluids

**IM route**

• Administer IM inj in large muscle mass; aspirate to avoid **IV** administration

• Patient should remain lying down for 30 min after IM inj

**Syringe compatibilities:** Glycopyrrolate, HYDROmorphone, midazolam, nalbuphine

## ADVERSE EFFECTS

**CNS:** *Drowsiness,* headache, dizziness, confusion, *vertigo,* EPS, disorientation, coma, seizures, depression

**CV:** Hyper/hypotension, palpitations, cardiac dysrhythmias

**EENT:** Dry mouth, blurred vision, photosensitivity

**GI:** Nausea, diarrhea, vomiting, difficulty swallowing

**INTEG:** Rash, urticaria, fever, chills, flushing, hyperpyrexia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys |
| **Half-life** | Unknown |

### Pharmacodynamics

| | PO | IM | RECT |
|---|---|---|---|
| **Onset** | 20-40 min | 15 min | 10-40 min |
| **Peak** | Unknown | Unknown | Unknown |
| **Duration** | 3-4 hr | 2-3 hr | 3-4 hr |

## INTERACTIONS

### Individual drugs

Alcohol: increased effect

### Drug classifications

CNS depressants: increased effect

## NURSING CONSIDERATIONS

### Assessment

• Monitor VS, B/P; check patients with cardiac disease more often

• Assess for signs of toxicity of other products or masking of symptoms of disease: brain tumor, intestinal obstructions

• Observe for drowsiness, dizziness

• Assess for nausea, vomiting before and after treatment

### Patient/family education

• Teach patient to use good oral hygiene; frequent rinsing of mouth, sugarless gum for dry mouth

• Caution patient to avoid hazardous activities until product response is determined; drowsiness may occur

• Inform patient that orthostatic hypotension occurs often and to rise from sitting or lying position gradually; avoid hot tubs, hot showers, and tub baths because hypotension may occur

• Advise patient to remain lying down after IM inj for at least 30 min

• Inform patient that in hot weather, heat stroke may occur; take extra precautions to stay cool

• Teach patient to avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber, serious product interactions may occur; avoid use with alcohol, CNS depressants, increased drowsiness may occur

• Teach patient about EPS

• Instruct patient to report sore throat, malaise, fever, bleeding, mouth sores; if these occur, CBC should be performed and product discontinued

### Evaluation

**Positive therapeutic outcome**

• Decreased nausea, vomiting

## triptorelin (Rx)

(trip-toe′rel-in)

**Trelstar, Trelstar Depot, Trelstar LA**

*Func. class.:* Gonadotropin-releasing hormone antagonist

*Chem. class.:* Synthetic decapeptide analog of LHRH

**ACTION:** Inhibitor of pituitary gonadotropin secretion; initially increases LH and FSH, with increases in testosterone, reduction in sex steroid levels

**Therapeutic outcome:** Decreased signs/symptoms of advanced prostate cancer

**USES:** Advanced prostate cancer

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity to this product or other LHRH agonists or LHRH

**Precautions:** Metastatic vertebral lesions, urinary tract obstruction, spinal cord compression, renal disease

## DOSAGE AND ROUTES

**Adult:** IM 3.75 mg q4wk; 11.25 mg q12wk, 22.5 mg q24wk

**Available forms:** Microgranules, depot inj 3.75 mg, 11.25 mg

### Implementation
- Give IM using implant, inserted by qualified person
- Use syringe with 20-G needle, withdraw 2 ml of sterile water for inj, inject into vial, shake well, withdraw vial contents, inject immediately

## ADVERSE EFFECTS
**CNS:** Headache, insomnia, dizziness, lability, fatigue
**CV:** *Hypertension,* peripheral edema
**ENDO:** Gynecomastia, breast tenderness, hot flashes
**GI:** Nausea, vomiting, diarrhea
**GU:** Impotence, urinary retention, UTI
**INTEG:** Rash, pain on injection, pruritus, hypersensitivity
**MISC:** Anaphylaxis, angioedema
**MS:** Osteoneuralgia

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | CYP450 |
| **Excretion** | Liver, kidneys |
| **Half-life** | 3 hr |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Drug/lab test
Increased: alk phos, estradiol, FSH, LH, testosterone levels
Decreased: testosterone levels, progesterone

## NURSING CONSIDERATIONS
### Assessment
- **Assess for severe hypersensitivity:** discontinue product and give antihistamines, have emergency equipment nearby
- Monitor I&O ratios; palpate bladder for distention in urinary obstruction
- Monitor for relief of bone pain (back pain)
- Assess levels of testosterone and PSA
- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education
- Teach patient that gynecomastia may occur but will decrease after treatment is discontinued
- Advise patient to report allergic reaction immediately
- Teach patient that disease flare may occur at beginning of therapy

### Evaluation
**Positive therapeutic outcome**
- More normal levels of PSA, acid phosphatase, alkaline phosphatase, testosterone level of <25 ng/dl, tumor response

## trospium (Rx)
(trose′pee-um)
**Sanctura, Sanctura XR**
*Func. class.:* Anticholinergic, overactive bladder product, urinary antispasmodic
*Chem. class.:* Muscarinic receptor antagonist

**ACTION:** Relaxes smooth muscles in bladder by inhibiting acetylcholine effect on muscarinic receptors

**Therapeutic outcome:** Absence of bladder distention, nocturia, frequency, urgency, incontinence

**USES:** Overactive bladder (urinary frequency, urgency)

## CONTRAINDICATIONS
Hypersensitivity, uncontrolled closed-angle glaucoma, urinary retention, gastric retention, myasthenia gravis

**Precautions:** Pregnancy, breastfeeding, children, renal/hepatic disease, controlled closed-angle glaucoma, ulcerative colitis, intestinal atony, bladder outflow obstruction

## DOSAGE AND ROUTES
**Adult:** PO 20 mg bid, give 5 ml ≥1 hr prior to meals or on empty stomach ER 60 mg qAM

### Renal dose
**Adult:** PO CCr < 30 ml/min 20 mg/day at bedtime
**Geriatric ≥75 yr:** PO titrate down to 20 mg/day based on response and tolerance

**Available forms:** Tabs 20 mg caps ER 60 mg

### Implementation
- Take 1 hr before meals or on empty stomach

## ADVERSE EFFECTS
**CNS:** Fatigue, dizziness, headache, confusion
**CV:** Tachycardia
**EENT:** Dry eyes, vision abnormalities
**GI:** Flatulence, abdominal pain, *constipation, dry mouth,* dyspepsia
**GU:** Urinary retention, UTI
**INTEG:** Dry skin, angioedema
**MISC:** Heat stroke, fever

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed (10%) |
| **Distribution** | Protein bound (50%-85%) |
| **Metabolism** | Not fully understood in humans; extensively metabolized |
| **Excretion** | Urine (6%), feces (85%); excreted in urine by active tubular secretion |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Alcohol: increased drowsiness

MetFORMIN, procainamide, quiNIDine, ranitidine, tenofovir, triamterene, vancomycin: increased or decreased action of trospium

### Drug classifications

CNS depressants: increased drowsiness

Products excreted by active renal secretion (aMILoride, digoxin, morphine): increased or decreased action of trospium

### Drug/food

High-fat meal: decreased absorption

## NURSING CONSIDERATIONS

### Assessment

- **Assess urinary patterns:** distention, nocturia, frequency, urgency, incontinence, voiding patterns
- **Beers:** Avoid in older adults with or at high risk for delirium
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excreted in limited amount in breast milk

### Patient/family education

- Advise patient to avoid hazardous activities; dizziness may occur
- Caution patient that alcohol may increase drowsiness
- Inform patient about anticholinergic effects that may occur
- Teach patient to avoid all other products unless approved by prescriber

### Evaluation

#### Positive therapeutic outcome

- Correction of urinary status: absence of dysuria, frequency, nocturia, incontinence

## ulipristal (Rx)

(ue'li-pris'tal)
**Ella**
*Func. class.:* Progesterone agonist/antagonist-abortifacient

**ACTION:** Binds to the progesterone receptor and prevents progesterone from occupying the receptor, postpones follicular rupture when taken immediately prior to ovulation

**Therapeutic outcome:** Absence of pregnancy

**USES:** Emergency contraception

## CONTRAINDICATIONS

Pregnancy, children/infants/neonates, postmenopausal females

**Precautions:** History of ectopic pregnancy, HIV

## DOSAGE AND ROUTES

**Adult/adolescent females:** PO 30 mg (1 tab) as soon as possible within 120 hr (5 days) of unprotected intercourse or a known or suspected contraceptive failure

**Available forms:** Tab 30 mg

### Implementation

- Administer without regard to food
- Store at room temperature, protect from light

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, fatigue
**GI:** Nausea, vomiting, abdominal pain
**GU:** Dysmenorrhea, breakthrough bleeding
**INTEG:** Acne vulgaris

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding >94% |
| **Metabolism** | Metabolized by CYP3A4 |
| **Excretion** | Unknown |
| **Half-life** | Terminal half-life 27-38 hrs |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Bosentan, carBAMazepine, felbamate, griseofulvin, OXcarbazepine, phenytoin, rifampin, St. John's wort, topiramate, bexarotene, dexamethasone, etravirine, flutamide, metyrapone, modafinil, nafcillin, nevirapine, pioglitazone, rifabutin, itraconazole, ketoconazole: decreased effect of ulipristal

Aldesleukin, IL-2, amiodarone, atazanavir, basiliximab, chloramphenicol, cimetidine, clarithromycin, dalfopristin, danazol, darunavir, delavirdine, diltiazem, dronedarone, erythromycin, fluconazole, FLUoxetine, fluvoxaMINE, imatinib, isoniazid, lapatinib, nefazodone, nelfinavir, niCARdipine, octreotide, pantoprazole, quinupristin, ranolazine, saquinavir, tamoxifen, telithromycin, tipranavir, verapamil, voriconazole, zafirlukast: increased ulipristal effect and adverse reactions

Aprepitant, fosaprepitant, efavirenz, fosamprenavir, quiNINE, ritonavir: increased or decreased ulipristal effect

### Drug classifications

Regular hormonal contraceptive methods: decreased contraceptive action

CYP3A4 inducers, barbiturates: decreased effect of ulipristal

CYP3A4 inhibitors: increased ulipristal effect and adverse reactions

### Drug/herb

St. John's wort: decreased effect of ulipristal

## NURSING CONSIDERATIONS

### Assessment

- **Assess need for emergency contraception,** pregnancy planned or suspected, obtain pregnancy test before use (pregnancy)
- Assess medications taken, many drug interactions may occur

### Patient/family education

- Instruct patient that if vomiting occurs within 3 hours of taking the tablet, consider repeating the dose
- Advise patient to report to provider any side effects
- Explain reason for medication and expected results
- Advise patient to avoid use in breastfeeding

### Evaluation

**Positive therapeutic outcome**

- Absence of pregnancy

## undecylenic acid topical

*See Appendix B*

## unoprostone ophthalmic

*See Appendix B*

ulipristal (Rx)

undecylenic acid topical

unoprostone ophthalmic

## valACYclovir (Rx)

(val-a-sye'kloh-vir)
**Valtrex**
*Func. class.:* Antiviral
*Chem. class.:* Synthetic acyclic purine nucleoside analog

**Do not confuse:** valACYclovir/valGANciclovir, Valtrex/Valcyte

**ACTION:** Interferes with DNA synthesis by conversion to acyclovir, causing decreased viral replication, time of lesional healing

**Therapeutic outcome:** Absence of itching, painful lesions; crusting and healing of lesions

**USES:** Treatment or suppression of herpes zoster (shingles), recurrent genital herpes, herpes labialis (cold sores), varicella, varicella-zoster

**Unlabeled uses:** Prevention of CMV infection in advanced HIV, posttransplant patients, Bell's palsy, herpes simplex virus prophylaxis

## CONTRAINDICATIONS

Hypersensitivity to this product, acyclovir, valGANciclovir

**Precautions:** Pregnancy, breastfeeding, geriatric, renal/hepatic disease, electrolyte imbalance, dehydration, hypersensitivity to penciclovir, famciclovir, ganciclovir, varicella

## DOSAGE AND ROUTES

### Genital herpes (suppressive initial)

**Adult:** PO 1 g bid × 10 days initially

### Genital herpes (recurrent episodes)

**Adult:** PO 500 mg bid × 3 days

### Genital herpes (suppressive therapy)

**Adult:** PO 1 g/day with normal immune function; 500 mg/day for those with ≤9 recurrences/yr; 500 mg bid in HIV-infected patients with CD4 ≥100

### Reduction of transmission

**Adult:** PO 500 mg/day for source partner

### Herpes zoster (shingles)

**Adult:** PO 1 g tid × 1 wk

### Herpes labialis

**Adult:** PO 2 g bid × 1 day at first sign of lesions

### Varicella (chickenpox) in immunocompetent patients

**Adolescent and child ≥2 yr:** PO 20 mg/kg/dose tid × 5 days, max 3 g/day; start at first sign, preferably within 24 hr of rash

### Renal dose

**Adult:** PO CCr 30-49 ml/min 1g q12hr (herpes zoster); 1 g q12hr × 1 day (herpes labialis); CCr 10-29 ml/min 1 g q24hr (genital herpes/herpes zoster); 500 mg q24hr (recurrent genital herpes); CCr <10 ml/min 500 mg q24hr (genital herpes/herpes zoster), 500 mg q24hr (recurrent genital herpes)

**Available forms:** Tabs 500, 1000 mg

### Implementation

- Give within 72 hr of outbreak (herpes zoster); as soon as possible (herpes labialis, genital herpes)
- Give orally before infection occurs
- Store at room temp; protect from light, moisture

## ADVERSE EFFECTS

**CNS:** Tremors, lethargy, *dizziness, headache, weakness,* depression
**ENDO:** *Dysmenorrhea*
**GI:** *Nausea, vomiting, diarrhea, abdominal pain, constipation,* increased AST
**HEMA:** Thrombocytopenic purpura, hemolytic uremic syndrome
**INTEG:** *Rash*
**MISC:** Dehydration

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Crosses placenta, enters breast milk, protein binding 13.5%-17.9% |
| **Metabolism** | Converts to acyclovir |
| **Excretion** | Urine, as acyclovir |
| **Half-life** | 2½-3½ hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Cimetidine, probenecid: increased blood levels of valACYclovir (only if renal disease is significant)

### Drug/lab test

Increased: LFTs, creatinine
Decreased: WBC, platelets

## NURSING CONSIDERATIONS

### Assessment

- **Assess for signs of infection;** characteristics of lesions; therapy should be started at first sign of herpes and is most effective within 72 hr of outbreak
- Assess C&S before product therapy; product may be given as soon as culture is performed,

V

lesion must be unroofed to obtain specimen; repeat C&S after treatment; determine the presence of other STDs
- Assess bowel pattern before, during treatment
- Assess for skin eruptions: rash
- Assess allergies before treatment, reaction of each medication
- Assess for thrombocytopenic purpura, hemolytic uremic syndrome, may be fatal
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excreted in breast milk

### Patient/family education
- Advise patient to take as prescribed; if dose is missed, take as soon as remembered up to 2 hr before next dose; do not double dose, without regard to meals
- Instruct patient to take product orally before infection occurs; product should be taken when itching or pain occurs, usually before eruptions
- Inform patient that partners need to be told that patient has herpes; they can become infected; condoms must be worn to prevent reinfections
- Tell patient that product does not cure infection, just controls symptoms and does not prevent infection to others
- Teach patient to report CNS changes (tremors, weakness, lethargy) immediately

### Evaluation
**Positive therapeutic outcome**
- Absence of itching, painful lesions; crusting and healed lesions

## valGANciclovir (Rx)
(val-gan-sy'kloh-veer)
**Valcyte**
*Func. class.:* Antiviral
*Chem. class.:* Synthetic nucleoside

**Do not confuse:** valGANciclovir/valACYclovir, Valcyte/Valtrex

**ACTION:** valGANciclovir is metabolized to ganciclovir; inhibits replication of human CMV in vivo and in vitro by selectively inhibiting viral DNA synthesis

**Therapeutic outcome:** Decreased proliferation of virus responsible for CMV retinitis

**USES:** Cytomegalovirus (CMV) retinitis in immunocompromised persons, including those with AIDS, after indirect ophthalmoscopy confirms diagnosis; prevention of CMV in transplantation; prevention of CMV in patients at risk going through transplant (kidney, heart, pancreas)

## CONTRAINDICATIONS
Breastfeeding, hypersensitivity to ganciclovir or valACYclovir, absolute neutrophil count $<500/mm^3$, platelet count $<25{,}000/mm^3$, hemodialysis, liver transplant

**Precautions:** Children, geriatric, renal function impairment, hypersensitivity to acyclovir, penciclovir, famciclovir

**BLACK BOX WARNING:** Preexisting cytopenias, secondary malignancy, infertility, anemia, pregnancy

## DOSAGE AND ROUTES
### Treatment of CMV
**Adult:** PO induction 900 mg bid × 21 days with food; maintenance 900 mg/day with food

### Transplant (CMV prophylaxis)
**Adult/adolescent >16 yr:** PO 900 mg/day with food starting within 10 days before transplantation until 100 days after transplantation
**Infant ≥4 mo/child/adolescent ≤16 yr:** PO give within 10 days of heart/kidney transplant; calculate dose as 7 × BSA × CCr and give a single daily dose

### Renal dose
CCr ≥60 ml/min same dosage as above; CCr 40-59 ml/min 450 mg bid × 21 days, then 450 mg/day; CCr 25-39 ml/min 450 mg/day × 21 days, then 450 mg q2day; CCr 10-24 ml/min 450 mg q2day, then 450 mg 2 ×/week

**Available forms:** Tabs 450 mg; powder for oral sol 50 mg/ml

### Implementation
**PO tab**
- Give with food for better absorption, avoid getting on skin, do not break, crush, or chew tab

**Oral SOL**
- Measure 9 ml of purified water in graduated cylinder, shake bottle to loosen powder, add ½ liquid, shake well, add remaining water, shake, remove child-resistant cap and push bottle adapter into neck of bottle, close with cap, give using the dispenser provided
- Store liquid in refrigerator; do not freeze; throw away any unused portion after 49 days

## ADVERSE EFFECTS
**CNS:** *Fever,* chills, coma, *confusion,* abnormal thoughts, dizziness, bizarre dreams, *headache,* psychosis, tremors, somnolence, *paresthesia, weakness,* seizures, insomnia
**EENT:** Retinal detachment in CMV retinitis
**GI:** *Abnormal liver function tests, nausea, vomiting, anorexia, diarrhea, abdominal pain,* hemorrhage

**GU:** Hematuria, increased creatinine, BUN
**HEMA:** Granulocytopenia, thrombocytopenia, irreversible neutropenia, anemia, eosinophilia
**INTEG:** *Rash,* alopecia, *pruritus,* urticaria, pain at inj site, phlebitis, Stevens-Johnson syndrome
**MISC:** Local and systemic infections and sepsis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed from GI tract |
| **Distribution** | Plasma protein binding unknown; crosses blood-brain barrier, CSF |
| **Metabolism** | Rapidly metabolized in intestinal wall and liver to ganciclovir |
| **Excretion** | Kidneys (ganciclovir) |
| **Half-life** | 3-4½ hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-3 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Adriamycin, amphotericin B, cycloSPORINE, dapsone, DOXOrubicin, flucytosine, pentamidine, trimethoprim/sulfamethoxazole, vinBLAStine, vinCRIStine: increased toxicity
Didanosine: increased effect; monitor for adverse effects, toxicity
Imipenem/cilastatin: increased seizures
Mycophenolate: increased effect of both drugs
Probenecid: decreased renal clearance of valGANciclovir
Radiation, zidovudine: severe granulocytopenia; do not coadminister

### Drug classifications

Antineoplastics, immunosuppressants: increased severe granulocytopenia; do not coadminister
Nucleoside analogs, other: increased toxicity

### Drug/food

Absorption: increased with high-fat meal

### Drug/lab test

Increased: creatinine
Decreased: RBC/WBC, Hct/Hgb

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Assess for leukopenia/neutropenia/thrombocytopenia:** WBCs, platelets q2day during 2 ×/day dosing and then qwk

**BLACK BOX WARNING: Malignancy:** monitor for malignancy; avoid accidental exposure of broken, crushed tabs, powder for solution; if these were in contact with skin, wash well with soap and water

- Assess serum creatinine or CCr ≥q2wk
- Assess for CMV retinitis by ophthalmoscopy before beginning treatment and q2wk

### Patient/family education

- Inform patient that product does not cure condition, that regular ophthalmologic and blood tests are necessary
- Caution patient that major toxicities may necessitate discontinuing product

**BLACK BOX WARNING: Pregnancy:** Caution patient to use contraception during treatment and that infertility may occur; men should use barrier contraception for 90 days after treatment, do not breastfeed

- Teach patient to increase fluid intake, report decreased urinary output
- Instruct patient to take with food, avoid high-fat meals
- Instruct patient to report seizures, dizziness; to avoid hazardous activities
- Caution patient to use sunscreen to prevent burns

### Evaluation

**Positive therapeutic outcome**
- Decreased symptoms of CMV

## TREATMENT OF OVERDOSE:

Maintain adequate hydration; dialysis may help reduce serum concentrations; consider use of hematopoietic growth factors

## valproate (Rx)

(val-proh'ate)
**Depacon**
## valproic acid (Rx)
**Depakene**
## divalproex sodium (Rx)
**Depakote, Depakote ER, Epival**
*Func. class.:* Anticonvulsant, vascular headache suppressant
*Chem. class.:* Carboxylic acid derivative

**ACTION:** Increases levels of γ-aminobutyric acid (GABA) in the brain, which decreases seizure activity

**Therapeutic outcome:** Decreased symptoms of epilepsy, bipolar disorder

**USES:** Simple (petit mal), complex (petit mal), absence, mixed seizures, manic episode associated with bipolar disorder, prophylaxis of migraine, adjunct in schizophrenia, tardive dyskinesia, aggression in children with ADHD, organic brain syndrome, tonic-clonic (grand mal)/myoclonic seizures

**Unlabeled uses:** Rectal for seizures (valproic acid)

## CONTRAINDICATIONS

Hypersensitivity, urea cycle disorders, mitochondrial disease, hepatic disease

**Precautions:** Breastfeeding, geriatric abrupt discontinuation, carnitine deficiency, coagulopathy, head trauma, organic brain syndrome, HIV, renal disease, suicidal ideation, surgery, thrombocytopenia

**BLACK BOX WARNING:** Children <2 yr, contraception requirements, hepatotoxicity, pancreatitis, pregnancy

## DOSAGE AND ROUTES

### For monotherapy or adjunct treatment of simple absence seizures, complex absence seizures, or complex partial seizures, and adjunctively for other seizure types that include absence or partial complex seizures (tonic-clonic seizures, myoclonic seizures)

**Adult, adolescent, and child 10 yr and older: PO/IV:** Initially, 10-15 mg/kg/day, increase by 5-10 mg/kg/day qwk, max 60 mg/kg/day

### For the treatment of acute mania associated with bipolar disorder, with or without psychotic features

**Adult: PO** (delayed-release divalproex [Depakote] or delayed-release valproic acid [Stavzor]): Initially, 750 mg/day in divided doses, then increase as rapidly as possible to the lowest effective dose that produces the desired clinical effect, max 60 mg/kg/day; **PO** (extended-release divalproex; i.e., Depakote ER): Initially, 25 mg/kg/day, increase as rapidly as possible to achieve the desired clinical effect. Consider a reduced initial dosage and slower dose titration in geriatric adults, max 60 mg/kg/day

### For migraine prophylaxis

**Adult ≤ 65 yr: PO** (delayed-release divalproex [Depakote] or delayed-release valproic acid [Stavzor]): Initially, 250 mg bid, titrate as needed up to a max 500 mg bid; (extended-release divalproex; Depakote ER): Initially, 500 mg qday × 1 wk, then increasing to 1000 mg qday, max 1000 mg/day

**Available:** Valproic acid: caps 250 mg; syr 250 mg/5 ml del rel cap (Stavzor) 125 mg; divalproex: del rel tabs 125, 250, 500 mg; ext rel tabs 250, 500 mg; sprinkle caps 125 mg; valproate: inj 100 mg/ml

### Implementation

- Swallow tabs and caps whole; do not break, crush, or chew
- Sprinkle cap contents on food
- Give elixir alone; do not dilute with carbonated beverage; do not give syrup to patients on sodium restriction
- Give with food or milk to decrease GI symptoms

**IV route**

- Dilute dose with ≥50 ml $D_5W$, NS, LR
- Run over 60 min (20 mg/min)

## ADVERSE EFFECTS

**CNS:** *Sedation, drowsiness,* dizziness, headache, incoordination, depression, hallucinations, behavioral changes, tremors, aggression, weakness, coma, suicidal ideation
**CV:** Hypotension/hypertension, chest pain, palpitations, peripheral edema
**EENT:** Visual disturbances, taste perversion
**GI:** *Nausea, vomiting, constipation, diarrhea, dyspepsia,* anorexia, cramps, hepatic failure, pancreatitis, toxic hepatitis, stomatitis, weight gain, dry mouth
**GU:** Enuresis, irregular menses
**HEMA:** Thrombocytopenia, leukopenia, lymphocytosis, increased pro-time, bruising, epistaxis, pancytopenia
**INTEG:** *Rash,* alopecia, photosensitivity, dry skin
**META:** Hyperammonemia, SIADH
**RESP:** Dyspnea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Breast milk, crosses placenta, widely distributed, protein binding 90% |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | 6-16 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 15-30 min |
| **Peak** | 1-4 hr |
| **Duration** | 4-6 hr |

## INTERACTIONS

### Individual drugs

Abciximab, cefoperazone, cefoTEtan, eptifibatide, heparin, tirofiban: increased bleeding risk
Alcohol: increased CNS depression
Cimetidine: decreased metabolism of valproic acid
ChlorproMAZINE, erythromycin, felbamate: increased valproic acid level
Phenytoin: increased action of phenytoin
Warfarin: increased bleeding

### Drug classifications

Antidepressants (tricyclics), barbiturates: increased action
Antihistamines, barbiturates, MAOIs, opioids, sedative/hypnotics: increased CNS depression
Tricyclics: decreased seizure threshold

### Drug/lab test

Increased: LFTs, bleeding time, ammonia
Decreased: sodium
False positive: ketones, urine
Interference: thyroid function tests

## NURSING CONSIDERATIONS

### Assessment

- Monitor blood tests: Hct, Hgb, RBC, serum folate, ammonia, platelets, pro-time, PTT, vit D if on long-term therapy
- Monitor liver function tests: AST, ALT, bilirubin, creatinine, failure; monitor for fever, anorexia, vomiting, lethargy, jaundice of skin, eyes that may occur during treatment, those with organic brain disorders, mental retardation, child <2 yr
- Monitor blood levels: therapeutic level 50-125 mcg/ml
- **Assess seizure disorder:** location, aura, activity, duration; seizure precautions should be in place
- **Assess bipolar disorder:** mood, activity, sleeping, eating, behavior; suicidal thoughts/behaviors
- **Hyperammonemic encephalopathy:** can be fatal in those with urea cycle disorders (UCD); lethargy, confusion, coma, CV, respiratory changes; discontinue
- **Assess migraines:** frequency, intensity
- Overdose symptoms: heart block, coma

**BLACK BOX WARNING:** Assess for pancreatitis, may be fatal; may occur anytime during treatment or several months/years after discontinuing treatment

- **Beers:** Avoid in older adults unless safer alternative is not available, ataxia, impaired psychomotor function may occur

**BLACK BOX WARNING: Do not use in pregnancy (migraine prophylaxis), use only in pregnancy (epilepsy, manic episodes) if other alternatives are not available; major malformation may occur, enroll pregnant patients in the North American Antiepileptic Drug Pregnancy Registry 888-233-2334, cautious use in breastfeeding, excreted in breast milk**

### Patient/family education

- Teach patient that physical dependency may result from extended use
- Instruct patient to report immediately suicidal thoughts/behaviors
- Instruct patient to avoid driving, other activities that require alertness
- Advise patient not to discontinue medication quickly after long-term use; seizures may result

**BLACK BOX WARNING:** Advise patient to report visual disturbances, rash, diarrhea, light-colored stools, jaundice, protracted vomiting to prescriber

- Advise patient to use contraception while taking this product, to notify provider if pregnancy is planned or suspected
- Instruct patient to drink plenty of fluids

### Evaluation

**Positive therapeutic outcome**

- Decreased seizures

## valsartan (Rx)

(val-zar'tan)
**Diovan**
*Func. class.:* Antihypertensive
*Chem. class.:* Angiotensin II receptor antagonist (type $AT_1$)

**Do not confuse:** Diovan/Zyban

**ACTION:** Blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; selectively blocks the binding of angiotensin II to the $AT_1$ receptor found in tissues

**Therapeutic outcome:** Decreased B/P

**USES:** Hypertension, alone or in combination, in patients >6 yr; HF, after MI with left ventricular dysfunction/failure in stable patients

## CONTRAINDICATIONS

Hypersensitivity, severe hepatic disease, bilateral renal artery stenosis

**BLACK BOX WARNING:** Pregnancy

**Precautions:** Breastfeeding, children, geriatric, HF, hypertrophic cardiomyopathy, aortic/mitral valve stenosis, CAD, angioedema, renal/hepatic disease, hypersensitivity to ACE inhibitors, hyperkalemia, hypovolemia, African descent

## DOSAGE AND ROUTES

### Hypertension (alone or in combination)

**Adult:** PO 80 or 160 mg/day alone or in combination with other antihypertensives, may increase to 320 mg HF Class II to IV
**Geriatric:** PO Adjust based on clinical response; may start with lower dose
**Child/adolescent 6-16 yr:** PO 1.3 mg/kg/day, max 40 mg/day

### HF

**Adult:** PO 40 mg bid, up to 60 mg bid

### Post MI

**Adult:** PO 20 mg bid as early as 12 hr after MI, may be titrated within 7 days to 40 mg bid, then titrate to maintenance of 160 mg bid

### Available forms: Tabs 80, 160, 320 mg

### Implementation

- Administer without regard to meals

## ADVERSE EFFECTS

**CNS:** *Dizziness, insomnia,* drowsiness, vertigo, headache, fatigue
**CV:** Angina pectoris, 2nd-degree AV block, cerebrovascular accident, hypotension, MI, dysrhythmias
**EENT:** Conjunctivitis
**GI:** Diarrhea, abdominal pain, nausea, hepatotoxicity
**GU:** Impotence, nephrotoxicity, renal failure
**HEMA:** *Anemia,* neutropenia
**META:** Hyperkalemia
**MISC:** Vasculitis, angioedema
**MS:** Cramps, myalgia, pain, stiffness
**RESP:** *Cough*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Bound to plasma proteins |
| **Metabolism** | Extensive |
| **Excretion** | Feces, urine, breast milk |
| **Half-life** | 9 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Up to 2 hr |
| **Peak** | 2-4 hr |
| **Duration** | 24 hr |

## INTERACTIONS

### Individual drugs

Aliskiren: do not use concurrently
Gemfibrozil, rifampin, ritonavir, telithromycin: increased valsartan levels
Lithium: increased effects of lithium

### Drug classifications

Diuretics (potassium-sparing, potassium supplements, ACE inhibitors): increased hyperkalemia
NSAIDs, salicylates: decreased antihypertensive effects

### Drug/herb

Ephedra, ma huang: decreased antihypertensive effect
Hawthorn: increased antihypertensive effect

### Drug/food

Decreased AUC by 40%
Salt substitutes with potassium: increased hyperkalemia

## NURSING CONSIDERATIONS

### Assessment

- Assess B/P (lying, sitting, standing), pulse q4hr; note rate, rhythm, quality periodically
- Monitor electrolytes: potassium, sodium, chloride; total $CO_2$
- **Assess for angioedema:** facial swelling, shortness of breath, edema in feet, legs daily
- Obtain baselines in renal, liver function tests before therapy begins
- Assess blood tests: BUN, creatinine, before treatment
- Monitor for edema in feet, legs daily
- Assess for skin turgor, dryness of mucous membranes for hydration status; correct volume depletion before initiating therapy
- **Overdose symptoms:** bradycardia or tachycardia, circulatory collapse

**BLACK BOX WARNING: Pregnancy/breastfeeding:** Do not use in pregnancy, may cause fetal death, do not breastfeed

### Patient/family education

- Teach patient not to take this product if breastfeeding or pregnant, or have had an allergic reaction to this product
- If a dose is missed, instruct patient to take as soon as possible, unless it is within an hour before next dose
- Advise patient to comply with dosage schedule, even if feeling better
- Teach patient to notify prescriber of fever, swelling of hands or feet, irregular heartbeat, chest pain, persistent cough

• Advise patient excessive perspiration, dehydration, diarrhea may lead to fall in blood pressure; consult prescriber if these occur
• Inform patient that product may cause dizziness, fainting; light-headedness may occur, maintain hydration
• Instruct patient to avoid potassium supplements and foods, salt substitutes
• Caution patient to rise slowly to sitting or standing position to minimize orthostatic hypotension; how to take B/P

**BLACK BOX WARNING:** Teach patient not to take this medication if pregnant or breastfeeding

### Evaluation

**Positive therapeutic outcome**
• Decreased B/P

## vancomycin

(van-koe-mye'sin)
**Vancocin**
*Func. class.:* Antiinfective—miscellaneous
*Chem. class.:* Tricyclic glycopeptide

**ACTION:** Inhibits bacterial cell wall synthesis, blocks glycopeptides

**Therapeutic outcome:** Bactericidal for the following organisms: staphylococci, streptococci, *Corynebacterium, Clostridium*

**USES:** *Actinomyces* sp., *Bacillus* sp., *Clostridium difficile, Clostridium* sp., *Enterococcus faecalis, Enterococcus faecium, Enterococcus* sp., *Lactobacillus* sp., *Listeria monocytogenes, Staphylococcus aureus* (MRSA), *Staphylococcus aureus* (MSSA), *Staphylococcus epidermidis, Staphylococcus* sp., *Streptococcus agalactiae* (group B streptococci), *Streptococcus bovis, Streptococcus pneumoniae, Streptococcus pyogenes* (group A beta-hemolytic streptococci), *Viridans streptococci;* may be effective against *Corynebacterium jeikeium, Corynebacterium* sp.; pseudomembranous colitis, staphylococcal enterocolitis, group A β-hemolytic streptococci, endocarditis prophylaxis for dental procedures, bacteremia, join/bone infections, osteomyelitis, pneumonia, septicemia

## CONTRAINDICATIONS

Hypersensitivity, previous hearing loss

**Precautions:** Pregnancy, breastfeeding, neonates, geriatric, renal disease

## DOSAGE AND ROUTES

### Serious staphylococcal infections (when other products are ineffective, including MRSA, diphtheroid organisms)

**Adult: IV** 500 mg (7.5 mg/kg) q6-8hr or 1 g (15 mg/kg) q12hr or 15-20 mg/kg q12hr
**Child: IV** 40-60 mg/kg/day divided q6-8hr
**Neonate: IV** 15 mg/kg initially followed by 10 mg/kg q8-24hr

### Pseudomembranous/staphylococcal enterocolitis

**Adult:** PO 125 mg qid × 10-14 days
**Child:** PO (unlabeled) 40 mg/kg/day divided q6hr × 7-10 days, max 2 g/day

### Staphylococcal Endocarditis prophylaxis for dental procedure

**Adult: IV** 2 g divided (500 mg q6hr or 1 g q12hr)
**Child: IV** 20 mg/kg over 1 hr; 1 hr before procedure

### Renal dose

**Adult:** IV 15-20 mg/kg loading dose in seriously ill; individualize all other doses

**Available forms:** Cap 125, 250 mg; powder for inj **IV** 500, 750 mg; vials 1, 5, 10 g; dextrose sol for inj 500 mg/100 ml, 750 mg/150 ml, 1 g/200 ml

### Implementation

• Give antihistamine if red man syndrome occurs: decreased B/P, flushing of neck, face; stop or slow infusion
• Give dose based on serum conc
• Give in equal intervals around the clock to maintain blood levels
• Store at room temp for up to 2 wk after reconstitution
• Have adrenaline, suction, tracheostomy set, endotracheal intubation equipment on unit; anaphylaxis may occur
• Provide adequate intake of fluids (2 L) to prevent nephrotoxicity

**PO route**
• Give without regard to food, swallow whole (only used for *Clostridium difficile*)

**Intermittent IV INF route**
• Give after reconstitution with 10 ml of sterile water for inj (500 mg/10 ml); further dilution is needed for **IV**, 500 mg/100 ml of 0.9% NaCl, $D_5W$ given as intermittent inf over 1 hr; decrease rate of inf if red man syndrome occurs

**Continuous IV INF route (unlabeled)**
• Reconstitute, then may inf 1-2 g in volume to give over 24 hr if intermittent **IV** route cannot be used

V

**Y-site compatibilities:** Acetylcysteine, acyclovir, alatrofloxacin, aldesleukin, alemtuzumab, alfentanil, allopurinol, alprostadil, amifostine, amikacin, amino acids injection, aminocaproic acid, amiodarone, amoxicillin-clavulanate, amsacrine, anidulafungin, argatroban, ascorbic acid injection, atenolol, atracurium, atropine, azithromycin, benztropine, bleomycin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, carmustine, caspofungin, cefpirome, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clarithromycin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAUNOrubicin liposome, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, doxapram, DOXOrubicin, DOXOrubicin liposomal, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, folic acid (as sodium salt), gallium, gemcitabine, gentamicin, glycopyrrolate, granisetron, HYDROmorphone, hydrOXYzine, ifosfamide, insulin, regular, irinotecan, isoproterenol, isosorbide, ketamine, labetalol, lactated Ringer's injection, lepirudin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methyldopate, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoXANtrone, morphine, multiple vitamins injection, mycophenolate, nalbuphine, naloxone, nesiritide, netilmicin, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ofloxacin, ondansetron, oxacillin, oxaliplatin, oxytocin, PACLitaxel (solvent/surfactant), palonosetron, pamidronate, pancuronium, papaverine, PEMEtrexed, penicillin G potassium/sodium, pentamidine, pentazocine, PENTobarbital, perphenazine, PHENobarbital, phentolamine, phenylephrine, phytonadione, piritramide, polymyxin B, potassium acetate/chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quiNIDine, ranitidine, remifentanil, rifampin, Ringer's injection, riTUXimab, sodium acetate/bicarbonate/citrate, succinylcholine, SUFentanil, tacrolimus, teniposide, thiamine, thiotepa, tigecycline, tirofiban, TNA (3-in-1), tobramycin, tolazoline, TPN (2-in-1), trastuzumab, urapidil, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

## ADVERSE EFFECTS

**CNS:** Headache
**CV:** Cardiac arrest, vascular collapse (rare), hypotension, peripheral edema
**EENT:** *Ototoxicity, permanent deafness,* tinnitus, nystagmus
**GI:** Nausea, pseudomembranous colitis
**GU:** Nephrotoxicity: increased BUN, creatinine, albumin, fatal uremia
**HEMA:** Leukopenia, eosinophilia, neutropenia
**INTEG:** Chills, fever, rash, thrombophlebitis at inj site, urticaria, pruritus, necrosis (red man syndrome), skin/subcutaneous tissue disorders
**MS:** Back pain
**RESP:** Wheezing, dyspnea
**SYST:** Anaphylaxis, superinfection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poorly absorbed (PO), completely absorbed (**IV**) |
| **Distribution** | Widely distributed, crosses placenta |
| **Metabolism** | Liver |
| **Excretion** | PO, feces; **IV**, kidneys |
| **Half-life** | 4-8 hr |

### Pharmacodynamics

| | IV |
|---|---|
| **Onset** | Immediate |
| **Peak** | Inf end |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Acyclovir, adefovir, amphotericin B, capreomycin, CISplatin, colistin, cycloSPORINE, foscarnet, ganciclovir, methotrexate, pamidronate, IV pentamidine, polymyxin B, streptozocin, tacrolimus, zoledronic acid: increased ototoxicity or nephrotoxicity
Cholestyramine, colestipol, cidofovir: do not use concurrently
MetFORMIN: increased lactic acidosis

### Drug classifications

Aminoglycosides, cephalosporins, NSAIDs: increased ototoxicity or nephrotoxicity
Nodepolarizing muscle relaxants: increased neuromuscular effects

### Drug/lab test

Increased: BUN/creatinine, eosinophils
Decreased: WBC

## NURSING CONSIDERATIONS

### Assessment

- **Assess for infection:** WBC, urine, stools, sputum, wound characteristics, throughout treatment, obtain C&S before starting treatment
- **Nephrotoxicity** Monitor I&O ratio, BUN, creatinine; report hematuria, oliguria because nephrotoxicity may occur

• Monitor blood tests: WBC; serum levels; peak 1 hr after 1-hr inf 25-40 mg/L; trough before next dose 5-10 mg/L, especially in renal disease, no trough levels are needed for PO form
• **Pseudomembranous colitis:** Assess for watery or bloody diarrhea, abdominal cramps, fever, pus, mucus, nausea, dehydration, discontinue immediately
• Obtain C&S before product therapy; product may be given as soon as culture is performed
• Assess auditory function during, after treatment; hearing loss, ringing, roaring in ears; product should be discontinued
• Monitor B/P during administration; sudden drop may indicate red man syndrome
• Assess for signs of infection
• **Red man syndrome:** flushing of neck, face, upper body, arms, back; may lead to anaphylaxis, slow IV infusion to >1 hr
• **Pregnancy/breastfeeding:** Use only if clearly needed, no well-controlled studies, do not breastfeed, excreted in breast milk

### Patient/family education

• Teach patient aspects of product therapy: need to complete entire course of medication to ensure organism death (7-10 days); culture may be performed after completed course of medication
• Advise patient to report sore throat, fever, fatigue; could indicate superinfection
• Instruct patient that product must be taken in equal intervals around the clock to maintain blood levels

### Evaluation

**Positive therapeutic outcome**
• Absence of fever, sore throat
• Negative culture after treatment

## vardenafil (Rx)

(var-den'a-fil)
**Levitra, Staxyn**
*Func. class.:* Impotence agent
*Chem. class.:* Phosphodiesterase type 5 inhibitor

## ACTION:

Inhibits phosphodiesterase type 5 (PDE5); enhances erectile function by increasing the amount of cyclic GMP, which causes smooth muscle relaxation and increased blood flow into the corpus cavernosum

**Therapeutic outcome:** Erection

## USES:

Treatment of erectile dysfunction

## CONTRAINDICATIONS

Hypersensitivity, coadministration of α-blockers or nitrates, renal failure, congenital or acquired QT prolongation

**Precautions:** Pregnancy; not indicated for women, children, or newborns; hepatic impairment; retinitis pigmentosa; cardiovascular disease; anatomic penile deformities; sickle cell anemia; leukemia; multiple myeloma; bleeding disorders; active peptic ulceration; renal disease

## DOSAGE AND ROUTES

**Adult:** PO 10 mg, taken 1 hr before sexual activity, dose may be reduced to 5 mg or increased to a max of 20 mg; max dosing frequency is once/day; orally disintegrating tab 10 mg 60 min before sexual activity; do not use with potent CYP3A4 inhibitors
**Geriatric >65 yr:** PO 5 mg initially, titrate as needed/tolerated

### Hepatic dose (Child-Pugh B)

**Adult:** PO 5 mg, max 10 mg

### Concomitant medications

Ritonavir, max 2.5 mg q72hr; for indinavir, ketoconazole 400 mg/day and itraconazole 400 mg/day, max 2.5 mg/day; for ketoconazole 200 mg/day, itraconazole 200 mg/day and erythromycin, max 5 mg/day

**Available forms:** Tabs 2.5, 5, 10, 20 mg; orally disintegrating tab 10 mg

### Implementation

• Take approximately 1 hr before sexual activity; do not use more than once a day
• Orally disintegrating tabs are not interchangeable with film-coated tabs
• **Orally disintegrating tab:** place on tongue, allow to dissolve, do not use water

## ADVERSE EFFECTS

**CNS:** *Headache, flushing, dizziness, insomnia,* seizures, transient global amnesia
**CV:** Hypertension, MI, CV collapse, chest pain
**EENT:** Conjunctivitis, tinnitus, photophobia, diminished vision, glaucoma, hearing loss
**GU:** Abnormal ejaculation, priapism
**MISC:** Rash, GERD, GGTP increased, NAION (nonarteritic ischemic optic neuropathy), dyspepsia
**MS:** Myalgia, arthralgia, neck pain
**RESP:** Rhinitis, sinusitis, dyspnea, pharyngitis, epistaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapid; reduced absorption with high-fat meal |
| **Distribution** | Bioavailability 15%; protein binding 95% |
| **Metabolism** | Liver |
| **Excretion** | Primarily in feces (91%-95%) |
| **Half-life** | 4-5 hr |

V

### Pharmacodynamics

| | |
|---|---|
| **Onset** | 20 min |
| **Peak** | ½-1½ hr |
| **Duration** | <5 hr |

## INTERACTIONS

### Individual drugs

Alcohol, amLODIPine, metoprolol, NIFEdipine: increased hypotension, do not use concurrently

Cimetidine, erythromycin, itraconazole, ketoconazole: increased levels

Clarithromycin, droperidol, procainamide, quiNIDine: serious dysrhythmias; do not use concurrently

### Drug classifications

Do not use with nitrates because of unsafe decrease in B/P that could result in heart attack or stroke

α-Blockers, protease inhibitors: increased hypotension; do not use concurrently

Angiotensin II receptor blockers: increased hypotension; do not use concurrently

Antidysrhythmics class Ia, III, quinolones: serious dysrhythmias; do not use together

Antiretroviral protease inhibitors: increased vardenafil levels

### Drug/food

High-fat meal: decreased absorption

### Drug/lab test

Increase: CK

## NURSING CONSIDERATIONS

### Assessment

- Assess for use of organic nitrates that should not be used with this product
- Assess for severe loss of vision while taking this or any similar products; these products should not be used if vision loss has occurred

### Patient/family education

- Advise that product does not protect against STDs, including HIV
- Teach that product absorption is reduced with a high-fat meal
- Instruct that product should not be used with nitrates in any form
- Inform that product has no effect in the absence of sexual stimulation
- Teach that patient should seek immediate medical attention if erection lasts for more than 4 hr
- Advise to inform physician of all medications being taken
- Teach patient to notify prescriber immediately and stop taking product if vision loss occurs

### Evaluation

**Positive therapeutic outcome**

- Sustainable erection

## varenicline (Rx)

(var-e-ni′kleen)

**Champix, Chantix**

*Func. class.:* Smoking cessation agent

**ACTION:** Partial agonist for nicotine receptors; partially activates receptors to help curb cravings; occupies receptors to prevent nicotine binding

**Therapeutic outcome:** Smoking cessation

**USES:** Smoking deterrent

## CONTRAINDICATIONS

Hypersensitivity, eating disorders

**Precautions:** Pregnancy, breastfeeding, children <18 yr, geriatric, renal disease, recent MI, angioedema

**BLACK BOX WARNING:** Bipolar disorder, depression, schizophrenia, suicidal ideation

## DOSAGE AND ROUTES

### Smoking cessation

**Adult:** PO therapy should begin 1 week prior to smoking stop date (i.e., take product plus tobacco for 7 days); titrate for 1 wk, days 1 through 3, 0.5 mg/day; days 4 through 7, 0.5 mg bid; day 8 through end of treatment 1 mg bid; treatment is 12 wk and may repeat for another 12 wk

### Renal dose

**Adult:** PO CCr ≤50 ml/min, titrate to max 0.5 mg bid

**Available forms:** Tabs 0.5, 1 mg, Chantix continuing month PAK; Chantix starting month PAK

### Implementation

- Do not break, crush, or chew tabs
- Give increased fluids, bulk in diet if constipation occurs
- Give with a full glass of water after eating
- Give sugarless gum, hard candy, or frequent sips of water for dry mouth

## ADVERSE EFFECTS

**CNS:** Headache, agitation, dizziness, insomnia, abnormal dreams, fatigue, malaise, behavior changes, depression, suicidal ideation, suicide, amnesia, hallucinations, hostility, mania, psychosis, tremor

**CV:** Dysrhythmias, hypertension, palpitations, tachycardia, angina, hypotension, MI

**EENT:** *Blurred vision,* tinnitus
**GI:** *Nausea, vomiting,* anorexia, *dry mouth,* increased/decreased appetite, *constipation,* flatulence, GERD
**GU:** Erectile dysfunction, urinary frequency, menstrual irregularities
**INTEG:** Rash, pruritus, angioedema, Stevens-Johnson syndrome
**MISC:** Weight loss or gain
**MS:** Back pain, myalgia, *arthralgia*
**RESP:** Dyspnea, rhinorrhea

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Steady state 4 days |
| **Metabolism** | Minimal |
| **Excretion** | Urine 92%, unchanged |
| **Half-life** | Elimination 24 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3-4 hr |
| **Duration** | 24 hr |

## NURSING CONSIDERATIONS

### Assessment

- **Assess smoking history:** motivation for smoking cessation, years used, amount each day, assess for smoking cessation after 12 wk; if progress has not been made, product may be used for an additional 12 wk
- Assess for renal function in geriatric

**BLACK BOX WARNING: Neuropsychiatric symptoms:** assess for mood, sensorium, affect, behavioral changes, agitation, suicidal ideation; suicide has occurred; possible worsening of depression, schizophrenia, bipolar disorder

- Angioedema/Stevens-Johnson syndrome: Rash during treatment, discontinue if rash, fever, fatigue, joint pain, lesions occur
- **Pregnancy/breastfeeding:** Not used in women

### Patient/family education

- Teach patient that treatment for smoking cessation lasts 12 wk and another 12 wk may be required
- Teach patient to use caution in driving, other activities requiring alertness; blurred vision may occur
- Advise patient to set a date to quit smoking and initiate treatment 1 wk prior to that date
- Teach patient how to titrate product
- Advise patient not to use with nicotine patches unless directed by prescriber; may increase B/P
- Advise patient to notify prescriber if pregnancy is suspected or planned
- Teach patient that vivid dreams, insomnia may occur during beginning of treatment, but usually subside
- To notify all prescribers of all OTC/Rx/herbs used

**BLACK BOX WARNING:** Instruct patient to notify prescriber immediately of change in thought/behavior (suicidal ideation, hostility, depression); stop product

### Evaluation

**Positive therapeutic outcome**
- Smoking cessation

**HIGH ALERT**

## vasopressin (Rx)

(vay-soe-press'in)
**Pressyn, Vasostrict**
*Func. class.:* Pituitary hormone
*Chem. class.:* Lysine vasopressin

**ACTION:** Promotes reabsorption of water by action on renal tubular epithelium; causes vasoconstriction on muscles in the GI system

**Therapeutic outcome:** Increased osmolality, decreased urine output in diabetes insipidus

**USES:** Diabetes insipidus (nonnephrogenic/nonpsychogenic), hypotension, postcardiotomy shock, septic shock

## CONTRAINDICATIONS

Hypersensitivity, chronic nephritis

**Precautions:** Pregnancy, breastfeeding, CAD, asthma, renal/vascular disease, migraines, seizures

## DOSAGE AND ROUTES

### Diabetes insipidus

**Adult:** IM/SUBCUT 5-10 units bid-qid prn; CONT **IV** INF 0.0005 units/kg/hr, (0.5 milliunit/kg/hr), double dose q30min as needed
**Child:** IM/SUBCUT 2.5-10 units bid-qid prn

### Hypotension in septic shock

**Adult:** IV 0.01 units/min, titrate by 0.005 units/min q10-15min until target B/P is achieved, to max 0.07 units/min after target B/P of 8 hr without use of catecholamines; taper 0.005 units/min qhr to maintain B/P

**Available forms:** Sol for inj 20 units/ml

### Implementation

**IM/SUBCUT route**
- May be given IM/SUBCUT for diagnosis of diabetes insipidus
- Give patient 16 oz water at administration to prevent nausea, vomiting, cramping

V

## ADVERSE EFFECTS

**CNS:** Drowsiness, headache, lethargy, flushing, vertigo
**CV:** Increased B/P, dysrhythmias, chest pain, cardiac arrest, shock, MI
**EENT:** Nasal irritation, congestion, rhinitis
**GI:** Nausea, heartburn, cramps, vomiting, flatus
**GU:** Vulval pain, uterine cramping
**MISC:** Tremor, sweating, vertigo, urticaria, bronchial constriction

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Erratically absorbed (IM) |
| **Distribution** | Widely distributed extracellular fluid |
| **Metabolism** | Liver, rapidly |
| **Excretion** | Kidneys, unchanged |
| **Half-life** | 10-20 min |

### Pharmacodynamics

| | IM | IV |
|---|---|---|
| **Onset** | 1 hr | Unknown |
| **Peak** | Unknown | Unknown |
| **Duration** | 3-8 hr | 3-8 hr |

## INTERACTIONS

### Individual drugs

CarBAMazepine, chlorproPAMIDE, clofibrate, fludrocortisone, urea: decreased antidiuretic effect
Demeclocycline, lithium: increased antidiuretic effect

### Drug classifications

Tricyclics: increased antidiuretic effect

## NURSING CONSIDERATIONS

### Assessment

- Assess intranasal use: nausea, congestion, cramps, headache; usually decreased with decreased dose
- Monitor pulse, B/P, ECG periodically during treatment, if using for CPR monitor continuously
- Monitor **Diabetes insipidus:** I&O ratio, weight daily, fluid/electrolyte balance, urine specific gravity check for edema in extremities; if water retention is severe, diuretic may be prescribed; check for water intoxication: lethargy, behavioral changes, disorientation, neuromuscular excitability
- Small doses may precipitate coronary adverse effects; keep emergency equipment nearby
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, breastfeeding women should pump and discard milk for 1.5 hr after receiving product

### Patient/family education

- Teach patient technique for nasal instillation: to insert tube into nasal cavity to instill product
- Caution patient to avoid OTC products for cough, hay fever because these preparations may contain EPINEPHrine, decrease product response; do not use with alcohol
- Advise patient to carry/wear emergency ID specifying therapy, disease process (diabetes insipidus)
- Teach patient to measure/record I&O
- Teach patient to avoid alcohol, all OTC medications unless approved by prescriber

### Evaluation

**Positive therapeutic outcome**

- Absence of severe thirst
- Decreased urine output, osmolality

## vedolizumab

(ve′-doe-liz′ue-mab)
**Entyvio**
*Func. class.:* Immunosuppressive, biologic response modifier

**ACTION:** A specific integrin receptor antagonist that inhibits the migration of specific memory T lymphocytes across the endothelium into inflamed gastrointestinal parenchymal tissue. The action reduces the chronic inflammatory process present in both ulcerative colitis and Crohn's disease

**Therapeutic outcome:** Lessening of ulcerative colitis and Crohn's disease

**USES:** For moderately to severely active ulcerative colitis/Crohn's disease; to reduce signs and symptoms, and to induce and maintain clinical remission in patients who have an inadequate response to conventional therapy

**CONTRAINDICATIONS:** Hypersensitivity

**Precautions:** Hepatic disease, infections, progressive multifocal leukoencephalopathy (PML), pregnancy, breastfeeding, live vaccines, TB, human antichimeric antibody (HACA)

## DOSAGE AND ROUTES

**Adult: IV** INF 300 mg; give over 30 min at weeks 0, 2, and 6 as induction therapy, then 300 mg q8wk

**Available forms:** Powder for injection 300 mg

### Implementation

- Full response is usually observed by 6 wk; those who do not respond by week 14 are unlikely to respond

• Give as IV infusion only, do not use as an IV push or bolus
• Make sure all immunizations are up to date
• Reconstitute with 4.8 ml of sterile water for injection, using a syringe with a 21- to 25-gauge needle
• Insert the syringe needle into the vial and direct the stream of sterile water for injection to the glass wall of the vial; gently swirl the solution for 15 sec; do not shake
• Allow the solution to stand for up to 20 min at room temperature to allow for reconstitution and for any foam to settle
• Once dissolved, product should be clear or opalescent, colorless to light brownish yellow, and free of visible particulates. Discard if discolored or if foreign particles are present.
• Before withdrawing solution from vial, gently invert vial 3 times. Withdraw 5 ml (300 mg) of reconstructed product using a 21- to 25-gauge needle. Discard remaining product.
• Add the 5 ml (300 mg) of reconstituted product to 250 ml of sterile 0.9% sodium chloride and gently mix infusion bag. Do not mix with other medications. Administer solution as soon as possible; if necessary, solution may be stored for up to 4 hr refrigerated; do not freeze. Infuse over 30 min; after infusion, flush line with 30 ml of sterile 0.9% sodium chloride injection. Discard any unused infusion solution.

## ADVERSE EFFECTS

**CNS:** Headache, fatigue, dizziness
**GI:** Nausea, vomiting
**MISC:** Rash, pruritus, infusion-related reactions
**MS:** Arthralgia, back pain
**SYST:** Anaphylaxis, progressive multifocal leukoencephalopathy (PML)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Antineoplastics, immunosuppressives: increased infection risk
Do not use with tumor necrosis factor (TNF) modifiers
Toxoids, vaccines: decreased immune response

## NURSING CONSIDERATIONS

### Assessment

• Ulcerative colitis/Crohn's disease: Monitor symptoms before and after treatment
• **Hypersensitivity:** Swelling of lips, tongue, throat, face, rash, wheezing, hypertension, if serious reactions occur discontinue product
• **Liver dysfunction:** Monitor for elevated hepatic enzymes, jaundice, malaise, nausea, vomiting, abdominal pain, and anorexia; these signs are predictive of severe liver injury that may be fatal or may require a liver transplant in some patients; if hepatic dysfunction is suspected, discontinue
• **Tuberculosis (TB) latent/active:** Obtain TB skin test both before and during treatment. Do not give in active infection such as influenza or sepsis.
• **Progressive multifocal leukoencephalopathy (PML):** Assess for increased weakness on one side of the body or clumsiness of limbs, visual disturbance, and changes in thinking, memory, and orientation leading to confusion and personality changes; severe disability or death can come over weeks or months
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

### Patient/family education

• Teach patient about the symptoms of infection and to report to health care provider immediately
• Advise patient to report planned or suspected pregnancy, or if breastfeeding
• Teach patient not to use live virus vaccines while taking this product, bring vaccinations up to date before starting product
• Teach patient to report allergic reactions, PML, teach symptoms

### Evaluation

**Positive therapeutic response**
• Lessening of ulcerative colitis and Crohn's disease

**⚠ HIGH ALERT**

## vemurafenib

(vem-ue-raf'e-nib)
**Zelboraf**
*Func. class.:* Biologic response modifiers; signal transduction inhibitors (STIs)

**ACTION:** Inhibitor of some mutated forms of BRAF serine threonine kinase, thereby

V

blocking cellular proliferation in melanoma cells with the mutation. It also inhibits other kinases including CRAF, ARAF, wild-type BRAF, SRMA, ACK1, MAP4H5, and FGR. It is a potent adenosine triphosphate-competitive inhibitor of RAFs with a modest preference for mutant BRAF and CRAF as compared with wild-type BRAF.

**Therapeutic outcome:** Decreased spread of malignancy

**USES:** Unresectable or metastatic malignant melanoma with V600E mutation of the BRAF gene

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, infants, neonates, hepatic disease, QT prolongation, secondary malignancy, torsades de pointes, hypokalemia, hypomagnesium, sunlight exposure

## DOSAGE AND ROUTES

**Adult: PO** 960 mg (4 tabs) bid about q12h

**Dose adjustments for toxicity due to symptomatic adverse reactions or QTc prolongation for Grade 1 or tolerable Grade 2 adverse events:**
No dosage change

**For intolerable Grade 2 or Grade 3 adverse events (1st episode):**
Interrupt treatment until toxicity resolves to grade ≤1; when resuming, reduce dosage to 720 mg (3 tabs) bid

**For intolerable Grade 2 or Grade 3 adverse events (2nd episode):**
Interrupt treatment until toxicity resolves to grade ≤1; when resuming, reduce dose to 480 mg (2 tabs) bid

**For intolerable Grade 2 or Grade 3 adverse events (3rd episode)**
Discontinue treatment permanently

**For Grade 4 adverse events (1st episode):**
Discontinue permanently or interrupt until toxicity resolves to grade ≤1; when resuming, reduce dose to 480 mg (2 tablets) bid

**For Grade 4 adverse events (2nd episode):**
Discontinue permanently

**Available forms:** Tab 240 mg

### Implementation

- Continue until disease progresses or unacceptable toxicity occurs
- Missed doses can be taken up to 4 hr before the next dose is due; take about 12 hr apart; take without regard to meals
- Swallow whole with a full glass of water; do not crush or chew
- Store at room temperature in original container

## ADVERSE EFFECTS

**CNS:** Asthenia, *fatigue,* fever, dizziness, headache, muscle paralysis, peripheral neuropathy
**CV:** Atrial fibrillation, hypotension, *peripheral edema,* QT prolongation
**EENT:** Blurred vision, iritis, photophobia, uveitis
**GI:** Constipation, decreased appetite, diarrhea, dysgeusia, nausea, vomiting, weight loss, hepatotoxicity
**INTEG:** Actinic keratosis, *alopecia,* hyperkeratosis, *maculopapular rash,* palmar-plantar erythrodysesthesia (hand and foot syndrome), papular rash, *photosensitivity,* pruritus, xerosis/dry skin
**MS:** *Arthralgia,* arthritis, back pain, extremity pain, musculoskeletal pain, *myalgias*
**RESP:** Cough
**SYST:** Anaphylaxis, secondary malignancy, Stevens-Johnson syndrome, toxic epidermal necrolysis, drug reaction with eosinophilia/anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 99% |
| **Metabolism** | Unknown |
| **Excretion** | 94% feces |
| **Half-life** | 30-120 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Abarelix, alfuzosin, amoxapine, apomorphine, arsenic trioxide, asenapine, chloroquine, ciprofloxacin, citalopram, clarithromycin, cloZAPine, cyclobenzaprine, dasatinib, dolasetron, dronedarone, droperidol, eribulin, erythromycin, ezogabine, flecainide, fluconazole, gatifloxacin, gemifloxacin, grepafloxacin, halofantrine, haloperidol, iloperidone, indacaterol, lapatinib, levofloxacin, levomethadyl, lopinavir/ritonavir, magnesium sulfate, maprotiline, mefloquine, methadone, moxifloxacin, nilotinib, norfloxacin, octreotide, ofloxacin, OLANZapine, ondansetron, paliperidone, palonosetron, pentamidine, pimozide, posaconazole, potassium sulfate, probucol, propafenone, QUEtiapine, quiNIDine,

ranolazine, rilpivirine, risperiDONE, saquinavir, sodium, sparfloxacin, SUNItinib, tacrolimus, telavancin, telithromycin, tetrabenazine, troleandomycin, vardenafil, vemurafenib, venlafaxine, vorinostat, ziprasidone: increased QT prolongation, torsades de pointes

### Drug classifications

β-agonists, Class IA antiarrhythmics (disopyramide, procainamide, quiNIDine), Class III antiarrhythmics (amiodarone, dofetilide, ibutilide, sotalol), halogenated anesthetics, local anesthetics, certain phenothiazines (chlorproMAZINE, fluPHENAZine, mesoridazine, perphenazine, prochlorperazine, thioridazine and trifluoperazine), tricyclic antidepressants: increased QT prolongation, torsades de pointes

CYP3A4 inducers (alcohol, barbiturates, bexarotene, carBAMazepine, erythromycin, etravirine, fluvoxaMINE, ketoconazole, metyrapone, modafinil, nevirapine, OXcarbazepine, phenytoin, rifabutin, rifampin, ritonavir): decreased vemurafenib effect

CYP3A4/CYP1A2 inhibitors (cimetidine, dalfopristin, delavirdine, enoxacin, indinavir, isoniazid, itraconazole, quinupristin, tipranavir): increased vemurafenib effect

### Drug/lab test

Alkaline phosphatase, bilirubin, LFTs, serum creatinine: increase

## NURSING CONSIDERATIONS

### Assessment

- **Hepatic disease:** Liver function test (LFT) abnormalities, altered bilirubin levels, may occur during treatment; monitor LFTs and bilirubin levels prior to treatment, then monthly; more frequent testing is needed in those presenting with grade 2 or greater toxicities; Laboratory alterations should be managed with dose reduction, treatment interruption, or discontinuation
- **QT prolongation:** has been reported with the use of crizotinib; therefore, crizotinib should be avoided in patients with QT prolongation; Monitor ECG and electrolytes in those with congestive heart failure, bradycardia, electrolyte imbalance (hypokalemia, hypomagnesemia), or in those who are taking concomitant medications known to prolong the QT interval; treatment interruption, dosage adjustment, treatment discontinuation may be needed in those who develop QT prolongation
- **Pregnancy/breastfeeding:** Identify if pregnancy is planned or suspected, do not use in pregnancy avoid breastfeeding
- Serum electrolytes, CCR, bilirubin, ECG
- **BRAF testing:** Obtain testing before use, do not use in wild-type *BRAF*, confirm *BRAF* V600E mutation
- **Skin reactions:** Assess for cuSCC skin reactions

### Patient/family education

- Teach patient/family that missed doses can be taken up to 4 hr before the next dose is due to maintain the twice-daily regimen, if vomiting occurs, do not retake dose, take next scheduled dose
- Teach patient to use reliable contraception; both women and men of childbearing age should use adequate contraceptive methods during therapy and for at least 90 days after completing treatment, pregnancy
- Teach patient to notify provider of new skin lesions
- Advise patient to avoid sun exposure, wear sunscreen, protective clothing

### Evaluation

**Positive therapeutic outcome**

- Decreased spread of malignancy

**⚠ HIGH ALERT**

**RARELY USED**

## venetoclax

(veh-neh′toh-klax)

**Venclexta**

*Func. class.:* Antineoplastic, signal transduction inhibitor

**USES:** Treatment of CLL in patients with a 17p deletion who have received at least one prior therapy

## CONTRAINDICATIONS

Hypersensitivity, pregnancy

## DOSAGE AND ROUTES

**Adult: PO** initially 20 mg qday × 7 days, increase dose qwk × 5 wk: wk 2, 50 mg/day; wk 3, 100 mg/day; wk 4, 200 mg/day; wk 5 and beyond, 400 mg/day. Continue therapy until disease progression. A dose reduction and/or therapy interruption may be necessary in patients who develop toxicity

## venlafaxine (Rx)

(ven-la-fax′een)

**Effexor, Effexor XR**

*Func. class.:* Second-generation SNRI antidepressant—miscellaneous

**Do not confuse:** Effexor/Effexor XR/Enablex

V

**ACTION:** Potent inhibitor of neuronal serotonin and norepinephrine uptake, weak inhibitor of dopamine; no muscarinic, histaminergic, or α-adrenergic receptors in vitro

**Therapeutic outcome:** Relief of depression

**USES:** Prevention/treatment of major depression, to treat depression at end of life; long-term treatment of generalized anxiety disorder, panic disorder, social anxiety disorder (Effexor XR only)

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, geriatric, mania, recent MI, cardiac/renal/hepatic disease, seizure disorder, hypertension, eosinophilic pneumonia, desvenlafaxine hypersensitivity

**BLACK BOX WARNING:** Children, suicidal ideation, bipolar disorder, interstitial lung disease

## DOSAGE AND ROUTES

### Depression

**Adult:** PO 75 mg/day in 2 or 3 divided doses; taken with food, may be increased to 150 mg/day; if needed may be further increased to 225 mg/day; increments of 75 mg/day should be made at intervals of no less than 4 days; some hospitalized patients may require up to 375 mg/day in 3 divided doses; EXT REL 37.5-75 mg PO daily, max 225 mg/day; give Effexor XR daily

### Anxiety disorders

**Adult:** PO 75 mg/day or 37.5 mg/day × 4-7 days initially, max 225 mg/day

### Hepatic dose

**Adult:** PO moderate impairment 50% of dose

### Renal dose

**Adult:** PO CCr 10-70 ml/min reduce dose by 25%-50%; CCr <10 ml/min reduce by 50%

### Hot flashes (unlabeled)

**Adult (male, prostate cancer):** PO 12.5 mg bid × 4 wk

**Adult female:** PO 37.5-75 mg/day

**Available forms:** Tabs scored (Effexor) 25, 37.5, 50, 75, 100 mg; ext rel caps (Effexor XR) 37.5, 75, 150, 225 mg

### Implementation

- Give with food or milk for GI symptoms
- Crush if patient is unable to swallow medication whole
- Store at room temperature; do not freeze

## ADVERSE EFFECTS

**CNS:** *Emotional lability, dizziness, weakness,* apathy, ataxia, headache, tremors, hypertonia, euphoria, hallucinations, hostility, insomnia, anxiety, suicidal ideation in children/adolescents, seizures, neuroleptic malignant syndrome–like reaction, anxiety, abnormal dreams, paresthesia

**CV:** Angina pectoris, extrasystoles, postural hypotension, syncope, thrombophlebitis, hypertension, tachycardia, change in QTc interval, increased cholesterol

**EENT:** *Abnormal vision,* taste, *ear pain*

**GI:** *Dysphagia, eructation,* colitis, gastritis, gingivitis, *constipation,* stomatitis, stomach and mouth ulceration, nausea, anorexia, dry mouth, *abdominal pain, vomiting, weight loss*

**GU:** *Anorgasmia,* abnormal ejaculation, urinary frequency, decreased libido, impotence, menstrual changes

**HEMA:** Thrombocytopenia, leukocytosis, leukopenia, abnormal bleeding

**INTEG:** Ecchymosis, acne, alopecia, brittle nails, dry skin, photosensitivity, sweating, angioedema (ext rel), Stevens-Johnson syndrome

**META:** *Peripheral edema, weight loss,* edema, glycosuria, hyperlipemia, hypokalemia

**MS:** Arthritis, bone pain, tenosynovitis, arthralgia

**RESP:** *Bronchitis, dyspnea,* cough

**SYST:** Neonatal abstinence syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Widely distributed, 27% protein binding |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys, 87% |
| **Half-life** | 5 hr, 11 hr (active metabolite) |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression
Cimetidine: increased venlafaxine effect
CloZAPine, desipramine, haloperidol, warfarin: increased levels of these products
Cyproheptadine: decreased venlafaxine effect
Indinavir: decreased effect of indinavir
Linezolid, methylene blue, sibutramine, SUMAtriptan, traMADol, traZODone, tryptophan: increased serotonin syndrome

### Drug classifications

Antihistamines, opioids, sedative-hypnotics: increased CNS depression
MAOIs: hyperthermia, rigidity, rapid fluctuations of vital signs, mental status changes, neuroleptic malignant syndrome

Salicylates, NSAIDs, platelet inhibitors, anticoagulants: increased bleeding risk
SSRIs, SNRIs, serotonin-receptor agonists: increased serotonin syndrome

### Drug/herb

Kava, valerian: increased CNS depression
St. John's wort: serotonin syndrome

### Drug/lab test

Increased: alkaline phosphatase, bilirubin, AST, ALT, BUN, creatinine, serum cholesterol, CPK, LDH
False positive: amphetamines, phencyclidine

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P (lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg hold product, notify prescriber; take vital signs q4hr in patients with CV disease
- Monitor blood tests: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy
- Monitor liver function tests: AST, ALT, bilirubin
- Check weight qwk; weight loss or gain; appetite may increase, peripheral edema may occur

**BLACK BOX WARNING:** Assess mental status: mood, sensorium, affect; increase in psychiatric symptoms: depression, panic; for suicidal ideation in children/adolescents, discuss with family members and in early treatment

- Monitor urinary retention, constipation; constipation is more likely to occur in children or geriatric
- **Assess for withdrawal symptoms:** headache, nausea, vomiting, muscle pain, weakness; do not usually occur unless product was discontinued abruptly, taper over 14 days
- Identify alcohol consumption; if alcohol is consumed, hold dose
- **Serotonin syndrome, neuroleptic malignant syndrome:** assess for increased heart rate, shivering, sweating, dilated pupils, tremors, high B/P, hyperthermia, headache, confusion; if these occur, stop product, administer a serotonin antagonist if needed; usually worse if given with linezolid, methylene blue, tryptophan
- **Beers:** Use with caution in older adults, may exacerbate or cause syndrome of inappropriate antidiuretic hormone secretion
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, use in late 3rd trimester has resulted in neonatal complications, do not breastfeed, excreted in breast milk

### Patient/family education

- Advise patient to notify prescriber of rash, hives, or allergic reactions
- Teach patient that therapeutic effects may take 2-3 wk
- Teach patient to use caution in driving or other activities requiring alertness because of drowsiness, dizziness, blurred vision; to avoid rising quickly from sitting to standing, especially geriatric
- Teach patient to avoid alcohol ingestion, other CNS depressants

Serotonin syndrome, neuroleptic malignant syndrome: advise patient to report immediately shivering, sweating, tremors, fever, dilated pupils

- Advise patient to avoid pregnancy, breastfeeding while taking this product, birth defects have occurred when used in the 3rd trimester
- Teach patient that worsening of symptoms, suicidal thoughts/behavior may occur in children, young adults
- Advise patient to take as prescribed, contents of capsule may be sprinkled on applesauce if unable to swallow whole

### Evaluation

**Positive therapeutic outcome**

- Decreased depression, anxiety; sense of well-being
- Absence of suicidal thoughts

## TREATMENT OF OVERDOSE:

ECG monitoring, induce emesis, lavage, administer anticonvulsant

**⚠ HIGH ALERT**

## verapamil (Rx)

(ver-ap'a-mil)
**Apo-Verap, Calan, Calan SR, Chronovera, Covera, Covera-HS, Isoptin, Isoptin SR, Novo-Veramil, Tarka, Veramil, Verelan, Verelan PM**

*Func. class.:* Calcium-channel blocker; antihypertensive; antianginal, antidysrhythmic (Class IV)
*Chem. class.:* Diphenylalkylamine

**Do not confuse:** Covera-HS/Covairyx HS

**ACTION:** Inhibits calcium ion influx across cell membrane during cardiac depolarization; produces relaxation of coronary vascular smooth muscle, peripheral vascular smooth muscle; dilates coronary vascular arteries; decreases SA/AV node conduction; dilates peripheral arteries

V

**Therapeutic outcome:** Decreased angina pectoris, dysrhythmias, B/P

**USES:** Chronic stable vasospastic, unstable angina; dysrhythmias, hypertension, supraventricular tachycardia, atrial flutter or fibrillation

## CONTRAINDICATIONS

Sick sinus syndrome, 2nd- or 3rd-degree heart block, hypotension <90 mm Hg systolic, cardiogenic shock, severe HF, Lown-Ganong-Levine syndrome, Wolff-Parkinson-White syndrome

**Precautions:** Pregnancy, breastfeeding, children, geriatric, HF, hypotension, hepatic injury, renal disease, concomitant β-blocker therapy

## DOSAGE AND ROUTES

### Angina

**Adult:** PO 80-120 mg tid, increase qwk, max 480 mg/day

### Dysrhythmias

**Adult:** PO 240-320 mg/day in 3-4 divided doses in digitalized patients

**Adult: IV** BOL 5-10 mg (0.075-0.15 mg/kg) over 2 min, may repeat 10 mg (0.15 mg/kg) ½ hr after first dose

**Child 1-15 yr: IV** BOL 0.1-0.3 mg/kg over >2 min, repeat in 30 min, max 5 mg in a single dose

**Child 0-1 yr: IV** BOL 0.1-0.2 mg/kg over ≥2 min, may repeat after 30 min

### Hypertension

**Adult:** PO 80 mg tid, may titrate upward; EXT REL 120-240 mg/day as a single dose, may increase to 240-480 mg/day

### Hepatic dose/geriatric/compromised ventricular function

**Adult:** PO 40 mg tid initially, increase as tolerated

**Available forms:** Tabs 40, 80, 120 mg; ext rel tabs 120, 180, 240 mg; inj 2.5 mg/ml in ampules, syringes, vials; ext rel caps 100, 200, 240, 300 mg

### Implementation

**PO route**

- **Regular release:** give without regard to food
- **Extended release:** do not crush or chew ext rel products
- Cap may be opened and contents sprinkled on food; do not dissolve, chew cap
- Give once a day before meals at bedtime; sus rel give with food to decrease GI symptoms

**Direct IV route**

- Give by direct **IV** undiluted (Y-site, 3-way stopcock) over at least 2 min, or 3 min geriatric; discard unused sol; to prevent serious hypotension, patient should be recumbent for 1 hr or more, with continuous ECG and B/P monitoring
- Do not use IV with IV β-blockers, may cause AV nodal blockade

**Y-site compatibilities:** Alfentanil, amikacin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, CARBOplatin, caspofungin, ceFAZolin, cefonicid, cefotaxime, cefoTEtan, cefOXitin, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, clindamycin, cyanocobalamin, cyclophosphamide, cycloSPORINE, cytarabine, DACTINomycin, DAPTOmycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, DOPamine, doxacurium, DOXOrubicin hydrochloride, doxycycline, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrALAZINE, hydrocortisone, HYDROmorphone, ifosfamide, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, miconazole, midazolam, milrinone, mitoXANtrone, morphine, multivitamins, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, papaverine, PEMEtrexed, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, rocuronium, sodium acetate, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiamine, ticarcillin/clavulanate, tirofiban, tobramycin, tolazoline, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, vinCRIStine, vinorelbine, voriconazole

**Y-site incompatibilities:** Acyclovir, albumin, aminophylline, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azaTHIOprine, cefoperazone, cefTAZidime, chloramphenicol, dantrolene, diazepam, diazoxide, ertapenem, fluorouracil, folic acid, furosemide, ganciclovir, indomethacin, pantoprazole, PENTobarbital, PHENobarbital, phenytoin, piperacillin/tazobactam, propofol, sodium bicarbonate,

thiotepa, tigecycline, trimethoprim/sulfamethoxazole

## ADVERSE EFFECTS

**CNS:** *Headache, drowsiness,* dizziness, anxiety, depression, weakness, asthenia, fatigue, insomnia, confusion, light-headedness
**CV:** *Edema,* HF, bradycardia, hypotension, palpitations, AV block, dysrhythmias
**GI:** *Nausea,* diarrhea, gastric upset, *constipation,* elevated liver function tests
**GU:** Impotence, nocturia, polyuria, gynecomastia
**HEMA:** Bruising, petechiae, bleeding
**INTEG:** Rash, bruising
**MISC:** Gingival hyperplasia
**SYST:** Stevens-Johnson syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO) |
| **Distribution** | Not known |
| **Metabolism** | Liver, extensively |
| **Excretion** | Kidneys (70%) |
| **Half-life** | Biphasic 4 min, 3-7 hr |

### Pharmacodynamics

| | PO | PO-EXT REL | IV |
|---|---|---|---|
| **Onset** | 1-2 hr | Unknown | 1-5 min |
| **Peak** | ½-1½ hr | 5-7 hr | 3-5 min |
| **Duration** | 3-7 hr | 24 hr | 2 hr |

## INTERACTIONS

### Individual drugs

CarBAMazepine, cycloSPORINE, digoxin, theophylline: increased levels of each specific product
Cimetidine, clarithromycin, erythromycin: increased effect of verapamil
FentaNYL, prazosin, quiNIDine: increased hypotension
Lithium: decreased lithium levels

### Drug classifications

Antihypertensive, β-adrenergic blockers, nitrates: increased effects of verapamil, monitor for CV effects
Nondepolarizing muscle relaxants: increased effect
NSAIDs: decreased antihypertensive effect

### Drug/herb

Ephedra (ma huang): increased hypertension
Ginseng, ginkgo: increased verapamil effect
St. John's wort: decreased verapamil effect

### Drug/food

Grapefruit juice: increased hypotension

### Drug/lab test

Increased: alkaline phosphatase, AST, ALT, BUN, creatinine, serum cholesterol

## NURSING CONSIDERATIONS

### Assessment

- **HF:** Assess fluid volume status: I&O ratio and record; weight; distended red veins; crackles in lung; color; quality, specific gravity of urine; skin turgor; adequacy of pulses; moist mucous membranes; bilateral lung sounds; peripheral pitting edema; dehydration symptoms of decreasing output, thirst, hypotension, dry mouth, and mucous membranes should be reported
- Monitor B/P and pulse, pulmonary capillary wedge pressure (PCWP), central venous pressure, index, often during inf; notify prescriber if <50 bpm, systolic B/P <90 mm Hg
- Monitor ALT, AST, bilirubin daily; if these are elevated, hepatotoxicity is suspected
- Monitor platelets; if <150,000/mm$^3$, product is usually discontinued and another product started
- Assess for extravasation; change site q48hr
- **Monitor cardiac status:** B/P, pulse, respiration, ECG
- Monitor renal/hepatic function tests during long-term treatment, serum potassium, periodically
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, avoid breastfeeding, excreted in breast milk
- **Beers:** Avoid use in older adults, may cause fluid retention or exacerbate heart failure

### Patient/family education

- Advise patient to increase fluids/fiber to counteract constipation
- Caution patient to avoid hazardous activities until stabilized on product and dizziness is no longer a problem
- Teach patient how to take pulse, B/P before taking product; to keep record or graph
- Instruct patient to limit caffeine consumption; to avoid alcohol, grapefruit, and OTC products unless directed by prescriber
- Advise patient to comply with medical regimen: diet, exercise, stress reduction, product therapy; to notify prescriber of irregular heartbeat, shortness of breath, swelling of feet and hands, pronounced dizziness, constipation, nausea, hypotension, **IV** calcium
- Teach patient to use as directed even if feeling better; may be taken with other CV products (nitrates, β-blockers)
- Caution patient not to discontinue abruptly; chest pain may occur
- **Stevens-Johnson syndrome:** Rash, fever, fatigue, joint pain, lesions, discontinue immediately

V

• Advise to report chest pain, palpitations, irregular heartbeats, swelling of extremities, skin irritation, rash, tremors, weakness
• Instruct patient to notify prescriber if pregnancy is planned; avoid breastfeeding

### Evaluation

**Positive therapeutic outcome**
• Decreased anginal pain
• Decreased dysrhythmias
• Decreased B/P

## TREATMENT OF OVERDOSE:
Defibrillation, atropine for AV block, vasopressor for hypotension, **IV** calcium

## vigabatrin (Rx)
(vye-ga'ba-trin)
**Sabril**
*Func. class.:* Anticonvulsant
*Chem. class.:* GABA transaminase inhibitor

**ACTION:** May inhibit reuptake and metabolism of GABA, may increase seizure threshold; structurally similar to GABA

**Therapeutic outcome:** Prevention of seizure activity

**USES:** Adjunct treatment of partial seizures in adults and children ≥12 yr, infantile spasm

## CONTRAINDICATIONS
Hypersensitivity to this product

**Precautions:** Pregnancy, breastfeeding, children <2 yr, geriatric patients, renal/hepatic disease, suicidal ideation/behavior, abrupt discontinuation

**BLACK BOX WARNING:** Visual disturbance, requires an experienced clinician

## DOSAGE AND ROUTES
### Partial seizures
**Adult/child ≥ 16 yr/child 10-16 yr, >60 kg:** PO 500 mg bid, titrate in 500-mg increments at weekly intervals, up to 1.5 g bid

### Infantile spasm
**Infant >1 mo, child ≤2 yr:** PO 50 mg/kg/day in 2 divided doses titrate in 25-50 mg/kg/day increments q3days, max 150 mg/kg/day

### Renal dose
**Adult:** PO CCr 50-80 ml/min, reduce dosage by 25%; PO CCr 30-49 ml/min, reduce dosage by 50%; PO CCr 10-29 ml/min, reduce dosage by 75%

**Available forms:** Powder for oral sol 500 mg; tablet 500 mg

### Implementation
**PO route (tab)**
• Give without regard to meals
**PO route (oral solution)**
• Reconstitute immediately before using
• Empty contents of appropriate number of packets into a clean cup
• For each packet, dissolve 10 ml of water, conc. 50 mg/ml; do not use other liquids
• Stir until dissolved; solution should be clear
• Use calibrated oral syringe to measure correct dosage
• Discard any unused solution

## ADVERSE EFFECTS
**CNS:** Headache, memory impairment, *dizziness,* irritability, lethargy, malignant hyperthermia, insomnia, suicidal ideation
**CV:** Edema
**EENT:** Vision impairment
**GI:** Nausea, vomiting, diarrhea, increased appetite, abdominal pain, GI bleeding, hemorrhoids, weight gain, constipation
**GU:** Impotence, dysmenorrhea
**HEMA:** Anemia
**INTEG:** Pruritus, rash
**RESP:** Coughing, respiratory depression, pulmonary embolism

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | >95% |
| **Distribution** | Widely; no protein binding |
| **Metabolism** | Not metabolized |
| **Excretion** | Urine 80% parent drug, slowed in renal disease |
| **Half-life** | 7.5 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Individual drugs
AzaTHIOprine, chloroquine, deferoxamine, ethambutol, hydroxychloroquine, interferons, loxapine, mecasermin, rh-IGF-1, pentostatin, tamoxifen, thiothixene: increased serious ophthalmic effects (glaucoma, retinopathy); avoid concurrent use

### Drug classifications
CNS depressants: increased CNS depression
Corticosteroids, phenothiazines, phosphodiesterase inhibitors: increased serious ophthalmic effects (glaucoma, retinopathy)

### Drug/lab test
Decreased: ALT/AST

## NURSING CONSIDERATIONS
### Assessment

**BLACK BOX WARNING:** Visual impairment: prescribers must be registered with the SHARE program due to risk of permanent vision loss; if no clinical response in 2-4 wk in pediatric patients or 3 mo in adults, provide vision assessment; assess again after ≤4 wk, at least q3mo, and 3-6 mo after stopping product

- Monitor renal studies: urinalysis, BUN, urine creatinine q3mo in those with renal disease
- Monitor hepatic studies: ALT, AST, bilirubin
- Assess description of seizures: location, duration, presence of aura
- Assess mental status: mood, sensorium, affect, behavioral changes; if mental status changes, notify prescriber
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, pregnant patient should enroll in the North American Antiepileptic Drug Pregnancy Registry 888-233-2334, do not breastfeed, excreted in breast milk
- **Beers:** Avoid in older adults unless safer alternatives are not available, may cause ataxia, impaired psychomotor function

### Patient/family education
- Teach patient to carry emergency ID stating patient's name, products taken, condition, prescriber's name and phone number
- Advise patient to avoid driving, other activities that require alertness
- Inform patient not to discontinue medication quickly after long-term use
- Instruct patient to notify prescriber if pregnancy is planned or suspected
- Instruct patient to report suicidal thoughts/behaviors immediately
- Teach patient to notify prescriber if pregnancy is planned or suspected, not to breastfeed

**BLACK BOX WARNING:** That drug may cause vision impairment, regular exams will be needed, notify prescriber at once if loss of vision occurs

- Instruct patient to avoid alcohol; drowsiness, dizziness may occur

### Evaluation
**Positive therapeutic outcome**
- Decreased seizure activity; document on patient's chart

## vilazodone (Rx)
(vil-az′oh-done)
**Viibryd**
*Func. class.:* Antidepressant
*Chem. class.:* SSRI, benzofuran

**ACTION:** A novel antidepressant unrelated to other antidepressants, enhances serotoninergic action by a dual mechanism

**Therapeutic outcome:** Remission of depressive symptoms

**USES:** Major depression

## CONTRAINDICATIONS
Concomitant use of MAOIs or within 14 days after discontinuing an MAOI or within 14 days after discontinuing vilazodone

**Precautions:** Abrupt discontinuation, bipolar disorder, bleeding, operating machinery, ECT, geriatrics, hepatic disease, hyponatremia, hypovolemia, infants, labor, pregnancy **C,** substance abuse, history of seizures, serotonin syndrome, neuroleptic malignant syndrome, use with serotonin precursors (e.g., tryptophan) or serotonergic drugs, suicidal ideation and worsening depression or behavior

**BLACK BOX WARNING:** Child, suicidal ideation

## DOSAGE AND ROUTES
### Major depressive disorder
**Adult:** PO 10 mg ×7 days, then 20 mg ×7 days, then 40 mg/day; if taking a potent CYP3A4 inhibitor, the max is 20 mg/day

**Available forms:** Tabs 10, 20, 40 mg

### Implementation
- Administer with food to increase absorption
- Store at room temperature, away from moisture, heat
- Do not use within 2 wk of MAOIs

## ADVERSE EFFECTS
**CNS:** Restlessness, dizziness, drowsiness, fatigue, mania, insomnia, migraine, neuroleptic malignant-like syndrome, paresthesias, seizures, suicidal ideation, tremor, night sweats, dream disorders
**CV:** Palpitations, ventricular extrasystole
**EENT:** Cataracts, blurred vision
**GI:** *Nausea,* vomiting, flatulence, *diarrhea, xerostomia,* altered taste, gastroenteritis, increased appetite
**GU:** Decreased libido, ejaculation disorder, increased frequency of urination, sexual dysfunction

**HEMA:** Bleeding, decreased platelets
**INTEG:** Sweating
**MS:** Arthralgia
**SYST:** Neonatal abstinence syndrome, withdrawal, serotonin syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 96-99% |
| **Metabolism** | Metabolized by the liver by CYP 3A4 (major) and CYP2C19 and CYP2D (minor) and non-CYP pathways |
| **Excretion** | Unknown |
| **Half-life** | 25 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4-5 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Selegiline, busPIRone, dextromethorphan, fenfluramine, dexfluramine, linezolid, methylene blue lithium, meperidine, fentaNYL, methylphenidate, dexmethylphenidate, metoclopramide, mirtazapine, nefazodone, pentazocine, phenothiazines, haloperidol, loxapine, thiothixene, molindone: increased serotonin syndrome

### Drug classifications

MAO inhibitors: do not use within 2 wk of this product
SSRIs, SNRIs, serotonin receptor agonists, ergots, amphetamines: increased serotonin syndrome
Anticoagulants, NSAIDs, platelet inhibitors, salicylates, thrombolytics: increased bleeding
CYP3A4 inducers: decreased vilazodone effect
CYP3A4 inhibitors (clarithromycin, dronedarone, efavirenz, erythromycin, ketoconazole and others): increased vilazodone levels

### Drug/herb

St. John's wort: increased serotonin syndrome

### Drug/food

Grapefruit juice: avoid use

### Drug/lab test

Decreased: sodium

## NURSING CONSIDERATIONS

### Assessment

- Assess mental status: orientation, mood behavior initially and periodically.

**BLACK BOX WARNING:** Initiate suicide precautions if indicated

- Assess for history of seizures, mania
- Monitor renal, hepatic status: hyponatremia (confusion, weakness, headache); monitor serum sodium
- **Abrupt discontinuation:** do not discontinue abruptly; taper, monitor for symptoms of withdrawal; if intolerable, resume previous dose and decrease more slowly
- Serotonin syndrome nausea, vomiting, sedation, sweating, facial flushing, high B/P; discontinue product, notify prescriber
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, if used in 3rd trimester, fetal complications may occur, avoid breastfeeding, excreted in breast milk

### Patient/family education

- Teach patient to take as directed, with food, do not double doses, that follow-up will be needed
- Advise patient to avoid abrupt discontinuation unless approved by prescriber
- Instruct patient not to drive or operate machinery until effects are known
- Instruct patient not to use other products unless approved by prescriber, do not use alcohol
- Advise patient to contact prescriber if allergic reactions, personality changes (aggression, anxiety, anger, hostility), extreme sleepiness or drowsiness, confusion, nervousness, restlessness, clumsiness, numbness, tingling or burning pain in hands, arms, legs or feet, tremors, or having unusual behavior or thoughts about self-harm
- Instruct patient to notify prescriber if pregnancy is planned or suspected; avoid breastfeeding

**BLACK BOX WARNING:** Suicidal thoughts/behaviors: discuss with family the possibility of suicidal thoughts/behaviors, to notify prescriber immediately if these occur

- **Neuroleptic malignant syndrome:** Fever, change in mental status, seizures, rigidity, discontinue product, notify prescriber immediately

### Evaluation

**Positive therapeutic outcome**

- Remission of depressive symptoms

**⚠ HIGH ALERT**

## vinBLAStine (VLB) (Rx)

(vin-blast'een)
**Velbe** 🍁
*Func. class.:* Antineoplastic
*Chem. class.:* Vinca rosea alkaloid

**Do not confuse:** vinBLAStine/vinCRIStine/vinorelbine

**ACTION:** Inhibits mitotic activity, arrests cell cycle at metaphase; inhibits RNA synthesis, blocks cellular use of glutamic acid needed for purine synthesis; a vesicant

**Therapeutic outcome:** Prevention of rapid growth of malignant cells; immunosuppression

**USES:** Breast, testicular cancer; lymphomas; neuroblastoma; Hodgkin's, non-Hodgkin's lymphomas; mycosis fungoides; histiocytosis; Kaposi's sarcoma, Langerhans' cell histiocytosis

## CONTRAINDICATIONS

Pregnancy, breastfeeding, infants, hypersensitivity, leukopenia, granulocytopenia, bone marrow suppression, infection

**Precautions:** Renal/hepatic disease, tumor lysis syndrome

**BLACK BOX WARNING:** Extravasation, intrathecal use

## DOSAGE AND ROUTES

**Doses vary greatly**

### Breast cancer

**Adult:** **IV** 4.5 mg/m$^2$ on day 1 of every 21 days in combination with DOXOrubicin and thiotepa

### Hodgkin's disease

**Adult:** **IV** 6 mg/m$^2$ on days 1 and 15 q28 days with DOXOrubicin (ABVD)
**Child:** **IV** 2.5-6 mg/m$^2$/day once q 1-2 wk × 3-6 wks; max weekly dose 12.5 mg/m$^2$

**Available forms:** Inj powder 10 mg for 10 ml **IV** inj; sol for inj 1 mg/ml

### Implementation

**IV inj route**
- Administer **IV** after diluting 10 mg/10 ml NaCl; give through Y-tube or 3-way stopcock or directly over 1 min

**Intermittent IV INF route**
- Further dilute in 50-100 ml of NS, inf over 15-30 min
- Give by intermittent inf
- Sol should be prepared by qualified personnel only under controlled conditions
- Use Luer-Lok tubing to prevent leakage; do not let sol come in contact with skin; if contact occurs, wash well with soap and water

**BLACK BOX WARNING:** Give hyaluronidase 150 units/ml in 1 ml of NaCl, through IV catheter or SUBCUT in circular pattern around extravasated site warm compress for extravasation for vesicant activity treatment

**BLACK BOX WARNING:** Do not administer intrathecally: fatal

**Y-site compatibilities:** Allopurinol, amifostine, aztreonam, bleomycin, CISplatin, cyclophosphamide, DOXOrubicin, droperidol, filgrastim, fludarabine, fluorouracil, granisetron, heparin, leucovorin, melphalan, methotrexate, metoclopramide, mitomycin, ondansetron, PACLitaxel, piperacillin/tazobactam, sargramostim, teniposide, thiotepa, vinCRIStine, vinorelbine

**Y-site incompatibilities:** Furosemide

## ADVERSE EFFECTS

**CNS:** Paresthesias, peripheral neuropathy, depression, headache, seizures, malaise
**CV:** Tachycardia, orthostatic hypotension, hypertension
**GI:** *Nausea, vomiting,* ileus, *anorexia, stomatitis, constipation,* abdominal pain, GI and rectal bleeding, hepatotoxicity, pharyngitis
**GU:** Urinary retention, renal failure, hyperuricemia
**HEMA:** Thrombocytopenia, leukopenia, myelosuppression, agranulocytosis, granulocytosis, aplastic anemia, neutropenia, pancytopenia
**INTEG:** *Rash, alopecia,* photosensitivity, extravasation, tissue necrosis
**META:** SIADH
**SYST:** Tumor lysis syndrome (TLS)
**RESP:** Fibrosis, pulmonary infiltrate, bronchospasm

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability |
| **Distribution** | Crosses blood-brain barrier slightly |
| **Metabolism** | Liver—active antineoplastic |
| **Excretion** | Biliary, kidneys |
| **Half-life** | Triphasic <5 min, 50-155 min, 23-85 hr |

### Pharmacodynamics

Unknown

V

## INTERACTIONS

### Individual drugs

Bleomycin: increased synergism
Methotrexate: increased methotrexate action
MitoMYcin: increased bronchospasm
Phenytoin: decreased phenytoin level
Radiation: increased toxicity, bone marrow suppression; do not use together

### Drug classifications

Anticoagulants, antiplatelets, NSAIDs, thrombolytics: increased bleeding risk
Antineoplastics: increased toxicity, bone marrow suppression
CYP3A4 inducers (barbiturates, bosentan, carBAMazepine, efavirenz, phenytoin, nevirapine, rifabutin, rifampin): decreased vinBLAStine effect
CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, FLUoxetine, fluvoxaMINE, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole): increased toxicity
Live virus vaccines: increased adverse reactions

### Drug/herb

St. John's wort: avoid use

### Drug/lab test

Increased: uric acid, bilirubin
Decreased: Hgb, platelets, WBC

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P (baseline and q15min) during administration
- Monitor CBC, differential, platelet count weekly; withhold product if WBC is $<2000/mm^3$ or platelet count is $<75,000/mm^3$; notify prescriber of results; recovery will take 3 wk; RBC, Hct, Hgb may be decreased; nadir occurs on days 4-10, and continues for another 1-2 wk
- **Tumor lysis syndrome:** monitor for hyperkalemia, hyperphosphatemia, hyperuricemia; usually occurs with leukemia, lymphoma; alkalinization of the urine; allopurinol should be used to prevent urate nephropathy; monitor electrolytes and renal function (BUN, uric acid, urine CCR)
- Monitor renal function tests: BUN, serum uric acid, urine CCr before, during therapy; I&O ratio; report fall in urine output of 30 ml/hr; for decreased hyperuricemia
- **Bronchospasm:** can be life threatening; usually occurs when giving mitoMYcin
- Monitor for cold, fever, sore throat (may indicate beginning of infection); notify prescriber if these occur
- Assess for bleeding: hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr, no rectal temp; avoid IM inj; use pressure to venipuncture sites
- Identify nutritional status: an antiemetic may need to be prescribed
- Assess for gout, joint pain, swelling, increased uric acid; allopurinol or other treatment may be used
- **Assess for symptoms indicating severe allergic reactions:** rash, pruritus, urticaria, itching, flushing, bronchospasm, hypotension; EPINEPHrine and resuscitative equipment should be nearby
- **Hepatitis:** transient hepatitis may occur with continuous IV

### Patient/family education

- Teach patient to avoid use of products containing aspirin or NSAIDs, razors, commercial mouthwash because bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
- Instruct patient to report signs of anemia, (fatigue, headache, irritability, faintness, shortness of breath)
- Caution patient to report any changes in breathing or coughing even several mo after treatment; avoid breastfeeding; may cause male infertility
- Advise patient to use sunscreen, wear protective clothing and sunglasses
- Inform patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair will be different in color, texture
- Advise patient to avoid vaccinations during treatment; serious reactions may occur

**BLACK BOX WARNING:** Teach patient to report irritation, pain, burning, discoloration at IV site extravasation

- Teach patient to report signs/symptoms of infection: fever, chills, sore throat; patient should avoid crowds and persons with known infections
- **Pregnancy:** teach patient to notify prescriber if pregnancy is planned or suspected, not to breastfeed, may cause male infertility. Advise patient that contraception will be necessary during treatment; teratogenesis may occur
- Instruct patient to avoid persons with known infections
- **Infection:** instruct patient to report sore throat, flulike symptoms

### Evaluation

**Positive therapeutic outcome**
- Decreased spread of malignant cells

**⚠ HIGH ALERT**

## vinCRIStine (VCR) (Rx)

(vin-kris′teen)
*Func. class.:* Antineoplastic—miscellaneous
*Chem. class.:* Vinca alkaloid

**Do not confuse:** vinCRIStine/vinBLAStine/vinorelbine

**ACTION:** Inhibits mitotic activity, arrests cell cycle at metaphase; inhibits RNA synthesis, blocks cellular use of glutamic acid needed for purine synthesis; a vesicant

**Therapeutic outcome:** Prevention of rapid growth of malignant cells, immunosuppression

**USES:** Lymphomas, neuroblastomas, Hodgkin's disease, acute lymphoblastic and other leukemias, rhabdomyosarcoma, Wilms' tumor, non-Hodgkin's lymphoma, malignant glioma, soft-tissue sarcoma; **liposomal:** Philadelphia chromosome- negative ALL in second or greater relapse or that has progressed after 2 or more antileukemia therapies

## CONTRAINDICATIONS

Pregnancy, breastfeeding, infants, hypersensitivity, radiation therapy

**BLACK BOX WARNING:** Intrathecal use

**Precautions:** Renal/hepatic disease, hypertension, neuromuscular disease

**BLACK BOX WARNING:** Extravasation

## DOSAGE AND ROUTES

**Adult:** **IV** 0.4-1.4 mg/m$^2$/wk, max 2 mg
**Child >10 kg:** **IV** 1-2 mg/m$^2$/wk, max 2 mg

**Available forms:** Inj 1 mg/ml; liposomal 5 mg/31 ml injection kit

### Implementation
### IV route (vinCRIStine)

**BLACK BOX WARNING:** Do not give intrathecally: fatal

- Administer **IV** after diluting with diluent provided or 1 mg/10 ml of sterile water or 0.9% NaCl; give through Y-tube or 3-way stopcock or directly over 1 min; do not use 5-mg vial for single doses

**BLACK BOX WARNING:** Hyaluronidase 150 units/ml in 1 ml of NaCl; apply warm compress for extravasation

**Y-site compatibilities:** Acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin–sulbactam, anidulafungin, argatroban, arsenic trioxide, asparaginase, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride/gluconate, capreomycin, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefoperazone, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, cefTRIAXone, cefuroxime, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, cladribine, clindamycin, codeine, cyclophosphamide, cycloSPORINE, cytarabine, $D_5$W-dextrose 5%, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, DAUNOrubicin citrate liposome, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doxacurium, doxapram, DOXOrubicin, DOXOrubicin liposomal, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentaNYL, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, gallium, ganciclovir, garenoxacin, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium phosphate/succinate, HYDROmorphone, hydrOXYzine, ifosfamide, imipenem-cilastatin, inamrinone, insulin, regular, isoproterenol, ketorolac, labetalol, lepirudin, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methadone, methohexital, methotrexate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, minocycline, mitoMYcin, mitoXANtrone, mivacurium, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, niCARdipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, PACLitaxel (solvent/surfactant), palonosetron, pamidronate, pancuronium, PEMEtrexed, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phenylephrine, piperacillin, piperacillin–tazobactam, potassium acetate/chloride/phosphates, procainamide, prochlorperazine,

V

promethazine, propranolol, quinupristin-dalfopristin, ranitidine, remifentanil, riTUXimab, rocuronium, sargramostim, sodium acetate/phosphates, succinylcholine, SUFentanil, sulfamethoxazole-trimethoprim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin, ticarcillin–clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinorelbine, voriconazole, zidovudine, zoledronic acid

**Y-site incompatibilities:** Amphotericin B conventional colloidal, cefepime, diazepam, gemtuzumab, IDArubicin, lansoprazole, nafcillin, pantoprazole, phenytoin

## ADVERSE EFFECTS

**CNS:** *Decreased reflexes, numbness, weakness, motor difficulties,* CNS depression, cranial nerve paralysis, seizures, peripheral neuropathy
**CV:** Orthostatic hypotension
**EENT:** *Diplopia*
**GI:** *Nausea, vomiting, anorexia, stomatitis, constipation,* paralytic ileus, abdominal pain, hepatotoxicity
**GU:** Renal tubular obstruction
**HEMA:** Thrombocytopenia, leukopenia, myelosuppression, anemia
**INTEG:** *Alopecia,* extravasation
**SYST:** Tumor lysis syndrome (TLS)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Complete bioavailability |
| **Distribution** | Rapidly, widely distributed; crosses blood-brain barrier |
| **Metabolism** | Liver |
| **Excretion** | Biliary, in feces, crosses placenta |
| **Half-life** | Triphasic <5 min, 50-155 min, 23-85 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | 1 wk |

## INTERACTIONS

### Individual drugs

Digoxin: decreased digoxin level
MitoMYcin-C: increased acute pulmonary reactions
Radiation: increased toxicity, bone marrow suppression; do not use together

### Drug classifications

CYP3A4 inducers (barbiturates, bosentan, carBAMazepine, efavirenz, phenytoins, nevirapine, rifabutin, rifampin): decreased vinCRIStine effect
CYP3A4 inhibitors (aprepitant, antiretroviral protease inhibitors, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, FLUoxetine, fluvoxaMINE, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole): increased toxicity
Peripheral nervous system products: increased neurotoxicity
Vaccines/toxoids: decreased immune response

### Drug/herb

St. John's wort: avoid use

### Drug/lab test

Increased: uric acid
Decreased: Hgb, WBC, platelets, sodium

## NURSING CONSIDERATIONS

### Assessment

- Monitor CBC, differential, platelet count weekly; withhold product if WBC is <4000/mm$^3$ or platelet count is <75,000/mm$^3$; notify prescriber of results; platelets may increase or decrease
- Assess neurologic status: paresthesia, weakness, cranial nerve palsies, orthostatic hypotension, lethargy, agitation, psychosis; notify prescriber
- **Bronchospasm:** more common with mitoMYcin
- Identify for increased uric acid levels, joint pain in extremities; increase fluid intake to 2-3 L/day unless contraindicated
- **Tumor lysis syndrome:** hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia; more common in leukemia, lymphoma, use alkalinization of urine with allopurinol, monitor electrolytes, renal function (BUN, urine, CCR, uric acid)

**BLACK BOX WARNING:** Extravasation: Assess for pain, swelling, poor blood return; if extravasation occurs, local injection of hyaluronidase and moderate heat to area may help disperse product

- **Pregnancy/breastfeeding:** Do not use in pregnancy, breastfeeding

### Patient/family education

- Teach patient to avoid use of products containing aspirin or NSAIDs, razors, commercial mouthwash because bleeding may occur; to report symptoms of bleeding (hematuria, tarry stools)
- Instruct patient to report signs of anemia (fatigue, headache, irritability, faintness, shortness of breath)

• Caution patient to report any changes in breathing or coughing, even several mo after treatment
• **Pregnancy:** instruct patient to notify prescriber if pregnancy is planned or suspected; advise patient that contraception will be necessary during and 2 mo after treatment; may be teratogenic, not to breastfeed
• Inform patient that hair may be lost during treatment; a wig or hairpiece may make patient feel better; new hair will be different in color, texture
• Advise patient to avoid vaccinations during treatment; serious reactions may occur
• Teach patient to report signs/symptoms of infection: fever, chills, sore throat; patient should avoid crowds or persons with known infections
• Advise patient to increase fluids, bulk in diet, exercise to prevent constipation
• **Infection:** instruct patient to report sore throat, fever, flulike symptoms; avoid persons with known infection

### Evaluation

**Positive therapeutic outcome**
• Decreased spread of malignancies

**⚠ HIGH ALERT**

## vinorelbine (Rx)

(vi-nor'el-bine)
**Navelbine**
*Func. class.:* Antineoplastic—miscellaneous
*Chem. class.:* Semisynthetic vinca alkaloid

**ACTION:** Inhibits mitotic spindle activity, arrests cell cycle at metaphase; inhibits RNA synthesis, blocks cellular use of glutamic acid needed for purine synthesis; a vesicant

**Therapeutic outcome:** Decreased spread of malignancy

**USES:** Unresectable, advanced non–small-cell lung cancer (NSCLC) stage IV; may be used alone or in combination with cisplatin for stage III or IV NSCLC

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, infants, granulocyte count <1000 cells/mm$^3$ pretreatment

**Precautions:** Children, geriatric, hepatic/pulmonary/neurologic/renal disease, bone marrow suppression

**BLACK BOX WARNING:** Extravasation severe neutropenia, intrathecal use

## DOSAGE AND ROUTES

**Adult: IV** 30 mg/m$^2$ qwk

**ANC:** 1000-1499/mm$^3$, give 50% dose; <1000 hold dose; <1000/mm$^3$ × 3 wk, discontinue

### Hepatic dose

**Adult:** IV total bilirubin 2.1-3 mg/dl 15 mg/m$^2$ qwk; total bilirubin ≥3 mg/dl 7.5 mg/m$^2$/day

**Available forms:** Inj 10 mg/ml

### Implementation

**BLACK BOX WARNING:** Do not give intrathecally: fatal, syringes with this product should be labeled "Warning: For IV use only, fatal if given intrathecally"

• **Extravasation:** Stop infusion, aspirate, then hyaluronidase 150 units/ml in 1 ml of 0.9% NaCl, thorough IV catheter or SUBCUT in circular pattern around site warm compress for extravasation for vesicant activity treatment
• Antacid before oral agent; give product after evening meal before bedtime

**Intermittent IV infusion route**
• Dilute to 0.5-2 mg/ml with 0.9% NaCl, 0.45% NaCl, $D_5W$, $D_5$/0.45% NaCl, LR, Ringer's; give over 6-10 min into Y-site or central line; flush line

**Continuous IV infusion route**
• Give 40 mg/m$^2$ q3wk after **IV** bol of 8 mg/m$^2$; may be given in combination with DOXOrubicin, fluorouracil, cisplatin

**Y-site compatibilities:** Amikacin, aztreonam, bleomycin, buprenorphine, butorphanol, calcium gluconate, CARBOplatin, cefotaxime, CISplatin, cimetidine, clindamycin, dexamethasone, enalaprilat, etoposide, famotidine, filgrastim, fluconazole, fludarabine, gentamicin, hydrocortisone, LORazepam, meperidine, morphine, netilmicin, ondansetron, plicamycin, streptozocin, teniposide, ticarcillin, tobramycin, vancomycin, vinBLAStine, vinCRIStine, zidovudine

## ADVERSE EFFECTS

**CNS:** Paresthesias, peripheral neuropathy, depression, headache, seizures, weakness, jaw pain, asthenia
**CV:** Chest pain
**GI:** *Nausea, vomiting,* ileus, *anorexia, stomatitis,* constipation, abdominal pain, *diarrhea,* hepatotoxicity, GI obstruction/perforation
**HEMA:** Neutropenia, anemia, thrombocytopenia, granulocytopenia

V

**INTEG:** *Rash, alopecia,* photosensitivity, inj site reaction, necrosis
**META:** Syndrome of inappropriate diuretic hormone
**MS:** Myalgia
**RESP:** Shortness of breath, dyspnea, pulmonary edema, acute bronchospasm, acute respiratory distress syndrome (ARDS)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poor bioavailability (<50%) |
| **Distribution** | Highly bound to platelets, lymphocytes |
| **Metabolism** | Liver, to metabolite |
| **Excretion** | Bile |
| **Half-life** | 43 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

NSAIDs, anticoagulants: increased bleeding risk
CYP3A4 inhibitors (antiretroviral protease inhibitors, aprepitant, clarithromycin, danazol, delavirdine, diltiazem, erythromycin, fluconazole, FLUoxetine, fluvoxaMINE, imatinib, ketoconazole, mibefradil, nefazodone, telithromycin, voriconazole): increased toxicity
CYP3A4 inducers (barbiturates, bosentan, carBAMazepine, efavirenz, phenytoins, nevirapine, rifabutin, rifampin): decreased vinorelbine effect

### Drug/herb

St. John's wort: avoid use

### Drug/lab test

Increased: LFTs, bilirubin
Decreased: Hgb, WBC, platelets

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P (baseline and q15min) during administration

**BLACK BOX WARNING: Bone marrow suppression:** Monitor CBC, differential, platelet count before each dose; withhold product if WBC is <4000/mm$^3$ or platelet count is <75,000/mm$^3$; notify prescriber of results; recovery will take 3 wk; liver function tests: AST, ALT, bilirubin, LDH

- **Bronchospasm:** more common with mitoMYcin; also dyspnea, wheezing; may be treated with oxygen, bronchodilators, corticosteroids, especially if there is underlying pulmonary disease
- **Neurological status:** Paresthesia, peripheral neuropathy, weakness, these may occur even after termination of treatment
- Monitor renal function tests: BUN, serum uric acid, urine CCr before, during therapy, I&O ratio; report fall in urine output of 30 ml/hr; for decreased hyperuricemia
- Monitor for cold, fever, sore throat (may indicate beginning **infection**); notify prescriber if these occur; effects of alopecia on body image
- **Assess for bleeding:** hematuria, guaiac, bruising or petechiae, mucosa or orifices q8hr: no rectal temp; avoid IM inj; use pressure on venipuncture sites
- **Assess for symptoms indicating severe allergic reactions:** rash, pruritus, urticaria, itching, flushing, bronchospasm, hypotension; EPINEPHrine and resuscitative equipment should be nearby
- Assess neurologic status: numbness, pain, tingling, loss of Achilles reflex, weakness, palsies

### Patient/family education

- Teach patient to use liquid diet: cola, gelatin; dry toast or crackers may be added if patient is not nauseated or vomiting
- Advise patient to rinse mouth 3-4 ×/day with water and brush teeth 2-3 ×/day with soft brush or cotton-tipped applicators for stomatitis; use unwaxed dental floss
- Advise patient to avoid crowds, people with infections, vaccinations
- **Pregnancy:** notify prescriber if pregnancy is planned or suspected; advise patient to use effective contraception during and for ≥2 mo after product is discontinued; do not use in pregnancy, breastfeeding
- Teach patient hair may be lost but will grow back; new hair may be different texture, color
- **Infection:** report sore throat, fever, flulike symptoms

### Evaluation

**Positive therapeutic outcome**

- Decreased spread of malignant cells

**⚠ HIGH ALERT**

## vismodegib

(vis'moe-deg'ib)
**Erivedge**
*Func. class.:* Antineoplastic biologic response modifier
*Chem. class.:* Signal transduction inhibitor (STI)

**ACTION:** A hedgehog (Hh) signaling pathway inhibitor

**Therapeutic outcome:** Decreased spread of tumor

**USES:** Patients who have metastatic basal cell carcinoma, locally advanced, that has recurred after surgery and who are not candidates for surgery/radiation

## CONTRAINDICATIONS

Hypersensitivity, breastfeeding

**BLACK BOX WARNING:** Intrauterine fetal death, male-mediated teratogenicity, pregnancy

**Precautions:** Children, blood donation

## DOSAGE AND ROUTES

**Adult: PO** 150 mg/day

**Available forms:** Cap 150 mg

### Implementation

- Give without regard to food
- To be swallowed whole, do not open or crush caps
- If a dose is missed, do not take additional dose, take at usual time
- Store at 77°F (25°C)

## ADVERSE EFFECTS

**GI:** *Nausea, vomiting, dysgeusia, constipation, anorexia, diarrhea*
**GU:** Amenorrhea, azotemia
**INTEG:** *Alopecia*
**META:** Hyponatremia
**MISC:** *Fatigue, decreased weight*
**MS:** *Arthralgia*

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding >99% |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Elimination 4 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Effect of each vismodegib, osimertinib, sofosbuvir
Increase: Effect of velpatasvir, topotecan
Increase: INR levels warfarin, increase INR monitoring

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING: Pregnancy:** Verify pregnancy status of all women within 7 days before starting therapy; effective contraception is needed during and for 7 mo after treatment; men receiving this product should use condoms with spermicide (even after vasectomy) during sexual intercourse with female partners and for 2 mo after the last dose; report exposure during pregnancy to the Genentech Adverse Event Line at 888-835-2555

### Patient/family education

**BLACK BOX WARNING:** Pregnancy: Teach patient to notify their provider immediately if pregnancy is suspected (or in a female partner for male patients); effective contraception is needed during and for 7 mo after treatment; men receiving this product should use condoms with spermicide (even after vasectomy) during sexual intercourse with female partners and for 2 mo after the last dose; if product is used during pregnancy or if the patient becomes pregnant during use, the woman (or female partner for male patients) should be apprised of the potential hazard to the fetus; encourage exposed women (either directly or through seminal fluid) to participate in the ERIVEDGE pregnancy pharmacovigilance program

- Teach patient about reason for treatment, expected results
- Teach patient if dose is missed, do not take, but resume scheduled doses; swallow whole, do not crush or chew
- Tell patient not to donate blood during therapy or for ≥7 months after conclusion of product
- Amenorrhea: It is unknown if reversible after completion of treatment

### Evaluation

**Positive therapeutic outcome**

- Decreased spread of tumor

## vitamin A (PO, OTC; IM, Rx)

**Aquasol A, Del-Vi-A, Vitamin A**

*Func. class.:* Vitamin, fat-soluble
*Chem. class.:* Retinol

**ACTION:** Needed for normal bone and tooth development, visual dark adaptation, skin disease, mucosa tissue repair; assists in production of adrenal steroids, cholesterol, RNA

V

**Therapeutic outcome:** Prevention, absence of vit A deficiency

## USES: Vit A deficiency

## CONTRAINDICATIONS

Pregnancy (parenteral), hypersensitivity to vit A, malabsorption syndrome (PO), hypervitaminosis A, parenteral, **IV** administration

**Precautions:** Pregnancy (PO), breastfeeding, impaired renal function, children, hepatic disease, infants, alcoholism, hepatitis

## DOSAGE AND ROUTES

**Adult and child >8 yr:** PO 100,000-500,000 international units/day × 3 days, then 50,000 international units/day × 2 wk; dose based on severity of deficiency; maintenance 10,000-20,000 international units for 2 mo

**Child 1-8 yr:** IM 5000-15,000 international units/day × 10 days

**Infant <1 yr:** IM 5000-15,000 international units × 10 days

### Maintenance

**Child 4-8 yr:** IM 15,000 international units/day × 2 mo

**Child <4 yr:** IM 10,000 international units/ day × 2 mo

**Available forms:** Caps 10,000, 25,000, 50,000 international units; drops 5000 international units; inj 50,000 international units/ml; tabs 10,000, 25,000, 50,000 international units

### Implementation

**PO route**

- Give with food (PO) for better absorption; do not give **IV** because anaphylaxis may occur, IM only
- Oral preparations are not indicated for vit A deficiency in those with malabsorption syndrome
- Store in airtight, light-resistant container

**IM route**

- Give deep in large muscle mass; do not use deltoid muscle for administration of >1 ml

## ADVERSE EFFECTS

**CNS:** Headache, increased ICP, intracranial hypertension, lethargy, malaise

**EENT:** Gingivitis, papilledema, exophthalmos, inflammation of tongue and lips

**GI:** Nausea, vomiting, anorexia, abdominal pain, *jaundice*

**INTEG:** Drying of skin, pruritus, increased pigmentation, night sweats, alopecia

**META:** Hypomenorrhea, hypercalcemia

**MS:** Arthralgia, retarded growth, hard areas on bone

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Stored in liver, kidneys, lungs |
| **Metabolism** | Liver |
| **Excretion** | Breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Cholestyramine, colestipol, mineral oil: decreased absorption of vit A

### Drug classifications

Contraceptives (oral), corticosteroids: increased levels of vit A

### Drug/lab test

False increase: bilirubin, serum cholesterol

## NURSING CONSIDERATIONS

### Assessment

- Assess nutritional status: increase intake of yellow and dark green vegetables, yellow/orange fruits, vit A–fortified foods, liver, egg yolks
- Assess vit A deficiency: decreased growth; night blindness; dry, brittle nails; hair loss; urinary stones; increased infection; hyperkeratosis of skin; drying of cornea
- Identify vit A deficiency by plasma vit A, carotene level
- Assess for chronic vit A toxicity: increased calcium, BUN, glucose, cholesterol, triglyceride level
- **Pregnancy/breastfeeding:** Do not use IM in pregnancy, fetal complications may occur, breastfeeding is considered safe at recommended dietary levels

### Patient/family education

- Instruct patient that if dose is missed, it should be omitted
- Inform patient that ophth exams may be required periodically throughout therapy
- Instruct patient not to use mineral oil while taking this product because absorption will be decreased
- Advise patient to notify prescriber of nausea, vomiting, lip cracking, loss of hair, headache
- Caution patient not to take more than the prescribed amount

### Evaluation

**Positive therapeutic outcome**

- Increase in growth rate, weight
- Absence of dry skin and mucous membranes, night blindness

## TREATMENT OF OVERDOSE:
Discontinue product

### vitamin A acid
*See tretinoin*

### vitamin $B_1$
*See thiamine*

### vitamin $B_{12}$ (cyanocobalamin) (PO, OTC; IM/SUBCUT, Rx)
(sye-an-oh-koe-bal'a-min)
**Alphamin, Anacobin** 🍁**, Bedoz** 🍁**, Cobex, Cobolin-M Crystamine, Crysti-1000, Cyanabin** 🍁**, Cyanoject, Cyomin, Ener-B, Hydrobexan, Hydro Cobex, Hydro-Crysti-12**
*Func. class.:* Vitamin $B_{12}$, water-soluble vitamin

### vitamin $B_{12}$a (hydroxocobalamin) (vit $B_{12}$) (Rx)
(hye-drox'o-ko-bal'a-min)
**Hydro Cobex, Hydroxycobal, LA-12, Nascobal, Neuroforter, Rubesol-1000, Rubramin PC, Shovite, Vibral LA, Vibral, Vitamin $B_{12}$**

**ACTION:** Needed for adequate nerve functioning, protein and carbohydrate metabolism, normal growth, RBC development and cell reproduction

**Therapeutic outcome:** Prevention, correction of vit $B_{12}$ deficiency

**USES:** Vit $B_{12}$ deficiency; pernicious anemia; vit $B_{12}$ malabsorption syndrome; Schilling test; increased requirements with pregnancy, thyrotoxicosis, hemolytic anemia, hemorrhage, renal and hepatic disease

## CONTRAINDICATIONS
Hypersensitivity, optic nerve atrophy

**Precautions:** Pregnancy, breastfeeding, children

## DOSAGE AND ROUTES
### Cyanocobalamin
**Adult:** PO up to 1000 mcg/day; SUBCUT/IM 30-100 mcg/day × 1 wk, then 100-200 mcg/mo

### Shilling test
**Adult and child:** IM 1000 mcg in 1 dose
**Child:** PO up to 1000 mcg/day; SUBCUT/IM 30-50 mcg/day × 2 wk, then 100 mcg/mo; NASAL 500 mcg qwk

### Hydroxocobalamin
**Adult:** SUBCUT/IM 30-50 mcg/day × 5-10 days, then 100-200 mcg/mo
**Child:** SUBCUT/IM 30-50 mcg/day × 5-10 days, then 30-50 mcg/mo

**Available forms:** Cyanocobalamin: tabs 25, 50, 100, 250, 500, 1000, 5000 mcg; ext rel tabs 100, 200, 500, 1000 mcg; lozenges: 100, 250, 500 mcg; nasal gel 500 mcg/spray; inj 100, 1000 mcg/ml; hydroxocobalamin: inj 1000 mcg/ml

### Implementation
**PO route**
- Give with fruit juice to disguise taste; administer immediately after mixing
- Give with meals if possible for better absorption; large doses should not be used because most is excreted

**IM route**
- Give by IM inj for pernicious anemia for life unless contraindicated

**IV route**
- May be mixed with TPN sol, but **IV** route is not recommended

**Y-site compatibilities:** Heparin, hydrocortisone sodium succinate, potassium chloride

**Solution compatibilities:** Dextrose/Ringer's or LR's combinations, dextrose/saline combinations, $D_5W$, $D_{10}W$, 0.45% NaCl, Ringer's or LR's sol, ascorbic acid

## ADVERSE EFFECTS
**CNS:** Flushing, optic nerve atrophy
**CV:** HF, peripheral vascular thrombosis, pulmonary edema
**GI:** *Diarrhea*
**INTEG:** Itching, rash, pain at inj site
**META:** Hypokalemia
**SYST:** Anaphylactic shock

### Pharmacokinetics
| | |
|---|---|
| **Absorption** | Well absorbed (IM, SUBCUT) |
| **Distribution** | Crosses placenta |
| **Metabolism** | Stored in liver, kidney, stomach |
| **Excretion** | 50%-90% (urine), breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics
Unknown

## INTERACTIONS
### Individual drugs
Aminosalicylic acid, chloramphenicol, cimetidine, colchicine: decreased absorption
PrediniSONE: increased absorption

V

### Drug classifications
Aminoglycosides, anticonvulsants, potassium products: decreased absorption

### Drug/herb
Goldenseal: decreased vit $B_{12}$ absorption

### Drug/lab test
False positive: intrinsic factor

## NURSING CONSIDERATIONS
### Assessment
- Assess for deficiency: anorexia, dyspepsia on exertion, palpitations, paresthesias, psychosis, visual disturbances, pallor, red inflamed tongue, neuropathy, edema of legs
- Monitor potassium levels during beginning treatment in patients with megaloblastic anemia
- Monitor CBC for increase in reticulocyte count during 1st wk of therapy, then increase in RBC and hemoglobin; folic acid levels, vit $B_{12}$ levels
- Assess nutritional status: egg yolks, fish, organ meats, dairy products, clams, oysters, which are good sources of vit $B_{12}$
- Monitor for pulmonary edema or worsening of HF in cardiac patients

### Patient/family education
- Instruct patient that treatment must continue for life if diagnosed as having pernicious anemia
- Advise patient to eat well-balanced diet from the food pyramid and comply with dietary recommendation
- Caution patient not to exceed the RDA of vit $B_{12}$ because adverse reactions may occur

### Evaluation
**Positive therapeutic outcome**
- Decreased anorexia, dyspnea on exertion, palpitations, paresthesias, psychosis, visual disturbances, edema of legs
- Prevention or correction of vit $B_{12}$ deficiency

## TREATMENT OF OVERDOSE:
Discontinue products

## vitamin C (ascorbic acid) (OTC, Rx)
(as-kor'bic)
**Acerca C, Apo-C, Ascor L-500, Cenolate, Equaline Vitamin C, Walgreens Gold Seal, and many more**
*Func. class.:* Vitamin C, water-soluble vitamin

**ACTION:** Needed for wound healing, collagen synthesis, antioxidant, carbohydrate metabolism

**Therapeutic outcome:** Replacement and supplementation of vit C

**USES:** Vit C deficiency, scurvy, delayed wound and bone healing, chronic disease, before gastrectomy, dietary supplement

**Unlabeled uses:** Common cold prevention

## CONTRAINDICATIONS
Tartrazine, sulfite sensitivity; G6PD deficiency

**Precautions:** Pregnancy, gout, diabetes, renal calculi (large doses)

## DOSAGE AND ROUTES
### RDA
**Neonate and up to 6 mo:** PO 30 mg/day
**Infant:** PO 40-50 mg/day
**Child 1-3 yr:** PO 15 mg/day
**Child 4-8 yr:** PO 25 mg/day
**Child 9-13 yr:** PO 45 mg/day
**Child 14-18 yr:** PO 65 mg/day (females), 75 mg/day (males)
**Adult:** PO 50-500 mg/day

### Scurvy
**Adult:** PO/SUBCUT/IM/**IV** 100 mg-250 mg daily × 2 wk, then 50 mg or more daily
**Child:** PO/SUBCUT/IM/**IV** 100-300 mg daily × 2 wk, then 35 mg or more daily

### Wound healing/chronic disease/fracture
May be given with zinc
**Adult:** SUBCUT/IM/**IV**/PO 200-500 mg daily for 1-2 mo
**Child:** SUBCUT/IM/**IV**/PO 100-200 mg added doses for 1-2 mo

### Urine acidification
**Adult:** 4-12 g daily in divided doses
**Child:** 500 mg q6-8hr

**Available forms:** Tabs 25, 50, 100, 250, 500, 1000, 1500 mg; effervescent tabs 1000 mg; chewable tabs 100, 250, 500 mg; time-release tabs 500, 750, 1000, 1500 mg; time-release caps 500 mg; crystals 4 g/tsp; powder 4 g/tsp; liquid 35 mg/0.6 ml; sol 100 mg/ml; syr 20 mg/ml, 500 mg/5 ml; inj SUBCUT, IM, **IV** 100, 250, 500 mg/ml

### Implementation
**PO route**
- Swallow time rel tabs or caps whole; do not break, crush, or chew
- Mix oral sol with foods or fluids

**IM route**
- Not to be diluted; give deep in large muscle mass

**IV, direct route**
- Give undiluted by *direct* **IV** 100 mg over at least 1 min, rapid inf may cause fainting

**Intermittent IV infusion route**
• Give by intermittent inf after diluting with $D_5W$, $D_{10}W$, 0.9% NaCl, 0.45% NaCl, LR, Ringer's sol, dextrose/saline, dextrose/Ringer's combinations; temp will increase pressure in ampules; wrap with gauze before breaking

**Syringe compatibilities:** Metoclopramide, aminophylline, theophylline

**Syringe incompatibilities:** CeFAZolin, doxapram

**Y-site compatibilities:** Warfarin

## ADVERSE EFFECTS

**CNS:** Headache, insomnia, dizziness, fatigue, flushing
**GI:** Nausea, vomiting, diarrhea, anorexia, heartburn, cramps
**GU:** Polyuria, urine acidification, oxalate or urate renal stones, dysuria
**HEMA:** Hemolytic anemia in patients with G6PD
**INTEG:** Inflammation at inj site

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Readily absorbed (PO) |
| **Distribution** | Widely distributed; crosses placenta |
| **Metabolism** | Oxidation |
| **Excretion** | Kidneys, inactive; breast milk |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug/lab test

False positive: negative in glucose tests (Clinitest, Tes-Tape)
False negative: occult blood (large dose), urine bilirubin, leukocyte determination

## NURSING CONSIDERATIONS

### Assessment

• Assess nutritional status for inclusion of foods high in vit C: citrus fruits, cantaloupe, tomatoes
• Assess for vit C deficiency before, during, and after treatment; scurvy (gingivitis, bleeding gums, loose teeth); poor bone development
• Monitor I&O ratio, polyuria; in patients receiving large doses, renal stones may occur; urine pH (acidification)
• Monitor ascorbic acid levels throughout treatment if continued deficiency is suspected
• Assess inj sites for inflammation, pain, redness, thrombophlebitis if in large doses
• **Pregnancy/breastfeeding:** Use only recommended dietary allowances in pregnancy, breastfeeding

### Patient/family education

• Teach patient necessary foods to be included in diet that are rich in vit C: citrus fruits, cantaloupe, tomatoes, chili peppers (red)
• Teach patient that smoking decreases vit C levels; not to exceed prescribed dose; increases will be excreted in urine, except time release
• Teach patient not to exceed RDA recommended dose, urinary stones may occur
• Teach patient using ascorbic acid for acidification of urine to test urine pH periodically

### Evaluation

**Positive therapeutic outcome**
• Absence of anorexia, irritability, pallor, joint pain, hyperkeratosis, petechiae, poor wound healing
• Reversal of scurvy: bleeding gums, gingivitis, loose teeth

## vitamin D (cholecalciferol, vitamin $D_3$ or ergocalciferol, vitamin $D_2$) (Rx, OTC)

**Calciferol, Delta-D, Drisdol, Radiostol, Radiostol Forte, vitamin D, vitamin $D_3$**
*Func. class.:* Vitamin D
*Chem. class.:* Fat-soluble vitamin

**Do not confuse:** Calciferol/calcitriol

**ACTION:** Needed for regulation of calcium, phosphate levels; normal bone development; parathyroid activity; neuromuscular functioning

**Therapeutic outcome:** Prevention of rickets, osteomalacia, normal calcium/phosphate levels

**USES:** Vit D deficiency, rickets, renal osteodystrophy, hypoparathyroidism, hypophosphatemia, psoriasis, rheumatoid arthritis

## CONTRAINDICATIONS

Hypersensitivity, hypercalcemia, renal dysfunction, hyperphosphatemia

**Precautions:** Pregnancy, CV disease, renal calculi

## DOSAGE AND ROUTES

### Deficiency

**Adult:** PO/IM 12,000 international units/day, then increased to 500,000 international units/day
**Child:** PO/IM 1500-5000 international units/day × 2-4 wk, may repeat after 2 wk or 600,000 international units as single dose

### Hypoparathyroidism

**Adult and child:** PO/IM 200,000 international units given with 4 g calcium tab

V

**Available forms:** Tabs 400, 1000, 50,000 international units; caps 25,000, 50,000 international units; oral sol 8000 international units/ml; inj 500,000 international units/ml, 500,000 international units/5 ml

### Implementation

**PO route**

- PO may be increased q4wk depending on blood level
- Store in airtight, light-resistant container at room temperature

**IM route**

- Give inj deeply in large muscle mass, administer slowly, aspirate to avoid **IV** administration, rotate inj site

## ADVERSE EFFECTS

**CNS:** Fatigue, weakness, drowsiness, seizures, headache, psychosis
**CV:** Hypertension, dysrhythmias
**GI:** Nausea, vomiting, anorexia, cramps, diarrhea, constipation, metallic taste, dry mouth
**GU:** Polyuria, nocturia, hematuria, albuminuria, renal failure, decreased libido
**INTEG:** Pruritus, photophobia
**MS:** Decreased bone growth, early joint pain, early muscle pain

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed |
| **Distribution** | Stored in liver |
| **Metabolism** | Liver, sun |
| **Excretion** | Bile, kidney |
| **Half-life** | 12-22 hr |

### Pharmacodynamics

| | PO | IM |
|---|---|---|
| **Onset** | Unknown | Unknown |
| **Peak** | 4 hr | Unknown |
| **Duration** | 15-20 days | Unknown |

## INTERACTIONS

### Individual drugs

Cholestyramine, colestipol, PHENobarbital, phenytoin: decreased effects of vit D
Verapamil: increased toxicity

### Drug classifications

Antacids, diuretics (thiazide): increased toxicity

## NURSING CONSIDERATIONS

### Assessment

- Monitor BUN, urinary calcium, AST, ALT, cholesterol, creatinine, uric acid, chloride, magnesium, electrolytes, urine pH, phosphate—may increase; calcium should be kept at 9-10 mg/dl; vit D at 50-135 international units/dl, phosphate at 70 mg/dl; alkaline phosphatase may be decreased
- Monitor for increased blood level; toxic reactions may occur rapidly
- Assess for dry mouth, metallic taste, polyuria, bone pain, muscle weakness, headache, fatigue, tinnitus, change in LOC, irregular pulse, dysrhythmias, increased respirations, anorexia, nausea, vomiting, cramps, diarrhea, constipation; may indicate hypercalcemia
- Assess renal status: decreased urinary output (oliguria, anuria), edema in extremities, weight gain ≥5 lb, periorbital edema
- Assess nutritional status, diet for sources of vit D (milk, cod, halibut, salmon, sardines, egg yolk), calcium (dairy products, dark green vegetables), phosphates (dairy products)
- **Pregnancy/breastfeeding:** Use only recommended dietary allowances in pregnancy, breastfeeding

### Patient/family education

- Advise patient to omit dose if missed; to avoid vitamin supplements unless directed by prescriber
- Inform patient of necessary foods to be included in diet
- Advise patient to keep appointments for evaluation because therapeutic and toxic levels are narrow
- Instruct patient to report weakness, lethargy, headache, anorexia, loss of weight; to report nausea, vomiting, abdominal cramps, diarrhea, constipation, excessive thirst, polyuria, muscle and bone pain
- Caution patient to decrease intake of antacids and laxatives containing magnesium

### Evaluation

**Positive therapeutic outcome**

- Calcium levels 9-10 ml/dl
- Decreasing symptoms of bone disease

## vitamin E (OTC)

**Aquasol E**

*Func. class.:* Vitamin E
*Chem. class.:* Fat-soluble vitamin

**ACTION:** Needed for digestion and metabolism of polyunsaturated fats, decreases platelet aggregation, decreases blood clot formation, promotes normal growth and development of muscle tissue, prostaglandin synthesis

**Therapeutic outcome:** Prevention and treatment of vit E deficiency

**USES:** Vit E deficiency, impaired fat absorption, hemolytic anemia in premature neonates, prevention of retrolental fibroplasia, sickle cell anemia, supplement in malabsorption syndrome

## CONTRAINDICATIONS

**IV** use in infants

**Precautions:** Pregnancy, anemia, breastfeeding, hypothrombinemia

## DOSAGE AND ROUTES

### Deficiency

**Adult:** PO 60-75 international units/day
**Child:** PO 1 international unit/kg (malabsorption)

### Prevention of deficiency

**Adult:** PO 30 international units/day
**Infant:** PO 5 international units/day

### Topical route

**Adult and child:** TOP apply to affected areas as needed

**Available forms:** Caps 100, 200, 400, 500, 600, 1000 international units; tabs 100, 200, 400 international units; drops 15 mg/0.3 ml; chew tabs 400 units; ointment, cream, lotion, oil

### Implementation

**PO route**

- Chew chewable tabs well
- Sol may be dropped in mouth or mixed with food
- Store in airtight, light-resistant container

**Topical route**

- Apply topical to moisturize dry skin

## ADVERSE EFFECTS

**CNS:** Headache, fatigue
**CV:** Increased risk of thrombophlebitis
**EENT:** Blurred vision
**GI:** Nausea, cramps, diarrhea
**GU:** Gonadal dysfunction
**INTEG:** Sterile abscess, contact dermatitis
**META:** Altered metabolism of hormones (thyroid, pituitary, adrenal), altered immunity
**MS:** Weakness

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 20%-80% (PO) |
| **Distribution** | Widely distributed, stored in fat |
| **Metabolism** | Liver |
| **Excretion** | Bile |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Cholestyramine, colestipol, mineral oil, sucralfate: decreased absorption

### Drug classification

Anticoagulants (oral): increased action of anticoagulants

## NURSING CONSIDERATIONS

### Assessment

- Assess nutritional status: intake of wheat germ, dark green leafy vegetables, nuts, eggs, liver, vegetable oils, dairy products, cereals
- Assess for vit E deficiency (usually in neonates): irritability, restlessness, hemolytic anemia
- **Pregnancy/breastfeeding:** Use only recommended dietary allowances in pregnancy, breastfeeding

### Patient/family education

- Inform patient necessary foods to be included in diet high in vit E
- Instruct patient to omit if dose is missed
- Instruct patient to avoid vit supplements unless directed by prescriber because overdose may occur

### Evaluation

**Positive therapeutic outcome**

- Absence of hemolytic anemia
- Adequate vit E levels
- Improvement in skin lesions
- Decrease in edema

**⚠ HIGH ALERT**

# vorapaxar

(vor′a-pax′ar)
**Zontivity**
*Func. class.:* Platelet inhibitor

**ACTION:** Antagonizes the protease-activated receptor-1 (PAR-1) expressed on platelets

**Therapeutic outcome:** Absence of MI, stroke

**USES:** Secondary myocardial infarction prophylaxis or stroke prophylaxis or thrombosis prophylaxis for reduction of thrombotic cardiovascular events in patients with a history of myocardial infarction or with peripheral arterial disease

## CONTRAINDICATIONS

**BLACK BOX WARNING:** Bleeding, intracranial bleeding, stroke

**Precautions:** Breastfeeding, coronary artery bypass graft surgery (CABG), geriatric patients, hepatic disease, labor, obstetric delivery, pregnancy, renal impairment, surgery

## DOSAGE AND ROUTES

**Adult: PO** 2.08 mg once daily with aspirin and/or clopidogrel

V

**Available forms:** Tab 2.08 mg

### Implementation
- May be administered without regard to food

## ADVERSE EFFECTS
**CNS:** Depression *intracranial bleeding*
**EENT:** retinal changes
**HEMA:** Anemia, bleeding
**INTEG:** Rash
**MISC:** Rash

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Within 1 week of treatment reaches ≥80% inhibition of thrombin receptor; protein binding 99% |
| **Metabolism** | Unknown |
| **Excretion** | Primarily feces |
| **Half-life** | 3-4 days, terminal approximately 8 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr |
| **Duration** | Unknown |

## INTERACTIONS
### Drug classifications
**Beers Criteria**
Increase: Vorapaxar effect: CYP3A4 inhibitors (clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, posaconazole, saquinavir, telaprevir

### Drug/herb
Decrease: Vorapaxar level, St. John's wort, avoid using concurrent (carBAMazepine, phenytoin, rifAMPin)
CYP3A inducers: decreased vorapaxar effect
Other platelet inhibitors, anticoagulants, calcium channel blockers, CYP3A inhibitors, estradiols, NSAIDs, rifampins, salicylates, SNRIs, SSRIs, thrombolytics: increased bleeding risk

## NURSING CONSIDERATIONS
### Assessment
**BLACK BOX WARNING:** Assess for bleeding, including intracranial bleeding and stroke during treatment. Bleeding should be suspected in any patient presenting with hypotension who has recently undergone surgery, coronary angiography, percutaneous coronary intervention (PCI), or CABG. Avoid products that increase bleeding risk (salicylates, NSAIDs, SSRIs, SNRIs), avoid use in liver failure

- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed, excretion unknown
- Teach patient to inform all providers that this product is being used, not to use OTC, Rx, or herbs without approval of prescriber
- Teach patient not to breastfeed, report if pregnancy is planned or suspected
- Advise patient to take as prescribed with aspirin or clopidogrel, not to use alone, not to discontinue without prescriber approval

### Patient/family education
- Advise patient to report any unusual bruising, bleeding to prescriber; that it may take longer to stop bleeding
- Teach patient to take without regard to food

### Evaluation
**Positive therapeutic outcome**
- Absence of MI, stroke

**⚠ HIGH ALERT**

## voriconazole (Rx)
(vohr-i-kahn'a-zol)
**Vfend**
*Func. class.:* Antifungal

**Do not confuse:** Vfend/Venofer

**ACTION:** Inhibits fungal CYP 450-mediation demethylation, needed for biosynthesis, causing leakage from cell membrane

**Therapeutic outcome:** Decreasing signs, symptoms of infection

**USES:** Invasive aspergillosis, serious fungal infections (*Candida* sp., *Scedosporium apiospermum, Fusarium* sp.), *Monosporium, apiospermum*

## CONTRAINDICATIONS
Pregnancy, breastfeeding, children, hypersensitivity, severe bone marrow depression, severe hepatic disease

**Precautions:** Renal disease (**IV**); Asian/African descent, cardiomyopathy, cholestasis, chemotherapy, lactase deficiency, visual disturbances, renal failure, pancreatitis, QT prolongation, hypokalemia, ventricular dysrhythmias, torsades de pointes

## DOSAGE AND ROUTES
### Esophageal candidiasis
**Adult/geriatric/child ≥12 yr:** PO IV **≥40 kg** 200 mg q12hr; **<40 kg** 100 mg q12hr

### Candidemia of the skin, kidney, bladder wall, abdomen (non-neutropenic patients)

**Adult/child ≥12 yr:** **IV** loading dose 6 mg/kg q12hr × 24 hr, then 3-4 mg/kg q12hr × ≥14 days and ≥7 days after resolution of symptoms; PO after loading dose **>40 kg** 200 mg q12hr × ≥14 days and ≥7 days after resolution of symptoms; **<40 kg** 100 mg q12hr × ≥14 days and ≥7 days after resolution of symptoms

### Invasive aspergillosis

**Adult/adolescent:** **IV** 6 mg/kg q12hr (loading dose) then 4 mg/kg q12hr, may reduce to 3 mg/kg q12hr if intolerable

**Child ≥12 yr:** **IV** 6 mg/kg q12hr, then 4 mg/kg q12hr

### Renal dose

**Adult:** PO CCr <50 ml/min, use only orally

### Hepatic dose

**Adult:** PO/IV (Child-Pugh Class A or B): Standard loading dose, then 50% of maintenance dose; (Child-Pugh Class C): Avoid use

**Available forms:** Tabs 50, 200 mg; powder for inj, lyophilized 200 mg, powder for oral susp 45 g (40 mg/ml after reconstitution)

### Implementation

- Give 1 hr before or after meals
- Store at room temperature (powder, tabs)

**Intermittent IV infusion route**

- Give product only after C&S confirms organism, and product needed to treat condition; make sure product only is used in life-threatening infections
- Reconstitute powder with 19 ml water for inj to 10 mg/ml, shake until dissolved; infuse over 1-2 hr at a conc of 5 mg/ml or less; do not admix with other products, 4.2% sodium bicarbonate inf

**Y-site compatibilities:** Acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium acetate/chloride/gluconate, CARBOplatin, carmustine, caspofungin, ceFAZolin, cefotaxime, cefoTEtan, cefOXitin, cefTAZidime, ceftizoxime, ceftRIAXone, chloramphenicol, chlorproMAZINE, cimetidine, ciprofloxacin, cisatracurium, CISplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, DACTINomycin, DAPTOmycin, DAUNOrubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydrAMINE, DOBUTamine, DOCEtaxel, dolasetron, DOPamine, doripenem, doxacurium, doxycycline, droperidol, enalaprilat, ePHEDrine, EPINEPHrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentaNYL, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrALAZINE, hydrocortisone, ifosfamide, imipenem/cilastatin, inamrinone, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, LORazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methohexital, methotrexate, methyldopate, methylPREDNISolone, metoclopramide, metoprolol, metroNIDAZOLE, midazolam, milrinone, mitoMYcin, morphine, nafcillin, nalbuphine, naloxone, niCARdipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, PACLitaxel, palonosetron, pancuronium, pentamidine, pentazocine, PENTobarbital, PHENobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium chloride/phosphates, procainamide, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate/bicarbonate/phosphates, streptozocin, succinylcholine, SUFentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, topotecan, trimethobenzamide, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinBLAStine, vinCRIStine, vinorelbine, zidovudine

**Y-site incompatibilities:** Amphotericin B colloidal, busulfan, cefepime, cyclopSPORINE, dantrolene, diazepam, DOXOrubicin, IDArubicin, mitoXANtrone, nitroprusside, pantoprazole, phenytoin, thiopental

## ADVERSE EFFECTS

**CNS:** *Headache,* paresthesias, peripheral neuropathy, *hallucinations,* psychosis, EPS, depression, Guillain-Barré syndrome, insomnia, suicidal ideation, dizziness, fever

**CV:** Tachycardia, hyper/hypotension, vasodilatation, atrial dysrhythmias, atrial fibrillation, AV block, bradycardia, HF, MI, QT prolongation, torsades de pointes, peripheral edema

**EENT:** *Blurred vision,* eye hemorrhage, *visual disturbances*

**GI:** *Nausea, vomiting, anorexia, diarrhea,* cramps, hemorrhagic gastroenteritis, acute liver failure, hepatitis, intestinal perforation, pancreatitis

V

**GU:** *Hypokalemia,* azotemia, renal tubular necrosis, permanent renal impairment, anuria, oliguria
**HEMA:** Anemia, eosinophilia, hypomagnesemia, thrombocytopenia, leukopenia, pancytopenia
**INTEG:** *Burning, irritation,* pain, necrosis at inj site with extravasation, dermatitis, *rash,* photosensitivity
**MISC:** Respiratory disorder
**SYST:** Stevens-Johnson syndrome, toxic epidermal necrolysis, sepsis, melanoma (photosensitivity reaction)

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | CYP3A4/CYP2C9 |
| **Excretion** | Via hepatic metabolism |
| **Half-life** | Elimination 6 hr (dose dependent) |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-2 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CISplatin, cycloSPORINE, polymyxin B, vancomycin: increased nephrotoxicity
CycloSPORINE, phenytoin, pimozide, predniSOLONE, quiNIDine, rifabutin, sirolimus, tacrolimus, warfarin: increased effects of each specific product
Digoxin: increased hypokalemia
Haloperidol, chloroquine, droperidol, pentamidine; arsenic trioxide, levomethadyl: increased QT prolongation

### Drug classifications

Aminoglycosides: increased nephrotoxicity
Benzodiazepines, calcium channel blockers, ergots, HMG-CoA reductase inhibitors, nonnucleoside reverse transcriptase inhibitors, protease inhibitors, proton pump inhibitors, sulfonylureas, vinca alkaloids: increased effects of each specific product
Class IA/III antidysrhythmics, some phenothiazines, beta agonists, local anesthetics, tricyclics, CYP3A4 inhibitors (amiodarone, clarithromycin, erythromycin, telithromycin, troleandomycin); CYP3A4 substrates (methadone, pimozide, QUEtiapine, quiNIDine, risperiDONE, ziprasidone): increased QT prolongation
Corticosteroids, diuretics (thiazide), skeletal muscle relaxants: increased hypokalemia

### Drug/herb

St. John's wort: do not use together

### Drug/food

High-fat foods: avoid use with high-fat meals, take 1 hr before or after a meal

### Drug/lab test

Increased: AST/ALT, alkaline phosphatase, creatinine, bilirubin
Decreased: Hgb/Hct, platelets, WBC

## NURSING CONSIDERATIONS

### Assessment

- Monitor VS q15-30min during first inf; note changes in pulse, B/P
- Monitor I&O ratio; watch for decreasing urinary output, change in specific gravity; discontinue product to prevent permanent damage to renal tubules
- Monitor blood tests: CBC, K, Na, Ca, Mg q2wk; BUN, creatinine weekly
- Monitor weight weekly; if weight increases >2 lb/wk, edema is present; renal damage should be considered
- **Assess for renal toxicity:** increasing BUN, serum creatinine; if BUN is >40 mg/dl or if serum creatinine >3 mg/dl, product may be discontinued or dosage reduced
- **Assess for hepatotoxicity:** increasing AST, ALT, alkaline phosphatase, bilirubin, baseline and periodically
- **Assess for allergic reaction:** dermatitis, rash; product should be discontinued, antihistamines (mild reaction) or EPINEPHrine (severe reaction) administered
- **Assess for hypokalemia:** anorexia, drowsiness, weakness, decreased reflexes, dizziness, increased urinary output, increased thirst, paresthesias
- **Assess for ototoxicity:** tinnitus (ringing, roaring in ears), vertigo, loss of hearing (rare)
- **QT prolongation:** ECG for QT prolongation, ejection fraction; assess for chest pain, palpitations, dyspnea
- **Pregnancy/breastfeeding:** Do not use in pregnancy, may cause fetal harm, do not breastfeed

### Patient/family education

- Teach that long-term therapy may be needed to clear infection (2 wk-3 mo depending on type of infection)
- Advise patient to notify prescriber of bleeding, bruising, or soft tissue swelling
- Teach to take 1 hr before or after meal (PO)

• Advise patient not to drive at night because of vision changes
• Advise to avoid strong, direct sunlight
• Advise women of childbearing age to use effective contraceptive

### Evaluation

**Positive therapeutic outcome**
• Decreased fever, malaise, rash, negative C&S for infecting organism

## vortioxetine

(vor'tye-ox'e-teen)
**Brintellix**
*Func. class.:* Antidepressant
*Chem. class.:* Serotonin modulator

**Do not confuse:** Brintellix/Brilinta

**ACTION:** Reuptake inhibition at the serotonin transporter and agonist, or antagonist effects at serotonin receptors

**Therapeutic outcome:** Decreased depression

**USES:** Major depressive disorder in adults

## CONTRAINDICATIONS

Hypersensitivity, MAOI therapy

**Precautions:** Pregnancy, breastfeeding, seizure disorder, bipolar disorder, hyponatremia, hypovolemia, children, suicidal ideation, abrupt discontinuation, anticoagulant therapy, bleeding, closed-angle glaucoma, geriatrics, hepatic disease

**BLACK BOX WARNING:** Children, suicidal ideation

## DOSAGE AND ROUTES

**Adult: PO** 10 mg/day, may start with 5 mg/day initially, increase to 20 mg/day as tolerated, max 20 mg/day; poor metabolizers of CYP2D6 max 10 mg/day

**Available forms:** Tabs 5, 10, 20 mg

### Implementation

• Give without regard to food

## ADVERSE EFFECTS

**CNS:** Flushing, mania, vertigo, dizziness, suicidal attempts
**GI:** *Nausea,* diarrhea, dyspnea, constipation, *vomiting,* flatulence
**GU:** Impotence, ejaculation/orgasm dysfunction
**INTEG:** Pruritus
**SYST:** Serotonin syndrome, neonatal abstinence syndrome angioedema, pulmonary hypertension in the newborn, SIADH

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 98% |
| **Metabolism** | Unknown |
| **Excretion** | Urine (59%), feces (26%) |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

CarBAMazepine: decreased vortioxetine levels
Lithium, traMADol, traZODone: increased serotonin syndrome

### Drug classifications

Anticoagulants, antiplatelets, NSAIDs, salicylates, thrombolytics: increased bleeding risk
Barbiturates, sedative/hypnotics, other CNS depressants: increased CNS effects
Serotonin receptor agonists, SSRIs, MAOIs, SNRIs (venlafaxine, DULoxetine): increased serotonin syndrome
Tricyclics: increased effect of tricyclics; use cautiously

### Drug/herb

St. John's wort: increased serotonin syndrome

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Mental status: assess mood, sensorium, affect, suicidal tendencies, increase in psychiatric symptoms, depression, panic

• **Serotonin syndrome:** monitor for increased heart rate, sweating, dilated pupils, tremors, twitching, hyperthermia, agitation
• Alcohol consumption: if alcohol is consumed, hold dose until AM
• Sexual dysfunction: assess for impotence
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, do not breastfeed

### Patient/family education

• Teach patient that therapeutic effect may take several wk
• Teach patient to use caution when driving, performing other activities that require alertness, because of drowsiness, dizziness, blurred vision; to report signs, symptoms, or bleeding

V

• Teach patient to avoid alcohol, other CNS depressants

**BLACK BOX WARNING:** Teach patient that suicidal ideas, behaviors may occur in children or young adults

• Teach patient to notify prescriber if pregnant, planning to become pregnant, or breastfeeding, pregnancy

**BLACK BOX WARNING:** Teach patient about the effects of serotonin syndrome: nausea/vomiting, tremors; if symptoms occur, to discontinue immediately, notify prescriber

• Advise patient that decrease in libido or impotence may occur

## Evaluation

**Positive therapeutic outcome**

• Decreased depression

**⚠ HIGH ALERT**

## warfarin (Rx)

(war′far-in)

**Coumadin, Jantoven, Warfilone** 🍁

*Func. class.:* Anticoagulant

**Do not confuse:** Coumadin/Cardura/Avandia Jantoven/Janumet/Januvia

**ACTION:** Interferes with blood clotting by indirect means; depresses hepatic synthesis of vit K–dependent coagulation factors (II, VII, IX, X)

**Therapeutic outcome:** Prevention of clotting or pulmonary embolism

**USES:** Antiphospholipid antibody syndrome, arterial thromboembolism prophylaxis, deep vein thrombosis, MI prophylaxis, post MI, stroke prophylaxis, thrombosis prophylaxis, pulmonary embolism

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity, hemophilia, leukemia with bleeding, peptic ulcer disease, thrombocytopenic purpura, hepatic disease (severe), malignant hypertension, subacute bacterial endocarditis, acute nephritis, blood dyscrasias, preeclampsia, eclampsia, hemorrhagic tendencies, surgery of CNS, eye, traumatic surgery with large open surface, bleeding tendencies of GI/GU/respiratory, stroke, aneurysms, pericardial effusion, spinal puncture, major regional/lumbar block anesthesia

**BLACK BOX WARNING:** Bleeding

**Precautions:** Alcoholism, geriatric, HF, debilitated patients, trauma, indwelling catheters, severe hypertension, active infections, protein C deficiency, polycythemia vera, vasculitis, severe diabetes, Asian patients (CYP2C9, protein C,S deficiency)

## DOSAGE AND ROUTES

**Adult:** PO 2-10 mg/day × 3 days, then titrated to INR/pro-time

**Adolescent/child/infant:** PO 0.2 mg/kg/day titrated to INR

**Available forms:** Tabs 1, 2, 2.5, 3, 4, 5, 6, 7.5, 10 mg

### Implementation

**PO route**

- Warfarin is usually given with **IV** heparin for 3 or more days, warfarin blood level may take several days

## ADVERSE EFFECTS

**CNS:** *Fever,* dizziness, fatigue, headache, lethargy

**CV:** Angina, chest pain, edema, hypotension, syncope

**GI:** *Diarrhea,* nausea, vomiting, anorexia, stomatitis, cramps, hepatitis, cholestatic jaundice

**GU:** Hematuria

**HEMA:** Hemorrhage, agranulocytosis, leukopenia, eosinophilia, ecchymosis, anemia, petechiae

**INTEG:** *Rash,* dermatitis, urticaria, alopecia, pruritus

**MISC:** Epistaxis, hemoptysis, mouth ulcers, taste disturbances, priapism, dyspnea

**MS:** Bone fractures

**SYST:** Anaphylaxis, coma, cholesterol, microembolisms, exfoliative dermatitis, purple toe syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO), completely absorbed |
| **Distribution** | Crosses placenta, 99% plasma protein binding |
| **Metabolism** | Liver |
| **Excretion** | Kidney, feces (active, inactive metabolites) |
| **Half-life** | Effective ½-2½ days |

### Pharmacodynamics

| | PO |
|---|---|
| **Onset** | 12-24 hr |
| **Peak** | ½-4 days |
| **Duration** | 3-5 days |

## INTERACTIONS

### Individual drugs

Allopurinol, amiodarone, chloral hydrate, chloramphenicol, cimetidine, clofibrate, clotrimoxazole, dextrothyroxine, diflunisal, disulfiram, erythromycin, furosemide, glucagon, heparin, indomethacin, isoniazid, mefenamic acid, metroNIDAZOLE, mifepristone, phenylbutazone, quiNIDine, RU-486, sulfinpyrazone, sulindac, thyroid: increased warfarin action

Aprepitant, azoTHIOprine, bosentan, carBAMazepine, dicloxicillin, ethchlorvynol, factor IX/ VIIa, griseofulvin, nafcillin, phenytoin, rifampin, sucralfate, sulfaSALAzine, thyroid, vitamin K: decreased warfarin action

Phenytoin: increased toxicity

W

### Drug classifications

Antidepressants (tricyclic), ethacrynic acids, HMG-CoA reductase inhibitors, NSAIDs, oxyphenbutazones, COX-2 selective inhibitors, penicillins, quinolones, salicylates, selective serotonin reuptake inhibitors, steroids, sulfonamides, thrombolytics: increased warfarin action

Barbiturates, bile acid sequestrants, contraceptives (oral), estrogens: decreased warfarin action

Sulfonylureas (oral): increased toxicity

### Drug/herb

*Anise, chamomile, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, kava, licorice, melatonin, red yeast rice, saw palmetto: increased risk of bleeding*

Coenzyme Q10, St. John's wort: decreased anticoagulant effect

### Drug/food

Vit K foods: decreased warfarin action

### Drug/lab test

Increased: $T_3$ uptake, liver function tests

Decreased: uric acid

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Monitor blood studies (Hct, PT, platelets, occult blood in stools) q3mo; INR: in hospital daily after 2nd or 3rd dose; once in therapeutic range for 2 consecutive days, monitor 2-3× wk for 1-2 wk, then less frequently depending on stability of INR results; *Outpatient:* monitor every few days until stable dose, then periodically thereafter depending on stability of INR results, usually at least monthly

**BLACK BOX WARNING:** Assess for bleeding gums, petechiae, ecchymosis, black tarry stools, hematuria, occult, cerebral, (intra abdominal); fatal hemorrhage can occur

- Monitor B/P, watch for increasing signs of hypertension
- Assess for fever, skin rash, urticaria
- Assess for needed dosage change q1-2wk

### Patient/family education

- Caution patient to avoid OTC preparations unless directed by prescriber; may cause serious product interactions; avoid alcohol
- Advise patient that product may be withheld during active bleeding (menstruation), depending on condition
- Advise patient to use soft-bristle toothbrush to avoid bleeding gums, avoid contact sports, use electric razor, avoid IM inj
- Instruct patient to carry/wear emergency ID identifying product taken

**BLACK BOX WARNING:** Advise patient to report any signs of bleeding: nosebleed, gums, under skin, urine, stools

- Teach patient to read food labels; limited intake of vit K foods (green leafy vegetables) is necessary to maintain consistent prothrombin levels

### Evaluation

**Positive therapeutic outcome**

- Decrease of deep vein thrombosis
- Pro-time (1.3-2.0 × control)
- Absence of pulmonary embolism

**e22**

warfarin (Rx)

## zafirlukast (Rx)

(za-feer'loo-cast)
**Accolate**
*Func. class.:* Bronchodilator
*Chem. class.:* Leukotriene receptor antagonist

**Do not confuse:** Accolate/Accupril/Aclovate

**ACTION:** Antagonizes the contractile action of leukotrienes ($LTC_4$, $LTD_4$, $LTE_4$) in airway smooth muscle; inhibits bronchoconstriction caused by antigens

**Therapeutic outcome:** Ability to breathe more easily

**USES:** Prophylaxis and treatment of chronic asthma in adults/children >5 yr

### CONTRAINDICATIONS

Hypersensitivity, hepatic encephalopathy

**Precautions:** Pregnancy, breastfeeding, children, geriatric, hepatic disease, Churg-Strauss syndrome, acute bronchospasm

### DOSAGE AND ROUTES

**Adult and child ≥12 yr:** PO 20 mg bid
**Child 5-11 yr:** PO 10 mg bid

**Available forms:** Tabs 10, 20 mg

#### Implementation

- Give PO 1 hr before or 2 hr after meals; absorption may be decreased if given with food

### ADVERSE EFFECTS

**CNS:** Headache, dizziness, suicidal ideation, fever, insomnia
**GI:** Nausea, diarrhea, abdominal pain, vomiting, dyspepsia, hepatic failure, hepatitis
**HEMA:** Agranulocytosis
**MISC:** Infections, pain, asthenia, myalgia, fever, increased ALT, urticaria, rash, angioedema

#### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Extensively by CYP2C9, CYP3A4 enzyme systems, protein binding (99%) |
| **Excretion** | Feces |
| **Half-life** | 10 hr |

#### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3 hr |
| **Duration** | Unknown |

### INTERACTIONS

#### Individual drugs

Aspirin: increased plasma levels of zafirlukast
Erythromycin, theophylline: decreased plasma levels of zafirlukast
Warfarin: increased pro-time

#### Drug/food

Decreased: bioavailability of zafirlukast

### NURSING CONSIDERATIONS

#### Assessment

- Assess respiratory rate, rhythm, depth; auscultate lung fields bilaterally; notify prescriber of abnormalities; not to be used for acute bronchospasm in acute asthma
- **Churg-Strauss syndrome (rare):** assess adults carefully (eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, neuropathy), may be caused by reducing oral corticosteroids
- **Hepatic disease:** Monitor liver function tests
- Assess for renal/pancreatic/visual function
- **Pregnancy/breastfeeding:** Use only if clearly needed, do not breastfeed, excreted in breast milk

#### Patient/family education

- Advise patient to check OTC medications, current prescription medications that may increase stimulation, do not stop other asthma medications unless instructed to do so
- Advise patient to avoid hazardous activities; dizziness may occur
- Advise patient that if GI upset occurs, to take product with 8 oz of water, take 1-2 hr after a meal; avoid food if possible; absorption may be decreased
- Advise to take even if symptom-free
- Advise patient to notify prescriber of nausea, vomiting, diarrhea, abdominal pain, fatigue, jaundice, anorexia, flulike symptoms (hepatic dysfunction)
- Advise patient not to use for acute asthma episodes
- Teach patient not to breastfeed

#### Evaluation

**Positive therapeutic outcome**
- Ability to breathe more easily

**⚠ HIGH ALERT**

## zaleplon (Rx)

(zal'eh-plon)
**Sonata**
*Func. class.:* Hypnotic, nonbarbiturate
*Chem. class.:* Pyrazolopyrimidine
**Controlled substance schedule IV**

**Do not confuse:** Sonata/Soriatane

**ACTION:** Binds selectively to ω-1 receptor of the γ-aminobutyric acid type A ($GABA_A$) receptor complex; results are sedation, hypnosis, skeletal muscle relaxation, anticonvulsant activity, anxiolytic action

**Therapeutic outcome:** Ability to sleep

**USES:** Insomnia (short-term treatment)

## CONTRAINDICATIONS

Hypersensitivity, severe hepatic disease

**Precautions:** Pregnancy, breastfeeding, children <15 yr, geriatric, renal/hepatic disease, psychosis, angioedema, respiratory disease, depression, sleep-related behavior (sleep walking), Asian descent, CNS depression

## DOSAGE AND ROUTES

**Adult:** PO 10 mg at bedtime; may increase dosage to 20 mg at bedtime if needed; 5 mg may be used in low-weight persons
**Geriatric:** PO 5 mg at bedtime; may increase if needed

**Available forms:** Caps 5, 10 mg

### Implementation

- Give ½-1 hr before bedtime for sleeplessness; give on empty stomach
- Store in tight container in cool environment

## ADVERSE EFFECTS

**CNS:** *Drowsiness,* amnesia, depersonalization, hallucinations, hyperesthesia, paresthesia, somnolence, tremor, vertigo, dizziness, anxiety, *lethargy, daytime sedation,* confusion, complex sleep-related reactions (sleep driving, sleep eating)
**CV:** Chest pain, peripheral edema
**EENT:** Vision changes, ear/eye pain, hyperacusis, parosmia
**GI:** Nausea, anorexia, colitis, dyspepsia, dry mouth, constipation, abdominal pain
**MISC:** Asthenia, fever, headache, myalgia, dysmenorrhea
**MS:** Myalgia, back pain, arthritis
**RESP:** Bronchitis
**SYST:** Severe allergic reactions

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Extravascular tissues, crosses blood-brain barrier; crosses placenta |
| **Metabolism** | Extensively, liver to inactive metabolites |
| **Excretion** | Kidneys |
| **Half-life** | 1 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Rapid |
| **Peak** | 1 hr |
| **Duration** | 3-4 hr |

## INTERACTIONS

### Individual drugs

Cimetidine: increased action of zaleplon

### Drug classifications

CYP3A4 inhibitors/inducers: increased or decreased zaleplon levels

### Drug/herb

Chamomile, hops, kava, valerian: increased CNS depression

### Drug/food

High-fat/heavy meal: prolonged absorption, sleep onset reduced

## NURSING CONSIDERATIONS

### Assessment

- **Sleep disorders:** assess for type of sleep problem, falling asleep, staying asleep; monitor for complex sleep disorders
- Assess for previous product dependence or tolerance; if product dependent or tolerant, amount of medication should be restricted
- **Pregnancy/breastfeeding:** Avoid in pregnancy, breastfeeding
- Monitor patient's mental status: mood, sensorium, affect, sleeping patterns, drowsiness, dizziness, suicidal tendencies, excessive sedation, impaired coordination
- **Beers:** Avoid in older adults with or at high risk for delirium, potential for worsening or inducing delirium

### Patient/family education

- Inform patient that product is for short-term use only
- Teach patient to take immediately before going to bed
- Advise patient that product may cause memory problems, dependence (if used for longer periods of time), changes in behavior/thinking, complex sleep-related behavior (sleep eating/driving)
- Advise patient not to ingest a high-fat/heavy meal before taking
- Advise patient to avoid OTC preparations unless approved by a physician, to avoid alcohol ingestion or other psychotropic medications unless prescribed by a health care provider, that 1-2 wk of therapy may be required before therapeutic effects occur
- Caution patient to avoid driving, activities requiring alertness; drowsiness may occur; until

medication response is known, tell patient that drowsiness may worsen at beginning of treatment
• Instruct patient not to discontinue medication abruptly after long-term use

### Evaluation

**Positive therapeutic outcome**
• Decreased sleeplessness

## zanamivir (Rx)

(zan-a-mee′veer)
**Relenza**
*Func. class.:* Antiviral
*Chem. class.:* Neuraminidase inhibitor

**ACTION:** Inhibits neuramidase enzyme needed for influenza virus replication

**Therapeutic outcome:** Decreased symptoms of influenza types A and B for those who have been symptomatic for no more than 2 days

**USES:** Treatment of influenza types A and B for those who have been symptomatic for no more than 2 days, seasonal influenza prophylaxis

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children <7 yr, geriatric, respiratory disease, angioedema, milk protein hypersensitivity, Reye's syndrome

## DOSAGE AND ROUTES

**Adult and child >7 yr:** INH 2 inh (two 5-mg blisters) q12hr × 5 days, on the 1st day 2 doses should be taken with at least 2 hr between doses

**Available forms:** Blisters of powder for inhalation 5 mg

### Implementation

• Give before exposure to influenza; continue for 5 days after contact
• Store in airtight, dry container

## ADVERSE EFFECTS

**CNS:** *Headache, dizziness,* fatigue, seizures, self-injury, delirium (child)
**EENT:** Ear, nose, throat infections, throat discomfort
**GI:** *Nausea, vomiting, diarrhea*
**RESP:** Nasal symptoms, cough, sinusitis, bronchitis, bronchospasm
**SYST:** Angioedema

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 4%-17% absorbed |
| **Distribution** | <10% protein binding |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys unchanged |
| **Half-life** | 2½-5 hr |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Individual drugs

Intranasal influenza vaccine: decreased effect; separate by ≥48 hr, do not restart antiviral drugs for ≥2 wk

## NURSING CONSIDERATIONS

### Assessment

• **Influenza:** headache, joint aches/pain, fever, cough, sore throat, baseline and periodically through treatment, only used in those who are symptomatic ≤ 2 days
• Assess for symptoms of influenza A: increased temp, malaise, aches and pains
• Assess for skin eruptions, photosensitivity after administration of product
• Monitor respiratory status: rate, character, wheezing, tightness in chest
• Assess for allergies before initiation of treatment, reaction of each medication
• **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, avoid use in breastfeeding

### Patient/family education

• Give patient "Patient's instructions for use" and review all points before using delivery system
• Teach patient to avoid hazardous activities if dizziness occurs
• Teach patient to use for the entire 5 days
• Inform patient that this product does not reduce transmission risk of influenza to others
• Advise patients with asthma or COPD to carry a fast-acting inhaled bronchodilator since bronchospasm may occur; to use scheduled inhaled bronchodilators before using this product, avoid use in those who are lactose intolerant
• Teach patient to use as directed, finish all medication
• Teach patient to avoid use if pregnant or breastfeeding

### Evaluation

**Positive therapeutic outcome**
• Absence of fever, malaise, cough, dyspnea in influenza A

Z

## zidovudine (Rx)

(zye-doe'vue-deen)
**Novo-AZT, Retrovir**
*Func. class.:* Antiretroviral
*Chem. class.:* Nucleoside reverse transcriptase inhibitor (NRTI)

**Do not confuse:** Retrovir/ritonavir

**ACTION:** Inhibits replication of HIV-1 by incorporating into cellular DNA by viral reverse transcriptase, thereby terminating the cellular DNA chain

**Therapeutic outcome:** Decreased symptoms of HIV-1 infection

**USES:** Used in combination with at least 2 other antiretrovirals for HIV-1 infection

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, granulocyte count $<1000/mm^3$ or Hgb <9.5 g/dl, severe renal disease, obesity

**BLACK BOX WARNING:** Hepatotoxicity, anemia, lactic acidosis, myopathy, neutropenia

## DOSAGE AND ROUTES

### For the treatment of human immunodeficiency virus (HIV) infection in combination with other antiretroviral agents

**Adults:** PO 300 mg BID or 200 mg TID; IV Infusion 1 mg/kg over 1 h q 4 h around the clock (total daily dose: 6 mg/kg/day). Initiate oral therapy as soon as possible. Monotherapy with zidovudine is not recommended for treatment of HIV

**Children and Adolescents:** ≥ 30 kg PO 300 mg BID (preferred) or 200 mg TID

**Infants and Children:** 9 to 29 kg PO 9 mg/kg/dose BID (preferred) or 6 mg/kg/dose tid

- Infants and Children 4 to 8 kg PO 12 mg/kg/dose BID (preferred) or 8 mg/kg/dose TID
- Neonates 35 wks gestational age and older (unlableled) PO 4 mg/kg/dose BID initially; increase to 12 mg/kg/dose BID after 4 wks of age.
- Premature Neonates 30 to 34 wks gestational age (unlabeled) PO 2 mg/kg/dose BID initially Increase to 3 mg/kg/dose BID at 2 wks of age, and then increase to 12 mg/kg/dose BID after 6 to 8 wks of age
- Premature Neonates less than 30 weeks gestational age† 2 mg/kg/dose PO twice daily initially. Increase to 3 mg/kg/dose PO twice daily at 4 weeks of age, and then increase to 12 mg/kg/dose PO twice daily after 8 to 10 weeks of age

### For perinatal human immunodeficiency virus (HIV) prophylaxis

Pregnant Females (intrapartum) IV Infusion 2 mg/kg over 1 h, followed by 1 mg/kg/h IV continuous infusion until clamping of the umbilical cord

Neonates ≥ 35 wks gestational age IV 3 mg/kg/dose q 12 h beginning as soon as possible after birth (preferably within 6 to 12 hours). Increase to 9 mg/kg/dose Iq12 h after 4 wks of age

### Renal dose

**Adult:** PO CCr 15 mL/min or more: No change; CCr <15 mL/min: 100 mg q 8 h or 300 mg q day

**Pediatric patients:** PO GFR 10 mL/min/1.73 m2 or more: No change; GFR <10 mL/min/1.73 m2: Reduce dose by 50%

**Available forms:** Caps 100 mg; tabs 300 mg; inj 10 mg/ml; oral syr 50 mg/5 ml

### Implementation

**PO route**

- Give on empty stomach
- Do not take dapsone at same time as didanosine
- Store in cool environment; protect from light

**Intermittent IV infusion route**

- Give after diluting with $D_5W$; give over 1 hr (<4 mg/ml), do not give by direct **IV**
- Protect unopened product from light; use diluted solutions within 24 hr if stored at room temperature, 48 hr if refrigerated

**Y-site compatibilities:** Acyclovir, alemtuzumab, allopurinol, amikacin, amphotericin B, anidulafungin, argatroban, aztreonam, ceftazidime, cefTRIAXone, cimetidine, clindamycin, dexamethasone, DOBUTamine, DOPamine, erythromycin, fluconazole, fludarabine, gentamicin, heparin, imipenem/cilastatin, LORazepam, metoclopramide, morphine, nafcillin, ondansetron, oxacillin, pentamidine, phenylephrine, piperacillin, potassium chloride, ranitidine, sargramostim, tacrolimus, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, zoledronic acid

**Additive incompatibilities:** Blood products or protein solutions

## ADVERSE EFFECTS

**CNS:** *Fever, headache, malaise,* diaphoresis, *dizziness, insomnia,* paresthesia, somnolence, chills, tremor, twitching, anxiety, confusion, depression, lability, vertigo, loss of mental acuity, seizures, malaise

**EENT:** Taste change, hearing loss, photophobia
**GI:** *Nausea, vomiting, diarrhea,* anorexia, cramps, *dyspepsia, constipation,* dysphagia, *flatulence,* rectal bleeding, mouth ulcer, abdominal pain, hepatomegaly
**GU:** Dysuria, polyuria, frequency, hesitancy
**HEMA:** Granulocytopenia, anemia
**INTEG:** *Rash,* acne, pruritus, urticaria
**MS:** Myalgia, arthralgia, muscle spasm
**RESP:** Dyspnea, cough, wheezing
**SYST:** Lactic acidosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Well absorbed (PO), completely absorbed (**IV**) |
| **Distribution** | Widely distributed—crosses placenta, CSF, protein binding 38% |
| **Metabolism** | Liver, mostly |
| **Excretion** | Kidneys |
| **Half-life** | Terminal ½-3 hr |

### Pharmacodynamics

| | PO | IV |
|---|---|---|
| **Onset** | Unknown | Rapid |
| **Peak** | ½-1½ hr | Inf end |
| **Duration** | Unknown | Unknown |

## INTERACTIONS

### Individual drugs

DOXOrubicin, ribavirin, staduvine: avoid concurrent use
Ganciclovir, radiation, SMZ/TMP, valganciclovir: increased bone marrow suppression
Methadone: increased zidovudine level

### Drug classifications

Antineoplastics: increased bone marrow suppression
Interferons, NRTIs: decreased zidovudine levels

### Drug/lab test

Increased: LFTs, granulocytes
Decreased: platelets, amylase, CPK

## NURSING CONSIDERATIONS

### Assessment

- HIV: Monitor symptoms of HIV baseline and throughout treatment
- **Assess for peripheral neuropathy:** tingling or pain in hands and feet, distal numbness; if these occur, product may be decreased or discontinued
- **Assess for pancreatitis:** abdominal pain, nausea, vomiting, elevated liver enzymes; product should be discontinued because condition can be fatal
- Assess children by dilated retinal examination q6mo to rule out retinal depigmentation

**BLACK BOX WARNING: Bone marrow suppression:** Monitor blood counts q2wk; watch for decreasing granulocytes, Hgb; if low, therapy may have to be discontinued and restarted after hematologic recovery; blood transfusions may be required; monitor viral load, CD4 counts, LFTs, plasma HIV RNA, serum creatinine/BUN baseline and throughout treatment

- Monitor lipid profile, blood glucose, hepatitis B serology, plasma hepatitis C RNA, more common in females

**BLACK BOX WARNING: Lactic acidosis, severe hepatomegaly with steatosis:** obtain baseline LFTs; if elevated, discontinue treatment; discontinue even if LFTs are normal but lactic acidosis, hepatomegaly are present: may be fatal

- **Pregnancy/breastfeeding:** Register pregnant patients at the Antiretroviral Pregnancy Registry 800-258-4263, do not breastfeed, excreted in breast milk

### Patient/family education

- Caution patient to take on empty stomach; to use exactly as prescribed
- Advise patient to report signs of infection: increased temp, sore throat, shortness of breath flulike symptoms; to avoid crowds and those with known infections; to avoid crowds or people with known infections
- Advise that fainting, dizziness may occur, to avoid driving or other hazardous activities until response is known
- Instruct patient to report signs of anemia: fatigue, headache, faintness, shortness of breath, irritability
- Advise patient to report bleeding; avoid use of razors or commercial mouthwash
- Inform patient that hair may be lost during therapy (rare); a wig or hairpiece may make patient feel better
- Caution patient to avoid OTC products or other medications without approval of prescriber serious drug interactions may occur
- Caution patient not to have any sexual contact without use of a condom; needles should not be shared; blood from infected individual should not come in contact with another's mucous membranes, compliance with treatment is required
- Teach patient that redistribution of body fat may occur
- Teach patient not to breastfeed during treatment

Z

### Evaluation

**Positive therapeutic outcome**
- Decreased infection; decreased symptoms of HIV infection, decreased viral load, increased CD4 counts

## zinc (PO, OTC; IV, Rx)

(zink sul′fate)
**Orazinc, PMS Egozinc, Verazinc, Zinca-Pak, Zincate, Zinc 15, Zinc-220**
*Func. class.:* Trace element; nutritional supplement

**ACTION:** Needed for adequate healing, bone and joint development, (23% zinc)

**Therapeutic outcome:** Replacement of zinc

**USES:** Prevention of zinc deficiency, adjunct to vit A therapy

**Unlabeled uses:** Wound healing

**Precautions:** Pregnancy (parenteral), breastfeeding, hypocupremia, neonatal prematurity, neonates, renal disease

## DOSAGE AND ROUTES

### Dietary supplement (elemental zinc)

**Adult/adolescent pregnant females:** PO 11-13 mg/day

### Nutritional supplement (IV)

**Adult:** **IV** 2.5-4 mg/day, may increase by 2 mg/day if needed
**Child 1-5 yr:** **IV** 50 mcg/kg/day
**Adult and lactating female:** PO 12-14 mg/day × 12 mo
**Adult and adolescent male ≥14 yr:** PO 11 mg/day
**Adult female ≥19 yr:** PO 8 mg/day
**Adolescent female ≥14 yr:** PO 9 mg/day
**Child 9-13 yr:** PO 8 mg/day
**Child 4-8 yr:** PO 5 mg/day
**Child 1-3 yr:** PO 3 mg/day
**Infant 7-12 mo:** PO 3 mg/day
**Infant birth to 6 mo:** PO 2 mg/day (adequate intake)

### Wound healing (unlabeled)

**Adult:** PO 50 mg tid until healed (elemental iron)

**Available forms:** Tabs 66, 110 220 mg; inj 1, 5 mg/ml, Caps 25, 50 mg

### Implementation

**PO route**
- Give with meals to decrease gastric upset; restrict dairy products, caffeine, which decrease absorption

**IV route**
- Part of TPN

## ADVERSE EFFECTS

**GI:** Nausea, vomiting, cramps, heartburn, ulcer formation

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Poorly absorbed (**PO**), completely absorbed (**IV**) |
| **Distribution** | Widely distributed |
| **Metabolism** | Liver |
| **Excretion** | 90% (feces), 10% (kidneys) |
| **Half-life** | Unknown |

### Pharmacodynamics

Unknown

## INTERACTIONS

### Drug classifications

Fluoroquinolones, tetracyclines: decreased absorption

### Drug/food

Caffeine, dairy products: decreased absorption of PO zinc

## NURSING CONSIDERATIONS

### Assessment

- Zinc deficiency: poor wound healing, absence of taste, smell, slowing growth
- Alkaline phosphatase, HDL monthly in long-term therapy
- Monitor zinc levels during treatment, CBC
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk (IV), considered safe in breastfeeding

### Patient/family education

- Inform patient that element must be taken for 3 mo to be effective
- Advise patient to report immediately nausea, diarrhea, rash, severe vomiting, restlessness, abdominal pain, tarry stools

### Evaluation

**Positive therapeutic outcome**
- Absence of zinc deficiency
- Improved wound healing

**OVERDOSE:** Diarrhea, rash, dehydration, restlessness

## ziprasidone (Rx)

(zi-praz′ih-dohn)
**Geodon, Zeldox**
*Func. class.:* Antipsychotic/neuroleptic
*Chem. class.:* Benzisoxazole derivative

**ACTION:** Unknown; may be mediated through both dopamine type 2 ($D_2$) and serotonin type 2 ($5\text{-}HT_2$) antagonism

**Therapeutic outcome:** Decreased signs/symptoms of psychosis

**USES:** Schizophrenia, acute agitation, acute psychosis, bipolar disorder, mania, psychotic depression, agitation

## CONTRAINDICATIONS

Hypersensitivity, breastfeeding

**Precautions:** Pregnancy, children, geriatric, renal/cardiac/hepatic disease, breast cancer, diabetes, AV block, CNS depression, seizure disorders, abrupt discontinuation, agranulocytosis, ambient temperature increase, suicidal ideation, torsades de pointes, strenuous exercise

**BLACK BOX WARNING:** Increased mortality in elderly patients with dementia-related psychosis

## DOSAGE AND ROUTES

### Schizophrenia

**Adult:** PO 20 mg bid with food, adjust dosage every 2 days upward to max of 80 mg bid; IM 10-20 mg; may give 10 mg q2hr, doses of 20 mg may be given q4hr, max 40 mg/day (acute episodes); switch to PO as soon as possible

### Bipolar disorder

**Adult:** PO 40 mg bid with food, on day 2 increase to 60 or 80 mg bid, then adjust to response; maintenance as adjunct to lithium/valproate 40-80 mg bid

**Available forms:** Tabs 20, 40, 60, 80 mg; inj 20 mg/ml single-dose vials

### Implementation

- Give reduced dosage in geriatric
- Give antiparkinsonian agent on order from prescriber, to be used for EPS
- Provide decreased stimulus by dimming lights, avoiding loud noises
- Store in tight, light-resistant container
- Provide supervised ambulation until patient is stabilized on medication; do not involve in strenuous exercise program because fainting is possible; patient should not stand still for a long time

**PO route**

- Take cap whole and with food, with plenty of fluid at same time of day
- Food increases absorption
- Store in airtight, light-resistant container

**IM route**

- Add 1.2 ml sterile water for inj to vial, shake vigorously until product is dissolved; give deeply in large muscle; do not mix with other products; do not use if particulates are present, keep patient recumbent for 30 min after injection
- Store injection at room temperature; protect from light; after reconstituting may be stored at room temperature × 24 hr, 7 days refrigerated

## ADVERSE EFFECTS

**CNS:** *EPS (pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia), drowsiness, insomnia, agitation, anxiety, headache,* seizures, neuroleptic malignant syndrome, dizziness, tremor, facial droop
**CV:** Orthostatic hypotension, tachycardia, prolonged QT/QTc, sudden death, heart failure (geriatric), torsades de pointes
**EENT:** Blurred vision, diplopia
**ENDO:** Metabolic changes, hyperprolactinemia (rare)
**GI:** *Nausea,* vomiting, *anorexia, constipation,* jaundice, weight gain, diarrhea, dry mouth, abdominal pain
**GU:** Enuresis, urinary incontinence, gynecomastia, impotence, priapism
**MS:** Decreased bone density
**RESP:** Rhinitis, dyspnea, infection, cough
**INTEG:** Rash, inj site pain, sweating

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 99% |
| **Metabolism** | Liver, extensively to metabolite |
| **Excretion** | Unknown |
| **Half-life** | Terminal 7 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | PO 6-8 hr; IM 60 min |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased sedation
Chloroquine, clarithromycin, droperidol, erythromycin, grepafloxacin, haloperidol, methadone, moxifloxacin, pentamidine: increased QT prolongation
CarBAMazepine, phenytoin, rifampin: increased excretion of ziprasidone
Ketoconazole: increased ziprasidone level
Lithium: increased EPS, possible neurotoxicity

### Drug classifications

Antihypertensives: increased hypotension
Antipsychotics: increased EPS

β-agonists, class IA/III antidysrhythmics, local anesthetics, phenothiazines (some), tricyclics: increased QT prolongation
Barbiturates: increased excretion of ziprasidone
CNS depressants: increased sedation
SSRIs, SNRIs: increased serotonin syndrome, increased neuroleptic malignant syndrome

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Assess geriatric with dementia closely; heart failure, sudden death have occurred

- Assess mental status before initial administration, AIMS assessment
- Monitor bilirubin, CBC, liver function tests, fasting blood glucose, cholesterol profile; potassium, magnesium when taken with loop/thiazide diuretics qmo
- Monitor urinalysis before, during prolonged therapy
- Monitor B/P standing and lying; also pulse, respirations; take these q4hr during initial treatment; establish baseline before starting treatment; report drops of 30 mm Hg; watch for ECG changes; QT prolongation may occur, QTc >500 msec should have products discontinued
- Assess dizziness, faintness, palpitations, tachycardia on rising
- **Assess EPS,** including akathisia (inability to sit still, no pattern to movements), tardive dyskinesia (bizarre movements of the jaw, mouth, tongue, extremities), pseudoparkinsonism (rigidity, tremors, pill rolling, shuffling gait)
- **Assess for neuroleptic malignant syndrome:** hyperthermia, increased CPK, altered mental status, muscle rigidity
- Assess constipation, urinary retention daily; if these occur, increase bulk and water in diet
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, may cause EPS in the neonate, enroll in the Atypical Antipsychotic Pregnancy Registry 866-961-2388, avoid breastfeeding, excretion unknown
- **Beers:** Avoid use in older adults except for schizophrenia, bipolar disorder, or short-term as an antiemetic during chemotherapy, increased risk of stroke and cognitive decline

### Patient/family education

- Advise patient that orthostatic hypotension may occur and to rise from sitting or lying position gradually; avoid hot tubs, hot showers, tub baths because hypotension may occur
- Advise patient to avoid abrupt withdrawal of this product; EPS may result; product should be withdrawn slowly
- Advise patient to avoid OTC preparations (cough, hay fever, cold) unless approved by prescriber, since serious product interactions may occur; avoid use with alcohol, CNS depressants; increased drowsiness may occur
- Teach patient to avoid hazardous activities if drowsy or dizzy
- Advise patient to increase fluids to prevent constipation
- Teach patient to use sips of water, candy, gum for dry mouth
- Teach patient to report impaired vision, tremors, muscle twitching
- Teach patient that in hot weather, heat stroke may occur; take extra precautions to stay cool, take adequate liquids

### Evaluation

**Positive therapeutic outcome**

- Decrease in emotional excitement, hallucinations, delusions, paranoia; reorganization of patterns of thought, speech

## TREATMENT OF OVERDOSE:

Lavage if orally ingested; provide airway; *do not induce vomiting*

**⚠ HIGH ALERT**

## ziv-aflibercept

(ziv-a-flih'ber-sept)
**Zaltrap**
*Func. class.:* Antineoplastic
*Chem. class.:* Signal transduction inhibitor (STI), fusion protein

**ACTION:** An angiogenesis inhibitor, a fusion protein that binds to vascular endothelial growth factors (VEGF-A, VEGF-B) and placental growth factor 1 and 2

**Therapeutic outcome:** Decrease in spread or size of tumor

**USES:** Metastatic colorectal cancer that is resistant or has progressed after an oxaliplatin-containing regimen in combination with 5-fluorouracil, leucovorin, irinotecan (FOLFIRI)

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Infertility, male-mediated teratogenicity, encephalopathy, hypertension, dental work, breastfeeding, children, neonates, geriatric patients, infection, neutropenia, pregnancy

**BLACK BOX WARNING:** Bleeding, GI bleeding/perforation, intracranial bleeding, surgery

## DOSAGE AND ROUTES

**Adult: IV** 4 mg/kg over 1 hr on day 1 every 2 wk in combination with the FOLFIRI regimen (irinotecan 180 mg/m$^2$ over 90 min on day 1 with dl-racemic leucovorin 400 mg/m$^2$ over 2 hr) (infused at the same time, in same Y-line; then on day 1 by 5-fluorouracil 400 mg/m$^2$ as a bolus, then 2400 mg/m$^2$ as a 46-hr cont IV inf)

**Available forms:** Solution for injection 100 mg/4 ml; 200 mg/8 ml

### Implementation

• Give before FOLFIRI chemotherapy; visually inspect for particulate matter and discoloration before use

**Dilution and preparation**

• Withdraw the calculated dose, add to 0.9% sodium chloride or dextrose 5% solution to 0.6–8 mg/mL; use polyvinyl chloride (PVC) infusion bags containing bis (2-ethylhexyl) phthalate (DHEP) or polyolefin infusion bags; do not re-enter the vial after first puncture; discard any unused portion; do not mix or combine with other drugs in the same infusion bag; the diluted solution may be stored refrigerated for ≤4 hr; discard any unused portion in the infusion bag

**IV infusion**

• Give diluted solution over 1 hr using a 0.2 micrometer polyethersulfone filter; do not use nylon or polyvinylidene fluoride (PVDF) filters; do not give IV push or bolus; do not mix or combine with other drugs in the same IV line; give using an infusion set made of one of the following: PVC containing DEHP, DEHP-free PVC containing trioctyl-trimellitate (TOTM), polypropylene, polyethylene-lined PVC, or polyurethane

**Dosage adjustments for recurrent or severe hypertension**

Hold until B/P is controlled and then permanently reduce dose to 2 mg/kg; discontinue in hypertensive crisis or hypertensive encephalopathy

**Dosage adjustments for proteinuria (2 g/24 hr)**

Hold until proteinuria is <2 g/24 hr; if proteinuria recurs, hold therapy until proteinuria is <2 g/24 hr, then reduce to 2 mg/kg; discontinue in nephrotic syndrome or thrombotic microangiopathy

## ADVERSE EFFECTS

**CNS:** Intracranial bleeding, *headache, dizziness,* reversible posterior leukoencephalopathy
**CV:** Hypertensive crisis, *hypertension,* stroke
**GI:** Nausea, hepatotoxicity, dyspepsia, GI hemorrhage, *abdominal pain,* GI perforation
**GU:** Proteinuria, hematuria
**HEMA:** Neutropenia, leukopenia
**INTEG:** Rash, pruritus, alopecia, hypersensitivity, palmar plantar erythrodysesthesia
**MISC:** Fatigue, epistaxis, night sweats, decreased weight, flulike symptoms, infection
**RESP:** Dyspnea, pulmonary embolism

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Elimination 6 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | Unknown |

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Severe bleeding: Assess for GI bleeding, intracranial bleeding, and pulmonary hemorrhage/hemoptysis; may be fatal; monitor patients for signs and symptoms of bleeding

**BLACK BOX WARNING:** GI perforation: some cases are fatal; monitor patients for signs and symptoms of GI perforation; discontinue therapy if GI perforation develops

• **Poor wound healing:** hold ≥4 wk before elective surgery; after major surgery, do not restart for ≥4 wk and until the surgical wound is entirely healed

• **Severe hypertension/hypertensive crisis:** usually occurs within the first 2 cycles (grade 3 or 4 hypertension); monitor B/P every 2 wk or more often if needed; treatment with antihypertensives may be needed; product may need to be discontinued

• **Severe proteinuria/nephrotic syndrome/thrombotic microangiopathy (TMA):** monitor urine protein by dipstick analysis and urinary protein–to–creatinine ratio (UPCR); obtain a 24-hr urine collection for a UPCR >1; for proteinuria of <2 g/24 hr, temporarily hold doses until proteinuria is <2 g/24 hr; if proteinuria recurs, hold doses until proteinuria is <2 g/24 hr, then permanently reduce; discontinue in nephrotic syndrome or TMA

- **Febrile neutropenia, neutropenic infection/sepsis:** monitor CBC with differential at baseline and before each cycle, hold FOLFIRI until the neutrophil count is ≥1.5 × $10^9$/L
- **Geriatric toxicity:** assess for diarrhea, dizziness, asthenia, weight loss, and dehydration that can indicate toxicity
- **Pregnancy Breastfeeding:** highly effective contraception during treatment and up to 3 mo after the last dose is needed for all patients of reproductive potential because infertility and male-mediated teratogenicity can occur; infertility can occur but is reversible within 18 wk after stopping product: do not breastfeed

### Patient/family education

- **Pregnancy C/breastfeeding:** teach that highly effective contraception should be used during treatment and up to 3 mo after the last dose in all patients of reproductive potential, infertility and male-mediated teratogenicity can occur; infertility is reversible within 18 wk after stopping product; do not breastfeed
- Teach patient about reason for treatment, expected results

**BLACK BOX WARNING:** Notify prescriber immediately of bleeding, severe abdominal pain, poor wound healing

### Evaluation

**Positive therapeutic outcome**

- Decrease in spread of size of tumor

## zoledronic acid (Rx)

(zoh'leh-drah'nick ass'id)

**Reclast, Zometa**

*Func. class.:* Bone-resorption inhibitor

*Chem. class.:* Bisphosphonate

**ACTION:** Inhibits normal and abnormal bone resorption; potent inhibitor of osteoclastic bone resorption; inhibits osteoclastic activity, reduces bone resorption and inhibits skeletal calcium release caused by stimulating factors released by tumors; reduction of abnormal bone resorption is responsible for therapeutic effect in hypercalcemia; may directly block dissolution of hydroxyapatite bone crystals

**Therapeutic outcome:** Serum calcium at normal level

**USES:** Moderate to severe hypercalcemia associated with malignancy; multiple myeloma; bone metastases from solid tumors (used with antineoplastics), active Paget's disease, osteoporosis, glucocorticoid-induced osteoporosis, osteoporosis prophylaxis in postmenopausal women

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypocalcemia, hypersensitivity to this product or bisphosphonates

**Precautions:** Children, geriatric, renal dysfunction, asthmatic patients, asthma, acute bronchospasm, anemia, chemotherapy, coagulopathy, dehydration, dental disease, diabetes mellitus, renal disease, electrolyte imbalance, hypertension, hypovolemia, phosphate hypersensitivity, infection, multiple myeloma

## DOSAGE AND ROUTES

### Hypercalcemia of malignancy

**Adult: IV** INF 4 mg, given as a single INF over ≥15 min, may re-treat with 4 mg if serum calcium does not return to normal within 1 wk

### Multiple myeloma/metastatic bone lesions

**Adult: IV** INF 4 mg, given over 15 min q3-4wk

### Osteoporosis

**Adult: IV** 5 mg over 15 min or more q12mo

### Active Paget's disease

**Adult: IV** INF 5 mg over ≥15 min

### Osteoporosis prophylaxis (Reclast), postmenopausal women

**Adult: IV** INF 5 mg every other yr

### Osteoporosis prophylaxis (Reclast) taking systemic glucocorticoids

**Adult: IV** 5 mg qyr

### Renal dose

**Adult:** IV INF CCr 50-60 ml/min 3.5 mg; CCr 40-49 ml/min 3.3 mg; CCR 30-39 ml/min 3 mg; CCr <30 ml/min don't use

### Early breast cancer (unlabeled)

**Adult: IV** 4 mg q6mo with goserelin 3.6 mg subcut qmo and tamoxifen 20 mg/day or anastrozole 1 mg/day for 3 yr

**Available forms:** Sol for inj 4 mg/5 ml (Zometa); inj 5 mg/100 ml (Reclast)

### Implementation

- Give acetaminophen before and for 72 hr after to decrease pain
- Sol reconstituted with sterile water may be stored under refrigeration for up to 24 hr **IV**
- Administer in separate **IV** line from all other products

**Zometa**
• Administer after reconstituting by adding 5 ml of sterile water for inj to each vial, then add up to ≥100 ml of sterile 0.9% NaCl, $D_5W$, run over ≥15 min
**Reclast**
• No further dilution required; inf over ≥15 min at constant rate; max 5 mg

## ADVERSE EFFECTS

**CNS:** Dizziness, headache, anxiety, confusion, insomnia, agitation
**CV:** Hypotension, leg edema, atrial fibrillation, chest pain
**GI:** Abdominal pain, anorexia, constipation, nausea, diarrhea, vomiting, taste change
**GU:** UTI, possible reduced renal function, renal damage
**META:** Anemia, hypokalemia, hypomagnesemia, hypophosphatemia, hypocalcemia, increased serum creatinine
**MISC:** *Fever, chills, flulike symptoms*
**MS:** Severe bone pain, *arthralgias, myalgias,* osteonecrosis of the jaw

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly cleared from circulation |
| **Distribution** | Taken up mainly by bones; plasma protein binding ~22% |
| **Metabolism** | Not metabolized |
| **Excretion** | Kidneys (~50% eliminated in urine within 24 hr) |
| **Half-life** | Terminal 167 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 15 min |
| **Duration** | Max effect 7 days |

## INTERACTIONS

### Individual drugs

Calcium, vitamin D: decreased zoledronic acid effect
Digoxin: hypomagnesemia, hypokalemia

### Drug classifications

Aminoglycosides, NSAIDs, radiopaque contrast agents: increased neurotoxicity
Aminoglycosides, loop diuretics: decreased serum calcium
Infusion solutions (calcium-containing): do not mix with calcium-containing inf sol such as lactated Ringer's sol

### Drug/lab test

Increased: creatinine
Decreased: calcium, phosphorus, magnesium, potassium, Hct/Hgb, RBC, platelets, WBC

## NURSING CONSIDERATIONS

### Assessment

• Assess renal function tests and calcium, phosphate, magnesium, potassium, creatinine; if creatinine is elevated hold treatment
• **Assess for hypocalcemia:** paresthesia, twitching, laryngospasm; Chvostek's/Trousseau's signs
• **Assess dental status;** dental health may be required before starting this product, assess mouth for sores, dental cavities, gingivitis, a dental professional exam should be done; cover with antiinfectives for dental extraction
• Assess for atrial fibrillation
• **Pregnancy/breastfeeding:** Not to use in pregnancy, breastfeeding
• **Fluid volume status:** Encourage additional fluid intake or give bolus before use
• **Skeletal survey:** Bone fractures may occur, prevent falls and injury

### Patient/family education

• Instruct patient to report hypercalcemic relapse: nausea, vomiting, bone pain, thirst
• Advise patient to continue with dietary recommendations including calcium and vit D; take a multiple vitamin daily, 500 mg of calcium, 400 international units vit D in multiple myeloma
• Teach patient if nausea/vomiting occur, eat small meals, use lozenges or chewing gum
• Advise patient if bone pain occurs, notify prescriber to obtain analgesic
• Advise patient not to use during pregnancy
• Instruct patient to continue good oral hygiene
• Teach patient that oral health may be required before starting product in high-risk patients, repair of dental cavities, treatment of gingivitis
• Advise patient to report ocular infection or eye pain immediately
• Teach patient that musculoskeletal pain and weakness may occur
• Advise patient to have regular checkups, report mouth sores or jaw pain (osteoporosis of the jaw)

### Evaluation

**Positive therapeutic outcome**
• Calcium levels decreased to normal

## TREATMENT OF OVERDOSE:

Correct clinically relevant reductions in serum calcium by administering **IV** calcium gluconate; in serum phosphorus, with potassium or sodium phosphate; in serum magnesium, with magnesium sulfate

Z

## ZOLMitriptan (Rx)

(zole-mih-trip′tan)
**Zomig, Zomig-ZMT**
*Func. class.:* Migraine agent, abortive
*Chem. class.:* $5HT_{1B}/5HT_{1D}$ receptor agonist (triptan)

**ACTION:** Binds selectively to the vascular serotonin type 1 ($5HT_{1B}/5HT_{1D}$) receptor subtype, exerts antimigraine effect; causes vasoconstriction in cranial arteries

**Therapeutic outcome:** Decreased severity, frequency of headache

**USES:** Acute treatment of migraine with or without aura

## CONTRAINDICATIONS

Angina pectoris, history of MI, documented silent ischemia, ischemic heart disease, uncontrolled hypertension, hypersensitivity, basilar or hemiplegic migraine, risk of CV events

**Precautions:** Pregnancy, breastfeeding, children, postmenopausal women, men >40 yr, geriatric, risk factors for CAD, hypercholesterolemia, obesity, diabetes, impaired renal/hepatic function

## DOSAGE AND ROUTES

**Adult:** PO start at 2.5 mg or lower (tab may be broken), may repeat after 2 hr, max 10 mg/24 hr; NASAL 1 spray in 1 nostril at onset of migraine, repeat in 2 hr if no relief

**Available forms:** Tabs 2.5, 5 mg; orally disintegrating tabs 2.5, 5 mg; nasal spray 2.5, 5 mg

### Implementation

- Give with fluids as soon as symptoms of migraine occur
- Provide quiet, calm environment with decreased stimulation for noise, bright light, excessive talking

**Orally disintegrating tablet**

- Give orally disintegrating tablet after opening; do not crush or chew, allow to dissolve on tongue

## ADVERSE EFFECTS

**CNS:** *Tingling, hot sensation, burning, feeling of pressure, tightness, numbness, dizziness, sedation*
**CV:** Palpitations, chest pain
**GI:** Abdominal discomfort, nausea, dry mouth, dyspepsia, dysphagia
**MISC:** Odd taste (spray)
**MS:** *Weakness, neck stiffness,* myalgia
**RESP:** Chest tightness, pressure

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | 25% plasma protein binding |
| **Metabolism** | Liver |
| **Excretion** | Urine, feces |
| **Half-life** | 3-3½ hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | Unknown |
| **Duration** | 2-3½ hr |

## INTERACTIONS

### Individual drugs

Cimetidine: increased half-life of ZOLMitriptan
Ergot: increased vasospastic effects
FLUoxetine, fluvoxaMINE, PARoxetine, sertraline: increased weakness, hyperreflexia, incoordination
Sibutramine: increased ZOLMitriptan levels

### Drug classifications

Contraceptives (oral): increased half-life of ZOLMitriptan
Ergot derivatives: increased vasospastic effects
MAOIs: do not use within 2 wk
Selective serotonin reuptake inhibitors: increased weakness, hyperreflexia, incoordination

### Drug/herb

SAM-e, St. John's wort: serotonin syndrome

### Drug/lab test

Increased: alkaline phosphatase

## NURSING CONSIDERATIONS

### Assessment

- Assess for tingling, hot sensation, burning, feeling of pressure, numbness, flushing
- Assess neurologic status: LOC, blurring vision, nausea, vomiting, tingling in extremities preceding headache
- Monitor ingestion of tyramine foods (pickled products, beer, wine, aged cheese), food additives, preservatives, colorings, artificial sweeteners, chocolate, caffeine, which may precipitate these types of headaches
- Assess for serotonin syndrome if also taking an SSRI
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, may cause fetal harm and death, do not breastfeed, excreted in breast milk
- **Beers:** Avoid use in older adults, may cause CNS effects

### Patient/family education

- Teach patient to report any side effects to prescriber

• Advise patient to use contraception while taking product
• Teach patient to report pain, rash, swelling of face
• Instruct patient not to double doses; if second dose is needed, wait at least 2 hr; disintegrating dosage form: do not split, break, alter, to remove from blister pack immediately before use
• Teach patient that product does not reduce or prevent number of migraines and not to use for other headaches

### Evaluation

**Positive therapeutic outcome**
• Decrease in frequency, severity of headache

**⚠ HIGH ALERT**

## zolpidem (Rx)

(zole-pi′dem)
**Ambien, Ambien CR, Edluar, Intermezzo, Zolpimist**
*Func. class.:* Sedative-hypnotic
*Chem. class.:* Nonbenzodiazepine of imidazopyridine class
**Controlled substance schedule IV**

**ACTION:** Produces CNS depression at limbic, thalamic, hypothalamic levels of CNS; may be mediated by neurotransmitter γ-aminobutyric acid (GABA); results are sedation, hypnosis, skeletal muscle relaxation, anticonvulsant activity, anxiolytic action

**Therapeutic outcome:** Ability to sleep, sedation

**USES:** Insomnia, short-term treatment; insomnia with difficulty of sleep onset/maintenance (ext rel)

## CONTRAINDICATIONS

Hypersensitivity to benzodiazepines

**Precautions:** Pregnancy, breastfeeding, children <18 yr, geriatric, anemia, hepatic disease, suicidal individuals, product abuse, seizure disorders, angioedema, depression, respiratory disease, sleep apnea, sleep-related behavior (sleep walking), myasthenia gravis, pulmonary disease, next-morning impairments; females (lower dose needed)

## DOSAGE AND ROUTES

**Adult:** PO 10 mg at bedtime × 7-10 days only; total dose max 10 mg; EXT REL 12.5 mg immediately before bedtime, may be useful for up to 24 wk in people 18-64 yr with primary insomnia; oral spray (Zolpimist) 10 mg (2 sprays) immediately before bedtime, max 10 mg/day; SL (Edluar) 10 mg just before bedtime
**Geriatric:** PO 5 mg at bedtime; EXT REL 6.25 mg

**Available forms:** Tabs 5, 10 mg; ext rel tabs 6.25, 12.5 mg; SL 1.75, 3.5, 5, 10 mg; oral spray 5 mg/spray

### Implementation

**PO route**
• Do not break, crush, or chew ext rel product or orally disintegrating tab
• Give ½-1 hr before bedtime for sleeplessness; give several hr before patient is to rise (to avoid hangover)
• Give with food or fluids; tab may be crushed or swallowed whole
• Do not use spray with or after a meal
• Store in airtight container in cool environment

## ADVERSE EFFECTS

**CNS:** Headache, lethargy, drowsiness, daytime sedation, dizziness, confusion, light-headedness, anxiety, irritability, amnesia, poor coordination, complex sleep-related reactions (sleep driving, sleep eating), depression, somnolence, suicidal ideation, abnormal thinking/behavioral changes
**CV:** Chest pain, palpitation
**GI:** Nausea, vomiting, diarrhea, heartburn, abdominal pain, constipation
**HEMA:** Leukopenia, granulocytopenia (rare)
**MISC:** Myalgia
**SYST:** Severe allergic reactions, angioedema, anaphylaxis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Rapidly absorbed |
| **Distribution** | Unknown |
| **Metabolism** | Liver—inactive metabolite |
| **Excretion** | Kidneys, breast milk |
| **Half-life** | 2½ hr, increased in geriatric |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | PO up to 1.5 mg |

## INTERACTIONS

### Individual drugs

Alcohol: increased action of both products

### Drug classifications

CNS depressants: increased action of both products
CYP3A4 inhibitors/inducers: increased or decreased zolpidem levels

Z

## NURSING CONSIDERATIONS

### Assessment

- Assess mental status: mood, sensorium, anxiety, affect, sleeping pattern, drowsiness, dizziness, especially geriatric; physical dependency, withdrawal symptoms: anxiety, panic attacks, agitation, seizures, headache, nausea, vomiting, muscle pain, weakness; suicidal tendencies; for indications of increasing tolerance and abuse
- Monitor B/P (lying, standing), pulse; if systolic B/P drops 20 mm Hg, hold product, notify prescriber
- Monitor I&O ratio for renal dysfunction
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, may cause fetal harm, cautious use in breastfeeding
- **Beers:** Avoid in older adults, CNS effects occur

### Patient/family education

- Advise patient that complex sleep-related behavior may occur (sleep driving/eating)
- Instruct patient that product may be taken with food or fluids, next-morning impairment may occur
- Caution patient not to use for everyday stress or longer than 3 mo unless directed by prescriber; not to take more than prescribed amount; may be habit forming; not to double or skip doses
- Caution patient to avoid OTC preparations unless approved by prescriber; alcohol and CNS depressants will increase CNS depression
- Advise patient to avoid driving, activities that require alertness, because drowsiness may occur; to avoid alcohol ingestion or other psychotropic medications; to rise slowly or fainting may occur, especially geriatric; that drowsiness may worsen at beginning of treatment
- Instruct patient not to discontinue medication abruptly after long-term use; withdrawal symptoms include vomiting, cramping, tremors, seizures
- Teach patient use of orally disintegrating tabs: place on tongue, allow to dissolve before swallowing
- Teach patient not to crush, chew, break ext rel tabs
- Teach patient to prime spray pump before using

### Evaluation

**Positive therapeutic outcome**

- Ability to sleep at night
- Decreased amount of early-morning awakening if taking product for insomnia

## TREATMENT OF OVERDOSE:

Lavage, VS, supportive care

## zonisamide (Rx)

(zone-is'a-mide)

**Zonegran**

*Func. class.:* Anticonvulsant

*Chem. class.:* Sulfonamides

**ACTION:** May act through sodium and calcium channels, but exact action is unknown; serotoninergic action

**Therapeutic outcome:** Decreased seizures

**USES:** Adjunctive therapy of partial seizures

## CONTRAINDICATIONS

Hypersensitivity to this product or sulfonamides

**Precautions:** Pregnancy, breastfeeding, children <16 yr, geriatric, allergies, renal/hepatic disease, psychiatric condition, hepatic failure, pulmonary disease, suicidal ideation

## DOSAGE AND ROUTES

**Adults and child >16 yr:** PO 100 mg/day, may increase after 2 wk to 200 mg/day, may increase q2wk, max dose 600 mg/day

**Available forms:** Caps 25, 50, 100 mg

### Implementation

- Give without regard to food, swallow whole

## ADVERSE EFFECTS

**CNS:** Dizziness, insomnia, paresthesias, depression, fatigue, headache, confusion, somnolence, agitation, irritability, speech disturbance, suicidal ideation, seizures, status epilepticus
**EENT:** Diplopia, verbal difficulty, speech abnormalities, taste perversion, amblyopia, pharyngitis, rhinitis, tinnitus, nystagmus
**GI:** Nausea, constipation, anorexia, weight loss, diarrhea, dyspepsia, dry mouth, abdominal pain
**GU:** Kidney stones
**HEMA:** Aplastic anemia, granulocytopenia (rare), ecchymosis
**INTEG:** Rash
**MISC:** Flulike symptoms
**SYST:** Stevens-Johnson syndrome, metabolic acidosis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 40% |
| **Metabolism** | Liver |
| **Excretion** | Kidneys |
| **Half-life** | In RBCs 105 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-6 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Individual drugs

Alcohol: increased CNS depression

### Drug classifications

CarBAMazepine, PHENobarbital, phenytoin: decreased half-life of zonisamide

CYP3A4 inducers, inhibitors: altered product levels

### Drug/herb

St. John's wort: increased effect of zonisamide

### Drug/food

Grapefruit: do not use together

### Drug/lab test

Increased: BUN, creatinine

## NURSING CONSIDERATIONS

### Assessment

- Assess for seizures: duration, type, intensity, precipitating factors
- Renal function: albumin conc, BUN, urinalysis, creatinine; serum bicarbonate baseline, periodically
- **Assess mental status:** mood, sensorium, affect, memory (long, short); suicidal thoughts/behavior
- Stevens-Johnson syndrome, aplastic anemia, fulminant hepatic necrosis; may cause death; monitor for rashes and hypersensitive reactions
- Assess for rash, hypersensitivity reaction
- Obtain bicarbonate before treatment/periodically; metabolic acidosis may occur in child
- **Pregnancy/breastfeeding:** Use only if benefits outweigh fetal risk, may cause fetal harm, pregnant patients should enroll in the North American Antiepileptic Drug Pregnancy Registry 888-233-2334, do not breastfeed, excreted in breast milk

### Patient/family education

- Advise patient not to discontinue product abruptly; seizures may occur
- Advise patient to avoid hazardous activities until stabilized on product
- Advise patient to carry/wear emergency ID stating product use
- Teach patient not to use grapefruit juice
- Teach patient to notify prescriber of sore throat, fever, easy bruising
- Teach patient to notify prescriber of rash immediately; to notify prescriber of back pain, abdominal pain, blood in urine; to increase fluid intake to reduce risk of kidney stones
- Teach patient to report suicidal thoughts, behaviors immediately
- **Beers:** Avoid in older adults unless safer alternative is not available, may cause ataxia, impaired psychomotor function

### Evaluation

#### Positive therapeutic outcome

- Decrease in severity of seizures

zafirlukast (Rx)
zidovudine (Rx)
ziv-aflibercept
zolpidem (Rx)
zaleplon (Rx)
zinc (PO, OTC; IV, Rx)
zoledronic acid (Rx)
zonisamide (Rx)
zanamivir (Rx)
ziprasidone (Rx)
ZOLMitriptan (Rx)

## Alpha-adrenergic Blockers

**ACTION:** α-Adrenergic blockers bind to α-adrenergic receptors, causing dilatation of peripheral blood vessels and lower peripheral resistance resulting in decreased blood pressure.

**USES:** α-Adrenergic blockers are used for benign prostatic hyperplasia, pheochromocytoma, prevention of tissue necrosis, and sloughing associated with extravasation of IV vasopressors.

### CONTRAINDICATIONS

Hypersensitive reactions may occur, and allergies should be identified before these products are given. Patients with myocardial infarction, coronary insufficiency, angina, or other evidence of coronary artery disease should not use these products.

### IMPLEMENTATION

**PO route**

- Start with low dose, gradually increasing to prevent side effects
- Give with food or milk for GI symptoms

**ADVERSE EFFECTS:** The most common side effects are hypotension, tachycardia, nasal stuffiness, nausea, vomiting, and diarrhea.

**PHARMACOKINETICS:** Onset, peak, and duration vary among products.

**INTERACTIONS:** Vasoconstrictive and hypertensive effects of EPINEPHrine are antagonized by α-adrenergic blockers.

### NURSING CONSIDERATIONS

#### Assessment

- Monitor electrolytes: potassium, sodium chloride, carbon dioxide
- Monitor weight daily, I&O
- Monitor B/P with patient lying, standing before starting treatment, q4hr thereafter
- Assess for nausea, vomiting, diarrhea
- Assess for skin turgor, dryness of mucous membranes for hydration status

#### Patient/family education

- Caution patient to avoid alcoholic beverages
- Advise patient to report dizziness, palpitations, fainting
- Instruct patient to change position slowly or fainting may occur
- Teach patient to take product exactly as prescribed; to avoid all OTC products (cough, cold, allergy) unless directed by prescriber

#### Evaluation

**Positive therapeutic outcome**

- Decreased B/P
- Increased peripheral pulses

### Generic Names

*α 1 blockers:*
silodosin

## Anesthetics—general/local

**ACTION:** Anesthetics (general) act on the CNS to produce tranquilization and sleep before invasive procedures. Anesthetics (local) inhibit conduction of nerve impulses from sensory nerves.

**USES:** General anesthetics are used to premedicate for surgery, and for induction and maintenance in general anesthesia. For local anesthetics, refer to individual product listing for indications.

### CONTRAINDICATIONS

Persons with CVA, increased ICP, severe hypertension, and cardiac decompensation should not use these products since severe adverse reactions can occur.

**Precautions:** Anesthetics (general) should be used with caution in the geriatric, children <2 yr, and those with cardiovascular disease (hypotension, bradydysrhythmias), renal/hepatic disease, and Parkinson's disease. The precaution for anesthetics (local) is pregnancy.

### IMPLEMENTATION

- Give anticholinergic preoperatively to decrease secretions
- Administer only with resuscitative equipment nearby
- Provide quiet environment for recovery to decrease psychotic symptoms

**ADVERSE EFFECTS:** The most common side effects are dystonia, akathisia, flexion of arms, fine tremors, drowsiness, restlessness, and hypotension. Also common are chills, respiratory depression, and laryngospasm.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** AOIs, tricyclics, and phenothiazines may cause severe hypo/hypertension when used with local anesthetics. CNS depressants will potentiate general and local anesthetics.

## NURSING CONSIDERATIONS

### Assessment

- Monitor VS q10min during **IV** administration, q30min after IM dose

### Evaluation

**Positive therapeutic outcome**

- Maintenance of anesthesia
- Decreased pain

### Generic Names

*General anesthetics:*
**droperidol** (high alert), **fentaNYL** (high alert), fentaNYL/droperidol, fentaNYL transdermal, fospropofol, midazolam, **propofol** (high alert)

*Local anesthetics:*
**lidocaine, parenteral** (high alert), penicillin G procaine, ropivacaine

## Antacids

**ACTION:** Antacids are basic compounds that neutralize gastric acidity and decrease the rate of gastric emptying. Products are divided into those containing aluminum, magnesium, calcium, or a combination of these.

**USES:** Antacids decrease hyperacidity in conditions such as peptic ulcer disease, reflux esophagitis, gastritis, or hiatal hernia.

## CONTRAINDICATIONS

Sensitivity to aluminum or magnesium products may cause hypersensitive reactions. Aluminum products should not be used by persons sensitive to aluminum. Magnesium products should not be used by persons sensitive to magnesium. Check for sensitivity before administering.

**Precautions:** Magnesium products should be given cautiously to patients with renal insufficiency, and during pregnancy and breastfeeding. Sodium content of antacids may be significant. Use with caution for patients with hypertension, or HF or those on a low-sodium diet.

## IMPLEMENTATION

- Advise patient not to take other products within 1-2 hr of antacid administration, since antacids may impair absorption of other products
- Give all products with an 8-oz glass of water to ensure absorption in the stomach
- Give another antacid if constipation occurs with aluminum products

**ADVERSE EFFECTS:** The most common side effect caused by aluminum-containing antacids is constipation, which may lead to fecal impaction and bowel obstruction. Diarrhea occurs often when magnesium products are given. Alkalosis may occur when systemic products are used. Constipation occurs more frequently than laxation with calcium carbonate. The release of $CO_2$ from carbonate-containing antacids causes belching, abdominal distention, and flatulence. Sodium bicarbonate may act as a systemic antacid and produce systemic electrolyte disturbances and alkalosis. Calcium carbonate and sodium bicarbonate may cause rebound hyperacidity and milk-alkali syndrome. Alkaluria may occur when products are used on a long-term basis, particularly in persons with abnormal renal function.

**PHARMACOKINETICS:** Duration is 20-40 min. If ingested 1 hr after meals, acidity is reduced for at least 3hr.

**INTERACTIONS:** Products whose effects may be increased by some antacids include quiNIDine, amphetamines, pseudoephedrine, levodopa, valproic acid, and dicumarol. Products whose effects may be decreased by some antacids include cimetidine, corticosteroids, ranitidine, iron salts, phenothiazines, phenytoin, digoxin, tetracyclines, ketoconazole, salicylates, and isoniazid.

## NURSING CONSIDERATIONS

### Assessment

- Assess for aggravating and alleviating factors of epigastric pain or hyperacidity; identify the location, duration, and characteristics of epigastric pain
- Assess GI symptoms, including constipation, diarrhea, abdominal pain; if severe abdominal pain with fever occurs, these products should not be given
- Assess renal symptoms, including increasing urinary pH, electrolytes

### Evaluation

**Positive therapeutic outcome**

- Absence of epigastric pain
- Decreased acidity

### Generic Names

aluminum hydroxide, bismuth subsalicylate, calcium carbonate, magaldrate, magnesium oxide, sodium bicarbonate

## Anti-Alzheimer Agents

**ACTION:** Anti-Alzheimer agents improve cognitive functioning by increasing acetylcholine

and inhibiting cholinesterase in the CNS. They do not cure the condition, but improve symptoms.

**USES:** Anti-Alzheimer agents are used for the treatment of Alzheimer's symptoms.

## CONTRAINDICATIONS

Persons with hypersensitivity reactions should not use these products.

**Precautions:** Anti-Alzheimer agents should be used cautiously in pregnancy, breastfeeding, sick sinus syndrome, GI bleeding, bladder obstruction, and seizures.

## IMPLEMENTATION

- Give lowest possible dose for therapeutic result; adjust dose to response
- Provide assistance with ambulation during beginning therapy if dizziness, ataxia occur

**ADVERSE EFFECTS:** The most common side effects are nausea, vomiting, diarrhea, dry mouth, insomnia, dizziness, urinary frequency, incontinence, and rash. The most serious side effects are seizures and dysrhythmias.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted by the kidneys.

**INTERACTIONS:** Increased synergistic reactions may occur with succinylcholine, cholinesterase inhibitors, and cholinergic agonists. There may be a decrease in the action of anticholinergics, and there may be additive effects when used with cholinergic agents.

## NURSING CONSIDERATIONS

### Assessment

- B/P, hypo/hypertension
- Mental status: affect, mood, behavioral changes, depression, confusion
- GI status: nausea, vomiting, anorexia, diarrhea
- GU status: urinary frequency, incontinence

### Patient/family education

- Instruct patient to report side effects, adverse reactions to healthcare provider
- Advise patient to use exactly as prescribed, at regular intervals
- Caution patient not to increase or abruptly decrease dose; serious consequences may result
- Inform patient that product is not a cure, but relieves symptoms

### Evaluation

#### Positive therapeutic outcome

- Decrease in confusion
- Improved mood

**Generic Names**
donepezil, memantine, rivastigmine

# Antianginals

**ACTION:** Antianginals are divided into the nitrates, calcium channel blockers, and β-adrenergic blockers. The nitrates dilate coronary arteries, causing decreased preload, and dilate systemic arteries, causing decreased afterload. Calcium channel blockers dilate coronary arteries and decrease SA/AV node conduction. β-adrenergic blockers decrease heart rate so that myocardial $O_2$ use is decreased. Dipyridamole selectively dilates coronary arteries to increase coronary blood flow.

**USES:** Antianginals are used in chronic stable angina pectoris, unstable angina, and vasospastic angina. Some (i.e., calcium channel blockers and β-blockers) may be used as dysrhythmics and in hypertension.

## CONTRAINDICATIONS

Persons with known hypersensitivity, increased ICP, or cerebral hemorrhage should not use some of these products.

**Precautions:** Antianginals should be used with caution in pregnancy, breastfeeding, children, postural hypotension, renal disease, and hepatic injury.

## IMPLEMENTATION

- Store protected from light, moisture; place in cool environment

**ADVERSE EFFECTS:** The most common side effects are postural hypotension, headache, flushing, dizziness, nausea, edema, and drowsiness. Also common are rash, dysrhythmias, and fatigue.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among coronary products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Monitor orthostatic B/P, pulse
- Assess for pain: duration, time started, activity being performed, character
- Assess for tolerance if taken over long period
- Assess for headache, light-headedness, decreased B/P; may indicate a need for decreased dosage

### Patient/family education

- Instruct patient to keep tabs in original container
- Instruct patient not to use OTC products unless directed by prescriber
- Advise patient to report bradycardia, dizziness, confusion, depression, fever
- Teach patient to take pulse at home; advise when to notify prescriber
- Advise patient to avoid alcohol, smoking, sodium intake
- Advise patient to comply with weight control, dietary adjustments, modified exercise program
- Teach patient to carry/wear emergency ID to identify product being taken, allergies
- Caution patient to make position changes slowly to prevent fainting

### Evaluation

**Positive therapeutic outcome**

- Decrease, prevention of anginal pain

### Generic Names

*Nitrates:*
isosorbide, nitroglycerin

*β-adrenergic blockers:*
atenolol, dipyridamole, metoprolol, nadolol, propranolol

*Calcium channel blockers:*
amLODIPine, **diltiazem** (high alert), niCARdipine, NIFEdipine, verapamil

*Miscellaneous:*
ranolazine

## Antianxiety Agents

**ACTION:** Benzodiazepines potentiate the action of GABA, including any other inhibitory transmitters in the CNS, resulting in decreased anxiety. Most agents cause a decrease in CNS excitability.

**USES:** Anxiety is relieved in conditions such as generalized anxiety disorder and phobic disorders. Benzodiazepines are also used for acute alcohol withdrawal to prevent delirium tremens, and some products are used for relaxation before surgery.

### CONTRAINDICATIONS

These products are contraindicated in hypersensitivity, acute closed-angle glaucoma, breastfeeding (diazepam), children <6 mo, and hepatic disease (clonazePAM).

**Precautions:** Antianxiety agents should be used cautiously in geriatric or debilitated patients. Usually smaller doses are needed since metabolism is slowed. Persons with renal/hepatic disease may show delayed excretion. ClonazePAM may increase the incidence of seizures.

### IMPLEMENTATION

- Give with food or milk for GI symptoms; may give crushed if patient is unable to swallow whole (tabs only, no controlled or sustained-release products)

**ADVERSE EFFECTS:** The most common side effects are dizziness, drowsiness, blurred vision, and orthostatic hypotension. Most adverse reactions are mediated through the CNS. There is potential for abuse and physical dependence with some products.

**PHARMACOKINETICS:** Most of these agents are metabolized by the liver and excreted via the kidneys.

**INTERACTIONS:** Increased CNS depression may occur when given with other CNS depressants. These products should be used together cautiously. Alcohol should not be used, as fatal reactions have occurred. The serum concentration and toxicity may be increased when used with benzodiazepines.

### NURSING CONSIDERATIONS

#### Assessment

- Assess B/P (lying and standing), pulse; if systolic B/P drops 20 mm Hg, hold product and notify prescriber; orthostatic hypotension can be severe
- Monitor renal/hepatic function tests: AST, ALT, bilirubin, creatinine, LDH, alkaline phosphatase
- Monitor physical dependency and withdrawal with some products, including headache, nausea, vomiting, muscle pain, and weakness after long-term use

#### Patient/family education

- Inform patient that product should not be used for everyday stress or long-term use; not to take more than prescribed amount since product is habit forming
- Caution patient to avoid driving and activities that require alertness since drowsiness and dizziness may occur
- Instruct patient to abstain from alcohol, other psychotropic medications unless directed by prescriber
- Caution patient not to discontinue abruptly; after extended periods, withdrawal symptoms may occur

#### Evaluation

**Positive therapeutic outcome**

- Decreased anxiety
- Increased relaxation

### Generic Names

*Benzodiazepines:*
ALPRAZolam, chlordiazePOXIDE, clonazePAM, diazepam, LORazepam, midazolam, triazolam

*Miscellaneous:*
busPIRone, doxepin, hydrOXYzine, PARoxetine, venlafaxine

## Antiasthmatics

**ACTION:** Bronchodilators are divided into anticholinergics, α/β-adrenergic agonists, β-adrenergic agonists, and phosphodiesterase inhibitors. Also included in antiasthmatic agents are corticosteroids, leukotriene antagonists, mast cell stabilizers, and monoclonal antibodies. Anticholinergics act by inhibiting interaction of acetylcholine at receptor sites on bronchial smooth muscle. α/β-adrenergic agonists act by relaxing bronchial smooth muscle and increasing diameter of nasal passages. β-adrenergic agonists act by action on $\beta_2$-receptors, which relaxes bronchial smooth muscle. Phosphodiesterase inhibitors act by blocking phosphodiesterase and increasing cAMP, which mediates smooth muscle relaxation in the respiratory system. Corticosteroids act by decreasing inflammation in the bronchial system. Leukotriene receptor antagonists decrease leukotrienes, and mast cell stabilizers decrease histamine; both act to decrease bronchospasm.

**USES:** Antiasthmatics are used for bronchial asthma; bronchospasm associated with bronchitis, emphysema, or other obstructive pulmonary diseases; Cheyne-Stokes respirations; and prevention of exercise-induced asthma. Some products are used for rhinitis and other allergic reactions.

### CONTRAINDICATIONS

Persons with hypersensitivity, closed-angle glaucoma, tachydysrhythmias, and severe cardiac disease should not use some of these products.

**Precautions:** Antiasthmatics should be used with caution in pregnancy, breastfeeding, hyperthyroidism, hypertension, prostatic hypertrophy, and seizure disorders.

### IMPLEMENTATION

- Give inhaled product after shaking; exhale, place mouthpiece in mouth, inhale slowly, hold breath, remove, exhale slowly
- Give PO product with meals to decrease gastric irritation
- Store inhaled product in light-resistant container; do not expose to temperatures >86° F (30° C)
- Give gum, small sips of water for dry mouth

**ADVERSE EFFECTS:** The most common side effects are tremors, anxiety, nausea, vomiting and irritation in the throat. The most serious adverse reactions are bronchospasm and dyspnea.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized by the liver and excreted in urine.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

### NURSING CONSIDERATIONS

#### Assessment

- Monitor respiratory function: vital capacity, forced expiratory volume, ABGs, lung sounds, heart rate and rhythm, aggravating and alleviating factors

#### Patient/family education

- Caution patient to avoid hazardous activities; drowsiness or dizziness may occur with some products
- Instruct patient to obtain bloodwork as required; some products require blood levels to be drawn
- Advise patient to avoid all OTC medications unless approved by provider
- Instruct patient to report side effects, including insomnia, heart palpitations, light-headedness; these side effects may occur with some products

#### Evaluation

**Positive therapeutic outcome**

- Decreased severity and number of asthma attacks
- Absence of dyspnea, wheezing

### Generic Names

*Bronchodilators:*
albuterol, arformoterol, **atropine** (high alert), formoterol, ipratropium, levalbuterol, terbutaline, theophylline, tiotropium

*Adrenergics:*
**EPINEPHrine** (high alert)

*Corticosteroids:*
beclomethasone, betamethasone, budesonide, cortisone, dexamethasone, flunisolide, fluticasone, hydrocortisone, methylPREDNISolone, predniSONE, triamcinolone

*Leukotriene antagonists:*
zafirlukast

*Monoclonal antibodies:*
omalizumab

## Anticholinergics

**ACTION:** Anticholinergics inhibit the muscarinic actions of acetylcholine at receptor sites in the autonomic nervous system. Anticholinergics are also known as antimuscarinic products.

**USES:** Anticholinergics are used for a variety of conditions: decreasing involuntary movements in parkinsonism (benztropine, trihexyphenidyl); bradydysrhythmias (atropine); nausea and vomiting (scopolamine); and as cycloplegic mydriatics (atropine, homatropine, scopalamine, cyclopentolate, tropicamide). Gastrointestinal anticholinergics are used to decrease motility (smooth muscle tone) in the GI, biliary, and urinary tracts and for their ability to decrease gastric secretions (propantheline, glycopyrrolate).

### CONTRAINDICATIONS

Persons with closed-angle glaucoma, myasthenia gravis, or GI/GU obstruction should not use some of these products.

**Precautions:** Anticholinergics should be used with caution in pregnant, breastfeeding, or geriatric patients, or in those with prostatic hypertrophy, HF, or hypertension. Use with caution in the presence of high environmental temperature.

### IMPLEMENTATION

**PO route**

- Give with or after meals to prevent GI upset; may give with fluids other than water
- Store at room temperature
- Give hard candy, frequent drinks, sugarless gum to relieve dry mouth

**IM/IV route**

- Give parenteral dose with patient recumbent to prevent postural hypotension
- Give parenteral dose slowly; keep in bed for at least 1 hr after dose; monitor VS
- Give after checking dose carefully; even slight overdose could lead to toxicity

**ADVERSE EFFECTS:** The most common side effects are dry mouth, constipation, urinary retention, urinary hesitancy, headache, and dizziness. Also common is paralytic ileus.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Increased anticholinergic effects may occur when used with MAOIs, tricyclics, and amantadine. Anticholinergics may cause a decreased effect of phenothiazines and levodopa.

### NURSING CONSIDERATIONS

#### Assessment

- Assess I&O ratio; retention commonly causes decreased urinary output
- Assess for urinary hesitancy, retention; palpate bladder if retention occurs
- Assess for constipation; increase fluids, bulk, exercise if this occurs
- Identify tolerance over long-term therapy; dosage may need to be increased or changed
- Assess mental status: affect, mood, CNS depression, worsening of mental symptoms during early therapy

#### Patient/family education

- Caution patient to avoid driving and other hazardous activities; drowsiness may occur
- Advise patient to avoid OTC medication: cough, cold preparations with alcohol, antihistamines unless directed by prescriber

#### Evaluation

**Positive therapeutic outcome**

- Decreased secretions
- Absence of nausea and vomiting

---

### Generic Names

**atropine** (high alert), benztropine, glycopyrrolate, hyoscyamine, scopolamine (transdermal), solifenacin

## Anticoagulants

**ACTION:** Anticoagulants interfere with blood clotting by preventing clot formation.

**USES:** Anticoagulants are used for DVT, pulmonary emboli, myocardial infarction, open heart surgery, disseminated intravascular clotting syndrome, atrial fibrillation with embolization, and in transfusion and dialysis.

### CONTRAINDICATIONS

Persons with hemophilia and related disorders, leukemia with bleeding, peptic ulcer disease, thrombocytopenic purpura, blood dyscrasias, acute nephritis, and subacute bacterial endocarditis should not use these products.

**Precautions:** Anticoagulants should be used with caution in pregnancy, geriatric, and alcoholism.

### IMPLEMENTATION

- Store in tight container (PO dose)

**SUBCUT route**
- Give at same time each day to maintain steady blood levels
- Do not massage area or aspirate when giving SUBCUT inj; give in abdomen between pelvic bones; rotate sites; do not pull back on plunger, leave in for 10 sec; apply gentle pressure for 1 min
- Do not change needles
- Avoid all IM inj that may cause bleeding

**ADVERSE EFFECTS:** The most serious adverse reactions are hemorrhage, agranulocytosis, leukopenia, eosinophilia, and thrombocytopenia, depending on the specific product. The most common side effects are diarrhea, rash, and fever.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Salicylates, steroids, and nonsteroidal antiinflammatories will potentiate the action of anticoagulants. Anticoagulants may cause serious effects. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment
- Monitor blood tests (Hct, platelets, occult blood in stools) q3mo
- Monitor PTT, which should be 1½-2 × control, PPT; daily, APTT, ACT, INR
- Monitor B/P; watch for increasing signs of hypertension
- Monitor for bleeding gums, petechiae, ecchymosis, black tarry stools, hematuria
- Monitor for fever, skin rash, urticaria
- Monitor for needed dosage change q1-2wk

### Patient/family education
- Advise patient to avoid OTC preparations that may cause serious product interactions unless directed by prescriber
- Inform patient that product may be held during active bleeding (menstruation), depending on condition
- Caution patient to use soft-bristle toothbrush to prevent bleeding gums; avoid contact sports; use electric razor
- Instruct patient to carry/wear emergency ID identifying product taken
- Instruct patient to report any signs of bleeding: gums, under skin, urine, stools

### Evaluation

**Positive therapeutic outcome**
- Decrease of DVT

## Generic Names

argatroban, dabigatran, **dalteparin** (high alert), **enoxaparin** (high alert), fondaparinux, **heparin** (high alert), **lepirudin** (high alert), **tinzaparin** (high alert), **warfarin** (high alert)

# Anticonvulsants

**ACTION:** Anticonvulsants are divided into the barbiturates, benzodiazepines, hydantoins, succinimides, and miscellaneous products. Barbiturates and benzodiazepines are discussed in separate sections. Hydantoins act by inhibiting the spread of seizure activity in the motor cortex. Succinimides act by inhibiting spike and wave formation; they also decrease amplitude, frequency, duration, and spread of discharge in seizures.

**USES:** Hydantoins are used in generalized tonic-clonic seizures, status epilepticus, and psychomotor seizures. Succinimides are used for absence (or petit mal) seizures. Barbiturates are used in generalized tonic-clonic and cortical focal seizures.

## CONTRAINDICATIONS

Hypersensitive reactions may occur, and allergies should be identified before these products are given.

**Precautions:** Persons with renal/hepatic disease should be watched closely.

## IMPLEMENTATION

**PO route**
- Give with food, milk to decrease GI symptoms
- Provide good oral hygiene as it is important for patients taking hydantoins

**ADVERSE EFFECTS:** Bone marrow depression is the most life-threatening adverse reaction associated with hydantoins or succinimides. The most common side effects are GI symptoms. Other common side effects for hydantoins are gingival hyperplasia and CNS effects such as nystagmus, ataxia, slurred speech, and confusion.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine, bile, and feces.

**INTERACTIONS:** Hydantoins cause decreased effects of estrogens, and oral contraceptives.

## NURSING CONSIDERATIONS

### Assessment
- Monitor renal function tests, including BUN, creatinine, serum uric acid, urine CCr before, during therapy

• Monitor blood tests: RBC, Hct, Hgb, reticulocyte counts weekly for 4 wk then monthly
• Monitor hepatic function tests: AST, ALT, bilirubin, creatinine
• Assess mental status, including mood, sensorium, affect, behavioral changes; if mental status changes, notify prescriber
• Assess for eye problems, including need for ophth examinations before, during, and after treatment (slit lamp, fundoscopy, tonometry)
• Assess for allergic reaction, including red, raised rash; if this occurs, product should be discontinued
• Assess for blood dyscrasias, including fever, sore throat, bruising, rash, jaundice
• Monitor toxicity, including bone marrow depression, nausea, vomiting, ataxia, diplopia, cardiovascular collapse, Stevens-Johnson syndrome

### Patient/family education

• Advise patient to carry/wear emergency ID stating products taken, condition, prescriber's name, phone number
• Advise patient to avoid driving, other activities that require alertness

### Evaluation

**Positive therapeutic outcome**

• Decreased seizure activity; document on patient's chart

### Generic Names

*Succinimides:*
ethosuximide

*Hydantoins:*
fosphenytoin, phenytoin

*Miscellaneous:*
acetaZOLAMIDE, carBAMazepine, clonazePAM, diazepam, eslicarbazepine, ezogabine, gabapentin, lacosamide, lamoTRIgine, **magnesium sulfate** (high alert), rufinamide, tiaGABine, topiramate, valproate/valproic acid/divalproex sodium, vigabatrin, zonisamide

*Barbiturates:*
**PHENobarbital** (high alert), primidone, **thiopental** (high alert)

## Antidepressants

**ACTION:** Antidepressants are divided into the tricyclics, MAOIs, and miscellaneous antidepressants (SSRIs). The tricyclics work by blocking reuptake of norepinephrine and serotonin into nerve endings and increasing action of norepinephrine and serotonin in nerve cells. MAOIs act by increasing concentrations of endogenous EPINEPHrine, norepinephrine, serotonin, and dopamine in storage sites in the CNS by inhibition of MAO; increased concentration reduces depression.

**USES:** Antidepressants are used for depression and, in some cases, enuresis in children.

### CONTRAINDICATIONS

The contraindications for antidepressants are seizure disorders, prostatic hypertrophy, and severe renal/hepatic/cardiac disease depending on the type of medication.

**Precautions:** Antidepressants should be used cautiously in pregnant, geriatric, and suicidal patients; severe depression; schizophrenia; hyperactivity; and diabetes mellitus.

### IMPLEMENTATION

**PO route**

• Give increased fluids, bulk in diet if constipation, urinary retention occur
• Give with food or milk for GI symptoms
• Give gum, hard candy, or frequent sips of water for dry mouth
• Store in airtight container at room temperature; do not refreeze
• Provide assistance with ambulation during beginning therapy since drowsiness/dizziness occurs

**ADVERSE EFFECTS:** The most serious adverse reactions are paralytic ileus, acute renal failure, hypertension, and hypertensive crisis, depending on the specific product. Common side effects are dizziness, drowsiness, diarrhea, dry mouth, urinary retention, and orthostatic hypotension.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

### NURSING CONSIDERATIONS

#### Assessment

• Monitor B/P (lying, standing), pulse q4hr; if systolic B/P drops 20 mm Hg, hold product, notify prescriber; take VS q4hr in patients with CV disease
• Monitor blood tests: CBC, leukocytes, differential, cardiac enzymes if patient is receiving long-term therapy
• Monitor hepatic function tests: AST, ALT, bilirubin, creatinine
• Monitor weight weekly; appetite may increase with product

• Monitor for EPS primarily in geriatric: rigidity, dystonia, akathisia
• Assess mental status: mood, sensorium, affect, suicidal tendencies, increase in psychiatric symptoms (depression, panic)
• Check for urinary retention, constipation; constipation is more likely to occur in children, geriatric patients
• Assess for withdrawal symptoms: headache, nausea, vomiting, muscle pain, weakness; do not usually occur unless product was discontinued abruptly
• Identify alcohol consumption; if alcohol is consumed, hold dose until AM

### Patient/family education

• Teach patient that therapeutic effects may take 2-3 wk
• Advise patient to use caution in driving or other activities requiring alertness because of drowsiness, dizziness, blurred vision
• Caution patient to avoid alcohol ingestion, other CNS depressants
• Instruct patient not to discontinue medication quickly after long-term use; may cause nausea, headache, malaise
• Instruct patient to wear sunscreen or large hat, since photosensitivity may occur

### Evaluation

**Positive therapeutic outcome**
• Decreased depression

### Generic Names

*Tetracyclics:*
mirtazapine

*Tricyclics:*
amitriptyline, clomiPRAMINE, desipramine, doxepin, imipramine, nortriptyline

*Miscellaneous:*
buPROPion, DULoxetine, levomilnacipran, traZODone, venlafaxine, vortioxetine

*SSRIs:*
citalopram, escitalopram, FLUoxetine, PARoxetine, sertraline

## Antidiabetics

**ACTION:** Antidiabetics are divided into the insulins that decrease blood glucose, phosphate, and potassium and increase blood pyruvate and lactate and oral antidiabetics that cause functioning β-cells in the pancreas to release insulin and improve the effect of endogenous and exogenous insulin.

**USES:** Insulins are used for ketoacidosis and diabetes mellitus types 1 and 2; oral antidiabetics are used for diabetes mellitus type 2.

### CONTRAINDICATIONS

Hypersensitive reactions may occur, and allergies should be identified before these products are given. Oral antidiabetics should not be used in juvenile or brittle diabetes, diabetic ketoacidosis, or severe renal/hepatic disease.

**Precautions:** Oral antidiabetics should be used with caution in pregnancy, breastfeeding, geriatric, cardiac disease, and in the presence of alcohol.

### IMPLEMENTATION

**PO route**
• Give oral antidiabetic 30 min before meals

**SUBCUT route**
• Give insulin after warming to room temperature by rotating in palms to prevent lipodystrophy from injecting cold insulin
• Give human insulin to those allergic to beef or pork
• Rotate inj sites when giving insulin; use abdomen, upper back, thighs, upper arm, buttocks; keep a record of sites

**ADVERSE EFFECTS:** The most common side effect of insulin and oral antidiabetics is hypoglycemia. Other adverse reactions for oral antidiabetics include blood dyscrasias, hepatotoxicity, and, rarely, cholestatic jaundice. Adverse reactions for insulin products include allergic responses and, more rarely, anaphylaxis.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Oral antidiabetics are metabolized in the liver, with metabolites excreted in urine, bile, and feces.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

### NURSING CONSIDERATIONS

#### Assessment

• Monitor blood, urine glucose levels during treatment to determine diabetes control (oral products)
• Monitor fasting blood glucose, 2 hr PP (60-100 mg/dl normal fasting level) (70-130 mg/dl—normal 2-hr level)
• Assess for hypoglycemic reaction that can occur during peak time

#### Patient/family education

• Advise patient to avoid alcohol and salicylates except on advice of prescriber

• Teach patient symptoms of ketoacidosis: nausea, thirst, polyuria, dry mouth, decreased B/P, dry, flushed skin, acetone breath, drowsiness, Kussmaul respirations
• Teach patient symptoms of hypoglycemia: headache, tremors, fatigue, weakness; that candy or sugar should be carried to treat hypoglycemia
• Advise patient to test urine for glucose/ketones tid if this product is replacing insulin
• Advise patient to continue weight control, dietary restrictions, exercise, hygiene

### Evaluation

**Positive therapeutic outcome**
• Decrease in polyuria, polydipsia, polyphagia
• Clear sensorium
• Absence of dizziness
• Stable gait

### Generic Names

albiglutide, canagliflozin, dapagliflozin, **dulaglutide** (high alert), empagliflozin, ertupiflozin, erttuglifloxacin, glipiZIDE, glyBURIDE, **insulin aspart** (high alert), **insulin detemir** (high alert), **insulin glargine** (high alert), **insulin glulisine** (high alert), **insulin lispro** (high alert), **insulin, regular** (high alert), **insulin, regular concentrated** (high alert), insulin, zinc suspension (Lente), insulin, zinc suspension extended (Ultralente), liraglutide, linagliptin, metFORMIN, miglitol, pioglitazone, repaglinide, rosiglitazone, saxagliptin, semaglutide, sitaGLIPtin

## Antidiarrheals

**ACTION:** Antidiarrheals work by various actions including direct action on intestinal muscles to decrease GI peristalsis or by inhibiting prostaglandin synthesis responsible for GI hypermotility, acting on mucosal receptors responsible for peristalsis, or decreasing water content of stools.

**USES:** Antidiarrheals are used for diarrhea of undetermined causes.

### CONTRAINDICATIONS

The contraindications are persons with severe ulcerative colitis, and pseudomembranous colitis with some products.

**Precautions:** Antidiarrheals should be used with caution in pregnancy, breastfeeding, children, geriatric patients, dehydration.

### IMPLEMENTATION

**PO route**
• Give for 48 hr only

**ADVERSE EFFECTS:** The most serious adverse reactions of some products are paralytic ileus, toxic megacolon, and angioneurotic edema. The most common side effects are constipation, nausea, dry mouth, and abdominal pain.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

### NURSING CONSIDERATIONS

#### Assessment

• Monitor electrolytes (potassium, sodium, chloride) if on long-term therapy
• Monitor bowel pattern before; for rebound constipation after termination of medication
• Assess response after 48 hr; if no response, product should be discontinued
• Identify dehydration in children

#### Patient/family education

• Advise patient to avoid OTC products
• Caution patient not to exceed recommended dose

#### Evaluation

**Positive therapeutic outcome**
• Decreased diarrhea

### Generic Names

bismuth subsalicylate, kaolin/pectin, loperamide

## Antidysrhythmics

**ACTION:** Antidysrhythmics are divided into four classes and miscellaneous antidysrhythmics:
• Class I increases the duration of action potential and the effective refractory period and reduces disparity in the refractory period between a normal and infarcted myocardium; further subclasses include Ia, Ib, Ic
• Class II decreases the rate of SA node discharge, increases recovery time, slows conduction through the AV node, and decreases heart rate, which decreases $O_2$ consumption in the myocardium
• Class III increases the duration of action potential and the effective refractory period
• Class IV inhibits calcium ion influx across the cell membrane during cardiac depolarization; decreases SA node discharge, decreases conduction velocity through the AV node

• Miscellaneous antidysrhythmics include those such as adenosine, which slows conduction through the AV node, and digoxin, which decreases conduction velocity and prolongs the effective refractory period in the AV node

**USES:** Antidysrhythmics are used for PVCs, tachycardia, hypertension, atrial fibrillation, and angina pectoris.

## CONTRAINDICATIONS

Contraindications vary widely among products.

**Precautions:** Precautions vary widely among products.

**ADVERSE EFFECTS:** Side effects and adverse reactions vary widely among products.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

• Monitor ECG continuously to determine product effectiveness, PVCs, or other dysrhythmias
• Assess for dehydration or hypovolemia
• Monitor B/P continuously for hypo/hypertension
• Monitor I&O ratio
• Monitor serum potassium
• Assess for edema in feet and legs daily

### Patient/family education

• Advise patient to comply with dosage schedule, even if patient is feeling better
• Instruct patient to report bradycardia, dizziness, confusion, depression, fever

### Evaluation

**Positive therapeutic outcome**

• Decrease in B/P in hypertension
• Decreased B/P, edema, moist crackles in HF

### Generic Names

*Class Ia:*
disopyramide, procainamide, quiNIDine

*Class Ib:*
**lidocaine, parenteral** (high alert), phenytoin

*Class Ic:*
flecainide, propafenone

*Class II:*
acebutolol, esmolol, propranolol, sotalol

*Class III:*
**amiodarone** (high alert), **dronedarone** (high alert), **ibutilide** (high alert)

*Class IV:*
verapamil

*Miscellaneous:*
**adenosine** (high alert), **atropine** (high alert), **digoxin** (high alert)

# Antiemetics

**ACTION:** The antiemetics are divided into the 5-$HT_3$ receptor antagonists, the phenothiazines, and the miscellaneous products. The 5-$HT_3$ receptor antagonists work by blocking serotonin peripherally, centrally, and in the small intestine. The phenothiazines act by blocking the chemoreceptor trigger zone in the brain. The miscellaneous products work by either decreasing motion sickness or delaying gastric emptying.

**USES:** Antiemetics are used to prevent nausea and vomiting due to cancer chemotherapy, radiotherapy, and surgery (5-$HT_3$ receptor antagonists); some of the miscellaneous products (antihistamines) work by decreasing motion sickness. Most other products are used for many types of nausea and vomiting.

## CONTRAINDICATIONS

Persons developing hypersensitive reactions should not use these products.

**Precautions:** Antiemetics should be used cautiously in pregnancy, breastfeeding, hepatic disease, and some GI disorders.

## IMPLEMENTATION

• Give prophylactically, before nausea and vomiting occur, in cancer chemotherapy
• Store at room temperature vial/ampules, oral products

**ADVERSE EFFECTS:** The most common side effects are headache, dizziness, fatigue, and diarrhea.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized by the liver and excreted by the kidneys.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information. Other CNS depressants increase CNS depression.

## NURSING CONSIDERATIONS

### Assessment

• Assess reason for nausea, vomiting; absence of nausea and vomiting after giving product
• Monitor hypersensitivity reactions: rash, bronchospasm with some products

### Patient/family education

- Caution patient to avoid hazardous activities if dizziness occurs; ask for assistance if hospitalized
- Instruct patient to rise slowly to prevent orthostatic hypotension
- Teach patient all aspects of product usage
- Teach patient conservative methods to control nausea and vomiting such as sips of water or other fluids and dry crackers

### Evaluation

**Positive therapeutic outcome**

- Absence or decreasing nausea and vomiting after use

### Generic Names

*5-$HT_3$ antagonists:*
dolasetron, granisetron, ondansetron, palonosetron

*Phenothiazines:*
chlorproMAZINE, prochlorperazine, promethazine

*Miscellaneous:*
aprepitant, meclizine, metoclopramide, scopolamine, trimethobenzamide

## Antifungals (systemic)

**ACTION:** Antifungals act by increasing cell membrane permeability in susceptible organisms by binding sterols and decreasing potassium, sodium, and nutrients in the cell.

**USES:** Antifungals are used for infections of histoplasmosis, blastomycosis, coccidioidomycosis, cryptococcosis, aspergillosis, phycomycosis, candidiasis, sporotrichosis causing severe meningitis, septicemia, and skin infections.

### CONTRAINDICATIONS

Persons with severe bone marrow depression or hypersensitivity should not use these products.

**Precautions:** Antifungals should be used with caution in renal/hepatic disease and pregnancy.

### IMPLEMENTATION

**IV route**

- Give by **IV** using in-line filter (mean pore diameter >1 μm) using distal veins; check for extravasation, necrosis q8hr
- Give product only after C&S confirms organism, make sure product is used in life-threatening infections
- Provide protection from light during infusion; cover with foil
- Give symptomatic treatment as ordered for adverse reactions: aspirin, antihistamines, antiemetics, antispasmodics
- Store protected from moisture and light; diluted sol is stable for 24 hr

**ADVERSE EFFECTS:** The most serious adverse reactions include renal tubular acidosis, permanent renal impairment, anuria, oliguria, hemorrhagic gastroenteritis, acute liver failure, and blood dyscrasias. Some common side effects include hypokalemia, nausea, vomiting, anorexia, headache, fever, and chills.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

### NURSING CONSIDERATIONS

#### Assessment

- Monitor VS q15-30min during first infusion; note changes in pulse, B/P
- Monitor I&O ratio; watch for decreasing urinary output, change in specific gravity; discontinue product to prevent permanent damage to renal tubules
- Monitor blood tests; CBC, potassium, sodium, calcium, magnesium q2wk
- Monitor weight weekly; if weight increases over 2 lb/wk, edema is present; renal damage should be considered
- Assess for renal toxicity: increasing BUN, if >40 mg/dl or if serum creatinine >3 mg/dl; product may be discontinued or dosage reduced
- Assess for hepatotoxicity: increasing AST, ALT, alkaline phosphatase, bilirubin
- Assess for allergic reaction: dermatitis, rash; product should be discontinued; antihistamines (mild reaction) or EPINEPHrine (severe reaction) administered
- Assess for hypokalemia: anorexia, drowsiness, weakness, decreased reflexes, dizziness, increased urinary output, increased thirst, paresthesias
- Assess for ototoxicity: tinnitus (ringing, roaring in ears), vertigo, loss of hearing (rare)

#### Patient/family education

- Teach patient that long-term therapy may be needed to clear infection (2 wk-3 mo depending on type of infection)

#### Evaluation

**Positive therapeutic outcome**

- Decreased fever, malaise, rash
- Negative C&S for infecting organism

### Generic Names

amphotericin B, anidulafungin, fluconazole, isavuconazonium, itraconazole, ketoconazole, micafungin, nystatin, posaconazole, voriconazole

## Antihistamines

**ACTION:** Antihistamines compete with histamines for $H_1$ receptor sites. They antagonize in varying degrees most of the pharmacologic effects of histamines.

**USES:** Antihistamines are used to control the symptoms of allergies, rhinitis, and pruritus.

### CONTRAINDICATIONS

Hypersensitivity to $H_1$-receptor antagonists occurs rarely. Patients with acute asthma and lower respiratory tract disease should not use these products since thick secretions may result. Other contraindications include closed-angle glaucoma, bladder neck obstruction, stenosing peptic ulcer, symptomatic prostatic hypertrophy, breastfeeding, and in the newborn.

**Precautions:** Antihistamines must be used cautiously in conjunction with intraocular pressure since they increase intraocular pressure. Caution should also be used in pregnancy, breastfeeding, and geriatric patients and patients with renal/cardiac disease, hypertension, and seizure disorders.

**ADVERSE EFFECTS:** Most products cause drowsiness; however, loratadine and fexofenadine produce little, if any, drowsiness. Other common side effects are headache and thickening of bronchial secretions. Serious blood dyscrasias may occur, but are rare. Urinary retention, GI effects occur with many of these products.

**PHARMACOKINETICS:** Onset varies from 20-60 min, with duration lasting 4-24 hr. In general, pharmacokinetics vary widely among products.

**INTERACTIONS:** Barbiturates, opioids, hypnotics, tricyclics, and alcohol can increase CNS depression when taken with antihistamines.

### NURSING CONSIDERATIONS

#### Assessment

- Check I&O ratio; be alert for urinary retention, frequency, dysuria; product should be discontinued if these occur
- Assess for blood dyscrasias: thrombocytopenia, agranulocytosis (rare)
- Assess for respiratory status, including rate, rhythm, increase in bronchial secretions, wheezing, chest tightness
- Assess for cardiac status, including palpitations, increased pulse, hypotension
- Assess CBC during long-term therapy, since hemolytic anemia, although rare, may occur
- Administer with food or milk to decrease GI symptoms; absorption may be decreased slightly
- Administer whole (sus rel tab)
- Provide hard candy, gum, frequent rinsing of mouth for dryness

#### Patient/family education

- Advise patient to notify prescriber if confusion, sedation, hypotension occur
- Caution patient to avoid driving and other hazardous activity if drowsiness occurs
- Instruct patient to avoid concurrent use of alcohol and other CNS depressants
- Inform patient to discontinue a few days before skin testing

#### Evaluation

**Positive therapeutic outcome**

- Absence of allergy symptoms, itching

### Generic Names

brompheniramine, budesonide, cetirizine, chlorpheniramine, cyproheptadine, desloratadine, diphenhydrAMINE, fexofenadine, levocetirizine, loratadine, promethazine

## Antihypertensives

**ACTION:** Antihypertensives are divided into angiotensin converting enzyme (ACE) inhibitors, β-adrenergic blockers, calcium channel blockers, centrally acting adrenergics, diuretics, peripherally acting antiadrenergics, and vasodilators. β-blockers, calcium channel blockers, and diuretics are discussed in separate sections. ACE inhibitors selectively suppress conversion of renin-angiotensin I to angiotensin II; dilatation of arterial and venous vessels occurs. Centrally acting adrenergics act by inhibiting the sympathetic vasomotor center in the CNS, which reduces impulses in the sympathetic nervous system; blood pressure, pulse rate, and cardiac output decrease. Peripherally acting antiadrenergics inhibit sympathetic vasoconstriction by inhibiting release of norepinephrine and/or depleting norepinephrine stores in adrenergic nerve endings. Vasodilators act on arteriolar smooth muscle by producing direct relaxation or vasodilatation; a reduction in blood pressure, with concomitant increases in heart rate and cardiac output, occurs.

**USES:** Antihypertensives are used for hypertension and for heart failure not responsive to conventional therapy. Some products are used in hypertensive crisis, angina, and for some cardiac dysrhythmias.

## CONTRAINDICATIONS

Hypersensitive reactions may occur, and allergies should be identified before these products are given. Antihypertensives should not be used in children or in patients with heart block.

**Precautions:** Antihypertensives should be used with caution in geriatric and dialysis patients, and in the presence of hypovolemia, leukemia, and electrolyte imbalances.

## IMPLEMENTATION

- Place patient in supine or Trendelenburg position for severe hypotension

**ADVERSE EFFECTS:** The most common side effects are marked hypotension, bradycardia, tachycardia, headache, nausea, and vomiting. Side effects and adverse reactions may vary widely between classes and specific products.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver, with metabolites excreted in urine, bile, and feces.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Monitor blood tests: neutrophil; decreased platelets occur with many of the products
- Monitor renal function tests: protein, BUN, creatinine; watch for increased levels, which may indicate nephrotic syndrome; obtain baselines in renal/hepatic function tests before beginning treatment
- Assess for edema in feet and legs daily
- Identify allergic reaction, including rash, fever, pruritus, urticaria: product should be discontinued if antihistamines fail to help
- Identify symptoms of HF: edema, dyspnea, wet crackles, B/P
- Assess for renal symptoms: polyuria, oliguria, frequency

### Patient/family education

- Instruct patient to comply with dosage schedule, even if feeling better
- Advise patient to rise slowly to sitting or standing position to minimize orthostatic hypotension

### Evaluation

#### Positive therapeutic outcome

- Decrease in B/P in hypertension
- Decreased B/P, edema, moist crackles in HF

### Generic Names

*Angiotensin-converting enzyme inhibitors:*
benazepril, enalapril, fosinopril, lisinopril, quinapril, ramipril, trandolapril

*Angiotensin II receptor blockers:*
azilsartan, candesartan, eprosartan, irbesartan, losartan, olmesartan, telmisartan, valsartan

*Centrally acting adrenergics:*
cloNIDine, guanFACINE, methyldopa

*Peripherally acting antiadrenergics:*
doxazosin, prazosin, reserpine

*Vasodilators:*
ambrisentan, fenoldopam, hydrALAZINE, macitentan, minoxidil, **nitroprusside** (high alert)

*Antiadrenergic: Combined α/β-blocker:*
labetalol

*Direct renin inhibitors:*
aliskiren

# Antiinfectives

**ACTION:** Antiinfectives are divided into several groups, which include but are not limited to penicillins, cephalosporins, aminoglycosides, sulfonamides, tetracyclines, monobactam, erythromycins, and quinolones. These products inhibit the growth and replication of susceptible bacterial organisms.

**USES:** Antiinfectives are used for infections of susceptible organisms. These products are effective against bacterial, rickettsial, and spirochete infections.

## CONTRAINDICATIONS

Hypersensitive reactions may occur, and allergies should be identified before these products are given. Cross-sensitivity can occur between products of different classes (penicillins or cephalosporins). Often persons allergic to penicillins are also allergic to cephalosporins.

**Precautions:** Antiinfectives should be used with caution in persons with renal/hepatic disease.

## IMPLEMENTATION

- Give for 10-14 days to ensure organism death, prevention of superinfection
- Give after C&S completed; product may be taken as soon as culture is obtained

**ADVERSE EFFECTS:** The most common side effects are nausea, vomiting, and diarrhea. Adverse reactions include bone marrow depression and anaphylaxis.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver. Metabolites are excreted in urine, bile, and feces.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Assess for nephrotoxicity: increased BUN, creatinine
- Monitor blood tests: AST, ALT, CBC, Hct, bilirubin; test monthly if patient is on long-term therapy
- Monitor bowel pattern daily; if severe diarrhea occurs, product should be discontinued
- Monitor urine output; if decreasing, notify prescriber; may indicate nephrotoxicity
- Assess for allergic reaction: rash, fever, pruritus, urticaria; product should be discontinued
- Assess for bleeding: ecchymosis, bleeding gums, hematuria, stool guaiac daily
- Assess for overgrowth of infection: perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

### Patient/family education

- Teach patient to comply with dosage schedule, even if feeling better
- Advise patient to report sore throat, bruising, bleeding, joint pain; may indicate blood dyscrasias (rare)

### Evaluation

**Positive therapeutic outcome**

- Absence of fever, fatigue, malaise, draining wounds

### Generic Names

*Aminoglycosides:*
amikacin, azithromycin, clarithromycin, gentamicin, neomycin, streptomycin, tobramycin

*Cephalosporins:*
cefaclor, cefadroxil, ceFAZolin, cefdinir, cefditoren, cefepime, cefixime, cefotaxime, cefprozil, ceftibuten, cefuroxime, cephalexin, cephradine

*Fluoroquinolones:*
ciprofloxacin, gemifloxacin, levofloxacin, norfloxacin, ofloxacin

*Ketolides:*
telithromycin

*Miscellaneous:*
adefovir, dalbavancin, DAPTOmycin, delafloxacin, doripenem, ertapenem, fidaxomicin, meropenem, meropenem/vaborbactam, oritavancin, peginterferon alfa-2a, telavancin, vancomycin

*Penicillins:*
amoxicillin/clavulanate, ampicillin/sulbactam, imipenem/cilastatin, nafcillin, penicillin G benzathine, penicillin G, penicillin G procaine, penicillin V, piperacillin/tazobactam, ticarcillin, ticarcillin/clavulanate

*Sulfonamides:*
sulfaSALAzine

*Tetracyclines:*
doxycycline, minocycline, tetracycline

## Antilipidemics

**ACTION:** Antilipidemics are divided into three categories or subclassifications; HMG-CoA reductase inhibitors (statins), bile acid sequestrants, and miscellaneous products. The HMG-CoA reductase inhibitors work by reduction of an enzyme that is responsible for the beginning step in cholesterol production. Bile acid sequestrants work by binding cholesterol in the GI system. The miscellaneous products work by various actions.

**USES:** Primary hypercholesterolemia in individuals as an adjunct with other lifestyle changes.

### CONTRAINDICATIONS

Persons breastfeeding (some products) or those with hypersensitivity to any product or severe hepatic disease should not take these products. Antilipidemics are identified as pregnancy on some products.

**Precautions:** Some products are identified as pregnancy.

### IMPLEMENTATION

- Give as directed by health care provider; times will vary with medication used
- Provide protection from sunlight and heat

**ADVERSE EFFECTS:** The most common side effects are headache, dizziness, fatigue, insomnia, peripheral edema, dysrhythmias, sinusitis, pharyngitis, abdominal pain, diarrhea, constipation, flatulence, and back pain.

**PHARMACOKINETICS:** Pharmacokinetics and pharmacodynamics vary with each product.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Obtain a diet and lifestyle history, including exercise, smoking, alcohol, and stress-related activities

### Patient/family education

- Teach patient all aspects of medication use
- Instruct patient to combine medication with lifestyle changes, including low-cholesterol diet, decreasing LDL in diet; avoid smoking, alcohol, and sedentary daily routine

### Evaluation

**Positive therapeutic outcome**

- Decrease in triglycerides and LDL cholesterol levels

### Generic Names

*HMG-CoA reductase inhibitors:*
atorvastatin, fluvastatin, lovastatin, pitavastatin, pravastatin, simvastatin

*Bile acid sequestrants:*
cholestyramine, colesevelam

*Miscellaneous:*
alirocumab, evolocumab, ezetimibe, fenofibrate, fenofibric acid, gemfibrozil, mipomersen, niacin, niacinamide

# Antineoplastics

**ACTION:** Antineoplastics are divided into alkylating agents, antimetabolites, antibiotic agents, hormonal agents, and miscellaneous agents. Alkylating agents act by cross-linking strands of DNA. Antimetabolites act by inhibiting DNA synthesis. Antibiotic agents act by inhibiting RNA synthesis and by delaying or inhibiting mitosis. Hormones alter the effect of androgens, luteinizing hormone, follicle-stimulating hormone, or estrogen by changing the hormonal environment.

**USES:** Antineoplastics vary widely among products and classes of products. They are used to treat leukemia, Hodgkin's disease, lymphomas, and other tumors throughout the body.

## CONTRAINDICATIONS

Hypersensitive reactions may occur, and allergies should be identified before these products are given. Also, persons with severe renal/hepatic disease should not use these products unless the benefits outweigh the risks.

**Precautions:** Persons with bleeding, severe bone marrow depression, or renal/hepatic disease should be watched closely.

## IMPLEMENTATION

- Check **IV** site for irritation; phlebitis
- Have EPINEPHrine available for hypersensitivity reaction
- Give antibiotics for prophylaxis of infection
- Provide strict medical asepsis, protective isolation if WBC levels are low
- Provide comprehensive oral hygiene, using careful technique and soft-bristle brush

**ADVERSE EFFECTS:** Most products cause thrombocytopenia, leukopenia, and anemia. If these reactions occur, the product may need to be stopped until the problem is corrected. Other side effects include nausea, vomiting, glossitis, and hair loss. Some products also cause hepatotoxicity, nephrotoxicity, and cardiotoxicity.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products cross the placenta and are excreted in breast milk and in urine.

**INTERACTIONS:** Toxicity may occur when used with other antineoplastics or radiation.

## NURSING CONSIDERATIONS

### Assessment

- Monitor CBC, differential, platelet count weekly; withhold product if WBC is <4000 or platelet count is <75,000; notify prescriber of results
- Monitor renal function tests: BUN, creatinine, serum uric acid, and urine creatinine clearance before, during therapy
- Monitor I&O ratio; report fall in urine output of 30 ml/hr
- Monitor temp q4hr (may indicate beginning infection)
- Monitor hepatic function tests before, during therapy (bilirubin, AST, ALT, LDH) monthly or as needed
- Assess for bleeding, including hematuria, guaiac, bruising or petechiae, mucosa, or orifices q8hr; obtain prescription for viscous lidocaine (Xylocaine)
- Identify jaundice of skin, sclera, dark urine, clay-colored stools, itchy skin, abdominal pain, fever, diarrhea
- Assess for edema in feet, joint pain, stomach pain, shaking
- Assess for inflammation of mucosa, breaks in skin

### Patient/family education

- Advise patient to report signs of infection, including increased temp, sore throat, malaise

• Instruct patient to report signs of anemia, including fatigue, headache, faintness, shortness of breath, irritability
• Instruct patient to report bleeding and to avoid use of razors and commercial mouthwash

### Evaluation

**Positive therapeutic outcome**
• Decreased tumor size

### Generic Names

*Alkylating agents:*
bendamustine, **busulfan** (high alert), **CARBOplatin** (high alert), **carmustine** (high alert), chlorambucil, **CISplatin** (high alert), **cyclophosphamide** (high alert), **dacarbazine** (high alert), **melphalan** (high alert), oxaliplatin

*Antimetabolites:*
capecitabine, **cytarabine** (high alert), decitabine, **etoposide** (high alert), **fluorouracil** (high alert), mercaptopurine, **methotrexate** (high alert), PEMEtrexed

*Antibiotic agents:*
**bleomycin** (high alert), **DACTINomycin** (high alert), **DAUNOrubicin** (high alert), **DOXOrubicin** (high alert), **mitoMYcin** (high alert), **mitoXANtrone** (high alert)

*Hormonal agents:*
flutamide, fulvestrant, goserelin, **irinotecan** (high alert), **leuprolide** (high alert), megestrol, tamoxifen, **topotecan** (high alert)

*Miscellaneous agents:*
abemaciclib, acalabrutinib, ado-trastuzumab, afatinib, alemtuzumab, anastrozole, axicabtegene, azaCITIDine, belinostat, bortezomib, brentuximab, cabazitaxel, **ceritinib** (high alert), cetuximab, crizotinib, dabrafenib, dasatinib, durvalumab, enasidenib, eribulin, erlotinib, gemcitabine, ibritumomab, ibrutinib, idelalisib, imatinib, interferon alfa-2a, interferon alfa-2b, ipilimumab, irinotecan, ixabepilone, lapatinib, midostaurin, nilotinib, niraparib, olaparib, palbociclib, panitumumab, pembrolizumab, pomalidomide, procarbazine, ranibizumab, riTUXimab, sipuleucel-T, sonidegib, tisagenlecleucel, trametinib, vemurafenib, **vinBLAStine** (high alert), **vinCRIStine** (high alert), **vinorelbine** (high alert)

## Antiparkinsonian Agents

**ACTION:** Antiparkinsonian agents are divided into cholinergics, dopamine agonists, and monoamine oxidase type B inhibitors. Cholinergics work by blocking or competing at central acetylcholine receptors. Dopamine agonists work by decarboxylation to dopamine or by activation of dopamine receptors. Monoamine oxidase type B inhibitors increase dopamine activity by inhibiting MAO type B activity.

**USES:** Antiparkinson agents are used alone or in combination for patients with Parkinson's disease.

### CONTRAINDICATIONS

Persons with hypersensitivity, closed-angle glaucoma, and undiagnosed skin lesions should not use these products.

**Precautions:** Antiparkinsonian agents should be used with caution in pregnancy, breastfeeding, children, renal/cardiac/hepatic disease, and affective disorder.

### IMPLEMENTATION

• Give product up until NPO before surgery
• Adjust dosage depending on patient response
• Give with meals; limit protein taken with product
• Give only after MAOIs have been discontinued for 2 wk
• Assist with ambulation during beginning therapy if needed
• Test for diabetes mellitus and acromegaly if on long-term therapy

**ADVERSE EFFECTS:** Side effects and adverse reactions vary widely among products. The most common side effects include involuntary movements, headache, numbness, insomnia, nightmares, nausea, vomiting, dry mouth, and orthostatic hypotension.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

### NURSING CONSIDERATIONS

#### Assessment

• Monitor B/P, respiration
• Assess mental status: affect, behavioral changes, depression, complete suicide assessment

#### Patient/family education

• Advise patient to change positions slowly to prevent orthostatic hypotension
• Instruct patient to report side effects: twitching, eye spasm; indicate overdose
• Advise patient to use product exactly as prescribed; if product is discontinued abruptly, parkinsonian crisis may occur

### Evaluation

**Positive therapeutic outcome**
- Decrease in akathisia
- Improvement in mood

### Generic Names
amantadine, benztropine, bromocriptine, carbidopa-levodopa, pramipexole, rasagiline, selegiline, tolcapone

## Antiplatelets

**ACTION:** The antiplatelets are divided into the platelet aggregation inhibitors, platelet adhesion inhibitors, and the glycoprotein IIb, IIIa inhibitors. The platelet aggregation inhibitors work by action on thrombin; the platelet adhesion inhibitors work by inhibition of phosphodiesterase; and the glycoprotein IIb, IIIa inhibitors work by preventing fibrin from binding to glycoprotein IIb, IIIa receptors.

**USES:** Antiplatelets are used to prevent myocardial infarction and stroke; other products are used for coronary syndromes.

### CONTRAINDICATIONS
Persons developing hypersensitive reactions should not use these products.

**Precautions:** Antiplatelets should be used cautiously in pregnancy, breastfeeding, and bleeding disorders.

### IMPLEMENTATION
- Give with heparin or other aspirin (some products)
- Store at room temperature vial/ampules, oral products

**ADVERSE EFFECTS:** The most common side effects are headache, dizziness, bleeding, and diarrhea.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized by the liver and excreted by the kidneys.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

### NURSING CONSIDERATIONS
#### Assessment
- Assess reason for use of these products
- Monitor hypersensitivity reactions with some products
- Monitor bleeding from orifices, stool urine
- Monitor blood tests: platelets, Hgb, Hct, PT/APTT, and INR

#### Patient/family education
- Caution patient to avoid hazardous activities if drowsiness, dizziness occurs; ask for assistance if hospitalized
- Teach patient all aspects of product usage

#### Evaluation

**Positive therapeutic outcome**
- Absence of MI, stroke, or other coronary syndromes

### Generic Names
*Platelet aggregation inhibitors:*
cilostazol, clopidogrel, ticagrelor, ticlopidine

*Platelet adhesion inhibitors:*
dipyridamole

*Glycoprotein IIb, IIIa inhibitors:*
**eptifibatide** (high alert), **tirofiban** (high alert)

## Antipsychotics

**ACTION:** Antipsychotics/neuroleptics are divided into several subgroups: phenothiazines, thioxanthenes, butyrophenones, dibenzoxazepines, dibenzodiazepines, and indolones and other heterocyclic compounds. Although chemically different, these subgroups share many pharmacologic and clinical properties. All antipsychotics work to block postsynaptic DOPamine receptors in the brain that are responsible for psychotic behavior, including hallucinations, delusions, and paranoia.

**USES:** Antipsychotic behavior is decreased in conditions such as schizophrenia, paranoia, and mania. These agents are also effective for severe anxiety, intractable hiccups, nausea, vomiting, behavioral problems in children, and for relaxation before surgery.

### CONTRAINDICATIONS
Persons with liver damage, severe hypertension or coronary disease, cerebral arteriosclerosis, blood dyscrasias, bone marrow depression, parkinsonism, severe depression, or closed-angle glaucoma; children $<12$ yr; persons withdrawing from alcohol or barbiturates should not use antipsychotics until these conditions are corrected.

**Precautions:** Caution must be used when antipsychotics are given to geriatric patients, since metabolism is slowed and adverse reactions can occur rapidly. Renal/hepatic disease may cause poor metabolism and excretion of the product. Seizure threshold is decreased with these products; increases in the dose of anticonvulsants may be required. Persons with diabetes

mellitus, prostatic hypertrophy, chronic respiratory disease, and peptic ulcer disease should be monitored closely.

## IMPLEMENTATION

- Give antiparkinsonian agent if extrapyramidal symptoms occur
- Administer liquid conc mixed in glass of juice or cola since taste is unpleasant; avoid contact with skin when preparing liquid conc or parenteral medications
- Supervise ambulation until stabilized on medication; do not involve in strenuous exercise program, since fainting is possible; patient should not stand still for long periods
- Increase fluids to prevent constipation
- Give sips of water, candy, gum for dry mouth
- Patient should remain lying down for at least 30 min after IM inj

**ADVERSE EFFECTS:** The most common side effects include extrapyramidal symptoms such as pseudoparkinsonism, akathisia, dystonia, and tardive dyskinesia, which may be controlled by use of antiparkinsonian agents. Serious adverse reactions such as hypotension, agranulocytosis, cardiac arrest, and laryngospasm have occurred. Other common side effects include dry mouth and photosensitivity.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely with different products and routes. Products are metabolized by the liver, are excreted in urine as metabolites, are highly bound to plasma proteins, cross the placenta, and enter breast milk. Half-life can be extended over 3 days.

**INTERACTIONS:** Because other CNS depressants can cause oversedation, these combinations should be used carefully. Anticholinergics may decrease the therapeutic actions of phenothiazines and also cause increased anticholinergic effects.

## NURSING CONSIDERATIONS

### Assessment

- Monitor bilirubin, CBC, hepatic function tests monthly, since these products are metabolized in the liver and excreted in urine
- Monitor I&O ratio: palpate bladder if low urinary output occurs, since urinary retention occurs with many of these products
- Assess affect, orientation, LOC, reflexes, gait, coordination, sleep pattern disturbances
- Assess dizziness, faintness, palpitations, tachycardia on rising
- Check B/P with patient lying and standing; wide fluctuations between lying and standing B/P may require dosage or product change, since orthostatic hypotension is occurring
- Assess for EPS, including akathisia, tardive dyskinesia, pseudoparkinsonism

### Patient/family education

- Advise patient to rise from sitting or lying position gradually, since fainting may occur
- Caution patient to avoid hot tubs, hot showers, or tub baths, since hypotension may occur
- Advise patient to wear sunscreen or protective clothing to prevent burns
- Advise patient to take extra precautions during hot weather to stay cool; heat stroke can occur
- Caution patient to avoid driving and other activities requiring alertness until response to medication is known
- Inform patient that drowsiness or impaired mental/motor activity is evident the first 2 wk, but tends to decrease over time

### Evaluation

**Positive therapeutic outcome**

- Decrease in excitement, hallucinations, delusions, paranoia
- Reorganization of thought patterns, speech

---

### Generic Names

*Phenothiazines:*
chlorproMAZINE, fluPHENAZine

*Butyrophenone:*
haloperidol

*Miscellaneous:*
ARIPiprazole, asenapine, iloperidone, loxapine, OLANZapine, paliperidone, QUEtiapine, risperiDONE, ziprasidone

# Antipyretics

**ACTION:** The antipyretics act on the CNS to control fever and also inhibit prostaglandin production.

**USES:** Antipyretics are used to decrease fever.

## CONTRAINDICATIONS

Persons developing hypersensitive reactions should not use these products.

**Precautions:** Antipyretics should be used cautiously in pregnancy, breastfeeding, geriatric patients, hepatic disease, and those with certain GI disorders.

## IMPLEMENTATION

- Give around the clock to keep fever reduced
- Store at room temperature

**ADVERSE EFFECTS:** The most common side effects are nausea, vomiting, and rash.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized by the liver and excreted by the kidneys.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Monitor temp frequently
- Assess reason for use and expected outcome
- Monitor hypersensitivity reactions: rash, bronchospasm with some products

### Patient/family education

- Teach patient all aspects of product usage

### Evaluation

**Positive therapeutic outcome**

- Absence or decreasing fever after use

---

### Generic Names

acetaminophen, aspirin, choline/magnesium salicylates, ibuprofen, ketoprofen, magnesium salicylate, naproxen, salsalate

## Antiretrovirals

**ACTION:** Antiretrovirals act by blocking DNA synthesis.

**USES:** Antiretrovirals are used in HIV infections, chronic hepatitis C to slow the progression of the disease.

## CONTRAINDICATIONS

Persons with hypersensitivity should not use these products.

**Precautions:** Antiretrovirals should be used cautiously in pregnancy, breastfeeding, and renal/hepatic disease. Protease inhibitors should be used cautiously in diabetes.

## IMPLEMENTATION

- Give in equal intervals around the clock
- Store at room temperature

**ADVERSE EFFECTS:** The most common side effects are nausea, vomiting, anorexia, headache, and diarrhea. The most serious adverse reactions are nephrotoxicity and blood dyscrasias.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized by the liver and excreted by the kidneys.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Monitor for signs of HIV infection: increased CD4 counts, decreased viral load; signs of chronic hepatitis C
- Monitor patients with compromised renal system; since product is excreted slowly in poor renal system function, toxicity may occur rapidly

### Patient/family education

- Instruct patient to report sore throat, fever, fatigue; may indicate superinfection
- Caution patient that product does not cure condition or prevent infecting others, but controls symptoms
- Instruct patient that product must be taken around the clock, in equal intervals to maintain blood levels for duration of therapy
- Instruct patient to notify prescriber of side effects such as bruising, bleeding, fatigue, malaise; may indicate blood dyscrasias

### Evaluation

**Positive therapeutic outcome**

- Decreased viral load
- Increased CD4 count
- Improvement in the symptoms of HIV/AIDS

---

### Generic Names

*Nonnucleoside reverse transcriptase inhibitors:*
delavirdine, efavirenz, etravirine, nevirapine, rilpivirine

*Nucleoside reverse transcriptase inhibitors:*
abacavir, didanosine, emtricitabine, lamiVUDine, stavudine d4t, tenofovir, zidovudine

*Protease inhibitors:*
atazanavir, **atazanavir/cobistat** (high alert), boceprevir, fosamprenavir, indinavir, nelfinavir, ritonavir, saquinavir, telaprevir, tipranavir

*Fusion inhibitors:*
enfuvirtide

*Miscellaneous:*
daclatasvir, dolutegravir, dolutegravir/rilpivirine, raltegravir

## Antituberculars

**ACTION:** Antituberculars act by inhibiting RNA or DNA, or interfering with lipid and protein synthesis, thereby decreasing tubercle bacilli replication.

**USES:** Antituberculars are used for pulmonary tuberculosis.

## CONTRAINDICATIONS

Persons with severe renal disease or hypersensitivity should not use these products.

**Precautions:** Antituberculars should be used with caution in pregnancy, breastfeeding, and hepatic disease.

## IMPLEMENTATION

- Give some of these agents on empty stomach, 1 hr before meals (only for isoniazid and rifampin) or 2 hr after meals
- Give antiemetic if vomiting occurs
- Give after C&S is completed; monthly to detect resistance

**ADVERSE EFFECTS:** Adverse effects vary widely among products. Most products can cause nausea, vomiting, anorexia, and rash. Serious adverse reactions include renal failure, nephrotoxicity, ototoxicity, and hepatic necrosis.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Assess for signs of anemia: Hct, Hgb, fatigue
- Monitor hepatic function tests weekly: ALT, AST, bilirubin
- Monitor renal status before treatment and monthly thereafter: BUN, creatinine, output, specific gravity, urinalysis
- Monitor hepatic status: decreased appetite, jaundice, dark urine, fatigue

### Patient/family education

- Teach patient that compliance with dosage schedule, duration is necessary
- Teach patient that scheduled appointments must be kept; relapse may occur
- Advise patient to avoid alcohol while taking product
- Advise patient to report flulike symptoms: excessive fatigue, anorexia, vomiting, sore throat; unusual bleeding, yellowish discoloration of skin/eyes

### Evaluation

#### Positive therapeutic outcome

- Decreased symptoms of TB
- Negative culture

**Generic Names**
ethambutol, isoniazid, pyrazinamide, rifabutin, rifampin, streptomycin

# Antitussives/Expectorants

**ACTION:** Antitussives suppress the cough reflex by direct action on the cough center in the medulla. Expectorants act by liquefying and reducing the viscosity of thick, tenacious secretions.

**USES:** Antitussives/expectorants are used to treat cough occurring in pneumonia, bronchitis, TB, cystic fibrosis, and emphysema; as an adjunct in atelectasis (expectorants); and for nonproductive cough (antitussives).

## CONTRAINDICATIONS

Some products are contraindicated in pregnancy, breastfeeding, and hypothyroidism

**Precautions:** Some products should be used cautiously with asthma and in geriatric and debilitated patients.

## IMPLEMENTATION

- Give decreased dosage to geriatric patients; their metabolism may be slowed
- Increase fluids to liquefy secretions
- Humidify patient's room

**ADVERSE EFFECTS:** The most common side effects are drowsiness, dizziness, and nausea.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Some products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Assess cough: type, frequency, character including sputum

### Patient/family education

- Advise patient to avoid driving and other hazardous activities until stabilized on this medication
- Caution patient to avoid smoking, smoke-filled rooms, perfumes, dust, environmental pollutants, cleaners that increase cough

### Evaluation

#### Positive therapeutic outcome

- Absence of cough

**Generic Names**
acetylcysteine, codeine, dextromethorphan, diphenhydrAMINE, guaiFENesin, HYDROcodone

## Antivirals

**ACTION:** Antivirals act by interfering with DNA synthesis that is needed for viral replication.

**USES:** Antivirals are used for mucocutaneous herpes simplex virus, herpes genitalis (HSV-1, HSV-2), varicella infections, herpes zoster, and herpes simplex encephalitis.

### CONTRAINDICATIONS
Persons with hypersensitivity or immunosuppressed individuals should not use these products.

**Precautions:** Antivirals should be used cautiously in pregnancy, breastfeeding, and renal/hepatic disease.

### IMPLEMENTATION
- Give increased fluids to 3 L/day to decrease crystalluria when given **IV**
- Store at room temperature for up to 12 hr after reconstitution

**ADVERSE EFFECTS:** The most common side effects are nausea, vomiting, anorexia, headache, and diarrhea. The most serious adverse reactions are nephrotoxicity and blood dyscrasias.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized by the liver and excreted by the kidneys.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

### NURSING CONSIDERATIONS
#### Assessment
- Monitor for signs of infection, anemia
- Monitor patients with a compromised renal system; since product is excreted slowly in poor renal system function, toxicity may occur rapidly
- Monitor renal function tests: urinalysis, BUN, serum creatinine or decreased CCr may indicate nephrotoxicity; I&O ratio; report hematuria, oliguria, fatigue, weakness; check for protein in the urine during treatment
- Assess C&S before treatment; agent may be given as soon as culture is taken; repeat C&S after treatment
- Monitor bowel pattern before, during treatment; if severe abdominal pain with bleeding occurs, agent should be discontinued
- Monitor skin reactions: rash, urticaria, itching
- Monitor hepatic function tests: AST, ALT
- Monitor blood tests: WBC, RBC, Hct, Hgb, bleeding time; blood dyscrasias

#### Patient/family education
- Instruct patient to report sore throat, fever, fatigue; may indicate superinfection
- Caution patient that product does not prevent infecting others or cure condition but controls symptoms
- Instruct patient that product must be taken around the clock in equal intervals to maintain blood levels for duration of therapy
- Instruct patient to notify prescriber of side effects such as bruising, bleeding, fatigue, malaise; may indicate blood dyscrasias

#### Evaluation
**Positive therapeutic outcome**
- Absence or control of infection

**Generic Names**
acyclovir, amantadine, cidofovir, daclatasvir, docosanol, entecavir, famciclovir, foscarnet, ganciclovir, lamiVUDine, maraviroc, oseltamivir, penciclovir, rapivab, ribavirin, simeprevir, sofosbuvir, valACYclovir, valGANciclovir, zanamivir

## β-adrenergic Blockers

**ACTION:** β-blockers are divided into selective and nonselective blockers. Selective β-blockers competitively block stimulation of $\beta_1$-receptors in cardiac smooth muscle; these products produce chronotropic and inotropic effects. Nonselective blockers produce a fall in blood pressure without reflex tachycardia or reduction in heart rate through a mixture of β-blocking effects; elevated plasma renins are reduced.

**USES:** β-blockers are used for hypertension, ventricular dysrhythmias, and prophylaxis of angina pectoris.

### CONTRAINDICATIONS
Hypersensitive reactions may occur, and allergies should be identified before these products are given. β-adrenergic blockers should not be used in heart block, HF, or cardiogenic shock.

**Precautions:** β-blockers should be used with caution in pregnant and geriatric patients or in renal/thyroid disease, COPD, CAD, diabetes mellitus, and asthma.

### IMPLEMENTATION
- Give PO before meals and at bedtime; tab may be crushed or swallowed whole
- Give reduced dosage in renal dysfunction

**ADVERSE EFFECTS:** The most common side effects are orthostatic hypotension, bradycardia, diarrhea, nausea, and vomiting. Serious adverse reactions include blood dyscrasias, bronchospasm, and HF.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver, with metabolites excreted in urine, bile, and feces.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Monitor renal function tests: protein, BUN, creatinine; watch for increased levels that may indicate nephrotic syndrome; obtain baselines in renal/hepatic function tests before beginning treatment
- Monitor I&O ratio, weight daily
- Monitor B/P during beginning of treatment and periodically thereafter, pulse q4hr; note rate, rhythm, quality
- Monitor apical/radial pulse before administration; notify prescriber of significant changes
- Check for edema in feet and legs daily

### Patient/family education

- Instruct patient to comply with dosage schedule, even if feeling better
- Caution patient to rise slowly to sitting or standing position to minimize orthostatic hypotension
- Advise patient to report bradycardia, dizziness, confusion, depression, fever
- Teach patient to take pulse at home; advise when to notify prescriber
- Instruct patient to comply with weight control, dietary adjustment, modified exercise program
- Advise patient to wear support hose to minimize effects of orthostatic hypotension
- Advise patient not to discontinue product abruptly; taper over 2 wk; may precipitate angina

### Evaluation

**Positive therapeutic outcome**

- Decrease in B/P in hypertension
- Decreased B/P, edema, moist crackles in HF

---

### Generic Names

*Selective $\beta_1$-receptor blockers:*
acebutolol, atenolol, esmolol, metoprolol, nebibolol

*$\beta_2$-receptor blocker:*
indacaterol

*Nonselective $\beta_1$ and $\beta_2$-blockers:*
carteolol, nadolol, propranolol, timolol

*Combined $\alpha_1$, $\beta_1$, and $\beta_2$-receptor blocker:*
labetalol

# Bone Resorption Inhibitors

**ACTION:** Bone resorption inhibitors are divided into the bisphosphonates and the selective estrogen receptor modulators. The bisphosphonates act by absorbing calcium phosphate crystals in bone and may directly block dissolution of hydroxyapatite crystals of bone, inhibiting normal and abnormal bone resorption and mineralization. Selective estrogen receptor modulators act by reducing resorption of bone and decreasing bone turnover, mediated through estrogen receptor binding.

**USES:** Bone resorption inhibitors are used for prevention and treatment of osteoporosis in postmenopausal women, treatment of Paget's disease, and treatment of osteoporosis in men.

## CONTRAINDICATIONS

Persons developing hypersensitive reactions or those with hypocalcemia should not use these products.

**Precautions:** Bone resorption inhibitors should be used cautiously in pregnancy, breastfeeding, the geriatric patient, renal/hepatic disease, and some GI disorders.

## IMPLEMENTATION

- Give for 6 months or more in Paget's disease
- Store at room temperature

**ADVERSE EFFECTS:** The most common side effects are nausea, vomiting, headache, bone pain, and rash.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are taken up by the bones and excreted by the kidneys.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Assess reason for use and expected outcome
- Monitor bone density test; hormonal status (women) before starting treatment and thereafter
- Monitor hypercalcemia: paresthesia, twitching, laryngospasm; Chvostek's, Trousseau's signs

### Patient/family education

- Instruct patient to remain upright for at least 30 min after taking to prevent esophageal irritation
- Teach patient all aspects of product usage
- Instruct patient to use weight-bearing exercise to increase bone density

### Evaluation

**Positive therapeutic outcome**

- Increase in bone mass
- Absence of fractures

### Generic Names

*Bisphosphonates:*
alendronate, etidronate, ibandronate, pamidronate, risedronate

*Selective estrogen receptor modulator:*
raloxifene

*Monoclonal antibody:*
denosumab

## Calcium Channel Blockers

**ACTION:** Calcium channel blockers inhibit calcium ion influx across the cell membrane in cardiac and vascular smooth muscle. This action produces relaxation of coronary vascular smooth muscle, dilates coronary arteries, slows SA/AV node conduction, and dilates peripheral arteries.

**USES:** Calcium channel blockers are used for chronic stable angina pectoris, vasospastic angina, dysrhythmias, hypertension, and unstable angina.

### CONTRAINDICATIONS

Persons with 2nd- or 3rd-degree heart block, sick sinus syndrome, hypotension of <90 mm Hg systolic, Wolff-Parkinson-White syndrome, or cardiogenic shock should not use these products, since worsening of those conditions may occur.

**Precautions:** HF may worsen since edema may be increased. Hypotension may worsen, since B/P is decreased. Patients with renal/hepatic disease should use these products cautiously since they are metabolized in the liver and excreted by the kidneys.

### IMPLEMENTATION

- Give PO before meals and at bedtime

**ADVERSE EFFECTS:** The most common side effects are dysrhythmias and edema. Also common are headache, fatigue, drowsiness, and flushing.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely with route of administration. Products are metabolized by the liver and excreted in the urine primarily as metabolites.

**INTERACTIONS:** Increased levels of digoxin and theophylline may occur when used with these products. Increased effects of β-blockers and antihypertensives may occur with calcium channel blockers.

### NURSING CONSIDERATIONS

#### Assessment

- Monitor cardiac system: B/P, pulse, respirations, ECG intervals (PR, QRS, QT)

#### Patient/family education

- Teach patient how to take pulse before taking product; patient should record or graph pulses to identify changes
- Advise patient to avoid hazardous activities until stabilized on this product since dizziness occurs frequently
- Inform patient of the need for compliance to all areas of medical regimen, including diet, exercise, stress reduction, and product therapy

#### Evaluation

**Positive therapeutic outcome**

- Decreased anginal pain
- Decreased B/P, dysrhythmias

### Generic Names

amLODIPine, clevidipine, **diltiazem** (high alert), felodipine, isradipine, niCARdipine, NIFEdipine, verapamil

## Cardiac Glycosides

**ACTION:** Cardiac glycosides act by inhibiting sodium and potassium ATPase and then making more calcium available to activate contracted proteins. Cardiac contractility and cardiac output are increased.

**USES:** Cardiac glycosides are used for HF, atrial fibrillation, atrial flutter, atrial tachycardia, and rapid digitalization in these disorders.

### CONTRAINDICATIONS

Hypersensitive reactions may occur, and allergies should be identified before these products are given. Also, persons with ventricular tachycardia, ventricular fibrillation, and carotid sinus syndrome should not use these products.

**Precautions:** Persons with acute MI and those who have or may develop serum potassium, calcium, or magnesium imbalances should

use these products cautiously. Also, geriatric patients and those with AV block, severe respiratory disease, hypothyroidism, or renal/hepatic disease should exercise caution when these products are prescribed.

## IMPLEMENTATION

- Give potassium supplements if ordered for potassium levels <3

**ADVERSE EFFECTS:** The most common side effects are cardiac disturbances, headache, hypotension, and GI symptoms. Also common are blurred vision and yellow-green halos.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely with the route of administration. Digitoxin is inactivated by the liver, and inactive metabolites are excreted in urine. Digoxin is excreted in urine mainly as the parent product and metabolites.

**INTERACTIONS:** Toxicity may occur when used with diuretics, succinylcholine, quiNIDine, and thioamines. Increased blood levels may occur with propantheline bromide, spironolactone, quiNIDine, verapamil, aminoglycosides (PO), amiodarone, anticholinergics, and quiNINE. Diuretics may increase toxicity.

## NURSING CONSIDERATIONS

### Assessment

- Monitor cardiac system: B/P, pulse, respirations, and increased urine output
- Monitor apical pulse for 1 min before giving product; if pulse <60, take again in 1 hr; if <60 notify prescriber
- Monitor electrolytes: potassium, sodium, chloride, calcium, magnesium; renal function tests, including BUN and creatinine; and blood tests, including AST, ALT, bilirubin
- Monitor I&O ratio, daily weights
- Monitor therapeutic product levels

### Patient/family education

- Teach patient how to take pulse before taking product; patient should record or graph pulse to identify changes
- Advise patient to avoid hazardous activities until stabilized on this product since dizziness occurs frequently
- Inform patient of the need for compliance to all areas of medical regimen, including diet, exercise, stress reduction, product therapy

### Evaluation

#### Positive therapeutic outcome

- Decreased weight, edema, pulse, respiration
- Increased urine output

**Generic Names**
**digoxin** (high alert)

# Cholinergics

**ACTION:** Cholinergics act by preventing destruction of acetylcholine, which increases concentration at sites where acetylcholine is released. This exaggerates the effects of acetylcholine and facilitates transmission of impulses across the myoneural junction. Cholinergics may also act by stimulating receptors for acetylcholine.

**USES:** Cholinergics are used for myasthenia gravis, as antagonists of nondepolarizing neuromuscular blockade, postoperative bladder distention and urinary distention, postoperative ileus.

## CONTRAINDICATIONS

Persons with obstruction of the intestine or renal system should not use these products.

**Precautions:** Caution should be used in patients with bradycardia, hypotension, seizure disorders, bronchial asthma, coronary occlusion, and hyperthyroidism, and in breastfeeding and children.

## IMPLEMENTATION

- Give only with atropine sulfate available for cholinergic crisis
- Give only after all other cholinergics have been discontinued
- Give increased dosages if tolerance occurs
- Give larger doses after exercise or fatigue
- Give on empty stomach for better absorption
- Store at room temperature

**ADVERSE EFFECTS:** The most serious adverse reactions are respiratory depression, bronchospasm, constriction, laryngospasm, respiratory arrest, convulsions, and paralysis. The most common side effects are nausea, diarrhea, and vomiting.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Monitor VS, respiration q8hr
- Monitor I&O ratio; check for urinary retention or incontinence

• Assess for bradycardia, hypotension, bronchospasm, headache, dizziness, seizures, respiratory depression; product should be discontinued if toxicity occurs

### Patient/family education

• Inform patient that product is not a cure; it only relieves symptoms (myasthenia gravis)
• Advise patient to carry/wear emergency ID specifying myasthenia gravis, products taken

### Evaluation

**Positive therapeutic outcome**

• Increased muscle strength, hand grasp
• Improved muscle gait
• Absence of labored breathing (if severe)

---

### Generic Names

bethanechol, physostigmine, pyridostigmine

## Cholinergic Blockers

**ACTION:** Cholinergic blockers inhibit or block acetylcholine at receptor sites in the autonomic nervous system.

**USES:** Many cholinergic blockers are used to decrease secretions before surgery, to reverse neuromuscular blockade, and to decrease motility of the GI, biliary, and urinary tracts. Other products are used for parkinsonian symptoms, including dystonia associated with neuroleptic products.

### CONTRAINDICATIONS

Hypersensitivity can occur, and allergies should be identified before administering these products. Persons with GI and GU obstruction should not use these products, since constipation and urinary retention may occur. They are also contraindicated in closed-angle glaucoma and myasthenia gravis.

**Precautions:** Caution must be used when these products are given to the geriatric patient, since metabolism is slowed. Also, persons with tachycardia or prostatic hypertrophy should use these products with caution.

### IMPLEMENTATION

• Give with food or milk to decrease GI symptoms
• Give parenteral dose with patient recumbent to prevent postural hypotension; give dose slowly, monitoring VS
• Give hard candy, gum, frequent rinsing of mouth for dryness

**ADVERSE EFFECTS:** The most common side effects are dryness of the mouth and constipation, which can be prevented by frequent rinsing of the mouth and increasing water and bulk in the diet.

**PHARMACOKINETICS:** Onset, peak, and duration vary with route.

**INTERACTIONS:** Increase in anticholinergic effect occurs when used with opioids, barbiturates, antihistamines, MAOIs, phenothiazines, amantadine.

### NURSING CONSIDERATIONS

#### Assessment

• Assess I&O ratio; be alert for urinary retention, frequency, dysuria; product should be discontinued if these occur
• Assess urinary hesitancy, retention; palpate bladder if retention occurs
• Assess constipation; increase fluids, bulk, exercise
• Assess for tolerance over long-term therapy; dosage may need to be changed
• Assess mental status: affect, mood, CNS depression, worsening of mental symptoms during early therapy

#### Patient/family education

• Caution patient to avoid driving and other hazardous activities if drowsiness occurs
• Advise patient to avoid concurrent use of cough, cold preparations with alcohol, antihistamines unless directed by prescriber
• Caution patient to use with caution in hot weather, since medication may increase susceptibility to heat stroke

#### Evaluation

**Positive therapeutic outcome**

• Absence of cramps
• Absence of EPS

---

### Generic Names

**atropine** (high alert), benztropine, glycopyrrolate, scopolamine

## Corticosteroids

**ACTION:** Corticosteroids are divided into glucocorticoids and mineralocorticoids. Glucocorticoids decrease inflammation by the suppression of migration of polymorphonuclear leukocytes, fibroblasts, increased capillary permeability, and lysosomal stabilization. They also have varied metabolic effects and modify the body's immune responses to many different stimuli. Mineralocorticoids act by increasing resorption of sodium by increasing hydrogen and potassium excretion in the distal tubule.

**USES:** Glucocorticoids are used to decrease inflammation and for immunosuppression. In addition, some products may be given for allergy, adrenal insufficiency, or cerebral edema. Mineralocorticoids are given for adrenal insufficiency or adrenogenital syndrome.

## CONTRAINDICATIONS

Hypersensitivity may occur and should be identified before administering. Since these products mask infection, they should not be used in systemic fungal infections or amebiasis. Mothers taking pharmacologic doses of corticosteroids should not breastfeed.

**Precautions:** Caution must be used when these products are prescribed for diabetic patients since hyperglycemia may occur. Also, patients with glaucoma, seizure disorders, peptic ulcer, impaired renal function, HF, hypertension, ulcerative colitis, or myasthenia gravis should be monitored closely if corticosteroids are given. Use with caution during pregnancy, in children, and in the geriatric patient.

## IMPLEMENTATION

- Give with food or milk to decrease GI symptoms
- Give single daily or alternate-day doses in the morning before 9 AM (for replacement therapy)

**ADVERSE EFFECTS:** The most common side effects include change in behavior, including insomnia and euphoria; GI irritation, including peptic ulcer; metabolic reactions, including hypokalemia, hyperglycemia, and carbohydrate intolerance; and sodium and fluid retention. Most adverse reactions are dose dependent.

**PHARMACOKINETICS:** For oral preparations the onset of action occurs between 1-2 hr, and duration can be up to 2 days, with a half-life of 2-4 days. Pharmacokinetics vary widely among products. These products cross the placenta and appear in breast milk.

**INTERACTIONS:** Decreased corticosteroid effect may occur with barbiturates, rifampin, and phenytoin; corticosteroid dosage may need to be increased. There is a possibility of GI bleeding when used with salicylates and indomethacin. Steroids may reduce salicylate levels. When using with digoxin, glycosides, potassium-depleting diuretics, and amphotericin, serum potassium levels should be monitored.

## NURSING CONSIDERATIONS

### Assessment

- Monitor potassium, blood glucose, urine glucose while on long-term therapy; hypokalemia and hyperglycemia are common
- Monitor weight daily; notify prescriber if weekly gain of >5 lb since these products alter fluid and electrolyte balance
- Assess for potassium depletion: paresthesias, fatigue, nausea, vomiting, depression, polyuria, dysrhythmias, weakness
- Assess for mental status: affect, mood, behavioral changes, aggression; if severe personality changes occur, including depression, product may need to be tapered and then discontinued
- Monitor I&O ratio; be alert for decreasing urinary output and increasing edema
- Monitor plasma cortisol levels during long-term therapy (normal level is 138-635 nmol/L when drawn at 8 AM)
- Assess for infection: increased temp, WBC, even after withdrawal of medication; product masks symptoms of infection
- Assess for adrenal insufficiency: nausea, anorexia, fatigue, dizziness, dyspnea, weakness, joint pain

### Patient/family education

- Advise patient that emergency ID as steroid user should be carried/worn
- Advise patient not to discontinue this medication abruptly; adrenal crisis can result
- Teach patient all aspects of product use, including cushingoid symptoms
- Instruct patient to take with meals or a snack
- Teach patient to avoid exposure to chickenpox or measles if taking immunosuppressives

### Evaluation

**Positive therapeutic outcome**

- Decreased inflammation

---

### Generic Names

*Glucocorticoids:*
beclomethasone, betamethasone, cortisone, dexamethasone, hydrocortisone, hydrocortisone sodium succinate, methylPREDNISolone, predniSOLONE, predniSONE, triamcinolone

# Diuretics

**ACTION:** Diuretics are divided into subgroups: thiazides and thiazidelike diuretics, loop diuretics, carbonic anhydrase inhibitors, osmotic diuretics, and potassium-sparing diuretics. Each one of these subgroups differs in its mechanism of action. Thiazides and thiazide-like diuretics increase excretion of water and sodium by inhibiting resorption in the early distal tubule. Loop diuretics inhibit resorption of sodium and chloride in the thick ascending limb of the loop of Henle. Carbonic anhydrase inhibitors increase sodium excretion by decreasing sodium-hydrogen ion

exchange throughout the renal tubule. Carbonic anhydrase inhibitors also decrease secretion of aqueous humor in the eye and thus decrease intraocular pressure. Osmotic diuretics increase the osmotic pressure of glomerular filtrate, thus decreasing net absorption of sodium. The potassium-sparing diuretics interfere with sodium resorption at the distal tubule, thus decreasing potassium excretion.

**USES:** Blood pressure is reduced in hypertension; edema is reduced in HF; intraocular pressure is decreased in glaucoma.

## CONTRAINDICATIONS

Persons with electrolyte imbalances (sodium, chloride, potassium), dehydration, or anuria should not be given these products until the problem is corrected.

**Precautions:** Caution must be used when diuretics are given to the geriatric patient, since electrolyte disturbances and dehydration can occur rapidly. Renal/hepatic disorders may cause poor metabolism and excretion of the product.

## IMPLEMENTATION

- Give in AM to avoid interference with sleep if using product as a diuretic
- Give potassium replacement if potassium is less than 3 mg/dl

**ADVERSE EFFECTS:** Hypokalemia, hyperuricemia, and hyperglycemia occur most frequently with thiazide diuretics. Aplastic anemia, blood dyscrasias, volume depletion, and dehydration may occur when thiazide-like diuretics, loop diuretics, or carbonic anhydrase inhibitors are given. Side effects and adverse reactions vary widely for the miscellaneous products.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among the different subgroups of these products.

**INTERACTIONS:** Cholestyramine and colestipol decrease the absorption of thiazide diuretics. Concurrent use of thiazides with diazoxide may increase hyperuricemia, hyperglycemia, and antihypertensive effects of thiazides. Ototoxicity may occur when loop diuretics are used with aminoglycosides. Thiazide and loop diuretics may increase therapeutic and toxic effects of lithium.

## NURSING CONSIDERATIONS

### Assessment

- Monitor weight, I&O ratio daily to determine fluid loss; check skin turgor for dehydration
- Monitor electrolytes: potassium, sodium, chloride: include BUN, blood glucose, CBC, serum creatinine, blood pH, ABGs, uric acid, calcium; electrolyte imbalances may occur quickly
- Monitor B/P with patient lying, standing; postural hypotension may occur since fluid loss occurs from intravascular spaces first
- Assess for signs of metabolic alkalosis, including drowsiness and restlessness
- Assess for signs of hypokalemia with some products: postural hypotension, malaise, fatigue, tachycardia, leg cramps, weakness

### Patient/family education

- Teach patient to take product early in the day (diuretic) to prevent nocturia

### Evaluation

#### Positive therapeutic outcome

- Improvement in edema of feet, legs, sacral area daily if medication is being used in HF
- Improvement in B/P if medication is being used as a diuretic
- Improvement in intraocular pressure if medication is being used to decrease aqueous humor in the eye

### Generic Names

*Thiazides:*
chlorothiazide, hydrochlorothiazide

*Thiazidelike:*
chlorthalidone, indapamide, metolazone

*Loop:*
bumetanide, furosemide

*Carbonic anhydrase inhibitors:*
acetaZOLAMIDE

*Potassium-sparing:*
aMILoride, spironolactone

*Osmotic:*
mannitol, urea

# Histamine $H_2$ Antagonists

**ACTION:** Histamine $H_2$ antagonists act by inhibiting histamine at $H_2$ receptor site in parietal cells, which inhibits gastric acid secretion.

**USES:** Histamine $H_2$ antagonists are used for short-term treatment of duodenal and gastric ulcers and maintenance therapy for duodenal ulcer and for gastroesophageal reflux disease.

## CONTRAINDICATIONS

Persons with hypersensitivity should not use these products.

**Precautions:** Caution should be used in pregnancy, breastfeeding, children <16 yr,

organic brain syndrome, and renal/hepatic disease.

## IMPLEMENTATION

- Give with meals for prolonged product effect
- Give antacids 1 hr before or 1 hr after cimetidine
- Give **IV** slowly; bradycardia may occur; give over 30 min
- Store diluted sol at room temperature for up to 48 hr

**ADVERSE EFFECTS:** The most serious adverse reactions are agranulocytosis, thrombocytopenia, neutropenia, aplastic anemia, and exfoliative dermatitis. The most common side effects are confusion (not with ranitidine), headache, and diarrhea.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Antacids interfere with absorption of histamine $H_2$ antagonists. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Monitor gastric pH (>5 should be maintained)
- Monitor I&O ratio, BUN, creatinine

### Patient/family education

- Advise patient that gynecomastia, impotence may occur but is reversible
- Caution patient to avoid driving and other hazardous activities until patient is stabilized on this medication
- Caution patient to avoid black pepper, caffeine, alcohol, harsh spices, extremes in temperature of food
- Caution patient to avoid OTC preparations: aspirin, cough, cold preparations
- Inform patient that product must be continued for prescribed time to be effective
- Advise patient to report bruising, fatigue, malaise; blood dyscrasias may occur

### Evaluation

**Positive therapeutic outcome**

- Decreased pain in abdomen

---

**Generic Names**
cimetidine, famotidine, ranitidine

# Immunosuppressants

**ACTION:** Immunosuppressants produce immunosuppression by inhibiting T lymphocytes.

**USES:** Most immunosuppressants are used for organ transplants to prevent rejection.

## CONTRAINDICATIONS

Products are contraindicated in hypersensitivity.

**Precautions:** Caution should be used in pregnancy and severe renal/hepatic disease.

## IMPLEMENTATION

- Give for several days before transplant surgery
- Give with meals for GI upset or place product in chocolate milk
- Give with oral antifungal for *Candida* infections

**ADVERSE EFFECTS:** The most serious adverse reactions are albuminuria, hematuria, proteinuria, renal failure, and hepatotoxicity. The most common side effects are oral *Candida* infection, gum hyperplasia, tremors, and headache. The most serious adverse reactions for azaTHIOprine are hematologic (leukopenia and thrombocytopenia) and GI (nausea and vomiting). There is a risk of secondary infection.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Monitor renal function tests: BUN, creatinine at least monthly during treatment, 3 mo after treatment
- Monitor hepatic function tests: alkaline phosphatase, AST, ALT, bilirubin
- Monitor product blood levels during treatment
- Assess for hepatotoxicity: dark urine, jaundice, itching, light-colored stools; product should be discontinued

### Patient/family education

- Advise patient to report fever, chills, sore throat, fatigue since serious infections may occur
- Caution patient to use contraceptive measures during treatment and for 12 wk after ending therapy

### Evaluation

**Positive therapeutic outcome**

- Absence of rejection

### Generic Names

azaTHIOprine, **basiliximab** (high alert), cycloSPORINE, everolimus, muromonab-CD3, secukinumab, sirolimus, tacrolimus, vedolizumab

## Laxatives

**ACTION:** Laxatives are divided into bulk products, lubricants, osmotics, saline laxative stimulants, and stool softeners. Bulks work by absorbing water and expanding to increase moisture content and bulk in the stool. Lubricants increase water retention in the stool, causing reabsorption of water in the bowel. Saline draws water into the intestinal lumen. Osmotics increase distention and promote peristalsis. Stimulants act by increasing peristalsis by direct effect on the intestine. Stool softeners reduce surface tension of liquid in the bowel.

**USES:** Laxatives are used as a preparation for bowel or rectal examination, for constipation, or as stool softeners.

### CONTRAINDICATIONS

Persons with GI obstruction, perforation, gastric retention, toxic colitis, megacolon, abdominal pain, nausea, vomiting, and fecal impaction should not use these products.

**Precautions:** Caution should be used in rectal bleeding, large hemorrhoids, and anal excoriation.

### IMPLEMENTATION

- Give alone only with water for better absorption; do not take within 1 hr of antacids, milk, or cimetidine
- Swallow tab whole; do not break, crush, or chew

**ADVERSE EFFECTS:** The most common side effects are nausea, abdominal cramps, and diarrhea.

**PHARMACOKINETICS:** Onset, peak, and duration vary among products.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

### NURSING CONSIDERATIONS

#### Assessment

- Monitor blood, urine electrolytes if product is used often by patient
- Monitor I&O ratio to identify fluid loss
- Determine cause of constipation; identify whether fluids, bulk, or exercise is missing from lifestyle
- Assess for cramping, rectal bleeding, nausea, vomiting; if these symptoms occur, product should be discontinued

#### Patient/family education

- Caution patient not to use laxatives for long-term therapy; bowel tone will be lost; that normal bowel movements do not always occur daily
- Caution patient not to use in presence of abdominal pain, nausea, vomiting
- Advise patient to notify prescriber of abdominal pain, nausea, vomiting
- Advise patient to notify prescriber if constipation is unrelieved or if symptoms of electrolyte imbalance occur: muscle cramps, pain, weakness, dizziness

#### Evaluation

**Positive therapeutic outcome**

- Decrease in constipation

### Generic Names

*Bulk laxative:*
psyllium

*Osmotic agent:*
lactulose

*Saline laxatives:*
magnesium salts, sodium biphosphate/sodium phosphate

*Stimulants:*
bisacodyl, senna

*Stool softener:*
docusate

## Neuromuscular Blocking Agents

**ACTION:** Neuromuscular blocking agents are divided into depolarizing and nondepolarizing blockers. They act by inhibiting transmission of nerve impulses by binding with cholinergic receptor sites.

**USES:** Neuromuscular blocking agents are used to facilitate endotracheal intubation and skeletal muscle relaxation during mechanical ventilation, surgery, or general anesthesia.

### CONTRAINDICATIONS

Persons who are hypersensitive should not be given this product.

**Precautions:** Caution should be used in pregnancy, breastfeeding, children <2 yr, thyroid disease, collagen disease, cardiac disease, electrolyte imbalances, dehydration, neuromuscular

disease (myasthenia gravis), and respiratory disease.

### IMPLEMENTATION

- Administer using nerve stimulator by anesthesiologist to determine neuromuscular blockade
- Administer anticholinesterase to reverse neuromuscular blockade
- Give **IV** undiluted over 1-2 min (only by qualified person, usually an anesthesiologist)
- Store in light-resistant, cool area
- Reassure patient if communication is difficult during recovery from neuromuscular blockade

**ADVERSE EFFECTS:** The most serious adverse reactions are prolonged apnea, bronchospasm, cyanosis, respiratory depression, and malignant hyperthermia. The most common side effects are bradycardia and decreased motility.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Aminoglycosides potentiate neuromuscular blockade. Check individual monographs for specific information.

### NURSING CONSIDERATIONS

#### Assessment

- Monitor for electrolyte imbalances (potassium, magnesium); may lead to increased action of this product
- Monitor VS (B/P, pulse, respirations, airway) q15min until fully recovered; rate, depth, pattern of respirations, strength of hand grip
- Monitor I&O ratio; check for urinary retention, frequency, hesitancy
- Assess for recovery: decreased paralysis of face, diaphragm, leg, arm, rest of body
- Assess for allergic reactions: rash, fever, respiratory distress, pruritus; product should be discontinued

#### Evaluation

**Positive therapeutic outcome**

- Paralysis of jaw, eyelid, head, neck, rest of body

---

#### Generic Names

**pancuronium** (high alert), **succinylcholine** (high alert), **vecuronium** (high alert)

## Nonsteroidal Antiinflammatories

**ACTION:** Nonsteroidal antiinflammatories decrease prostaglandin synthesis by inhibiting an enzyme needed for biosynthesis.

**USES:** Nonsteroidal antiinflammatories are used to treat mild to moderate pain, osteoarthritis, rheumatoid arthritis, and dysmenorrhea.

### CONTRAINDICATIONS

Persons with hypersensitivity, asthma, or severe renal/hepatic disease should not use these products.

**Precautions:** Caution should be used in pregnancy, breastfeeding, children, geriatric patients, bleeding/GI/cardiac disorders, and hypersensitivity to other antiinflammatory agents.

### IMPLEMENTATION

- Give with food to decrease GI symptoms; however, best to take on empty stomach to facilitate absorption
- Store at room temperature

**ADVERSE EFFECTS:** The most serious adverse reactions are nephrotoxicity (dysuria, hematuria, oliguria, azotemia), blood dyscrasias, and cholestatic hepatitis. The most common side effects are nausea, abdominal pain, anorexia, dizziness, and drowsiness.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

### NURSING CONSIDERATIONS

#### Assessment

- Monitor renal, hepatic, blood tests: BUN, creatinine, AST, ALT, Hgb, before treatment, periodically thereafter
- Monitor audiometric, ophth examination before, during, and after treatment.
- Check for eye, ear problems: blurred vision, tinnitus; may indicate toxicity

#### Patient/family education

- Advise patient to report blurred vision, ringing, roaring in ears; may indicate toxicity
- Caution patient to avoid driving, other hazardous activities if dizziness, drowsiness occurs, especially in geriatric patients
- Advise patient to report change in urine pattern, increased weight, edema, increased pain in

joints, fever, blood in urine; indicate nephrotoxicity
• Inform patient that therapeutic effects may take up to 1 mo to occur

### Evaluation

**Positive therapeutic outcome**
• Decreased pain, stiffness in joints
• Decreased swelling in joints
• Ability to move more easily

---

### Generic Names

celecoxib, diclofenac, etodolac, ibuprofen, indomethacin, ketoprofen, ketorolac, nabumetone, naproxen, piroxicam, sulindac

## Opioid Analgesics

**ACTION:** These agents depress pain impulse transmission at the spinal cord level by interacting with opioid receptors. Products are divided into opiates and nonopiates.

**USES:** Most opioid analgesics are used to control moderate to severe pain and are used before and after surgery.

### CONTRAINDICATIONS

Hypersensitive reactions occur frequently. Check for sensitivity before administering. These products should not be used if opioid addiction is suspected.

**Precautions:** Caution must be used when these products are given to persons with an addictive personality, since the possibility of addiction is so great. Also, persons with increased ICP may experience an even greater increase in ICP. Persons with severe heart disease, renal/hepatic disease, respiratory conditions, and seizure disorders should be monitored closely for worsening condition.

### IMPLEMENTATION

• Give with antiemetic if nausea or vomiting occurs
• Give when pain is beginning to return; determine dosage interval by patient response
• Provide assistance with ambulation; patient should not be ambulating during product peak

**ADVERSE EFFECTS:** GI symptoms, including nausea, vomiting, anorexia, constipation, and cramps are the most common side effects. Other common side effects include lightheadedness, dizziness, and sedation. Serious adverse reactions such as respiratory depression, respiratory arrest, circulatory depression, and increased ICP may result but are less common and usually dose dependent.

**PHARMACOKINETICS:** Onset of action is immediate by **IV** route and rapid by IM and PO routes. Peak occurs from 1-2 hr, depending on route, with a duration of 2-8 hr. These agents cross the placenta and appear in breast milk.

**INTERACTIONS:** Barbiturates, other opioids, hypnotics, antipsychotics, or alcohol can increase CNS depression when taken with opioids.

### NURSING CONSIDERATIONS

#### Assessment

• Monitor I&O ratio; be alert for urinary retention, frequency, dysuria; product should be discontinued if these occur
• Assess for respiratory dysfunction: respiratory depression, rate, rhythm, character; notify prescriber if respirations are <12/min
• Assess for CNS changes: dizziness, drowsiness, hallucinations, euphoria, LOC, pupil reaction
• Assess for allergic reactions: rash, urticaria
• Assess for need for pain medication, use pain scoring

#### Patient/family education

• Advise patient to report any symptoms of CNS changes, allergic reactions, or shortness of breath
• Caution patient that physical dependency may result when used for extended periods
• Teach patient that withdrawal symptoms may occur, including nausea, vomiting, cramps, fever, faintness, anorexia
• Advise patient to avoid alcohol and other CNS depressants

#### Evaluation

**Positive therapeutic outcome**
• Decrease in pain

---

### Generic Names

buprenorphine, butorphanol, codeine, **fentaNYL** (high alert), fentaNYL transdermal, **HYDROmorphone** (high alert), **meperidine** (high alert), **methadone** (high alert), **morphine** (high alert), nalbuphine, **oxyCODONE** (high alert), **oxymorphone** (high alert), **pentazocine** (high alert), **remifentanil** (high alert)

## Salicylates

**ACTION:** Salicylates have analgesic, antipyretic, and antiinflammatory effects. The analgesic and antiinflammatory activities may be mediated through the inhibition of prostaglandin

synthesis. Antipyretic action results from inhibition of the hypothalamic heat-regulating center.

**USES:** The primary uses of salicylates are relief of mild to moderate pain and fever and in inflammatory conditions such as arthritis, thromboembolic disorders, and rheumatic fever.

## CONTRAINDICATIONS

Hypersensitivity to salicylates is common. Check for sensitivity before administering. Persons with bleeding disorders, GI bleeding, and vit K deficiency should not use these products since salicylates increase pro-time. Children should not use these products since salicylates have been associated with Reye's syndrome.

**Precautions:** Caution is needed when salicylates are given to patients with anemia, renal/hepatic disease, and Hodgkin's disease. Caution should also be exercised in pregnancy and breastfeeding.

## IMPLEMENTATION

- Give with food or milk to decrease gastric irritation; give 30 min before or 1 hr after meals with a full glass of water

**ADVERSE EFFECTS:** The most common side effects are GI symptoms and rash. Serious blood dyscrasias and hepatotoxicity may result when used for long periods at high doses. Tinnitus or impaired hearing may indicate that blood salicylate levels are reaching or exceeding the upper limit of the therapeutic range.

**PHARMACOKINETICS:** Onset of action occurs in 15-30 min, with a peak of 1-2 hr and a duration up to 6 hr. These products are metabolized by the liver and excreted by the kidneys.

**INTERACTIONS:** Increased effects of anticoagulants, insulin, methotrexate, heparin, valproic acid, and oral sulfonylureas may occur when used with salicylates. Aspirin may decrease serum concentrations of nonsteroidal antiinflammatory agents.

## NURSING CONSIDERATIONS

### Assessment

- Monitor renal/hepatic function tests: AST, ALT, bilirubin, creatinine, LDH, alkaline phosphatase, BUN if patient is on long-term therapy since these products are metabolized and excreted by the liver and kidney
- Monitor blood tests: CBC, Hct, Hgb, and pro-time if patient is on long-term therapy, since these products increase the possibility of bleeding and blood dyscrasias
- Assess for hepatotoxicity: dark urine, clay-colored stools, jaundiced skin and sclera, itching, abdominal pain, fever, diarrhea, which may occur with long-term use
- Assess for ototoxicity: tinnitus, ringing, roaring in ears; audiometric testing is needed before and after long-term therapy

### Patient/family education

- Advise patient that blood sugar levels should be monitored closely if patient is diabetic
- Caution patient not to exceed recommended dosage; acute poisoning may result
- Inform patient that therapeutic response takes 2 wk in arthritis
- Caution patient to avoid use of alcohol since GI bleeding may result
- Advise patient to notify prescriber if ringing in the ears or persistent GI pain occurs
- Advise patient to take with full glass of water to reduce risk of lodging in esophagus

### Evaluation

**Positive therapeutic outcome**

- Decreased pain, fever

---

### Generic Names

aspirin, magnesium salicylate, salsalate

# Sedatives/Hypnotics

**ACTION:** The sedatives/hypnotics depress the CNS; some products at the cerebral cortex, others inhibit transmitters in the CNS.

**USES:** Sedatives/hypnotics are used for the treatment of sleep disorders, seizures, muscle spasms, and alcohol withdrawal.

## CONTRAINDICATIONS

Persons with hypersensitivity reactions should not use these products.

**Precautions:** Sedatives/hypnotics should be used cautiously in pregnancy and breastfeeding.

## IMPLEMENTATION

- Give lowest possible dose for therapeutic result; adjust dose to response
- Provide assistance with ambulation during beginning therapy if dizziness, ataxia occur

**ADVERSE EFFECTS:** The most common side effects are nausea and drowsiness. The most serious side effects are Stevens-Johnson syndrome, blood dyscrasias, and risk of dependency.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted by the kidneys.

**INTERACTIONS:** Increased CNS depression may occur with other CNS depressants such as alcohol, opiates, antipsychotics, and antidepressants.

## NURSING CONSIDERATIONS

### Assessment

- Monitor mental status: affect, mood, behavioral changes, depression, confusion; seizure activity

### Patient/family education

- Inform patient that these products should only be used for short-term insomnia
- Caution patient not to drive or engage in other hazardous activities while taking these products
- Instruct patient to avoid breastfeeding while taking these products
- Instruct patient to avoid alcohol or other CNS depressants as drowsiness will increase
- Teach patient that some of the products take two nights to be effective
- Advise patient to report side effects, adverse reactions to health care provider
- Instruct patient to use exactly as prescribed, at regular intervals

### Evaluation

**Positive therapeutic outcome**

- Ability to sleep throughout the night
- Absence or decreasing seizure activity

### Generic Names

*Barbiturates:*
**PHENobarbital** (high alert)

*Benzodiazepines:*
chlordiazePOXIDE, clorazepate, diazepam, flurazepam, LORazepam, midazolam, oxazepam, temazepam, triazolam

*Miscellaneous products:*
chloral hydrate, dexmedetomidine, **droperidol** (high alert), eszopiclone, hydrOXYzine, promethazine, ramelteon, suvorexant, tasimelton, zaleplon, zolpidem

# Skeletal Muscle Relaxants

**ACTION:** Most skeletal muscle relaxants inhibit synaptic responses in the CNS by stimulating receptors and decreasing neurotransmission, decreasing pain and spasticity.

**USES:** Skeletal muscle relaxants are used for musculoskeletal disorders with pain or spasticity related to spinal cord injuries.

## CONTRAINDICATIONS

Persons with hypersensitivity should not use these products.

**Precautions:** Skeletal muscle relaxants should be used cautiously in pregnancy, breastfeeding, the geriatric patient, peptic ulcer, renal/hepatic disease, stroke, seizure disorder, and diabetes.

## IMPLEMENTATION

- Give when pain is beginning to return, not after pain is severe
- Store in dry area, away from heat and sunlight

**ADVERSE EFFECTS:** The most common side effects are dizziness, weakness, fatigue, drowsiness, and headache. Some products can cause seizures, cardiovascular collapse, and severe CNS depression.

**PHARMACOKINETICS:** Pharmacokinetics vary widely among products. Check individual monographs for specific information.

**INTERACTIONS:** CNS depressants used with skeletal muscle relaxants may lead to increased CNS depression.

## NURSING CONSIDERATIONS

### Assessment

- Monitor pain: character, location, duration, alleviating/aggravating factors

### Patient/family education

- Advise patient not to use with other CNS depressant unless prescriber approved
- Inform patient that many products require 1-2 mo of treatment for full effect
- Caution patient to avoid hazardous activities until response to medication is known
- Caution patient that most products should not be discontinued quickly, but tapered over 1-2 wk

### Evaluation

**Positive therapeutic outcome**

- Decrease in pain or spasticity

### Generic Names

*Centrally acting:*
baclofen, carisoprodol, cyclobenzaprine, diazepam, methocarbamol

*Direct-acting:*
dantrolene

# Thrombolytics

**ACTION:** Thrombolytics activate conversion of plasminogen to plasmin (fibrinolysin). Plasmin is able to break down clots (fibrin).

**USES:** Thrombolytics are used to treat DVT, PE, arterial thrombosis, arterial embolism, arteriovenous cannula occlusion, lysis of coronary artery thrombi after MI, and acute evolving transmural MI.

## CONTRAINDICATIONS

Persons with hypersensitivity, active bleeding, intraspinal surgery, neoplasms of the CNS, ulcerative colitis/enteritis, severe hypertension, renal/hepatic disease, hypocoagulation, COPD, subacute bacterial endocarditis, rheumatic valvular disease, cerebral embolism/thrombosis/hemorrhage, intra-arterial diagnostic procedure or surgery (10 days), and recent major surgery should not use these products.

**Precautions:** Caution should be used in arterial emboli from left side of heart and pregnancy.

## IMPLEMENTATION

- Administer as soon as thrombi identified; not useful for thrombi over 1wk old
- Administer cryoprecipitate or fresh, frozen plasma if bleeding occurs
- Give loading dose at beginning of therapy; may require increased loading doses
- Give heparin after fibrinogen level is over 100 mg/dl; heparin INF to increase PTT to 1.5-2 × baseline for 3-7 days
- About 10% of patients have high streptococcal antibody titers requiring increased loading doses
- Give **IV** therapy using 0.8-μm filter
- Store reconstituted sol in refrigerator; discard after 24 hr
- Provide bed rest during entire course of treatment

**ADVERSE EFFECTS:** Serious adverse reactions include GI, GU, intracranial, and retroperitoneal bleeding and anaphylaxis. The most common side effects are decreased Hct, urticaria, headache, and nausea.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Monitor VS, B/P, pulse, respirations, neurologic signs, temp at least q4hr (increased temp is an indicator of internal bleeding), cardiac rhythm following intracoronary administration; systolic pressure increase of >25 mm Hg should be reported to prescriber
- Assess for neurologic changes that may indicate intracranial bleeding
- Assess retroperitoneal bleeding: back pain, leg weakness, diminished pulses
- Assess for allergy: fever, rash, itching, chills; mild reaction may be treated with antihistamines
- Assess for bleeding during 1st hr of treatment: hematuria, hematemesis, bleeding from mucous membranes, epistaxis, ecchymosis
- Monitor blood tests (Hct, platelets, PTT, PT, TT, APTT) before starting therapy; PT or APTT must be less than 2 times control before starting therapy; TT or PT q3-4hr during treatment

### Patient/family education

- Teach patient to avoid venous or arterial puncture, injection, rectal temp
- Teach patient to treat fever with acetaminophen or aspirin
- Teach patient to apply pressure for 30 sec to minor bleeding sites; inform prescriber if this does not attain hemostasis; apply pressure dressing

### Evaluation

**Positive therapeutic outcome**

- Resolution of thrombosis, embolism

---

### Generic Names

**alteplase** (high alert), drotrecogin alfa, **tenecteplase** (high alert), **urokinase** (high alert)

# Thyroid Hormones

**ACTION:** Thyroid hormones increase metabolic rates, resulting in increased cardiac output, $O_2$ consumption, body temp, blood volume, growth, development at cellular level, respiratory rate, and enzyme system activity.

**USES:** Thyroid hormones are used for thyroid replacement.

## CONTRAINDICATIONS

Persons with adrenal insufficiency, myocardial infarction, or thyrotoxicosis should not use these products.

**Precautions:** Caution should be used in pregnancy and breastfeeding. Geriatric patients and those with angina pectoris, hypertension, ischemia, cardiac disease, or diabetes mellitus or insipidus should be watched closely when using these products.

## IMPLEMENTATION

- Give at same time each day to maintain product level
- Give only for hormone imbalances; not to be used for obesity, male infertility, menstrual conditions, lethargy
- Remove medication 4 wk before RAIU test

**ADVERSE EFFECTS:** The most common side effects include insomnia, tremors, tachycardia, palpitations, angina, dysrhythmias, weight loss, and changes in appetite. Serious adverse reactions include thyroid storm.

**PHARMACOKINETICS:** Pharmacokinetics vary widely among products. Check individual monographs for specific information.

## INTERACTIONS

- Impaired absorption of thyroid products may occur when administered with cholestyramine, iron products (separate by 4-5 hr).
- Increased effects of anticoagulants, sympathomimetics, tricyclics, catecholamines may occur.
- Decreased effects of digoxin, glycosides, insulin, hypoglycemics may occur.
- Decreased effects of thyroid products may occur with estrogens.

## NURSING CONSIDERATIONS

### Assessment

- Monitor B/P, pulse before each dose
- Monitor I&O ratio
- Monitor weight daily in same clothing, using same scale, at same time of day
- Monitor height, growth rate if given to a child
- Monitor $T_3$, $T_4$, which are decreased; radioimmunoassay of TSH, which is increased; ratio uptake, which is decreased if patient is on too low a dosage of medication
- Assess for increased nervousness, excitability, irritability; may indicate too high a dosage of medication, usually after 1-3 wk of treatment
- Assess for cardiac status: angina, palpitation, chest pain, change in VS

### Patient/family education

- Advise patient/family that hair loss will occur in children and is temporary
- Advise patient to report excitability, irritability, anxiety; indicates overdose
- Caution patient not to switch brands unless directed by prescriber
- Caution family that hypothyroid children will show almost immediate behavior/personality change
- Advise patient that treatment product is not to be taken to reduce weight
- Advise patient to avoid OTC preparations with iodine; read labels; to avoid iodine-containing foods: iodized salt, soybeans, tofu, turnips, some seafood, some bread

### Evaluation

#### Positive therapeutic outcome

- Absence of depression
- Increased weight loss, diuresis, pulse, appetite
- Absence of constipation, peripheral edema, cold intolerance, pale, cool, dry skin, brittle nails, alopecia, coarse hair, menorrhagia, night blindness, paresthesias, syncope, stupor, coma, rosy cheeks

### Generic Names

levothyroxine, liothyronine ($T_3$), liotrix, thyroid USP

# Vasodilators

**ACTION:** Vasodilators act in various ways. Check individual monographs for specific action.

**USES:** Vasodilators are used to treat intermittent claudication, arteriosclerosis obliterans, vasospasm and muscular ischemia, ischemic cerebral vascular disease, hypertension, and angina.

## CONTRAINDICATIONS

Some products are contraindicated in acute MI, paroxysmal tachycardia, and thyrotoxicosis.

**Precautions:** Caution should be used in uncompensated heart disease or peptic ulcer disease.

## IMPLEMENTATION

- Give with meals to reduce GI symptoms
- Store in tight container at room temperature

**ADVERSE EFFECTS:** The most common side effects are headache, nausea, hypotension, hypertension, and ECG changes.

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Most products are metabolized in the liver and excreted in urine.

**INTERACTIONS:** Interactions vary widely among products. Check individual monographs for specific information.

## NURSING CONSIDERATIONS

### Assessment

- Assess bleeding time in individuals with bleeding disorders
- Assess cardiac status: B/P, pulse, rate, rhythm, character; watch for increasing pulse

### Patient/family education

- Inform patient that medication is not cure, may need to be taken continuously
- Advise patient that it is necessary to quit smoking to prevent excessive vasoconstriction
- Advise patient that improvement may be sudden, but usually occurs gradually over several weeks

• Instruct patient to report headache, weakness, increased pulse, since product may need to be decreased or discontinued
• Instruct patient to avoid hazardous activities until stabilized on medication; dizziness may occur

### Evaluation

**Positive therapeutic outcome**
• Ability to walk without pain
• Increased temp in extremities
• Increased pulse volume

### Generic Names
amyl nitrite, bosentan, dipyridamole, hydrALAZINE, minoxidil, nesiritide

## Vitamins

**ACTION:** The action of vitamins varies widely among products and classes. Check individual monographs for specific action.

**USES:** Vitamins are used to correct and prevent vitamin deficiencies.

**CONTRAINDICATIONS**
Hypersensitive reactions may occur, and allergies should be identified before these products are given.

**IMPLEMENTATION**
• Give PO with food for better absorption
• Store in tight, light-resistant container

**ADVERSE EFFECTS:** There is an absence of side effects or adverse reactions with the water-soluble vitamins (C, B). However, fat-soluble vitamins (A, D, E, K) may accumulate in the body and cause adverse reactions (refer to individual monographs).

**PHARMACOKINETICS:** Onset, peak, and duration vary widely among products. Check individual monographs for specific information.

**NURSING CONSIDERATIONS**

### Patient/family education
• Advise patient not to take more than prescribed amount

### Evaluation

**Positive therapeutic outcome**
• Absence of vitamin deficiency

### Generic Names
*Fat-soluble:*
phytonadione (vitamin $K_1$), vitamin A, vitamin D, vitamin E

*Water-soluble:*
ascorbic acid (C), cyanocobalamin ($B_{12}$), pyridoxine ($B_6$), riboflavin ($B_2$), thiamine ($B_1$)

*Miscellaneous:*
multivitamins

# Appendix A

## Selected New Drugs

### abaloparatide (Rx)

**Tymlos**

*Func. class.:* Parathyroid hormone analog and modifier

**ACTION:** A synthetic peptide analog of a parathyroid hormone–related protein that acts as an agonist at the PTH receptors. Therapeutic outcome: Increased bone mineral density

**USES:** For the treatment of postmenopausal women with osteoporosis at high risk for fracture

### CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Breastfeeding, children, pregnancy, radiation, hypercalcemia, hypercalciuria, hyperuricemia, hyperparathyroidism, renal disease, orthostatic hypotension

**BLACK BOX WARNING:** Osteogenic sarcoma; cumulative use of abaloparatide or other parathyroid hormone analogs for more than 2 yr during a patient's lifetime is not recommended

### DOSAGE AND ROUTES

**For the treatment of postmenopausal women with osteoporosis at high risk for fracture**

**Adult postmenopausal female:** SUBCUT 80 mcg qday

**Available forms:** Solution for injection 80 mcg (pen)

#### Implementation

**SUBCUT route**

- Visually inspect for particulate matter and discoloration before use
- Do not use IV/IM; needles are not included with the pen. A separate prescription will be needed for the needles. The correct needles to use with the pen are 8-mm, 31-gauge, Clickfine needles, such as ReliOn, Smart Sense, or TopCare brands
- *Storage:* Before the first use, store the pen in the refrigerator (do not freeze). After the first use, store for up to 30 days at room temperature between 68 and 77° F (20 and 25° C); do not freeze or expose it to heat. Keep the cap on when not in use. Do not store with a needle attached. Use the pen only for 30 days. Properly dispose
- Place the capped needle straight onto the pen. A click will be heard when attached
- Pull off the outer pen needle cap from the pen needle and keep it to recap the needle after the injection; pull off the inner pen needle cap and dispose of it
- Prime before the first use, which removes air bubbles
- Turn the dose knob on the pen away from you (clockwise) until it stops. You will see "80" lined up in the dose display window
- Hold the pen with the pen needle pointing up. Tap lightly with your finger on the cartridge holder to move any air bubbles in the cartridge to the top of the cartridge
- Press the green injection button until it will not go any farther. You will see "0" lined up in the dose display window. A drop of liquid should come out of the needle tip. If not, repeat the priming steps
- Set the patient's dose on the pen by turning the dose knob on the pen away from you (clockwise) until the dose knob stops and "80" is lined up in the dose display window
- Choose and clean an injection site in the periumbilical region of the abdomen. Avoid the 2-inch area around the navel. Do not inject into areas where the skin is tender, bruised, red, scaly, or hard. Avoid areas with scars or stretch marks
- Insert the pen needle straight into the patient's skin
- Press the green injection button on the pen until it cannot go any farther and "0" is in the dose display window. Do not move the pen after inserting the needle
- Continue to press the green injection button while counting to 10. Counting to 10 will allow the full dose to be given
- After counting to 10, release the green injection button and slowly remove the pen from the injection site by pulling the pen needle straight out
- Place the outer needle cap back on the pen needle. Press on the outer needle cap until it snaps into place

• Unscrew the used, capped needle from the pen. To unscrew the capped needle, you may need to turn it 8 or more turns and then pull until the capped needle comes off. Properly dispose of the used needle
• Firmly replace the pen cap onto the pen. Keep the pen cap on the pen for storage between injections
• Rotate site daily and give the same time daily
• The first several doses should be given with the patient lying down in case of orthostatic hypotension

## ADVERSE EFFECTS

**CNS:** Dizziness

**META:** Hypercalcemia, hyperuricemia

**INTEG:** Injection site reactions

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding is approximately 70% |
| **Half-life** | 0.7 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset, peak, duration** | Unknown |

## INTERACTIONS

None known

## NURSING CONSIDERATIONS

### Assessment

• Osteoporosis: Assess for before and during treatment
• Blood studies: Monitor serum calcium, uric acid baseline and periodically
• Pregnancy/breastfeeding not indicated for women of reproductive potential

### Patient/family education

• Advise patient not try to inject until they or their caregiver receives training
• Teach patient that they should receive the first several injections where they can sit or lie down until they know how it affects them
• Advise patient to inject 1 time each day into the lower stomach area (abdomen) just under the skin (subcutaneous). Avoid giving the injection within the 2-inch area around the belly button (navel), rotate injection sites daily
• Advise patient to take at same time each day; if they forget or cannot take at the usual time, take it as soon as remembered on that day
• Teach patient not to share pen or pen needles with other people, even if the needle has been changed

### Evaluation

**Positive therapeutic outcome**

• Prevention of fractures in postmenopausal osteoporosis

# abemaciclib

uh-beh′-muh-sy′-klib)

**Verzenio**

*Func. class.:* Antineoplastic

*Chem. class.:* Protein kinase inhibitors

**ACTION:** It is an inhibitor of the cyclin-dependent kinases 4 and 6. It is a protein kinase inhibitor

**USES:** For the treatment of HR-positive, HER2-negative advanced or metastatic breast cancer with disease progression after endocrine therapy and before chemotherapy in the metastatic setting, as monotherapy or in combination with fulvestrant

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Breastfeeding, contraception requirements, hepatic disease, hepatotoxicity, infertility, neutropenia, pregnancy, pregnancy testing, reproductive risk, thromboembolic disease

## DOSAGE AND ROUTES

**For the treatment of HR-positive, HER2-negative advanced or metastatic breast cancer with disease progression after endocrine therapy and before chemotherapy in the metastatic setting, as monotherapy**

**Adult: PO** 200 mg bid until disease progression or unacceptable toxicity.

**For the treatment of HR-positive, HER2-negative advanced or metastatic breast cancer with disease progression after endocrine therapy in combination with fulvestrant**

**Adult: PO** 150 mg bid with fulvestrant (500 mg IM as two 250-mg [5 ml] injections, 1 injection in each buttock, on days 1, 15, 29, and every month thereafter) until disease progression or unacceptable toxicity. Pre- and perimenopausal women should also be treated with a gonadotropin-releasing hormone agonist

**Available forms:** Tabs 50, 100, 150, 200 mg

### Therapeutic drug monitoring

**Dosage adjustments for treatment-related toxicities:**

Interrupt therapy per specific instructions. Restart as appropriate at the following reduced doses: *Starting dose:* **Monotherapy**, 200 mg bid; **combination with fulvestrant**, 150 mg

bid; ***First occurrence:*** Monotherapy, 150 mg bid; **combination with fulvestrant**, 100 mg bid; ***Second occurrence:*** Monotherapy, 100 mg bid; combination with fulvestrant, 50 mg bid; ***Third occurrence:*** Monotherapy, 50 mg bid; combination with fulvestrant, not applicable

**Diarrhea:** ***Grade 1***: Begin antidiarrheals, increase oral fluid intake. No change needed; ***Grade 2, first occurrence:*** Begin antidiarrheals, increase oral fluid intake. If diarrhea does not resolve to grade 1 or less within 24 hr, hold therapy until resolution. No change needed unless grade 2 diarrhea persists; upon resolution to grade 1 or less, resume at the next lower dose level***; Grade 2, recurrent despite maximal supportive measures***: Begin antidiarrheals, increase oral fluid intake. When diarrhea resolves to grade 1 or less, resume at the next lower dose level; ***Grade 3 or 4, or requires hospitalization:*** Begin antidiarrheals, increase oral fluid intake. When diarrhea resolves to less than or equal to grade 1, resume at the next lower dose level

**Hematologic toxicities:** ***Grade 3, first occurrence***: Hold, when the toxicity resolves to grade 2 or less, resume; dose reduction is not needed unless growth factor was needed. If treatment with growth factor is needed, additionally wait for at least 48 hr after the last dose of growth factor before resuming at the next lower dose level; ***Grade 3, recurrent, or grade 4:*** Hold, when the toxicity resolves to grade 2 or less, resume at the next lower dose level If treatment with growth factor is needed, additionally wait for at least 48 hr after the last dose of growth factor before resuming

### Hepatic dose

**Adult:** PO *Child-Pugh A or B:* No change: *Child-Pugh C:* Reduce dosing to once per day; *Grade 1 (AST/ALT 1.1 to 3 times the upper limit of normal [ULN[), without an increase in total bilirubin above 2 times ULN:* No change; *Grade 2, first occurrence (AST/ALT 3.1 to 5 times ULN), without an increase in total bilirubin above 2 times ULN:* No change; if grade 2 persists, hold; after resolution to baseline or grade 1, resume at the next lower dose level; *Grade 2, recurrent (AST/ALT 3.1 to 5 times ULN), without an increase in total bilirubin above 2 times ULN:* Hold. after resolution to baseline or grade 1, resume at the next lower dose level; *Grade 2 or 3 (AST/ALT 3.1 to 20 times ULN) with total bilirubin greater than 2 times ULN, in the absence of cholestasis:* Discontinue*; Grade 4 (AST/ALT greater than 20 times ULN):* Discontinue

**Implementation:** Take with food at the same time every day

- Swallow tablets whole; do not chew, crush, or split. Not to take if broken, cracked
- If a dose is missed, do not replace the missed dose. Resume with the next scheduled daily dose

## ADVERSE EFFECTS

**CNS:** Dizziness, drowsiness, fatigue, fever, headache

**GI:** *Diarrhea, abdominal pain, anorexia, nausea, vomiting, constipation, stomatitis, weight loss, decreased appetite*

**GU:** Renal failure (rare)

**HEMA:** Anemia, leukemia, neutropenia, thrombocytopenia

**INTEG:** *Rash, alopecia*

**MS:** Arthralgia

**MISC:** Infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 96.3% |
| **Metabolism** | Metabolized in the liver by CYP3A4 |
| **Excretion** | Feces |
| **Half-Life:** | 18.3 hr, half-life fecal excretion 97.1% |

### Pharmacodynamics

| | |
|---|---|
| **Onset, Peak, Duration** | Unknown |

## INTERACTIONS

Strong or moderate CYP3A4 inhibitors: Increased abemaciclib effect, avoid concomitant use

Strong or moderate CYP3A4 inducers: Decreased abemaciclib effect, avoid concomitant use

## NURSING CONSIDERATIONS

### Assessment

- **Diarrhea**: Assess for diarrhea, at the first sign of loose stools antidiarrheal therapy should be started, increase oral fluids
- **Neutropenia:** Obtain CBC baseline, then q2wk for the first 2 mo, then monthly for the next 2 mo, and as needed
- **Thromboembolism:** Monitor patients for signs and symptoms of thrombosis and pulmonary embolism and treat as needed; **PE:** Chest pain, worse when breathing deeply or cough, coughing, coughing up blood, dizziness, fainting, tachypnea, rapid heartbeat, irregular

heartbeat, shortness of breath; **thrombosis:** Pain, swelling of the affected extremity/area with erythema and warmth over the vicinity of the clot, discoloration including a bluish or suffused color, positive Homan's sign: pain with dorsiflexion of the foot; pain on palpation, presence of a palpable cord

- **Hepatotoxicity:** Increases in LFTs may occur, monitor LFTs baseline, then q2wk for the first 2 mo, then monthly for the next 2 mo, and as needed
- Infection: May occur, assess for urinary tract infection, lung infection, pharyngitis, conjunctivitis, sinusitis, vaginal infection, sepsis
- **Pregnancy/breastfeeding:** Avoid by females of reproductive potential during treatment and for at least 3 wk after the last dose, can cause fetal harm or death when used during pregnancy; discontinue breastfeeding during treatment and for 3 wk after the final dose. It is not known whether present in breast milk. Obtain a pregnancy test before starting treatment

### Patient/family education

- **Infection:** May occur; teach patient to report urinary pain, hesitancy, increased temperature, fever, shaking, chills, cough, sore throat, sinus pain; report to health care provider
- **Diarrhea**: Teach patient, at the first sign of loose stools to start antidiarrheal therapy, increase fluids, and notify their healthcare provider
- **Thromboembolism:** Teach patient to report immediately chest pain, worse when breathing deeply or cough, coughing, coughing up blood, dizziness, fainting, tachypnea, rapid heartbeat, irregular heartbeat. shortness of breath; pain, swelling of the extremity with redness and warmth discoloration including a bluish color
- **Pregnancy/breastfeeding:** Teach patient product is not to be used in pregnancy, breastfeeding, contraception should be used during and for at 3 wk after last dose

### Evaluation

**Positive therapeutic outcome**

- Decrease in size of cancerous tumor

**RARELY USED**

**⚠ HIGH ALERT**

## acalabrutinib

**Calquence**

*Func. class.:* Antineoplastic

**USES:** For the treatment of mantle cell lymphoma

## DOSAGE AND ROUTES

**For the treatment of mantle cell lymphoma (MCL) in patients who have received at least 1 prior therapy**

**Adult:** PO 100 mg bid (approximately 12 hr apart) until disease progression.

**⚠ HIGH ALERT**

**RARELY USED**

## alectinib

(al-ek'ti-nib)

**Alecensa**

*Func. class.:* Antineoplastics

**USES:** Anaplastic lymphoma kinase (ALK)–positive metastatic non-small cell lung cancer that has progressed or is intolerant to crizotinib

## CONTRAINDICATIONS

Hypersensitivity

## DOSAGE AND ROUTES

**Adult:** PO 600 mg bid, with food, until disease progression or unacceptable toxicity

**⚠ HIGH ALERT**

## avelumab

a-vel'ue-mab)

**Bavencio**

*Func. class.:* Antineoplastic monoclonal antibody

*Chem. class.:* Human IgG1 monoclonal antibody

**ACTION:** A human IgG1 monoclonal antibody that binds to the programmed death ligand found on T cells and blocks the interaction on receptors on the tumor cell

**USES:** For the treatment of Merkel cell carcinoma

## CONTRAINDICATIONS

Pregnancy, hypersensitivity

**Precautions:** Adrenal insufficiency, autoimmune disease, breastfeeding, colitis, Crohn's disease, contraception requirements, diabetes mellitus, diarrhea, hepatic disease, hepatitis, hyperglycemia, infertility, infection, infusion-related reactions, organ transplant, pulmonary disease, pneumonitis, reproductive risk, thyroid disease

## DOSAGE AND ROUTES

### For the treatment of metastatic Merkel cell carcinoma

**Adult, Adolescent, and Child > 12 yr of age:** IV 10 mg/kg IV over 60 min q2wk until disease progression. Give antihistamine (diphenhydramine) and acetaminophen 30 to 60 min before the first 4 infusions; premedication may be administered before subsequent doses as necessary

### For the treatment of locally advanced or metastatic urothelial carcinoma, in patients with disease progression on or after platinum-containing chemotherapy, or within 12 mo of neoadjuvant or adjuvant platinum-containing chemotherapy

**Adult:** IV 10 mg/kg IV over 60 min q2wk until disease progression or unacceptable toxicity. Give antihistamine (diphenhydramine) and acetaminophen 30 to 60 min before the first 4 infusions; premedication may be administered before subsequent doses as necessary

### Management of treatment-related toxicity

**Immune-mediated reactions**

**Colitis:** *Grade 2 or 3 toxicity:* Hold and give corticosteroids (predniSONE 1 to 2 mg/kg/day or equivalent, then taper); resume therapy when the adverse event recovers to grade 1 or less after the corticosteroid taper; permanently discontinue if grade 3 toxicity occurs or recurs. *Grade 4 toxicity:* Permanently discontinue, give corticosteroids (predniSONE 1 to 2 mg/kg/day or equivalent, then taper)

**Endocrinopathies (including hyperglycemia, hypothyroidism, hyperthyroidism, adrenal insufficiency):** *Grade 3 or 4 toxicity:* Hold, give corticosteroids and manage the endocrinopathy with the following: insulin or antihyperglycemics for hyperglycemia, hormone replacement therapy for hypothyroidism; resume, when the adverse event recovers to grade 1 or less after the corticosteroid taper

**Hepatitis:** *Grade 2 toxicity (AST or ALT level of 3 to 5 times the upper limit of normal [ULN] or a total bilirubin level of 1.5 to 3 times the ULN):* Hold, give corticosteroids (predniSONE 1 to 2 mg/kg/day equivalent initially, then taper); resume when the adverse event recovers to grade 1 or less after the corticosteroid taper. *Grade 3 or 4 toxicity (AST or ALT level greater than 5 times the ULN or a total bilirubin level greater than 3 times the ULN):* Permanently discontinue, give corticosteroids (predniSONE 1 to 2 mg/kg/day or equivalent initially, then taper).

**Nephritis:** *Grade 2 or 3 toxicity (serum creatinine [SCr] level of 1.5- to 6-times the ULN):* Hold, give corticosteroids predniSONE 1 to 2 mg/kg/day or equivalent initially, then taper); resume therapy when the adverse event recovers to grade 1 or less after the corticosteroid taper. *Grade 4 toxicity (SCr level greater than 6-times the ULN):* Permanently discontinue, give corticosteroids (predniSONE 1 to 2 mg/kg/day or equivalent initially then taper).

**Pneumonitis:** *Grade 2 toxicity:* Hold, give corticosteroids (predniSONE 1 to 2 mg/kg/day or equivalent initially, then taper); resume when the adverse event recovers to grade 1 or less after the corticosteroid taper; permanently discontinue if grade 2 toxicity occurs or recurs. *Grade 3 or 4 toxicity:* Permanently discontinue, give corticosteroids (predniSONE 1 to 2 mg/kg/day or equivalent initially, then taper).

**Other immune-mediated adverse reactions (including myocarditis, myositis, psoriasis, arthritis, exfoliative dermatitis, erythema multiforme, pemphigoid, hypopituitarism, uveitis, Guillain-Barre syndrome, bullous rash/dermatitis, Stevens-Johnson syndrome/toxic epidermal necrolysis, pancreatitis, rhabdomyolysis, myasthenia gravis, histiocytic necrotizing lymphadenitis, demyelination, vasculitis, hemolytic anemia, hypophysitis, iritis, and encephalitis):** *Grade 2 or 3 toxicity:* Hold, give corticosteroids (predniSONE 1 to 2 mg/kg/day or equivalent initially) and hormone replacement therapy if indicated. When the adverse event recovers to grade 1 or less, begin a corticosteroid taper. Resume if the adverse event remains at grade 1 or less after the corticosteroid taper. Permanently discontinue if grade 3 toxicity occurs recurs, the corticosteroid dose remains at 10 mg/day or greater of predniSONE (or equivalent) for longer than 12 wk, or for persistent grade 2 or 3 immune-mediate adverse reactions lasting 12 wk or longer. *Grade 4 toxicity (excluding endocrinopathies):* Permanently discontinue, give corticosteroids (predniSONE 1 to 2 mg/kg/day or equivalent initially)

**Infusion-related reactions:** *Grade 1 or 2 toxicity:* Temporarily hold or slow the infusion. *Grade 3 or 4 toxicity:* Permanently discontinue. Available forms: Solution for injection 200 mg/10 ml

### Implementation

**IV route**

- Visually inspect for particulate matter and discoloration before use

### Dilution

- Add the required amount/volume of drug to a 250-ml bag of 0.9% sodium chloride injection or 0.45% sodium chloride injection; mix by gentle inversion
- Discard any unused drug left in the vial
- *Storage after dilution:* Store at room temperature (up to 25° C or 77° F) for up to 4 hr or refrigerated (2 to 8° C; 36 to 46° F) for up to 24 hr from the time of dilution. Do not freeze or shake; protect from light. If refrigerated, allow the diluted solution to warm to room temperature before use

### Intermittent IV infusion

- Administer the diluted solution IV over 60 min
- Use a sterile, nonpyrogenic, low-protein-binding, 0.2-micron inline filter
- Do not administer other drugs through the same infusion line
- Follow cytotoxic handling procedures

## ADVERSE EFFECTS

**CNS:** Fatigue, chills, fever, dizziness, headache, flushing

**GI:** Nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia

**HEMA:** Anemia, thrombocytopenia, lymphopenia

**INTEG:** Urticaria

**MS:** Back pain, arthralgia, myalgia

**Pharmacokinetics**

| | |
|---|---|
| **Half-life** | 6.1 days, steady state 4-6 wk |

## INTERACTIONS

None known

## NURSING CONSIDERATIONS

### Assessment

- **Serious infection:** Some may be fatal. Monitor patients for signs and symptoms of infection; hold therapy for grade 3 or higher infection. Serious *Pneumocystis jiroveci* pneumonia (PJP) has occurred; consider PJP prophylaxis in at-risk patients before starting treatment, hold if PJP is suspected. If PJP diagnosis is confirmed, treat the infection until resolution and then resume at the previous dose and give PJP prophylaxis for the duration of therapy
- **Myelosuppression:** Assess for anemia, thrombocytopenia, neutropenia; obtain a CBC at least weekly during treatment
- **Pregnancy/breastfeeding:** Product can cause fetal harm; females of reproductive potential should avoid becoming pregnant while taking this product, do not breastfeed during and for at least 1 mo after the last dose

### Patient/family education

- Teach patient to report adverse reactions immediately, report diarrhea, flu-like symptoms
- Teach patient about reason for treatment, expected results
- **Pregnancy/breastfeeding:** Advise patient to notify provider if pregnancy is planned or suspected, to use effective contraception during treatment and up to 30 days after discontinuing treatment, not to use during pregnancy, breastfeeding, and for at least 1 mo after last dose

### Evaluation

**Positive therapeutic outcome**

Improving blood counts

## axicabtagene ciloleucel

(ax-i-cab'tay-jeen-sye-lo'loo-sel)

**Yescarta**

*Func. class.:* Antineoplastic, cellular immunotherapies

*Chem. class.:* Chimeric antigen receptor (CAR) T-cell therapy

## ACTION:

A chimeric antigen receptor (CAR) T-cell therapy that works by redirecting T cells to target an antigen on B cells in patients with hematologic malignancies.

## USES:

For the treatment of non-Hodgkin's lymphoma (NHL)

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Neurotoxicity, allergic reactions, anemia, neutropenia, thrombocytopenia, secondary malignancy, hypogammaglobulinemia, B-cell aplasia, pregnancy, breastfeeding, hepatitis B, vaccinations, infection

**BLACK BOX WARNING:** Cytokine release syndrome

## DOSAGE AND ROUTES

**For the treatment of relapsed or refractory large B-cell lymphoma (diffuse large B-cell lymphoma [DLBCL] not otherwise specified, primary mediastinal large B-cell lymphoma, high-grade B-cell lymphoma, and DLBCL arising from follicular lymphoma) after 2 or more lines of systemic therapy**

**Adult:** IV $2 \times 10^6$ CAR-positive viable T cells per kg of body weight (max dose of $2 \times 10^8$ CAR-positive viable T-cells) as a single IV dose

## Therapeutic drug monitoring

### Management of treatment-related toxicity

**Cytokine release syndrome (CRS) (without concurrent neurologic toxicity):** For ≥ grade 2 toxicity, give tocilizumab 8 mg/kg IV over 1 hr (max 800 mg); repeat tocilizumab 8 mg/kg IV q8hr as needed if IV fluids or supplemental oxygen is not effective. Max 3 doses/24 hr, or max 4 doses. ***Grade 2 toxicity (oxygen requirement <40% $FiO_2$, hypotension responsive to fluids or a low dose of 1 vasopressor agent, or grade 2 organ toxicity):*** No improvement within 24 hr after starting tocilizumab, start methylprednisolone 1 mg/kg IV bid or dexamethasone 10 mg IV q6hr, continue corticosteroids until the toxicity resolves to ≤ grade 1, then taper over 3 days. ***Grade 3 toxicity (oxygen requirement of ≥ 40% FiO2, hypotension requiring high-dose or multiple vasopressor agents, grade 3 organ toxicity, or grade 4 transaminitis):*** Start methylprednisolone 1 mg/kg IV bid or dexamethasone 10 mg IV q6hr; continue corticosteroids until the toxicity resolves to ≤ grade 1, then taper over 3 days. ***Grade 4 toxicity (i.e., requirements for ventilator support, continuous venovenous hemodialysis [CVVHD], or grade 4 organ toxicity (excluding transaminitis):*** Give methylprednisolone 1000 mg IV/day for 3 days. If the condition improves, begin methylprednisolone 1 mg/kg IV bid or dexamethasone 10 mg IV q6hr. Continue corticosteroids until the toxicity resolves to ≤ grade 1, then taper over 3 days

**Neurologic toxicity (without concurrent CRS):** Consider seizure prophylaxis with a nonsedating antiseizure medication. ***Grade 2 toxicity:*** Start dexamethasone 10 mg IV q6hr until the toxicity resolves to ≤ grade 1, then taper over 3 days. ***Grade 3 toxicity:*** Start dexamethasone 10 mg IV q6hr until the toxicity resolves to ≤ grade 1, then taper over 3 days. ***Grade 4 toxicity:*** Give methylprednisolone 1000 mg IV daily for 3 days. If condition improves, begin dexamethasone 10 mg IV q6hr. Continue corticosteroids until the toxicity resolves to ≤ grade 1, then taper over 3 days.

**Neurologic toxicity with concurrent CRS:** May use seizure prophylaxis with a nonsedating antiseizure medication. For grade 2 or higher CRS, give tocilizumab 8 mg/kg IV over 1 hr (max dose, 800 mg); may repeat tocilizumab 8 mg/kg IV q8hr as needed, max 3 doses/24 hr or max 4 doses. ***Grade 2 neurotoxicity:*** If no improvement in 24 hr after starting tocilizumab, start dexamethasone 10 mg IV q6hr (if not already taking other corticosteroids); continue corticosteroids until the toxicity resolves to ≤ 1, then taper over 3 days. ***Grade 3 neurotoxicity:*** Give dexamethasone 10 mg IV q6hr; start with the first dose of tocilizumab. Continue corticosteroids until the toxicity resolves to ≤ grade 1, then taper over 3 days. ***Grade 4 neurotoxicity:*** Give methylprednisolone 1000 mg IV daily for 3 days; start with the first dose of tocilizumab. If the condition improves, start dexamethasone 10 mg IV q6hr. Continue corticosteroids until the toxicity resolves to ≤ grade 1, then taper over 3 days.

## Implementation

### IV route

- Premedicate patients with acetaminophen 650 mg and diphenhydramine 12.5 mg IV or PO 1 hr before use
- Confirm that tocilizumab is available at the facility before the infusion
- Visually inspect the infusion bag for any breaks or cracks before thawing. Do not infuse if the bag is compromised; follow local guidelines or call Kite Pharma at 844-454-5483
- For autologous and IV use
- Each dose contains a max of $2 \times 10^8$ CAR-positive viable T cells suspended in a single patient-specific infusion bag; the total infusion bag volume is about 68 ml
- Ensure tocilizumab and emergency equipment are available before use
- Coordinate the timing of the product's thaw and infusion; confirm the infusion time in advance, and adjust the start time for thaw so that the patient will be ready
- Premedicate with acetaminophen and diphenhydramine approximately 1 hr before the infusion; avoid corticosteroid use except in the case of a life-threatening emergency

## Preparation

- Match the patient's identity with the patient identifiers on the cassette; do not remove the product bag from the cassette if the patient-specific label does not match the intended recipient
- Remove the product bag from the cassette; verify that the patient information on the cassette label matches the bag label
- Put the infusion bag inside a second, sterile bag to protect against leaks and port contamination
- Thaw the infusion bag at 37° Celsius (C) using a water bath or dry thaw method; once there is no visible ice, gently mix the contents of the bag

• If visible cell clumps remain, continue to gently mix; small clumps should disperse
• Do not wash, spin down, and/or resuspend in new media before use
• ***Storage***: After thawing, may store at room temperature (20 to 25° C) ≤ 3 hr

**Intravenous (IV) infusion**

• Confirm the patient's identity with the patient identifiers on the infusion bag
• Prime the tubing with normal saline before use; do not use a leukocyte-depleting filter
  • Give as an IV infusion within 30 min via gravity or a peristaltic pump until the infusion bag is empty
  • Gently agitate during the infusion to prevent cell clumping
  • Rinse the tubing with normal saline at the same infusion rate to ensure all product is given

## ADVERSE EFFECTS

**CNS:** Confusion, chills, delirium, dizziness, drowsiness, fatigue, fever, hallucinations, irritability, malaise, neurotoxicity, paranoia, tremor, weakness

**CV:** Atrial fibrillation/flutter, AV block, bundle branch block, orthostatic hypotension, QT prolongation, sinus tachycardia, supraventricular tachycardia, ventricular tachycardia, hypotension

**GI:** Abdominal pain, nausea, vomiting, anorexia, constipation, diarrhea, weight loss

**HEMA:** Anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia, thromboembolism, thrombosis

**META:** Hypokalemia, hyponatremia, hypophosphatemia, hyperuricemia

### Pharmacokinetics

| | |
|---|---|
| **Absorption, distribution, metabolism, excretion** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset, duration** | Unknown |
| **Peak** | 7-14 days |

## INTERACTIONS

None known

## NURSING CONSIDERATIONS

### Assessment

• **Allergic reactions, anaphylaxis:** Premedicate acetaminophen and diphenhydramine before use. Use with caution in those with DMSO, aminoglycoside hypersensitivity
• **Cytopenias (anemia, neutropenia, and thrombocytopenia):** Monitor complete blood counts regularly until recovery
• **Secondary malignancy:** Lifelong monitoring for the development of secondary malignancies is recommended. Report cases of secondary malignancy to Kite at 844-454-5483; instructions will be provided regarding patient sample collection for testing
• **Hypogammaglobulinemia and B-cell aplasia:** Monitor immunoglobulin levels after therapy; provide infection precautions, antibiotic therapy, and immunoglobulin replacement as required
• **Hepatitis B virus (HBV) reactivation:** May cause hepatitis B exacerbation, fulminant hepatitis, hepatic failure, and death; may occur with drugs directed against B cells. Screen all patients for HBV, hepatitis C virus, and HIV before cell collection (leukapheresis)
• **Serious infections (bacterial, fungal, viral):** Some may be life threatening or fatal. Monitor for infection before and after use; antiinfective therapy should be used as needed. Febrile neutropenia has also been reported; it may occur concurrently with cytokine release syndrome, assess for infection and give broad-spectrum antibiotics, fluids as needed
• Patients should avoid cell, organ, tissue, and blood donation
• **Pregnancy/breastfeeding:** Should be avoided, there are not any studies available, pregnancy testing is needed before starting treatment, contraception should be used during treatment, but length of time after treatment concludes is unknown; avoid breastfeeding, excretion is unknown

**BLACK BOX WARNING: Cytokine release syndrome (CRS)** may be fatal or life threatening. Do not use in active infection or inflammatory disorders. Confirm that 2 tocilizumab doses are available before infusion. Observe for CRS qday for ≥ 7 days in a certified facility after the infusion, continue monitoring for ≥ 4 wk after the infusion. Assess for fever, hypoxia, and hypotension. Treat severe or life-threatening CRS with tocilizumab or tocilizumab and corticosteroids. Those with mild symptoms (fever, nausea, fatigue, headache, myalgia, and malaise) may require symptomatic treatment only. Monitor patients with grade 2 or higher CRS (hypotension, not responsive to fluids, or hypoxia requiring supplemental oxygenation) with continuous cardiac telemetry and pulse oximetry. Possible ECG to assess cardiac function. Axicabtagene ciloleucel is available only through a restricted program under a Risk Evaluation and Mitigation Strategy (REMS) called the YESCARTA REMS

• **Severe neurotoxicity** (encephalopathy, seizures, cerebral edema) some fatal, usually occurs within 8 wk. Assess for neurotoxicity daily ≥ 7 days in a certified healthcare facility after infusion and for ≥ 4 wk after the infusion. Monitor those with grade 2 or higher neurotoxicity with continuous cardiac telemetry and pulse oximetry. Nonsedating, antiseizure medicines (levetiracetam) may be required for seizure prophylaxis

### Patient/family education

• Advise patient to avoid driving, operating machinery, or performing other dangerous duties for 8 wk after treatment, mental status changes, seizures may occur or change in consciousness or coordination
• Do not donate blood, organs, tissues
• Teach patient to report fever, fast heartbeat, confusion, inability to speak to healthcare provider
• Advise patient to avoid vaccinations (live virus) during and for 6 wk after treatment

### Evaluation

**Positive therapeutic outcome**
• Prevention of spread of cancer

**⚠ HIGH ALERT**

## betrixaban (Rx)

(be-trix'-a-ban)
**Bevyxxa**
*Func. class.:* Antithrombotic agent
*Chem. class.:* Synthetic, selective factor Xa inhibitor

**ACTION:** Inhibits factor Xa; neutralization of factor Xa interrupts blood coagulation and thrombin formation

**USES:** Prevention/treatment of deep venous thrombosis, PE at-risk, acutely ill, hospitalized medical patients

## CONTRAINDICATIONS

Hypersensitivity, active major bleeding

**Precautions:** Pregnancy, breastfeeding, children, geriatric patients, hepatic disease, renal disease

**BLACK BOX WARNING:** Spinal/epidural anesthesia, lumbar puncture

## DOSAGE AND ROUTES

**For venous thromboembolism prophylaxis (i.e., deep venous thrombosis [DVT] prophylaxis, pulmonary embolism prophylaxis) in at-risk, acutely ill, hospitalized medical patients**

**Adult: PO** 160 mg once, followed by 80 mg qday for 35 to 42 days

### Implementation

• Give capsules with food
• If a dose is not taken at the scheduled time, the dose should be taken as soon as possible on the same day. Do not take a double dose

## ADVERSE EFFECTS

**CNS:** Headache

**GI:** Nausea, constipation, diarrhea

**HEMA:** Bleeding, major bleeding (intracranial, cerebral, retroperitoneal hemorrhage)

**META:** Hypokalemia

**EENT:** Ocular hemorrhage

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 60% |
| **Metabolism** | Affected cytochrome P450 isoenzymes and drug transporters: P-gp, betrixaban is a substrate of P-glycoprotein (P-gp) |
| **Excretion** | 85% of the dose is recovered in the feces and 11% in the urine |
| **Half-life** | 19 to 27 hr |

## INTERACTIONS

### Drug classifications

Salicylates, NSAIDs: Increased bleeding risk

### Individual drugs

Abciximab, eptifibatide, tirofiban, clopidogrel, dipyridamole, quiNIDine, valproic acid: Increased bleeding risk

### Drug/herb

Feverfew, garlic, ginger, ginkgo, ginseng, green tea, horse chestnut, kava: Increased bleeding risk

## NURSING CONSIDERATIONS

### Assessment

**BLACK BOX WARNING:** Monitor patients who have received epidural/spinal anesthesia or lumbar puncture for neurologic impairment, including spinal hematoma; may lead to permanent disability or paralysis

• Assess for bleeding: Gums, petechiae, ecchymosis, black tarry stools, hematuria; decreased Hct, notify prescriber
• Assess for risk of hemorrhage if coadministering with other products that may cause bleeding
• Assess for hypersensitivity: Rash, fever, chills; notify prescriber
• **Beers:** Avoid in older adults; increased risk of bleeding, lower creatinine clearance

### Patient/family education

• Teach patient to use soft-bristle toothbrush to avoid bleeding gums; to use electric razor
• Advise patient to report any signs of bleeding: Gums, under skin, urine, stools
• Advise patient to avoid OTC products containing aspirin, NSAIDs

### Evaluation

**Positive therapeutic outcome**
• Prevention of DVT

## brexpiprazole

(brex-pip'-ra-zole)
**Rexulti**
*Func. class.:* Antipsychotic, atypical

**ACTION:** Although the exact mechanism of action is unknown, may exert its effects through a combination of partial agonist activity at dopaminergic D-2 receptors and serotonergic 5-HT1A receptors and antagonist activity at serotonergic 5-HT2A receptors

**USES:** Adjunctive treatment of major depressive disorder, schizophrenia

## CONTRAINDICATIONS

Hypersensitivity

## DOSAGE AND ROUTES

### For the treatment of schizophrenia

**Adult:** PO Initially, 1 mg qday, on Day 5, increase to 2 mg qday, on Day 8, may increase to 4 mg qday based on response and tolerability. The recommended dose range is 2 to 4 mg/day (max: 4 mg/day)

### For the adjunctive treatment of major depression

**Adult:** PO initially, 0.5 to 1 mg qday, after titration to 1 mg/day, increase to the target dose of 2 mg qday, titrate dosage at weekly intervals based on response and tolerability

### Hepatic dose

**Adult:** PO Mild hepatic impairment: No change, moderate to severe hepatic impairment (Child-Pugh score 7 or more): Max 2 mg qday for major depression and 3 mg qday for schizophrenia

### Renal dose

**Adult:** PO CCr ≥ 60 ml/min: No change; CCr <60 ml/min, including end-stage renal disease (ESRD): Max is 2 mg qday for major depression and 3 mg qday for schizophrenia

**Available forms: Tablet:** 0.25, 0.50, 1, 2, 3, 4 mg

### Implementation

• Initiate treatment at the low end of the dosage range in geriatric adults
• Coadministration of certain drugs may need to be avoided or dosage adjustments may be necessary; review drug interactions. In those who are poor metabolizers (PMs) of CYP2D6 (CYP2D6 PMs), give one half of the usual dose. In those who are CYP2D6 PMs and receiving a moderate or strong CYP3A4 inhibitor, give one quarter of the usual. If the coadministered drug is discontinued, adjust the dose accordingly for those who are CYP2D6 PMs. Periodically reassess for need of continued maintenance therapy
• Without regard to food

## ADVERSE EFFECTS

**CNS:** Akathisia, fatigue, drowsiness, dizziness, tremor, sedation, insomnia, EPS

**EENT:** Blurred vision, dry mouth, nasopharyngitis

**GI:** Constipation, diarrhea, nausea, flatulence, abdominal cramping/pain

**GU:** UTI

**MISC:** Weight gain, myalgia

### Pharmacokinetics

| | |
|---|---|
| **Half-life** | 91 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 4 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Anticholinergics: Increased temperature
Other CNS depressants: Increased CNS depression
Strong CYP2D6 inhibitors, strong CYP3A4 inhibitors: Increased brexpiprazole effect

### Drug/herb

Decrease: Brexpiprazole effect: St. John's wort, may need to increase product dose

### Drug/food

Increase: Brexpiprazole effect: Grapefruit juice, avoiding using together

### Drug/lab test

## NURSING CONSIDERATIONS

### Assessment

• **Hypersensitivity:** Do not use in hypersensitivity, rash, facial swelling, urticaria, and anaphylaxis have been observed; discontinue immediately

**BLACK BOX WARNING: Suicidal ideation:** Provide close supervision and control, patient should receive the smallest quantity consistent with good management in order to reduce the risk of overdose. In those who exhibit changes in symptoms, worsening of depression, suicidality, or other unusual changes in mood or behaviors, a decision should be made to change or discontinue treatment. If discontinuing, the medication should be tapered as rapidly as possible, but with recognition that abrupt discontinuation of the drug can also cause adverse symptoms. Children and young adults < 24 yr are at increased risk

• **Tardive dyskinesia:** Periodic evaluation for movement disorders is recommended (AIMS). If signs and symptoms of tardive dyskinesia appear, discontinuation should be considered

• **Seizure disorder**: Use cautiously in patients with seizures, a history of seizure disorder, or with conditions that potentially lower the seizure threshold. Conditions that lower the seizure threshold may be more prevalent in elderly patients who are 65 yr or older

• **Orthostatic hypotension**: Monitor for dizziness, lightheadedness, and tachycardia and occasionally syncope. These risks are greatest at the beginning of treatment and during dose escalation. May be at increased risk include those with dehydration, hypovolemia, treatment with antihypertensive medications, history of cardiac disease (heart failure, myocardial infarction, coronary artery disease, ischemia, or conduction abnormalities), history of cerebrovascular disease, and those patients who are antipsychotic-naive. Elderly patients may be at higher risk for syncope and cardiovascular and cerebrovascular events. In at-risk patients, consider using a lower starting dosage and slower titration, and monitor orthostatic vital signs, such as heart rate and blood pressure. A fall risk assessment should be completed recurrently in at-risk patients on long-term antipsychotic therapy

• **Hematological disease:** Those with a history of clinically significant low WBC count or drug-induced leukopenia/neutropenia should have frequent complete blood count (CBC) assessments during the first few months of treatment. Discontinuation should be considered if a clinically significant decline in WBC occurs in the absence of an identifiable cause. Patients with clinically significant neutropenia should be closely monitored for fever and infection, and appropriate medical intervention should be instituted if necessary. Discontinue in patients with severe neutropenia (ANC < 1000/mm$^3$)

• **Pregnancy/breastfeeding:** No well-controlled studies, only use when benefits outweigh the fetal risks. Neonates exposed to antipsychotics during the third trimester of pregnancy are at risk for extrapyramidal and/or withdrawal symptoms after delivery. Enroll patient at The National Pregnancy Registry for Psychiatric Medications at https://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry or by phone 866-961-2388. It is not known if antipsychotics, through their effect on prolactin, would affect labor or delivery; consider the benefits of breastfeeding, the risk of potential infant drug exposure, and the risk of an untreated or inadequately treated condition. If a breastfeeding infant experiences an adverse effect related to a maternally ingested drug, healthcare providers are encouraged to report the adverse effect to the FDA

### Patient/family education

• Advise patient to use caution when driving or operating machinery or performing other tasks that require mental alertness until they know how the drug affects them. Patients should also be advised to avoid ethanol ingestion during treatment. Somnolence from antipsychotic use could lead to falls with the potential for fractures and other injuries

### Evaluation

**Positive therapeutic outcome:**

• Decreased depression

**RARELY USED**

**⚠ HIGH ALERT**

## brigatinib

(bri-ga'-ti-nib)

**Alunbrig**

*Func. class.:* Antineoplastic

**USES:** For the treatment of advanced ALK-positive metastatic non-small cell lung cancer that has progressed on or is intolerant to crizotinib

## DOSAGES AND ROUTES

**Adult:** PO 90 mg qday × 7 days, if tolerated during the first 7 days, increase to 180 mg qday. Continue until disease progression or unacceptable toxicity

**⚠ HIGH ALERT**

# brivaracetam

(briv-a-ra'se-tam)

**Briviact**

*Func. class.:* Anticonvulsant

## ACTION

The exact mechanism not known, may occur in modulation of synaptic vesicle proteins, additional anticonvulsant activity may be related to the modulation of voltage-dependent sodium channels

## USES

For the adjunctive treatment of partial seizures

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Abrupt discontinuation, breastfeeding, depression, driving or operating machinery, geriatric, hepatic disease, pregnancy, suicidal ideation

## DOSAGE AND ROUTES

**Adult and Adolescent 16 yr and older:** PO/IV 50 mg bid. Adjust dose to 25 mg bid IV or 100 mg bid based on clinical response; max 100 mg bid. Use IV when PO is temporarily not feasible

**Available forms:** Tabs 10, 25, 50, 75, 100; oral solution 10 mg/ml; solution for injection 50 mg/5 ml (10 mg/ml)

### Implementation

- May be administered without regard to meals
- To discontinue, gradually reduce the dose to minimize the risk for increased seizure frequency and status epilepticus

**Tablets:** Swallow tablets whole; do not crush or chew

**Oral solution:**

- No dilution is necessary
- Measure and administer the oral solution using a calibrated measuring device
- A nasogastric tube or gastrostomy tube may be used for administration
- **Storage:** Discard any unused solution after 5 mo of first opening the bottle

**IV Infusion**

- Visually inspect parenteral products for particulate matter and discoloration before use, do not use if discoloration or particulate matter is present, injection is a clear, colorless solution
- May be given IV without further dilution or may be mixed with a diluent, including 0.9% NaCl Injection, LR injection, or D5 injection
- Infuse over 2 to 15 min
- **Storage:** After dilution, the solution may be stored ≤ 4 hr at room temperature and may be stored in polyvinyl chloride (PVC) bags. Discard any unused injection vial contents, for single dose only

## ADVERSE EFFECTS

**CNS:** *Dizziness, drowsiness,* ataxia, euphoria, fatigue, irritability, depression, emotional lability, hallucinations, psychosis, suicidal ideation

**GI:** Constipation, nausea, vomiting

**HEMA:** Leukopenia

**INTEG:** Angioedema

**RESP:** Bronchospasm

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | unknown |
| **Distribution** | Protein binding 20% |
| **Metabolism** | By hydrolysis to form a hydroxy metabolite metabolized by CYP2C19 |
| **Excretion** | Urine feces <1% |
| **Half-life** | 9 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1 hr without food high-fat meal slows absorption |

## INTERACTIONS

### Drug classifications

Tricyclic antidepressants, antihistamines, benzodiazepines, other CNS depressants: Increased sedation

## INTERACTIONS

### Individual drugs

Carbamazepine: Increased toxicity possible
Sevelamer: Decreased brivaracetam absorption

### Drug/lab test

Increase: LFTs
Decrease: Hct/Hgb, WBC, RBC

## NURSING CONSIDERATIONS

### Assessment

- Seizures: Assess for type, location, duration, character; provide seizure precautions
- Renal studies: Monitor urinalysis, BUN, urine creatinine q3mo
- Blood studies: Monitor CBC, LFTs
- Mental status: Assess mood, sensorium, affect, behavioral changes, suicidal thoughts/behaviors; if mental status changes, notify prescriber
- Provide assistance with ambulation during early part of treatment, dizziness, drowsiness occurs

### Patient/family education

- Teach patient to carry emergency ID stating patient's name, medications taken, condition, prescriber's name, and phone number
- Teach patient how to use oral solution, use calibrated device to measure
- Advise the patient to notify prescriber if pregnancy is planned or suspected
- Advise the patient to avoid driving, other activities requiring alertness until response is known, drowsiness occurs during beginning therapy
- Teach patient not to discontinue quickly after long-term use, withdrawal seizure may occur
- Teach patient not to breastfeed
- Teach patient to report suicidal thoughts/behaviors immediately

### Evaluation

**Positive therapeutic outcome**

- Decreased seizure activity

## brodalumab (Rx)

(broe-dal'-ue-mab)

**Siliq**

*Func. class.:* Immunosuppressive

*Chem. class.:* Recombinant human IgG1 monoclonal antibody

**ACTION:** Human IgG2 monoclonal antibody that binds to interleukin-17 receptor A (IL-17RA) and prevents IL-17 cytokines from activating the receptor

**USES:** For the treatment of moderate to severe plaque psoriasis in those who are candidates for phototherapy or systemic therapy and have failed to respond or have lost response to other systemic therapies

## CONTRAINDICATIONS

Hypersensitivity, Crohn's disease

**Precautions:** Pregnancy, breastfeeding, children, depression, geriatric patients, immunosuppression, infection, suicidal ideation, vaccination

## DOSAGE AND ROUTES

**Adult: SUBCUT** 210 mg at weeks 0, 1, and 2 then 210 mg q2wk. Discontinue if inadequate response after 12 to 16 wk

**Available form:** Prefilled syringe 210 mg/1.5 ml

### Implementation

**SUBCUT route**

- Due to the product's association with suicidal ideation/behavior, this product is only available through a restricted program (SILIQ Risk Evaluation and Mitigation Strategy (REMS) Program). Those prescribing this product must be certified in the SILIQ REMS Program. Patients must sign a Patient-Prescriber Agreement Form. For information, visit the SILIQ REMS website or telephone 855-511-6135
- Remove prefilled syringe from refrigerator and allow to reach room temperature (about 30 min) without removing the needle cap, once brought to room temperature, do not place back into the refrigerator. If needed, the prefilled syringe may be stored at room temperature for up to 14 days. Any prefilled syringe that has been stored at room temperature for more than 14 days MUST be discarded.
- Do not shake the prefilled syringe. DO NOT use the prefilled syringe if it has been dropped on a hard surface. Use a new syringe and call 800-321-4576.
- Visually inspect for particulate matter and discoloration, the solution should be clear to slightly opalescent, colorless to slightly yellow, and may contain a few small translucent particles. Do not use if discolored, cloudy, or foreign particulate matter is present
- Only an individual trained in subcutaneous drug delivery should administer the injection. A patient who is properly trained in injection technique may self-inject using the prefilled syringe or vial, if his or her prescriber deems the action appropriate. However, the first injection needs to be under the supervision of a qualified health care professional
- Use front part of the middle thigh, the gluteal or abdominal region, and the outer area of the upper arm. For injection sites, rotate injection sites. Do not use where skin is tender, bruised, red, hard, thick, scaly, or affected by psoriasis
- Gently pinch the cleaned area of skin and insert the needle at about a 45-degree angle subcutaneously using a quick, dartlike motion. Push the plunger slowly and evenly to deliver the dose, remove the needle, and release the pinched skin. Do not rub the injection site; slight bleeding may occur
- Each single-use prefilled syringe contains 210 mg/1.5 ml of product. Inject the entire 1.5 ml contents of the syringe. No preservatives are present; discard any unused portion
- Protect from light, do not freeze

## ADVERSE EFFECTS

**CNS:** Headache, fatigue, suicidal ideation

**EENT:** Sinusitis

**GI:** Nausea, diarrhea

**MS:** Arthralgia

**INTEG:** Erythema, pruritus

**HEMA:** Bleeding, neutropenia

**MISC:** Infection, injection site reactions, antibody formation, pharyngitis, TB

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 55% |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | Unknown |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 3 days |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

CYP 450 enzymes (carbamazepine, cyclosporine, ethosuximide, fosphenytoin, phenytoin, tacrolimus, theophylline, aminophylline, warfarin). Increased altered effect of each product, monitor if products are initiated or discontinued, dose adjustments may be needed

Do not give concurrently with live virus vaccines; immunizations should be brought up to date before treatment

## NURSING CONSIDERATIONS

### Assessment

- Assess for injection site pain, swelling, redness—use cold compress to relieve pain/swelling give at 45-degree angle using abdomen, thighs; rotate injection sites; discard unused portions
- Infection: Assess for infections (fever, flu-like symptoms, dyspnea, change in urination, redness/swelling around any wounds), stop treatment if present; some serious infections including sepsis may occur, may be fatal; patients with active infections should not be started on this product
- **TB:** Obtain a TB test before starting this product, do not use in active TB, for latent TB, give antituberculosis therapy before use of this product, monitor closely for signs and symptoms of active tuberculosis infection during and after treatment
- Pregnancy/breastfeeding; No data, no data in breastfeeding, excretion unknown
- Suicidal ideation: There is an increased incidence of suicidal ideation and behavior among recipients with a history of suicidality or depression, assess the risks and benefits of treatment when considering use in those with a history of depression or psychosis

### Patient/family education

- Teach patient about self-administration if appropriate: Injection should be made in thigh, abdomen, upper arm; rotate sites at least 1 inch from old site; do not inject in areas that are bruised, red, hard
- Teach patient that if medication is not taken when due, inject next dose as soon as remembered and inject next dose as scheduled
- Teach patient not to take any live virus vaccines during treatment
- Teach patient to report signs of infection (fever, sweats, or chills; muscle aches; weight loss; cough; warm, red, or painful skin or sores on body different from psoriasis; diarrhea or stomach pain; shortness of breath; blood in phlegm (mucus); burning when urinate or urinating more often than normal); allergic reactions (itching, rash)
- Advise patient to tell provider of all prescription, OTC, herbals, and supplements currently taken
- **Suicidal ideation:** Advise patients and caregivers to seek medical attention for suicidal ideation, new-onset or worsening depression, anxiety, or other mood changes

### Evaluation

**Positive therapeutic outcome**

- Decreased in lesions

**RARELY USED**

## C1 esterase inhibitor subcutaneous, human

**Haegarda**

**USES:** For the routine prophylaxis to prevent hereditary angioedema attacks

## DOSAGE AND ROUTES

### For the treatment of acute attacks of hereditary angioedema (HAE)

**Adult and adolescent: ≥ 84 kg IV** Inject 4200 International Units (2 vials) as a slow intravenous injection over approximately 5 min; may give a second dose

**Adult and adolescent: < 84 kg IV** Inject 50 International Units per kg body weight up to 4200 International Units as a slow intravenous injection over approximately 5 min; may give second dose

**For routine angioedema prophylaxis in patients with hereditary angioedema**
**Adult/adolescent: SUBCUT** 60 International Units/kg twice weekly (every 3 or 4 days)

## CONTRAINDICATIONS
Leporine protein hypersensitivity

**RARELY USED**

### cerliponase alfa
**Brineura**
*Func. class.:* Alimentary tract and metabolism agents; lysosomal storage disorder agents

**USES:** For the treatment of late infantile neuronal ceroid lipofuscinosis type 2

## DOSAGE/ROUTES
**For the treatment of patients with late-infantile neuronal ceroid lipofuscinosis type 2 (CLN2) disease, a form of Batten disease**
**Child and adolescent 3 to 17 yr: IV** 300 mg every other wk. Give first at an infusion rate of 2.5 ml/hr, then with the required infusion of intraventricular electrolytes at the same infusion rate of 2.5 ml/hr (complete infusion time is 4.5 hr). Pretreatment with antihistamines with or without antipyretics or corticosteroids is recommended 30 to 60 min before the start of the infusion

**⚠ HIGH ALERT**

**RARELY USED**

### cobimetinib
(koe-bi-me'ti-nib)
**Cotellic**
*Func. class.:* Antineoplastic

**USES:** Orphan drug. For the treatment of unresectable or metastatic melanoma in patients with a BRAF V600E or V600K mutation, in combination with vemurafenib

## CONTRAINDICATIONS
Hypersensitivity

## DOSAGE AND ROUTES
**Adult: PO** 60 mg (three 20-mg tablets) qday × 21 days, in combination with vemurafenib 960 mg bid × 28 days; repeat cycle q28days until disease progression or unacceptable toxicity

**⚠ HIGH ALERT**

### copanlisib
(koh-pan'-lih-sib)
**Aliqopa**
*Func. class.:* Antineoplastic biologic response modifiers
*Chem. class.:* Tyrosine kinase inhibitor

**ACTION:** Inhibits tyrosine kinase created in patients with non-Hodgkin's lymphoma, induces tumor cell death by apoptosis and by inhibiting the proliferation of primary malignant B-cell lines

**USES:** For the treatment of non-Hodgkin's lymphoma (NHL)

## CONTRAINDICATIONS
Pregnancy, hypersensitivity

**Precautions:** Breastfeeding, contraception requirements, children, diabetes mellitus, diarrhea, geriatric patients, hepatic/pulmonary disease, hyperglycemia, hypertension, infertility, male-mediated teratogenicity, neutropenia, pneumonitis, bone marrow suppression, infection, reproductive risk, serious rash, thrombocytopenia

## DOSAGE AND ROUTES
**For the treatment of relapsed follicular lymphoma in patients who have received at least 2 prior systemic therapies**
**Adult: IV** 60 mg over 1 hr on days 1, 8, and 15 repeated q28days until disease progression

### Dosage adjustment for related toxicities
**Infection:**
***Grade 3 or higher toxicity:*** Hold until the infection resolves; ***suspected* Pneumocystis jiroveci *pneumonia (PJP) infection (any grade):*** Hold, if PJP diagnosis is confirmed, treat the infection until resolution and then resume product at the previous dose. PJP prophylaxis is recommended for the duration of therapy
**Hyperglycemia:**
***Predose fasting blood glucose of 160 mg/dl or higher or a random/nonfasting blood glucose of 200 mg/dl or higher:*** Hold until the fasting glucose is 160 mg/dl or less or a random/nonfasting blood glucose is 200 mg/dl or less; ***pre- or postdose blood glucose of 500 mg/dl or higher (first occurrence):*** Hold until fasting glucose is 160 mg/dl or less or a random/nonfasting blood glucose is 200 mg/dl or less; resume product at 45 mg; ***pre- or postdose blood glucose of 500 mg/dl or higher (subsequent occurrences):*** Hold product until fasting glucose is

160 mg/dl or less or a random/nonfasting blood glucose is 200 mg/dl or less; resume at 30 mg. Discontinue if hyperglycemia persists at the 30-mg dose

**Hypertension:**

***Predose systolic B/P of 150 mm Hg or higher or predose diastolic B/P of 90 mm Hg or higher:*** Hold until B/P is less than 150/90 mm Hg based on two consecutive measurements (taken at least 15 min apart); ***post-dose B/P of 150/90 mm Hg or higher (nonlife threatening):*** Continue product at the previous dose if antihypertensive treatment is not required. Consider a dose reduction (from 60 mg to 45 mg or from 45 mg to 30 mg) if antihypertensive treatment is required. Discontinue if hypertension persists despite antihypertensive treatment; ***post-dose B/P (life threatening):*** Discontinue

**Noninfectious pneumonitis;**

***grade 2 toxicity:*** Hold and treat with systemic corticosteroids. Resume at 45 mg when the toxicity recovers to grade 1 or less. Discontinue if grade 2 toxicity recurs; ***grade 3 or higher toxicity:*** Discontinue

**Neutropenia:**

***Absolute neutrophil count (ANC) of 0.5 to 1 $\times$ $10^3$*** cells/$mm^3$: Continue at the previous dose and monitor the ANC at least weekly; ***ANC of less than 0.5 $\times$ $10^3$*** cells/$mm^3$: Hold, monitor the ANC at least weekly until the ANC is $0.5 \times 10^3$ cells/$mm^3$ or greater; resume at the previous dose. Reduce to 45 mg if an ANC of $0.5 \times 10^3$ cells/$mm^3$ or less recurs

**Thrombocytopenia:**

***Platelet count less than 25 $\times$ $10^9$*** cells/L: Hold, resume at a reduced dose (from 60 mg to 45 mg or from 45 mg to 30 mg) if the platelet count recovers to $75 \times 10^9$ cells/L or greater within 21 days. Discontinue if the platelet count does not recover to $75 \times 10^9$ cells/L within 21 days

**Severe cutaneous reactions:**

***Grade 3 toxicity:*** Hold until the toxicity resolves. Resume at a reduced dose (from 60 mg to 45 mg or from 45 mg to 30 mg); ***life-threatening (grade 4) toxicity:*** Discontinue

**Other severe and non-life-threatening toxicities:**

***Grade 3 toxicity:*** Hold until the toxicity resolves, resume at a reduced dose (from 60 mg to 45 mg or from 45 mg to 30 mg); ***grade 4 or life-threatening toxicity***: Discontinue

**Available forms:** Powder for injection 60 mg

## IMPLEMENTATION

**IV route**

- Visually inspect for particulate matter and discoloration before use

**Reconstitution:**

- Add 4.4 ml of sterile 0.9% NaCl injection to the 60-mg lyophilized powder vial (15/ml)
- Gently shake and then allow to stand for 1 min letting the bubbles rise to the surface; repeat if needed, solution will be colorless to slightly yellowish
- Storage of reconstituted vial: If not diluted immediately, store refrigerated at 2 to 8° C (36 to 46° F) for up to 24 hr before use; protect from direct sunlight

**Dilution**

- Into an infusion bag containing 100 ml of sterile 0.9% sodium chloride injection, add the appropriate volume (based on the desired dose) from the reconstituted vial as follows: **60-mg dose:** 4 ml; **45-mg dose:** 3 ml; **30-mg dose:** 2 ml
- Invert the infusion bag to mix
- Discard any unused contents from the reconstituted vial
- *Storage of diluted admixture:* If not used immediately, store refrigerated at 2 to 8° degrees C (36 to 46° F) for up to 24 hr (from vial reconstitution) before use; protect from direct sunlight

### Intermittent IV Infusion

- Allow the diluted admixture in the infusion bag to warm to room temperature (if stored in refrigerator) before use
- Give over 1 hr
- Do not mix or inject product with other drugs or diluents
- Follow cytotoxic handling procedures

## ADVERSE EFFECTS

**CNS:** Fatigue

**GI:** Nausea, vomiting, diarrhea, stomatitis

**HEMA:** *Anemia,* neutropenia, thrombocytopenia, bleeding, lymphopenia

**INTEG:** Rash, exfoliative dermatitis

**ENDO:** Hyperglycemia, hypophosphatemia

**MISC:** Hypertriglyceridemia, hyperuricemia

### Pharmacokinetics

| | |
|---|---|
| **Distribution** | Protein binding 84.2% |
| **Metabolism** | Avoid use with strong CYP3A inhibitors or inducers, this product is a substrate of the P-glycoprotein (P-gp) and breast cancer resistance protein (BCRP) transporters and a multidrug and toxin extrusion member 2 (MATE2)-K inhibitor |

## INTERACTIONS

CYP3A4 inhibitors (ketoconazole, itraconazole, erythromycin, clarithromycin), P-gp inhibitors: Increased copanlisib concentrations

Increased plasma concentrations of simvastatin, calcium channel blockers, ergots

CYP3A4 inducers (dexamethasone, phenytoin, carBAMazepine, rifampin, PHENobarbital), antacids, proton pump inhibitors: Decreased copanlisib concentrations

### Drug/food

Increased copanlisib effect—grapefruit juice; avoid use while taking product

### Drug/herb

Decreased copanlisib concentration—St. John's wort

### Drug/lab test

Increased uric acid, blood glucose, triglycerides

Decreased phosphate

## NURSING CONSIDERATIONS

### Assessment

- **Serious infection:** Some may be fatal. Monitor patient for signs and symptoms of infection; hold therapy for grade 3 or higher infection. Serious *Pneumocystis jiroveci* pneumonia (PJP) has occurred; consider PJP prophylaxis in at-risk patients before starting treatment, hold if PJP is suspected. If PJP diagnosis is confirmed, treat the infection until resolution and then resume at the previous dose and give PJP prophylaxis for the duration of therapy
- **Myelosuppression:** Anemia, thrombocytopenia, neutropenia; obtain a CBC at least weekly during treatment
- **Pregnancy/breastfeeding:** Product can cause fetal harm, females of reproductive potential should avoid becoming pregnant while taking this product; malformations may occur; do not breastfeed during and for at least 1 mo after the last dose; men with female partners of reproductive potential should avoid fathering a child and use effective contraception during and for at least 1 mo after therapy
- **Severe hyperglycemia**: Elevated HbA1c and infusion-related hyperglycemia have occurred; monitor blood glucose levels before and after the infusion, product interruption, dose reduction, or discontinuation may be needed for hyperglycemia. Blood glucose levels typically peak at 5 to 8 hr postinfusion and then decline to baseline levels in most patients. Use with caution in diabetes mellitus. Initiate product after these patients have achieved optimal blood glucose control; monitor blood glucose levels in these patients closely
- **Severe hypertension and infusion-related hypertension:** Use with caution in those with preexisting hypertension; monitor B/P before and after the infusion; optimal B/P control should be achieved before each dose. Therapy interruption, dose reduction, or therapy discontinuation may be necessary in patients who develop hypertension. A mean increase in systolic (+16.8 mm Hg) and diastolic (+7.8 mm Hg) B/P was observed at 2 hr postinfusion on day 1 of cycle 1; B/P may remain elevated for 6-8 hr after the start of the infusion

### Evaluation

**Positive therapeutic outcome**

- Improving blood counts

### Patient/family education

- Teach patient to report adverse reactions immediately, bleeding; report diarrhea, hepatic, hematologic symptoms/toxicity, flulike symptoms
- Teach patient about reason for treatment, expected results
- **Pregnancy/breastfeeding:** Teach patient to notify provider if pregnancy is planned or suspected, to use effective contraception during treatment and up to 30 days after discontinuing treatment, not to use during pregnancy, breastfeeding; men with female partners of reproductive potential should be cautioned to avoid fathering a child and use effective contraception during and for at least 1 mo after therapy

**⚠ HIGH ALERT**

**RARELY USED**

# daratumumab

(dar' a- toom-ue-mab)

**Darzalex**

*Func. class.:* Antineoplastic

**USES:** For the treatment of multiple myeloma in patients who have received at least 3 prior lines of therapy including a proteasome inhibitor (PI) and an immunomodulatory agent or who are double-refractory to a PI and an immunomodulatory agent

## CONTRAINDICATIONS

Hypersensitivity

## DOSAGE AND ROUTES

**Adult: IV** 16 mg/kg (actual body weight) weekly on weeks 1 to 8 (8 doses), 16 mg/kg q other week on weeks 9 to 24 (8 doses), and then 16 mg/kg q4wk starting on week 25 until disease progression.

⚠ HIGH ALERT

RARELY USED

## daunorubicin/cytarabine

(daw-noe-roo'bi-sin sye-tare'a-been)

**Vyxeos**

*Func. class.:* Antineoplastic

**USES:** For the treatment of newly diagnosed therapy-related AML or AML with myelodysplasia-related changes

### DOSAGES AND ROUTES

**Adult: IV** First induction, 44 mg/m$^2$ daunorubicin liposomal and 100 mg/m$^2$ cytarabine liposomal over 90 min on days 1, 3, and 5; patients who do not achieve a response may receive a second induction. Second induction (given 2 to 5 wk after the first induction cycle), 44 mg/m$^2$ daunorubicin liposomal and 100 mg/m$^2$ cytarabine liposomal on days 1 and 3. Consolidation therapy (given 5 to 8 wk after the start of the last induction), 29 mg/m$^2$ daunorubicin liposomal and 65 mg/m$^2$ cytarabine liposomal on days 1 and 3. Patients without disease progression or unacceptable toxicity should receive a second cycle of consolidation therapy given 5 to 8 wk after the start of the previous consolidation

RARELY USED

## delafloxacin

(dela-flox'-a-sin)

**Baxdela**

*Func. class.:* Antiinfective

**USES:** For the treatment of acute bacterial skin and skin structure infections

### DOSAGE AND ROUTES

**Adult: PO** 450 mg q12hr × 5 to 14 days; **IV** 300 mg q12hr × 5 to 14 days

**Available forms:** Tablets and injection

RARELY USED

## deutetrabenazine

**Austedo**

**USES:** For the treatment of chorea associated with Huntington's disease or tardive dyskinesia

### DOSAGE AND ROUTES

**For the treatment of chorea associated with Huntington's disease (Huntington's chorea) or tardive dyskinesia**

**Adult: PO** in treatment-naive patients (patients not switching from tetrabenazine) initially, 6 mg qday, increase at weekly intervals by increments of 6 mg/day to a max of 48 mg/day; in patients switching from tetrabenazine: Discontinue tetrabenazine and start deutetrabenazine the next day. Current tetrabenazine dosage of 12.5 mg/day, initiate deutetrabenazine 6 mg once daily; tetrabenazine 25 mg/day, initiate deutetrabenazine 6 mg twice daily; tetrabenazine 37.5 mg/day, initiate deutetrabenazine 9 mg twice daily; tetrabenazine 50 mg/day, initiate deutetrabenazine 12 mg twice daily; tetrabenazine 62.5 mg/day, initiate deutetrabenazine 15 mg twice daily; tetrabenazine 75 mg/day, initiate deutetrabenazine 18 mg twice daily; tetrabenazine 87.5 mg/day, initiate deutetrabenazine 21 mg twice daily; tetrabenazine 100 mg/day, initiate deutetrabenazine 24 mg twice daily

### CONTRAINDICATIONS

Hypersensitivity, hepatic disease, MAOIs

**BLACK BOX WARNING:** Suicidal ideation

RARELY USED

## dolutegravir/rilpivirine

(doe-loo-teg'- ra- vir/ril-pi-vir'-een)

**Juluca**

*Func. class.:* Antiviral

**USES:** For the treatment of HIV-1 infection in adults

### DOSAGES AND ROUTES

**For the treatment of HIV infection in adults who are virologically suppressed (HIV-1 RNA <50 copies per ml) on a stable antiretroviral regimen for at least 6 mo with no history of treatment failure and no known substitutions associated with resistance to the individual components with concurrent rifabutin**

**Adult: PO** 1 tab (dolutegravir 50 mg; rilpivirine 25 mg) plus an additional 25 mg tablet of rilpivirine (total daily rilpivirine dose of 50 mg) qday with a meal. When rifabutin coadministration is stopped, reduce rilpivirine dose to 25 mg qday with a meal

**For the treatment of human immunodeficiency virus (HIV) infection without concurrent rifabutin**
**Adult: PO** 1 tab (dolutegravir 50 mg; rilpivirine 25 mg) qday with a meal

## RARELY USED

### dupilumab
(doo-pil′-ue-mab)
**Dupixent**
*Func. class.:* Dermatologicals

**USES:** For the treatment of moderate-to-severe atopic dermatitis in patients whose disease is not adequately controlled with topical therapies or when those therapies are not advised

## DOSAGE AND ROUTES
**Adult: SUBCUT** 600 mg initially (administered as two 300-mg injections), then 300 mg every other week

## ⚠ HIGH ALERT

### durvalumab
(dur-val′-yoo-mab)
**Imfinzi**
*Func. class.:* Antineoplastic monoclonal antibodies

**ACTION:** A human IgG1 kappa (IgG1k) monoclonal antibody, produced in Chinese hamster ovary, inhibits programmed death ligand interactions

**USES:** For the treatment of advanced or metastatic urothelial carcinoma

## CONTRAINDICATIONS
Pregnancy, hypersensitivity

**Precautions:** Adrenal insufficiency, aseptic meningitis, autoimmune disease, breastfeeding, colitis, contraception requirements, Crohn's disease, diabetes mellitus, diarrhea, hemolytic anemia, hepatic disease, hepatitis, hypophysitis, hypopituitarism, IBS, infusion-related reactions, keratitis, myocarditis, organ transplant, pneumonitis, pulmonary disease, reproductive risk, serious rash, SLE, thyroid disease, ulcerative colitis, uveitis

## DOSAGE AND ROUTES
**For the treatment of locally advanced or metastatic urothelial carcinoma, in patients with disease progression on or after platinum-containing chemotherapy, or within 12 mo of neoadjuvant or adjuvant platinum-containing chemotherapy**
**Adult: IV** 10 mg/kg over 60 min, q2wk until disease progression or unacceptable toxicity

**Management of immune-mediated toxicities (dose reductions are not recommended; manage adverse reactions by interruption or discontinuation of therapy as appropriate)**
**Adrenal insufficiency:**
***Grade 2 to 4:*** Hold until patient is stable and start corticosteroids (1-2 mg/kg/day of predniSONE or equivalent). Begin hormone replacement therapy as needed. When adrenal insufficiency improves to grade 1 or less, begin a steroid taper over at least 1 mo
**Colitis or diarrhea:**
***Grade 2:*** Hold and start corticosteroids (1-2 mg/kg/day of predniSONE or equivalent). If there is worsening or no improvement, increase corticosteroids and/or other systemic immunosuppressants. When colitis improves to grade 1 or less, begin a steroid taper over at least 1 mo. Treatment may be resumed without a dose reduction when colitis is less than or equal to grade 1 and the corticosteroid dose has been reduced to less than 10 mg of predniSONE or equivalent per day. ***Grade 3 or 4:*** Permanently discontinue and start corticosteroids (1-2 mg/kg/day of predniSONE or equivalent). If there is worsening or no improvement, consider increasing the dose of corticosteroids and/or other systemic immunosuppressants. When colitis improves to grade 1 or less, begin a steroid taper over at least 1 mo
**Diabetes, Type 1:**
***Grade 2 to 4:*** Hold until patient is stable and start insulin as needed
**Hypophysitis:**
***Grade 2 to 4:*** Hold until patient is stable and start corticosteroids (1- 2 mg/kg/day of predniSONE or equivalent). Begin hormone replacement therapy as needed. When hypophysitis improves to grade 1 or less, begin a steroid taper over at least 1 mo

**Infection:**
***Grade 3 or 4:*** Hold and initiate symptomatic management; treat with antiinfectives for suspected or confirmed infections

**Infusion-related reactions:**
***Grade 1 or 2:*** Interrupt or slow the rate of the infusion. Consider premedications before subsequent dosing. *Grade 3 or 4:* Permanently discontinue

**Pneumonitis/interstitial lung disease (ILD):**
***Grade 2:*** Hold and start corticosteroids (1-2 mg/kg/day of predniSONE or equivalent). If there is worsening or no improvement, increase the dose of corticosteroids, other systemic immunosuppressants. When pneumonitis improves to grade 1 or less, begin a steroid taper over at least 1 mo. Treatment may be resumed without a dose reduction when pneumonitis is less than or equal to grade 1 and the corticosteroid dose has been reduced to less than 10 mg of predniSONE or equivalent per day. ***Grade 3 or 4:*** Permanently discontinue and start corticosteroids (1 to 4 mg/kg/day of predniSONE or equivalent). If there is worsening or no improvement, consider increasing the dose of corticosteroids and/or other systemic immunosuppressants. When pneumonitis improves to grade 1 or less, begin a steroid taper over at least 1 mo

**Rash:**
***Grade 2 for more than 1 week or grade 3:*** Hold and start corticosteroids (1-2 mg/kg/day of predniSONE or equivalent). If there is worsening or no improvement, consider increasing the dose of corticosteroids and/or other systemic immunosuppressants. When the rash improves to grade 1 or less, begin a steroid taper over at least 1 mo. Treatment may be resumed without a dose reduction when the rash is less than or equal to grade 1 and the corticosteroid dose has been reduced to less than 10 mg of predniSONE or equivalent per day. ***Grade 4:*** Permanently discontinue and start corticosteroids (1 to 2 mg/kg/day of predniSONE or equivalent). If there is worsening or no improvement, consider increasing the dose of corticosteroids and/or other systemic immunosuppressants. When the rash improves to grade 1 or less, begin a steroid taper over at least 1 mo

**Thyroid disorders:**
***Hypothyroidism, grade 2 to 4:*** Initiate thyroid hormone replacement as needed. ***Hyperthyroidism, grade 2 to 4:*** Hold until patient is clinically stable. Manage patient symptomatically as clinically indicated

**Other immune-mediated toxicities:**
***Grade 3:*** Hold and begin symptomatic management of the toxicity. Based on the severity of the reaction, may use of corticosteroids. If there is worsening or no improvement, consider increasing the dose of corticosteroids and/or other systemic immunosuppressants. When the toxicity improves to grade 1 or less, begin a steroid taper over at least 1 mo. Treatment may be resumed without a dose reduction when the toxicity is less than or equal to grade 1 and the corticosteroid dose has been reduced to less than 10 mg of predniSONE or equivalent per day. ***Grade 4:*** Permanently discontinue and start symptomatic treatment and corticosteroids (1 to 4 mg/kg/day of predniSONE or equivalent). If there is worsening or no improvement, consider increasing the dose of corticosteroids and/or other systemic immunosuppressants. When the toxicity improves to grade 1 or less, begin a steroid taper over at least 1 mo

## Patients with hepatic impairment dosing

**Baseline hepatic impairment:**
***Mild hepatic impairment:*** No change. ***Moderate (bilirubin 1.5 to 3 times the upper limit of normal [ULN] and any AST) or severe (bilirubin greater than 3 times ULN and any AST):*** Specific guidelines unknown

**Management of immune-mediated hepatitis:**
***ALT/AST 3.1 to 5 times the upper limit of normal (ULN) or total bilirubin 1.6 to 3 times ULN (grade 2):*** Hold and start treatment with corticosteroids (1 to 2 mg/kg/day of predniSONE or equivalent). If there is worsening or no improvement, consider increasing the dose of corticosteroids, other systemic immunosuppressants. When hepatitis improves to grade 1 or less, begin a steroid taper over at least 1 mo. ***ALT/AST less than or equal to 8 times ULN or total bilirubin less than or equal to 5 times ULN (grade 3a):*** Hold and start corticosteroids (1 to 2 mg/kg/day predniSONE or equivalent). If there is worsening or no improvement, increase corticosteroids, systemic immunosuppressants. When hepatitis improves to grade 1 or less, begin a steroid taper over at least 1 mo. ***ALT/AST greater than 8 times ULN or total bilirubin greater than 5 times ULN (grade 3b):*** Permanently discontinue and start corticosteroids (1 to 2 mg/kg/day of predniSONE or equivalent). If there is worsening or no improvement, increase the dose of corticosteroids, systemic immunosuppressants. When hepatitis improves to grade 1 or less, begin a steroid taper over at least 1 mo. ***Concurrent ALT/AST greater than 3 times ULN and total bilirubin greater than 2 times ULN with no***

***other cause:*** Permanently discontinue and start corticosteroids (1 to 2 mg/kg/day of predniSONE or equivalent). If there is worsening or no improvement, consider increase the dose of corticosteroids, systemic immunosuppressants. When hepatitis improves to grade 1 or less, begin a steroid taper over at least 1 mo

### Renal dose

Mild to moderate renal impairment (Ccr greater than or equal to 30 ml/min): No change; severe renal impairment (Ccr 15 to 29 ml/min): Unknown

**Available forms:** Powder for injection 120 mg/2.4 ml, 500 mg/10 ml

### Implementation

**IV route**

- Follow cytotoxic handling procedures
- Visually inspect for particulate matter and discoloration, product should be clear to opalescent, colorless to slightly yellow, free from particles. Discard if the solution is cloudy, discolored, or particles are observed
- Do not shake

### Preparation

- **Withdraw** the required volume of drug and transfer into an intravenous container containing 0.9% sodium chloride injection or 5% dextrose injection, to prepare an infusion with a final concentration ranging from 1 mg/ml to 15 mg/ml
- **Mix** diluted solution by gentle inversion. Do not shake
- **Discard** partially used or empty vials of durvalumab

### Storage of diluted solution

- Does not contain a preservative; give immediately after preparation
- If storage of the diluted solution is necessary, the total time from vial puncture to the start of administration should be less than 24 hr if refrigerated (2 to 8° C; 36 to 46° F), or less than 4 hr at room temperature (up to 25° C; up to 77° F). Do not freeze

**IV infusion**

- **Give** diluted over 60 min through an IV line using a low-protein-binding 0.2 or 0.22 micron in-line filter
- Do not admix or give other products through the same line

## ADVERSE EFFECTS

**CNS:** *Fatigue, fever*

**GI:** *Nausea, diarrhea, constipation, anorexia, abdominal pain,* colitis

**HEMA:** Anemia, hemolytic anemia, lymphopenia

**RESP:** Cough, dyspnea

**META:** Hyponatremia, hyperbilirubinemia, hypercalcemia, hypermagnesemia, hypoalbuminemia

**ENDO:** Hyperglycemia, hyper- or hypothyroidism

**MISC:** Infection, peripheral edema, infection, musculoskeletal pain, rash, antibody formation, aseptic meningitis, dehydration, infusion reactions, keratitis, myocarditis, uveitis

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Steady state 16 wk |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 17 days |

## INTERACTIONS

None known

### Drug/lab test

Increased: LFTs, blood glucose, serum creatinine/BUN, thyroid function tests
Decreased: Thyroid function tests

## NURSING CONSIDERATIONS

### Assessment

- Monitor baseline and periodically blood glucose, LFTs, serum creatinine/BUN
- **Serious infection**: Some may be fatal. Monitor patients for signs and symptoms of infection; use prophylactic anti-infectives as appropriate
- **Pregnancy/breastfeeding:** Product can cause fetal harm, females of reproductive potential should avoid becoming pregnant during and for 3 mo after final dose; obtain a pregnancy test before starting product, do not breastfeed during and for at least 3 mo after the last dose
- **Immune-mediated pneumonitis or interstitial lung disease (ILD):** May be fatal. Monitor for signs or symptoms (new or worsening chest pain or shortness of breath) of pneumonitis. If pneumonitis is suspected, obtain a chest x-ray; an interruption or discontinuation of therapy and treatment with high-dose corticosteroids (followed by a steroid taper) may be necessary. The median time to onset of immune-mediated pneumonitis was 55.5 days (range 24 to 423 days)
- **Immune-mediated hepatitis**: May be fatal. Monitor for abnormal liver tests before each cycle of treatment interruption or discontinuation of therapy may be needed with high-dose corticosteroids (followed by a steroid taper). The median time to onset of immune-mediated hepatitis was 51.5 days (range 15 to 312 days)

• **Diarrhea and immune-mediated colitis**: Monitor for signs and symptoms of colitis (diarrhea or severe abdominal pain). Treatment with antidiarrheal agents and high-dose corticosteroids (followed by a steroid taper), along with an interruption or discontinuation of therapy, may be necessary. The median time to onset of immune-mediated colitis was 73 days (range 13 to 345 days). Use with caution in those with inflammatory bowel disease such as ulcerative colitis or Crohn's disease
• **Thyroid disease/disorders (hypothyroidism/hyperthyroidism:** Monitor thyroid function tests (TFTs) at baseline and periodically during treatment. Asymptomatic patients with abnormal TFTs can receive treatment, manage these patients with hormone replacement and symptomatic management as needed. The median time to onset of hypothyroidism was 42 days (range 15 to 239 days), and the median time to first onset of hyperthyroidism was 43 days (range 14 to 71 days)
• **Immune-mediated adrenal insufficiency and hypophysitis/hypopituitarism:** Monitor for signs and symptoms of adrenal insufficiency (hypotension, decreased cortisol level, fatigue, weakness, and weight loss) and hypophysitis (decreased pituitary hormone levels, pituitary gland inflammation, severe intractable headache, and vision impairment) during and after treatment. An interruption of therapy, treatment with high-dose corticosteroids, and hormone replacement may be necessary
• **Immune-mediated nephritis:** Monitor renal function at baseline and before each cycle of treatment. No initial dose adjustment is recommended in patients with renal dysfunction; use with caution in patients with renal disease or renal impairment. If immune-mediated nephritis occurs, an interruption or discontinuation of therapy may be needed with treatment with high-dose corticosteroids
• **Immune-mediated reactions (aseptic meningitis, hemolytic anemia, immune thrombocytopenic purpura, myocarditis, myositis) and ocular inflammatory toxicity (uveitis and keratitis):** Monitor for signs and symptoms of immune-mediated reactions; confirm etiology or exclude other causes. Therapy may need to be temporarily withheld or permanently discontinued; administer corticosteroids as needed
• **Severe infusion-related reactions**: Monitor signs and symptoms of an infusion-related reaction. Interrupt or slow the rate of infusion in those with mild or moderate infusion reactions. Permanently discontinue in those with grade 3 or 4 infusion reactions

### Patient/family education

• Teach patient to report adverse reactions immediately, report diarrhea, hepatic, flulike symptoms, cough, trouble breathing
• Teach patient about reason for treatment, expected results
• **Pregnancy/breastfeeding:** Teach patient to notify provider if pregnancy is planned or suspected, to use effective contraception during treatment and for 3 mo after discontinuing treatment, breastfeeding or for 3 mo after final dose

### Evaluation

**Positive therapeutic outcome**
• Lack of disease progression

**RARELY USED**

## edaravone

(e-dar'-a-vone)
**Radicava**
*Func. class.:* CNS agents

**USES:** For the treatment of amyotrophic lateral sclerosis

## DOSAGE AND ROUTES

**For the treatment of amyotrophic lateral sclerosis (ALS)**
**Adult: IV** 60 mg qday × 14 days then a 14-day drug-free period for an initial treatment cycle. For subsequent cycles, give × 10 days out of 14-day periods followed by 14-day drug-free periods

**⚠ HIGH ALERT**
**RARELY USED**

## enasidenib

(en'-a-sid'-a-nib)
**IDHIFA**
*Func. class.:* Antineoplastic

**USES:** For the treatment of relapsed or refractory acute myeloid leukemia with IDH2 mutation

## DOSAGE AND ROUTES

**For the treatment of relapsed or refractory AML with an isocitrate dehydrogenase-2 (IDH2) mutation**
**Adult: PO** 100 mg qday until disease progression. Treat those without disease progression for a minimum of 6 mo to allow time for clinical response

**RARELY USED**

## ertugliflozin

(er-too-gli-floe'-zin)
**Steglatro**
*Func. class.:* Antidiabetic

**USES:** For the treatment of type 2 diabetes mellitus

## DOSAGE AND ROUTES

**For the treatment of type 2 diabetes mellitus in combination with diet and exercise**
**Adult: PO** 5 mg qday, in the morning, with or without food, max: 15 mg qday

**RARELY USED**

## etelcalcetide

(e-tel-kal'-se-tide)
**Parsabiv**
*Func. class.:* Parathyroid analogs

**USES:** For the treatment of secondary hyperparathyroidism in adults with chronic kidney disease on hemodialysis

## DOSAGE AND ROUTES

**For the treatment of secondary hyperparathyroidism in patients with chronic kidney disease on hemodialysis**
**Adult: IV** 5 mg 3 times/wk at the end of hemodialysis treatment

**For patients switching from cinacalcet to etelcalcetide**
**Adult: IV** 5 mg 3 times/wk at the end of hemodialysis treatment after discontinuing etelcacetide for at least 7 days

## guselkumab (Rx)

(gus-elk'-ue-mab)
**Tremfya**
*Func. class.:* Antirheumatic agent (disease modifying), immunomodulator, anti-TNF
*Chem. class.:* Recombinant human IgG1 monoclonal antibody, DMARD

**ACTION:** A form of human IgG1 monoclonal antibody selectively binds to the p19 subunit of interleukin 23 (IL-23) cytokine, inhibiting its interaction with the IL-23 receptor. A naturally occurring cytokine, IL-23 is involved in normal inflammatory and immune responses. By inhibiting the interaction of IL-23 with its receptor, blocks the release of proinflammatory cytokines and chemokines

**USES:** For the treatment of moderate to severe plaque psoriasis in those who are candidates for phototherapy or systemic therapy

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, geriatric patients, infection, vaccination

## DOSAGE AND ROUTES

**Adult: SUBCUT** 100 mg at week 0, week 4, and every 8 wk thereafter

**Available forms:** Prefilled syringe 100 mg/ml

### Implementation

**SUBCUT route**

- Remove prefilled syringe from refrigerator and allow to reach room temperature (about 30 min) without removing the needle cap
- Do not shake the prefilled syringe
- Visually inspect for particulate matter and discoloration, the solution should be colorless to slightly yellow and may contain a few small translucent particles. Do not use if discolored, cloudy, or if foreign particulate matter is present
- Only an individual trained in subcutaneous drug delivery should administer the injection. A patient who is properly trained in injection technique may self-inject using the prefilled syringe or vial, if his or her prescriber deems the action appropriate. However, the first injection needs to be under the supervision of a qualified health care professional
- Use front part of the middle thigh, the gluteal or abdominal region, and the outer area of the upper arm. For injection sites, rotate injection sites. Do not use where skin is tender, bruised, red, hard, thick, scaly, or affected by psoriasis
- Gently pinch the cleaned area of skin and insert the needle at about a 45-degree angle subcutaneously using a quick, dartlike motion. Push the plunger slowly and evenly to deliver the dose, remove the needle, and release the pinched skin. Do not rub the injection site; slight bleeding may occur
- Each single-use prefilled syringe contains 100 mg/ml of product. Inject the entire 1 ml contents of the syringe. No preservatives are present; discard any unused portion
- Protect from light, do not freeze

## ADVERSE EFFECTS

**CNS:** Headache

**EENT:** Sinusitis

**GI:** Diarrhea

**MS:** Arthralgia

**INTEG:** Erythema, pruritus, skin discoloration

**HEMA:** Bleeding

**MISC:** Infection, injection site reactions, antibody formation, pharyngitis, edema, TB

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | 49% |
| **Distribution** | Unknown |
| **Metabolism** | Unknown |
| **Excretion** | Unknown |
| **Half-life** | 15-18 days |

### Pharmacodynamics

| | |
|---|---|
| **Onset, peak duration** | Unknown |

## INTERACTIONS

Avoid use with CYP2D6 substrates

Do not give concurrently with live virus vaccines; immunizations should be brought up to date before treatment

### Drug/lab test

Increased: ALT, AST

## NURSING CONSIDERATIONS

### Assessment

- Assess for injection site pain, swelling, redness—use cold compress to relieve pain/swelling, give at 45-degree angle using abdomen, thighs; rotate injection sites; discard unused portions
- **Infection**: Assess for infections (fever, flu-like symptoms, dyspnea, change in urination, redness/swelling around any wounds), stop treatment if present; some serious infections, including sepsis, may occur, may be fatal; patients with active infections should not be started on this product
- **TB:** Obtain a TB test before starting this product, do not use in active TB; for latent TB, give antituberculosis therapy before use of this product, monitor closely for signs and symptoms of active tuberculosis infection during and after treatment
- **Pregnancy/breastfeeding**: Use only if benefits outweigh fetal risk, cautious use in breastfeeding, excretion unknown

### Patient/family education

- Teach patient about self-administration if appropriate: Injection should be made in thigh, abdomen, upper arm; rotate sites at least 1 inch from old site; do not inject in areas that are bruised, red, hard
- Teach patient that if medication is not taken when due, inject next dose as soon as remembered and inject next dose as scheduled
- Teach patient not to take any live virus vaccines during treatment
- Teach patient to report signs of infection (fever, sweats, or chills; muscle aches; weight loss; cough; warm, red, or painful skin or sores on body different from psoriasis; diarrhea or stomach pain; shortness of breath; blood in phlegm (mucus); burning when urinate or urinating more often than normal); allergic reactions (itching, rash)
- Advise patient to tell provider of all prescription, OTC, herbals, and supplements currently taken

### Evaluation

**Positive therapeutic outcome**

- Decrease in lesions

# inotuzumab ozogamicin

(ih-noh-too′-zoo-mab oh′-zoh-ga-MIH-sin)

**Besponsa**

*Func. class.:* Antineoplastic monoclonal antibodies

**ACTION:** A CD22-directed antibody-drug conjugate, CD22 is expressed on pre-B-cells and mature B-cells. Consists of a cytotoxic agent; it induces double-strand DNA breaks, resulting in cell cycle arrest and apoptotic cell death

**USES:** For the treatment of adults with relapsed or refractory B-cell precursor acute lymphoblastic leukemia

## CONTRAINDICATIONS

Pregnancy, hypersensitivity

**Precautions:** Alcoholism, bleeding, breastfeeding, contraception requirements, diabetes mellitus, electrolyte imbalances, females, geriatric patients, infertility, male-mediated teratogenicity, neutropenia, bone marrow suppression, infection, reproductive risk, thrombocytopenia, thyroid disease, QT prolongation

**BLACK BOX WARNING:** Hepatic disease, hepatotoxicity, mortality, sinusoidal obstructive disease, venoocclusive disease

## DOSAGE AND ROUTES

### For the treatment of relapsed or refractory B-cell precursor ALL

**Adult: IV** 0.8 mg/m$^2$ day 1 and 0.5 mg/m$^2$ days 8 and 15 (cycle 1). Length of cycle 1 is 21 days, may extend to 28 days in those who achieve a

complete remission (CR) or a complete remission with incomplete hematologic recovery (CRi) or to allow for recovery from toxicity. In patients who do not achieve a CR or CRi, give product at the same dosage (0.8 mg/m$^2$ on day 1 and 0.5 mg/m$^2$ on days 8 and 15) repeated q8days; discontinue if a CR or CRi is not achieved after 3 cycles. In patients who achieve a CR or CRi, give product 0.5 mg/m$^2$ on days 1, 8, and 15 repeated q28days. In patients who proceed to hematopoietic stem cell transplant (HSCT), administer 2 cycles of therapy; consider a third cycle in patients who do not achieve CR or CRi and minimal residual disease (MRD) negativity after 2 cycles. Patients not proceeding to HSCT should receive a maximum of 6 cycles of therapy.

## Management of treatment-related toxicity

Do not interrupt doses within a treatment cycle (day 8 or day 15 dose) for neutropenia or thrombocytopenia. Dosing interruptions within a cycle are recommended for nonhematologic toxicity. If a dose reduction is necessary, do not re-escalate the dose

**Hematologic toxicity:**

***Absolute neutrophil count (ANC) of 1 × 10$^9$*** cells/L or greater before starting therapy: If the ANC decreases, hold the next cycle of therapy until recovery of the ANC to 1 × 10$^9$ cells/L or greater. Discontinue therapy if low ANC lasts longer than 28 days and is suspected to be due to inotuzumab ozogamicin. ***Platelet count of 50 × 10$^9$*** cells/L or greater before starting ***therapy:*** If platelet count decreases, hold the next cycle of therapy until the platelet count recovers to 50 × 10$^9$ cells/L or greater. Discontinue therapy if low platelet count lasts longer than 28 days and is suspected to be due to inotuzumab ozogamicin. ***ANC was less than 1 × 109 cells/L and/or platelet count was less than 50 X 10$^9$*** cells/L before starting therapy: If the ANC or platelet count decreases, hold the next cycle until at least 1 of the following occurs: the ANC and platelet counts recover to baseline or better for the prior cycle; the ANC recovers to 1 × 10$^9$ cells/L or greater and the platelet count recovers to 50 × 10$^9$ cells/L or greater; the patient has stable or improved disease (based on most recent bone marrow assessment) and the ANC and platelet count decrease is considered to be due to the underlying disease and not product-related toxicity

**Infusion-related reactions:**

***Mild to moderate reactions:*** Hold infusion and start medical management. Consider discontinuing or give steroids and antihistamines depending on the severity; ***severe or life-threatening reactions:*** Stop infusion, permanently discontinue

**Nonhematologic toxicity:**

Evaluate for toxicity before each dose. For grade 2 or higher toxicity, hold until toxicity recovers to grade 1 or less (or pretreatment grade level). Dose modifications depend on duration of dosing interruption as follows: ***Less than 7 days (within a cycle):*** Hold the next dose; maintain a minimum of 6 days between doses; ***7 days or greater:*** omit the next dose within the cycle; ***14 days or greater:*** After recovery, decrease the total dose by 25% for the subsequent cycle. If further dose modification is required, reduce the number of doses to 2 per cycle for subsequent cycles. If a 25% decrease in the total dose followed by a decrease to 2 doses per cycle is not tolerated, permanently discontinue therapy; ***greater than 28 days:*** consider permanent discontinuation

## Hepatic dose

*Baseline hepatic impairment*: No change

**Treatment-related hepatotoxicity:**

Evaluate for toxicity before each dose. Dosing interruptions within a cycle are recommended for hepatic impairment. If a dose reduction is necessary, do not re-escalate the dose. *Total bilirubin level of 1.5 times the upper limit of normal (ULN) or less and AST/ALT level of 2.5 times the ULN or less:* No dose adjustment is necessary. *Total bilirubin level greater than 1.5 times the ULN and AST/ALT level greater than 2.5 times the ULN:* Hold therapy until the total bilirubin level is 1.5 times the ULN or less and the AST/ALT level is 2.5 times the ULN or less unless hyperbilirubinemia is due to Gilbert's syndrome or hemolysis. Dose modifications depend on duration of dosing interruption as follows: *Less than 7 days (within a cycle):* Hold the next dose; maintain a minimum of 6 days between doses. *7 days or greater:* Omit the next dose within the cycle; *14 days or greater:* After recovery, decrease the total dose by 25% for the subsequent cycle. If further dose modification is required, reduce the number of doses to 2 per cycle for subsequent cycles. If a 25% decrease in the total dose followed by a decrease to 2 doses per cycle is not tolerated, permanently discontinue; *greater than 28 days:* Permanently discontinue

**Hepatic venoocclusive disease (VOD)/sinusoidal obstruction syndrome (SOS) or other severe liver toxicity:** Permanently discontinue

**Available forms:** Powder for injection 0.9 mg

### Implementation

#### IV route

- Visually inspect for particulate matter and discoloration before use
- Follow cytotoxic handling procedures
- Available as a single-dose, preservative-free, 0.9-mg lyophilized powder vial
- Premedication with a corticosteroid, an antipyretic agent (acetaminophen), and an antihistamine before each dose is recommended; observe patients during and for at least 1 hr after the end of the infusion for symptoms of infusion-related reactions

### Reconstitution

- After calculating the number of vials needed, add 4 ml of sterile water for injection to each vial for a final vial concentration of 0.25 mg/ml (0.9 mg/3.6 ml); gently swirl the vial to dissolve powder, do not shake
- The reconstitution solution should be clear to opalescent, colorless to slightly yellow, and free of visible foreign matter
- **Storage of reconstituted vials:** If not further diluted immediately, vials may be stored in the refrigerator (at 2 to 8° C or 36 to 46° F) for up to 4 hr after reconstitution; protect from light, do not freeze

### Dilution

- Add the required dose/volume from the reconstituted vials to an infusion container made of polyvinyl chloride (PVC) or non-DEHP-containing polyolefin (polypropylene and/or polyethylene), or ethylene vinyl acetate (EVA); discard any unused portion
- Add 0.9% sodium chloride injection to the infusion container for a final total volume of 50 ml; gently invert to mix, do not shake
- **Storage of admixture:** If not infused immediately, the diluted solution may be stored at room temperature (20 to 25° C or 68 to 77° F) for up to 4 hr or refrigerated (2 to 8° C or 36 to 46° F) for up to 3 hr; protect from light and do not freeze

### IV infusion

- Allow refrigerated admixtures to warm to room temperature for 1 hr before use
- Give admixture (protected from light) as an IV infusion over 1 hr through an infusion line made of PVC, polyolefin (polypropylene and/or polyethylene), or polybutadiene
- Complete infusion within 8 hr of reconstitution
- The diluted solution does not need to be filtered; if it is filtered, use polyethersulfone (PES)-, polyvinylidene fluoride (PVDF)-, or hydrophilic polysulfone (HPS)-based filters
- Do not use filters made of nylon or mixed cellulose ester (MCE)
- Do not mix with or administer as an infusion with other drugs

## ADVERSE EFFECTS

**CNS:** *Fatigue, fever, headache, migraine, chills*

**GI:** *Nausea, vomiting, diarrhea, stomatitis, constipation, anorexia, abdominal pain,* hepatotoxicity

**HEMA:** Anemia, thrombocytopenia, *bleeding, hematoma, hematuria, ecchymosis, venoocculsive disease*

**MISC:** Infection, asthenia, QT prolongation, tumor lysis syndrome, sinusoidal obstruction syndrome

### Pharmacokinetics

| | |
|---|---|
| **Absorption, metabolism, excretion, half-life** | Unknown |
| **Distribution** | Protein binding 97% |

### Pharmacodynamics

| | |
|---|---|
| **Onset, peak, duration** | Unknown |

## INTERACTIONS

Other products that increase QT prolongation: Increased QT prolongation

### Drug/lab test

Increased LFTs

## NURSING CONSIDERATIONS

### Assessment

- **Serious infection**: Some may be fatal. Monitor patients for signs and symptoms of infection; use prophylactic antiinfectives as appropriate
- **Severe myelosuppression/bone marrow suppression:** Assess for thrombocytopenia, neutropenia; obtain a CBC before each dose, therapy interruption or permanent discontinuation may be necessary in patients who develop severe myelosuppression
- **Pregnancy/breastfeeding:** Product can cause fetal harm, females of reproductive potential should avoid becoming pregnant during and for 8 mo after final dose; obtain a pregnancy test before starting product, do not breastfeed during and for at least 2 mo

after the last dose; men with female partners of reproductive potential should avoid fathering a child and use effective contraception during and for at least 5 mo after therapy

• **QT prolongation**: Obtain an electrocardiogram (ECG) and monitor serum electrolytes before the start of treatment and periodically during therapy as needed. Use with caution in patients with a history of QT prolongation or who have an electrolyte imbalance. Avoid concomitant use with other drugs known to prolong the QT interval; if coadministration is unavoidable, monitor ECGs and serum electrolytes after starting the other QT-prolonging drug. Females, geriatric patients, patients with diabetes mellitus, thyroid disease, malnutrition, alcoholism, hepatic dysfunction, or patients who have received high-cumulative-dose anthracycline therapy may also be at increased risk for QT prolongation

**BLACK BOX WARNING: Severe or life-threatening** hepatotoxicity, including venoocclusive disease (VOD)/sinusoidal obstruction syndrome (SOS): Monitor liver function tests (LFTs), total bilirubin, alkaline phosphatase levels before and after each dosage change; therapy interruption, dose reduction, or permanent discontinuation may be necessary in those who develop liver function test abnormalities. Closely monitor for VOD/SOS (hepatomegaly, rapid weight gain, and ascites). Permanently discontinue in those who develop VOD/SOS; in those who undergo a hematopoietic stem cell transplant (HSCT), monitor LFTs frequently during the first month post-HSCT; then continue to monitor LFTs but less often. Time from HSCT to onset of VOD/SOS was 15 days (range 3 to 57 days). The risk of VOD/SOS may be greater in patients who receive an HSCT or a conditioning regimen that contains 2 alkylating agents before HSCT and in patients who have an increased total bilirubin level before a HSCT; other risk factors include hepatic disease (e.g., cirrhosis, nodular regenerative hyperplasia, active hepatitis), a prior HSCT, increased age, later salvage lines, and a larger number of treatment cycles

**BLACK BOX WARNING: Mortality:** Those who underwent a hematopoietic stem cell transplant (HSCT) may have a higher 100-day post-HSCT nonrelapse mortality; monitor closely for post-HSCT toxicity. The most common causes of post-HSCT death were venoocclusive disease/sinusoidal obstruction syndrome and infectious complications

### Patient/family education

• Teach patient to report adverse reactions immediately, bleeding; report diarrhea, hepatic, hematologic symptoms/toxicity, flulike symptoms

• Teach patient about reason for treatment, expected results

• **Pregnancy/breastfeeding:** Teach patient to notify provider if pregnancy is planned or suspected, to use effective contraception during treatment and for 8 mo after discontinuing treatment, breastfeeding or for 2 mo after final dose; men with female partners of reproductive potential should be cautioned to avoid fathering a child and use effective contraception during and for at least 5 mo after therapy

### Evaluation

**Positive therapeutic outcome**

• Improving blood counts

## RARELY USED

## L-glutamine

**Endari**

*Func. class.:* Functional bowel agents, hematological agents

**USES:** For the treatment of short bowel syndrome in patients receiving specialized nutritional support in conjunction with recombinant human growth hormone; for the treatment of sickle cell disease

## DOSAGE AND ROUTES

### For the treatment of short bowel syndrome in patients receiving specialized nutritional support in conjunction with recombinant human growth hormone

**Adult: PO** 5 g (1 packet) 6 times/day for up to 16 wk given in conjunction with a specialized diet adjusted for individual patient requirements and preferences. Recombinant human growth hormone (rh-GH) should be given during the first 4 wk of therapy

### To reduce the acute complications of sickle cell disease

**Adult: > 65 kg PO** 15 g (3 packets) bid; 30 to 65 kg 10 g (2 packets) bid

**Child and Adolescent:** 5 to 17 yr and >65 kg 15 g (3 packets) **bid**; 30 to 65 kg 10 g (2 packets) **bid**; <30 kg 5 g (1 packet) **bid**

## lesinurad/allopurinol (Rx)

(le-sin'-ure-ad/al-oh-pure'i-nole)

**Duzallo**

*Func. class.:* Antigout agent, antihyperuricemic

*Chem. class.:* Xanthine oxidase inhibitor

**ACTION:** Inhibits the enzyme xanthine oxidase, reducing uric acid synthesis

**USES:** For the treatment of hyperuricemia associated with gout

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, renal/hepatic disease

## DOSAGE AND ROUTES

**For the treatment of hyperuricemia associated with gout in patients not achieving target serum uric acid levels with allopurinol alone**

**Adult: PO** 1 tablet (lesinurad 200 mg; allopurinol 300 mg) qday in those who have not achieved target serum uric acid on allopurinol 300 mg/day or more

### Renal dose

**Adult:** CCr less than 45 ml/min: Use not recommended

**Available forms:** Tabs 200 mg-200 mg, 200 mg-300 mg

### Implementation

**PO route**

- Give in the a.m. with food and water
- To provide adequate hydration (drink 2 liters [68 ounces] of fluid daily)
- Do not discontinue if a gout flare occurs during treatment; the flare can be managed concurrently as appropriate for the individual patient
- Missed dose: Do not take a missed dose later in the day. Wait to take on the next day; do not double the dose

## INTERACTIONS

### Individual drugs

Ammonium chloride, vit C, potassium/sodium phosphate: Increase: kidney stone formation—Ampicillin, amoxicillin: Increase: rash, avoid concurrent use

Rasburicase: Increase xanthine nephropathy, calculi

### Drug categories

Oral anticoagulants, oral antidiabetics, theophylline: Increased action of each product

ACE inhibitors, thiazides: Increased hypersensitivity, toxicity

Antineoplastics (mercaptopurine, azaTHIOprine): Increased bone marrow depression

## SIDE EFFECTS

**CNS:** Headache

**GI:** Nausea, vomiting, malaise, cramps, diarrhea

**INTEG:** Rash

**MS:** Acute gouty attack

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Allopurinol: Protein binding < 1 %; lesinurad: highly bound to plasma proteins |
| Metabolism: **Lesinurad:** Metabolized via oxidation CYP2C9 | |
| **Excretion** | Allopurinol: Excreted in feces, urine |
| **Half-life** | Allopurinol: 1-2 hr; lesinurad: 5 hr |

### Pharmacodynamic

| | |
|---|---|
| **Onset, duration** | Unknown |
| **Peak** | Allopurinol: 1.5 hr |

## NURSING CONSIDERATIONS

### Assessment

- **Gout: Assess** for joint pain, swelling; may use with NSAIDs for acute gouty attacks; uric acid levels q2wk; uric acid levels should be ≤ 6 mg/dl, effect may take several weeks
- Monitor CBC, AST, BUN, creatinine, prothrombin time/INR, before starting treatment, periodically; prothrombin time/INR should be reassessed periodically in patients receiving coumarin anticoagulant therapy
- Monitor I&O ratio; increase fluids to 2 L/day prevent stone formation and toxicity
- Assess for rash, hypersensitivity reactions, discontinue product
- **Hepatic disorder:** Monitor LFTs baseline and periodically, assess for abdominal pain, jaundice of skin, eyes
- **Bone marrow suppression:** Usually in those who have received concomitant drugs that may cause this reaction, may occur 6 wk to 6 yr after starting allopurinol
- **Pregnancy/breastfeeding:** Use only if needed, no well-controlled studies, use cautiously in breastfeeding

### Patient/family education

- Teach patient to avoid hazardous activities if drowsiness or dizziness occurs

• Teach patient to avoid alcohol, caffeine; will increase uric acid levels
• Teach patient to avoid large doses of vit C; kidney stone formation may occur
• Teach patient to reduce dairy products, refined sugars, sodium, meat if taking for calcium oxalate stones
• Advise patient to take as prescribed; if dose is missed, take as soon as remembered; do not double dose; tabs may be crushed
• Advise patient to increase fluid intake to 2 L/day
• Teach patient to report skin rash, stomatitis, malaise, fever, aching; product should be discontinued

### Evaluation

**Positive therapeutic outcome**

• Decreased pain in joints, decreased stone formation in kidneys, decreased uric acid levels

## RARELY USED

## letermovir

(le- term- oh- vir)

**Prevymis**

*Func. class.:* Antiviral

**USES:** For the prevention of cytomegalovirus after allogenic hematopoietic stem cell transplant

## DOSAGE AND ROUTES

**For cytomegalovirus (CMV) disease prophylaxis in CMV-seropositive recipients [R+] or an allogeneic hematopoietic stem cell transplant (HSCT) without concurrent cyclosporine**

**Adult: PO/IV** 480 mg qday started between day 0 and day 28 posttransplantation (before or after engraftment) and continued through day 100 posttransplantation

**For cytomegalovirus (CMV) disease prophylaxis in patients with concurrent cyclosporine**

**Adult: PO/IV** 240 mg qday started between day 0 and day 28 posttransplantation (before or after engraftment) and continued through day 100 posttransplantation. If cyclosporine is initiated after starting letermovir, reduce letermovir to 240 mg with the next dose. If cyclosporine is discontinued after starting letermovir, increase the dose of letermovir to 480 mg. If cyclosporine dosing is interrupted due to high cyclosporine concentrations, no dosage adjustment of letermovir is needed

## meropenem/vaborbactam (Rx)

(mer-oh-pen′em/va bor bak′ tam)

**Vabomere**

*Func. class.:* Antiinfective—miscellaneous

*Chem. class.:* Carbapenem

**ACTION:** Bactericidal; interferes with cell wall replication of susceptible organisms

**USES:** For the treatment of complicated urinary tract infections caused by *Citrobacter* freundii, *Citrobacter koseri*, *Enterobacter aerogenes*, *Enterobacter cloacae*, *Escherichia coli*, *Klebsiella oxytoca*, *Klebsiella pneumoniae*, *Morganella morganii*, *Proteus mirabilis*, *Providencia* spp., *Pseudomonas aeruginosa*, *Serratia marcescens*

## CONTRAINDICATIONS

Hypersensitivity to this product, carbapenems

**Precautions:** Pregnancy, breastfeeding, geriatric patients, renal disease, seizure disorder, gram-negative infection, pneumonia, hypersensitivity to cephalosporins, penicillins

## DOSAGE AND ROUTES

**For the treatment of complicated urinary tract infection (UTI), including pyelonephritis**

**Adult: IV:** 4 g (2 g meropenem and 2 g vaborbactam) q8hr for up to 14 days

### Renal dose

**Adult:** IV; eGFR 50 ml/min/1.73 $m^2$ or more: No change; eGFR 30 to 49 ml/min/1.73 $m^2$: 2 g (1 g meropenem and 1 g vaborbactam) q8hr; eGFR 15 to 29 ml/min/1.73 $m^2$: 2 g (1 g meropenem and 1 g vaborbactam) q12hr; eGFR less than 15 ml/min/1.73 $m^2$: 1 g (0.5 g meropenem and 0.5 g vaborbactam) q12hr

**Intermittent hemodialysis:** Meropenem and vaborbactam are removed by hemodialysis, give appropriate renal dose of meropenem; vaborbactam after hemodialysis

**Available forms:** Powder for injection 2 g

### Implementation

**IV route**

• Visually inspect for particulate matter and discoloration before use

### Reconstitution

• Constitute the appropriate number of vials as needed for the dose
  • 2 vials are used for 4 g (2 g meropenem and 2 g vaborbactam) dose

- 1 vial is used for 2 g (1 g meropenem and 1 g vaborbactam) or 1 g (0.5 g meropenem and 0.5 g vaborbactam) doses

• Withdraw 20 ml of 0.9% sodium chloride Injection from an infusion bag and constitute each vial
- For 4 g (2 g meropenem and 2 g vaborbactam) dose/250 to 1000 ml
- For 2 g (1 g meropenem and 1 g vaborbactam) dose/125 to 500 ml
- For 1 g (0.5 g meropenem and 0.5 g vaborbactam) dose 70 to 250 ml

• Mix gently to dissolve. The constituted solution is concentrations of 0.05 g/ml meropenem and 0.05 g/ml vaborbactam; the final volume is 21.3 ml
• Further dilute before use; do not use by direct injection

### Dilution
• Withdraw the full or partial constituted vial contents from each vial and add back into the 0.9% sodium chloride Injection infusion bag
• The final concentration of meropenem and vaborbactam will be between 2 and 8 mg/ml
• ***Storage:*** Complete infusion within 4 hr if stored at room temperature or 22 hr if refrigerated at 2 to 8° C (36 to 46° F)

### Intermittent IV infusion
• Give over 3 hr

## ADVERSE EFFECTS
**CNS:** Seizures, dizziness, weakness, headache, insomnia, agitation, confusion, drowsiness

**CV:** Hypotension, tachycardia

**ENDO:** Hypoglycemia

**GI:** Diarrhea, nausea, vomiting, pseudomembranous colitis, hepatitis, glossitis, jaundice

**INTEG:** Rash, urticaria, pruritus, pain at inj site, phlebitis, erythema at inj site

**RESP:** Dyspnea, hyperventilation, cough, sputum

**SYST:** Anaphylaxis, Stevens-Johnson syndrome, angioedema

### Pharmacokinetics

| | |
|---|---|
| **Distribution** | Protein binding 2% (meropenem), 33% (vaborbactam) |
| **Metabolism** | Meropenem is a substrate of OAT1 and OAT3 transporters, use after hemodialysis |
| **Excretion** | Kidneys |
| **Half-life** | 1.22 hr (meropenem), 1.68 hr (vaborbactam) |

### Pharmacodynamics

| | |
|---|---|
| **Onset, peak, duration** | Unknown |

## INTERACTIONS
### Individual drugs
Probenecid: Increased meropenem levels
Valproic acid: Increased effect of this agent

### Drug/lab test
Increase: AST, ALT, LDH, BUN, alk phos, bilirubin, creatinine
Decrease: Prothrombin time
False positive: Direct Coomb's test

## NURSING CONSIDERATIONS
### Assessment
• Assess for sensitivity to carbapenem antibiotics, penicillins, cephalosporins
• Renal disease: Lower dose may be required; monitor serum creatinine/BUN sodium, before, during therapy
• **Pseudomembranous colitis:** Assess bowel pattern daily; if severe diarrhea, abdominal pain, fatigue occurs, product should be discontinued
• **Infection**: Assess temperature, sputum, characteristics of wound before, during, and after treatment
• **Allergic reactions, anaphylaxis:** Assess for rash, laryngeal edema, wheezing, urticaria, pruritus; may occur immediately or several days after therapy begins; identify if there has been hypersensitivity to penicillins, cephalosporins, beta-lactams, cross-sensitivity may occur
• Seizures: May occur in those with brain lesions, seizure disorder, bacterial meningitis, or renal disease; stop product and notify prescriber if seizures occur
• Overgrowth of infection: Assess for perineal itching, fever, malaise, redness, pain, swelling, drainage, rash, diarrhea, change in cough, sputum

### Patient/family education
• **Pseudomembranous colitis:** Teach patient to report severe diarrhea
• Advise patient to report sore throat, bruising, bleeding, joint pain, may indicate blood dyscrasias (rare)
• Teach patient to report overgrowth of infection: Black furry tongue, vaginal itching, foul-smelling stools

### Evaluation
#### Positive therapeutic outcome
• Negative C&S; absence of symptoms and signs of infection

**⚠ HIGH ALERT**

**RARELY USED**

## midostaurin

(mye-doe-staw′-rin)

**Rydapt**

*Func. class.:* Antineoplastic

**USES:** For the treatment of newly diagnosed, FLT3 mutation-positive AML in combination with standard cytarabine and daunorubicin induction and consolidation therapy and for the treatment of aggressive systemic mastocytosis, systemic mastocytosis with associated hematological neoplasm, or mast cell leukemia

### DOSAGE AND ROUTES

**For the treatment of newly diagnosed, FLT3 mutation-positive AML in combination with standard cytarabine and daunorubicin induction and consolidation therapy**

**Adult: PO** 50 mg bid on days 8 to 21 of each cycle of induction therapy with cytarabine and daunorubicin; additionally, give midostaurin 50 mg bid on days 8 to 21 of each cycle of consolidation with high-dose cytarabine therapy

**For the treatment of aggressive systemic mastocytosis, systemic mastocytosis with associated hematological neoplasm, or mast cell leukemia**

**Adult: PO** 100 mg bid until disease progression

## neratinib

(ne-ra′-ti-nib)

**Nerlynx**

*Func. class.:* Antineoplastic

*Chem. class.:* Protein kinase inhibitors

**ACTION:** It is an irreversible inhibitor of the epidermal growth factor receptor (EGFR) and the human epidermal receptor type 2 (HER2) and HER4. It is a protein kinase inhibitor

**USES:** For the extended adjuvant treatment of early stage HER2-positive breast cancer, after completion of adjuvant trastuzumab

### CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Breastfeeding, contraception requirements, geriatric, hepatic disease, hepatotoxicity, infertility, pregnancy, pregnancy testing, reproductive risk

### DOSAGE AND ROUTES

**For the extended adjuvant treatment of early stage HER2-positive breast cancer, after completion of adjuvant trastuzumab-based therapy**

**Adult: PO** 240 mg qday with food, × 1 yr

### Therapeutic drug monitoring

**Dosage adjustments for treatment-related toxicities:**

Interrupt therapy per specific instructions. Restart as appropriate at the following reduced doses: **Starting dose:** 240 mg qday; **first dose reduction**: 200 mg qday; **second dose reduction:** 160 mg qday; **third dose reduction:** 120 mg qday

- ***Diarrhea:*** Antidiarrheal prophylaxis (loperamide) is recommended during the first 2 cycles (56 days); additional antidiarrheals may be needed
- ***Grade 1 to 3, with complicating features (dehydration, fever, hypotension, renal failure, or grade 3 or 4 neutropenia):*** Hold, modify diet, and give fluids of 2 L; if IV fluids are needed for grade 3 diarrhea, evaluate LFTs with fractionated bilirubin and prothrombin time; when diarrhea resolves to < grade 1 or baseline, give loperamide 4 mg with each dose. If diarrhea resolves to < grade 1 in 1 wk or less, resume the same dose. If resolution to ≤ grade occurs after 1-3 wk, resume at the next lower dose. Discontinue if diarrhea does not recover to ≤ grade 1, if diarrhea results in a treatment delay of >3 wk, or for those unable to tolerate 120 mg daily
- ***Grade 1 (increase of <4 stools/day over baseline), no complicating features:*** Continue, adjust antidiarrheals, modify diet. Give fluids of 2 L when diarrhea resolves to < grade 1 or baseline, give loperamide 4 mg with each subsequent dose.
- ***Grade 2 (increase of 4 to 6 stools per day over baseline), no complicating features:*** Continue, adjust antidiarrheals, and modify diet. Maintain fluid intake of 2 L; if grade 2 diarrhea lasts for ≥ 5 days even with optimal medical therapy, hold; when diarrhea resolves to < grade 1 or baseline, give loperamide 4 mg with each dose; if diarrhea resolves to < grade 1 in ≤ 1 wk, resume at the same dose. If resolution to ≤ grade 1 occurs after 1-3 wk, resume the next lower dose. Discontinue if diarrhea does not recover to ≤ grade 1, if diarrhea results in a delay of more than 3 wk, or if grade 2 or higher diarrhea recurs at 120 mg/day

• ***Grade 3 (increase of greater than or equal to 7 stools per day over baseline; incontinence; hospitalization indicated; limiting self-care activities of daily living), no complicating features:*** Continue, adjust antidiarrheals, modify diet. Maintain fluid intake of 2 L; if IV fluids are required, evaluate LFTs including fractionated bilirubin and prothrombin time. If grade 3 diarrhea lasts for ≥ 2 days, hold product. When diarrhea resolves to less than grade 1 or baseline, administer loperamide 4 mg with each subsequent neratinib dose. If diarrhea resolves to less than grade 1 in 1 wk or less, resume neratinib treatment at the same dose. If resolution to grade 1 or less occurs after 1 to 3 wk, resume neratinib treatment at the next lower dose. Discontinue neratinib treatment if diarrhea does not recover to grade 1 or less, if diarrhea results in a treatment delay of more than 3 wk, or if grade 2 or higher diarrhea recurs at 120 mg per day

• ***Grade 4 (life-threatening consequences; urgent intervention required):*** Permanently discontinue; if IV fluids are required, evaluate liver function tests, including fractionated bilirubin and prothrombin time

### Hepatic dose

**Adult:** PO *Child-Pugh A or B:* No change: *Child-Pugh C:* Reduce starting dose to 80 mg qday; *grade 3 elevations in ALT (5 to 20 X ULN) or bilirubin (3 to 10 X ULN):* Hold and evaluate causes; first occurrence, if LFTs resolve to ≤ to grade 1 (ALT ≤ to 3 X ULN or bilirubin ≤ I to 1.5 X ULN) in≤3wk, resume at the next lower dose, discontinue if hepatotoxicity does not recover to ≤ 1, if hepatotoxicity results in a treatment delay of > 3 wk, or if grade 3 ALT or bilirubin occurs again despite one dose reduction; *grade 4 elevations in ALT (> 20 X ULN) or bilirubin (> 10 X ULN):* Permanently discontinue

**Available forms:** Tablet 40 mg

**Implementation:** Take with food at the same time every day

• Swallow tablets whole; do not chew, crush, or split

• If a dose is missed, do not replace the missed dose. Resume with the next scheduled daily dose

- Antidiarrheal prophylaxis is recommended during the first 2 cycles (56 days) of treatment and should be initiated with the first dose of neratinib; loperamide should be taken as directed next, titrating to 1 to 2 bowel movements/day; additional antidiarrheal agents may be required to manage patients with loperamide-refractory diarrhea

• Weeks 1 to 2 (days 1 to 14): Take loperamide 4 mg tid

• Weeks 3 to 8 (days 15 to 56): Take loperamide 4 mg bid

• Weeks 9 to 52 (days 57 to 365): Take loperamide 4 mg as needed (max 16 mg/day)

## ADVERSE EFFECTS

**GI:** *Diarrhea, abdominal pain, anorexia, nausea, vomiting*

**GU: Renal failure(rare)**

**INTEG:** *Rash*

**MS:** *Muscle cramps*

**MISC:** Infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding >99%; |
| **Metabolism** | Liver by CYP3A4, avoid with strong and moderate CYP3A4 inhibitors and inducers |
| **Excretion** | Fecal excretion 97.1% |
| **Half-life** | After 7 days was 14.6 hr half-life of active metabolites 21.6 hr, 13.8 hr, 10.4 hr, respectively |

## INTERACTIONS

Gastric acid reducing agents: void concomitant use with proton pump inhibitors (PPI) and H2-receptor antagonists, decreased effect, separate by 3 hr after antacid dosing

Strong or moderate CYP3A4 inhibitors: Increased neratinib effect, avoid concomitant use

Strong or moderate CYP3A4 inducers: Decreased neratinib effect, avoid concomitant use

P-glycoprotein (P-gp) substrates: Increased CNS and CV adverse reactions, monitor for adverse reactions of narrow therapeutic agents that are P-gp substrates

## NURSING CONSIDERATIONS

### Assessment

• **Hepatotoxicity:** Use with caution in those with preexisting hepatic disease; a dose reduction is required for patients with severe (Child-Pugh C) hepatic disease at baseline. Monitor LFTs (total bilirubin, AST, ALT, alkaline phosphatase) baseline, q mo X 3 mo and then q3mo thereafter and as needed. Monitor LFTs (including fractionated bilirubin and prothrombin time) in those experiencing grade 3 diarrhea or any signs of hepatotoxicity (fatigue, nausea, vomiting, right upper quadrant tenderness, fever, rash, eosinophilia)

• **Geriatrics** >65 yr: Monitor geriatric patients more closely for toxicities (vomiting, diarrhea, renal failure, dehydration) during treatment

• **Infection:** May occur after completion of adjuvant trastuzumab-based therapy, assess for urinary tract infection, cellulitis, and erysipelas
• **Pregnancy/breastfeeding:** Avoid by females of reproductive potential during treatment and for at least 1 mo after the last dose, can cause fetal harm or death when used during pregnancy; discontinue breastfeeding during treatment and for 1 mo after the final dose. It is not known whether present in breast milk. Obtain a pregnancy test before starting treatment. Males with female partners of reproductive potential should avoid pregnancy and use effective contraception during and ≥ 3 mo after the last dose

### Patient/family education

• *Infection:* May occur; to report urinary pain, hesitancy, skin redness, pain, heat; fever, shaking, chills
• **Pregnancy/breastfeeding:** Not to be used in pregnancy, breastfeeding, contraception should be used during and for at least 1 mo after last dose, men with a partner that may become pregnant should use contraception during and for at least 3 mo after last dose

### Evaluation

**Positive therapeutic outcome**
Decrease in size of cancerous tumor

**⚠ HIGH ALERT**

**RARELY USED**

## niraparib

(nye-rap'-a-rib)
**Zejula**
*Func. class.:* Antineoplastic

**USES:** For the treatment of recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer

## DOSAGE AND ROUTES

**Adult: PO** 300 mg qday until disease progression or unacceptable toxicity. Begin therapy no later than 8 wk after the last platinum-containing regimen

## ribociclib

(rye-boe-sye'-klib)
**Kisqali**
*Func. class.:* Antineoplastic
*Chem. class.:* Protein kinase inhibitors

**ACTION:** A cyclin-dependent kinase (CDK) 4 and 6 inhibitor. Regulates cell cycle progression through phosphorylation of the retinoblastoma protein. The combination of ribociclib and an antiestrogen such as letrozole inhibited tumor growth more than either agent alone. It is a protein kinase inhibitor

**USES:** For the initial endocrine-based treatment of hormone receptor (HR)-positive, HER2-negative advanced or metastatic breast cancer in combination with an aromatase inhibitor in postmenopausal women

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Breastfeeding, contraception requirements, hepatic disease, hepatotoxicity, infertility, neutropenia, pregnancy, pregnancy testing, reproductive risk, thromboembolic disease

## DOSAGE AND ROUTES

**For the initial endocrine-based treatment of hormone receptor (HR)-positive, HER2-negative advanced or metastatic breast cancer in combination with an aromatase inhibitor in postmenopausal women**
**Adult:** 600 mg qday on days 1 to 21, followed by 7 days of rest, in combination with letrozole (2.5 mg daily) or another aromatase inhibitor on days 1 to 28; repeat cycle q28days

**Available forms:** Tablets 200, 400, 600 mg

### Therapeutic drug monitoring

**Neutropenia:**
• ***ANC ≥ 1,000 cells/mm³ (grade 2 or less):*** No change
• ***ANC 500 cells/mm³ to 999 cells/mm³ (grade 3):*** Hold. For the first occurrence of grade 3 neutropenia, resume at the original dose level when the ANC returns to ≥ 1000 cells/mm³ (grade 2 or less); for recurrent grade 3 neutropenia, resume at the next lower dose level (reduce 600 mg to 400 mg; reduce 400 mg to 200 mg). If further dose reduction below 200 mg per day is required, discontinue
• ***ANC <500 cells/mm³ (grade 4):*** Hold. Resume at the next lower dose level when the ANC returns to ≥ 1000 cells/mm³ (grade 2 or less) (reduce 600 mg to 400 mg; reduce 400 mg to 200 mg). If further dose reduction below 200 mg per day is required, discontinue

**Neutropenic fever**
• ***ANC 500 cells/mm³ to 999 cells/mm³ (grade 3 neutropenia) with single episode of fever >38.3°C (or) above 38°C for more than 1 hr and/or concurrent infection:*** Hold, resume at the next lower dose level when the ANC returns to ≥ 1000 cells/mm³ (grade 2 or less) (reduce 600 mg to 400 mg; reduce 400 mg to 200 mg). If further dose reduction below 200 mg per day is required, discontinue

**QT prolongation**

• ***QTcF 481 to 500 msec and no serious arrhythmia:*** Hold, monitor ECG frequently. For the first occurrence, resume at the same dose when QTcF prolongation resolves to ≤480 msec; for a recurrence of QTcF >480 msec, resume at the next lower dose level (reduce 600 mg to 400 mg; reduce 400 mg to 200 mg). If further dose reduction below 200 mg per day is required, discontinue

• ***QTcF greater than 500 msec and no serious arrhythmia:*** Repeat ECG. If the QTcF >500 msec on at least 2 separate ECGs at the same visit, hold; monitor ECG more frequently. Resume at the next lower dose level (reduce 600 mg to 400 mg; reduce 400 mg to 200 mg) when QTcF prolongation resolves to ≤480 msec. If further dose reduction below 200 mg per day is required, discontinue

• ***QTcF >500 msec OR >60 msec change from baseline AND associated with torsades de pointes, polymorphic ventricular tachycardia, unexplained syncope, or signs/symptoms of serious arrhythmia:***

**Hepatic dose**

• *Mild hepatic impairment (Child-Pugh class A):* No change; *moderate to severe hepatic impairment (Child-Pugh class B or C):* Reduce the starting dose to 400 mg qday

• *AST/ALT greater than ULN to 3 times ULN (grade 1); total bilirubin less than 2 times ULN:* No change

• *AST/ALT 3.01 to 5 times ULN (grade 2); total bilirubin less than 2 times ULN:* If baseline hepatic impairment was grade 2, continue; monitor LFTs more frequently. If baseline was grade 0 or 1, hold. For the first occurrence of grade 2 hepatotoxicity, resume treatment at original dose, when AST/ALT resolve ≤ to baseline. For recurrent grade 2 hepatotoxicity, resume at the next lower dose level (reduce 600 mg to 400 mg; reduce 400 mg to 200 mg), monitor LFTs more frequently. If further dose reduction below 200 mg/day is required, discontinue

• *AST/ALT greater than 3 times ULN (greater than grade 2); total bilirubin GREATER than 2 times ULN (irrespective of baseline; in the absence of cholestasis):* Discontinue *AST/ALT 5.01 to 20 times ULN; (grade 3); total bilirubin less than 2 times ULN:* Hold. For the first occurrence of grade 3 hepatotoxicity, resume at the next lower dose level when AST/ALT recover to ≤ baseline grade (reduce 600 mg to 400 mg; reduce 400 mg to 200 mg). monitor LFTs more frequently. If further dose reduction below 200 mg per day is required, discontinue. Discontinue for recurrent grade 3 hepatotoxicity

• *AST/ALT greater than 20 times ULN (grade 4); total bilirubin less than 2 times ULN:* Discontinue

**Nephrotoxicity dosage adjustments**

***Serum creatinine (SCr) less than or equal to 3 times the upper limit of normal (ULN) or glomerular filtration rate (GFR) greater than or equal to 25% of the lower limit of normal (LLN) (grade 1 or 2):*** No change

***SCr 3.01 to 6 times ULN or GFR less than 25% of LLN (chronic dialysis not indicated) (grade 3):*** Hold. For the first occurrence of a grade 3, resume at the original dose ≤ grade 1; for a recurrent grade 3, resume at the next lower dose level (reduce 600 mg to 400 mg; reduce 400 mg to 200 mg). If further dose reduction below 200 mg per day is required, discontinue

***SCr greater than 6 times ULN or requiring chronic dialysis or renal transplant (grade 4):*** Discontinue

### Implementation

• Take ribociclib and letrozole at the same time every day, preferably in the morning

• Swallow tablets whole; do not chew, crush, or split. Not to take if broken, cracked

• If a dose is missed, or if the patient vomits, do not replace the missed dose. Resume with the next scheduled daily dose

## ADVERSE EFFECTS

**CV:** QT prolongation, peripheral edema

**GI:** Diarrhea, abdominal pain, anorexia, nausea, vomiting, constipation, stomatitis, weight loss

**CNS:** Fatigue, headache, insomnia

**MS:** Back pain

**Dermatologic:** *Alopecia, skin rash, pruritus*

**HEMA:** Leukemia, neutropenia

**MISC:** Infection

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Protein binding 70% |
| **Metabolism** | Extensively metabolized (CYP3A4) |
| **Excretion** | Unchanged drug 17% and 12% in feces and urine, respectively, |
| **Half-life** | 29.7-54.7 hr\fecal excretion 97.1% |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 1-4 hr |
| **Duration** | Unknown |

## INTERACTIONS

Drugs known to prolong QT interval: Increased QT prolongation, avoid concomitant use
Strong or moderate CYP3A4 inhibitors- Increased ribociclib effect, avoid concomitant use, if cannot be avoided, reduce dose
Strong or moderate CYP3A4 inducers: Decreased ribociclib effect, avoid concomitant use

### Drug/lab test

Increase: LFTs

### Drug/food

To avoid pomegranate/pomegranate juice, and grapefruit/ grapefruit juice
Nursing considerations
Assessment
• **Hepatotoxicity:** Including elevated transaminases with or without an elevation in total bilirubin, may occur in combination therapy with ribociclib plus letrozole. The median time to onset of ≥ grade 3 transaminase elevations was 57 days, with a median time to resolution to grade 2 or less of 24 days. Monitor LFTs baseline, q2wk for the first 2 cycles, before the next 4 cycles, and then as needed. A dose interruption, reduction, or discontinuation of therapy may be necessary. Use with caution in those with baseline hepatic disease; reduce dose in Child-Pugh class B or C hepatic disease
• **Bone marrow suppression:** Neutropenia is the most frequent. The median time to onset of grade 2 or higher neutropenia was 16 days, with the median time to resolution (to normalization or grade <3) of 15 days. Monitor a CBC baseline, q2wk for the first 2 cycles, before the next 4 cycles, and then as needed. A dose interruption, reduction, or discontinuation of therapy may be needed in those with an absolute neutrophil count (ANC) <1000 cells/mm$^3$;
• **Long QT syndrome:** Avoid the use in long QT syndrome, uncontrolled or significant cardiac disease (cardiac arrhythmias, recent MI, heart failure, unstable angina, bradycardia or bradyarrhythmias), electrolyte imbalance (hypomagnesemia, hypokalemia, hypocalcemia), with products causing prolonged QT interval or strongly inhibit CYP3A4, as this may lead to prolongation of the QTcF interval. Use with caution in conditions that increase the risk of QT prolongation (hypertension, CAD). Females, geriatric patients, diabetes mellitus, thyroid disease, malnutrition, alcoholism, or hepatic disease may also be at increased risk for QT prolongation. Assess ECG before starting therapy; do not start product if QTcF >450 msec. Repeat ECG at day 14 of the first cycle, at the beginning of the second cycle, and then as needed; prolongation of the QTcF interval may require interruption of therapy, dose reduction, or discontinuation of therapy. Monitor serum electrolytes (potassium, calcium, phosphorous and magnesium) baseline, at the beginning of the first 6 cycles, and as needed; correct electrolyte imbalances before starting product
• **Pregnancy/breastfeeding:** Avoid by females of reproductive potential during treatment and for at least 3 wk after the last dose, can cause fetal harm or death when used during pregnancy; discontinue breastfeeding during treatment and for 3 wk after the final dose. It is not known whether present in breast milk. Obtain a pregnancy test before starting treatment

### Patient/family education

• **Pregnancy/breastfeeding:** Not to be used in pregnancy, breastfeeding, contraception should be used during and for at 3 wk after last dose
• **Hepatotoxicity:** Patient should report immediately yellowing of skin or eyes, dark urine
• **QT Prolongation:** Teach patient the signs and symptoms of QT prolongation (irregular or rapid heartbeat, fainting). Advise to contact their health care provider immediately if any of these occur
• **Neutropenia:** Teach patient to immediately contact their health care provider if a fever occurs, usually may occur with an infection
• **Drug Interactions:** Teach patient to avoid pomegranate/pomegranate juice, and grapefruit/ grapefruit juice; to avoid strong CYP3A inhibitors, strong CYP3A inducers, and drugs known to prolong the QT interval; all OTC/RX and herbals, supplements should be approved by provider

### Evaluation

**Positive therapeutic outcome**
• Decrease in size of cancerous tumor

## safinamide

(sa-fin'-a-mide)
**Xadago**
*Func. class.:* Antiparkinson's agent
*Chem. class.:* MAO type B inhibitor

**ACTION:** The precise mechanism of action of safinamide in treating "off" episodes in Parkinson's disease is unknown; however, one mechanism may be related to its MAO-B inhibitory activity, which causes an increase in

dopamine levels centrally. The elevated dopamine levels and subsequent increased dopaminergic activity are likely to mediate the beneficial effects of safinamide

**USES:** For adjunctive treatment to levodopa-carbidopa therapy in patients with Parkinson's disease experiencing "off" episodes

## CONTRAINDICATIONS

Hypersensitivity, MAOI therapy

**Precautions:** Abrupt discontinuation, alcoholism, breastfeeding, pregnancy, cataracts, use with CNS depressants, dental work, diabetic retinopathy, hypertension, hepatic disease, impulse control problems, psychosis, schizophrenia, surgery, uveitis

## DOSAGE AND ROUTES

### For adjunctive treatment to levodopa-carbidopa therapy in patients with Parkinson's disease experiencing "off" episodes

**Adult: PO** 50 mg per day, initially. May increase after 2 wk to 100 mg qday, based on need and tolerability. Max: 100 mg/day.

**Available forms:** Tablet 50, 100 mg

### Implementation

- Give at the same time each day; may be given with or without food
- If a dose is missed, take the next dose at the usual time on the next day
- Food and drug interactions with safinamide can be serious. Patients should avoid foods/beverages containing large amounts of tyramine

## ADVERSE EFFECTS

**CNS:** Drowsiness, dyskinesia, insomnia, impulse control symptoms, neuroleptic malignant syndrome, psychosis, serotonin syndrome

**CV:** Orthostatic hypotension

**MISC:** Cough, dyspepsia, cataracts

### Pharmacokinetics

| | |
|---|---|
| **Absorption** | Unknown |
| **Distribution** | Not highly protein bound |
| **Metabolism** | Inhibits intestinal breast cancer resistance protein (BCRP) |
| **Excretion** | Excreted via kidneys 5% (unchanged), 76% recovered in the urine |
| **Half-life** | 20-26 hr |

### Pharmacodynamics

| | |
|---|---|
| **Onset** | Unknown |
| **Peak** | 2-3 hr |
| **Duration** | Unknown |

## INTERACTIONS

### Drug classifications

Anxiolytics, sedatives; hypnotics barbiturates: Increased severe somnolence, avoid using together

MAOIs, linezolid: Increased hypertension, hypertensive crisis, do not use within 14 days of these products

Some other opioids; SNRIs; tricyclic antidepressants and other cyclic antidepressants; triazolopyridine antidepressants; cyclobenzaprine; stimulants (methylphenidate, amphetamines): Increased serotonin syndrome, use the lowest dose

Decreased safinamide effects: Atypical antipsychotics

### Individual drugs

ALPRAZolam, clonazePAM, zolpidem, zaleplon: Increased severe somnolence, avoid using together

Meperidine, dextromethorphan: Increased serotonin syndrome, use lowest dose

## NURSING CONSIDERATIONS

### Assessment

- **Parkinson's disease:** Assess for changes before and during treatment; tremors, pin-rolling movement, balance, anxiety, drooling, depression, delusions, hallucinations, insomnia, shuffling gait; decreasing of "off" periods
- **Mental status:** Assess for affect, depression, mood, complete suicide assessment
- **Hypertension:** May cause hypertension, exacerbate preexisting hypertension, or cause hypertensive crisis. Monitor for new-onset hypertension or hypertension that is not adequately controlled after starting product, adjust dose if elevations in B/P are sustained, do not exceed max dose; monitor for hypertension if coadministered with sympathomimetics (prescription or nonprescription nasal, oral, and ophthalmic decongestants, cold preparations)
- **Drug interactions:** Review drug interactions before use. There are many serious reactions
- **Impulse control:** Inquire periodically about new or worsening impulse control symptoms, (gambling, increased sexual urges, binge eating, intense urges to spend money, or other intense urges); if these occur dose reduction or discontinuation may be needed
- **Pregnancy/breastfeeding:** May cause fetal harm, use in pregnancy only if the potential benefit outweighs fetal risk; do not use in breastfeeding, serious adverse reactions may occur
- **Hepatic disease:** Monitor LFTs baseline and periodically in those with hepatic disease

• Neuroleptic malignant syndrome-like symptoms: Assess for elevated temperature, muscular rigidity, altered consciousness, and autonomic instability, may occur with rapid dose reduction
• **Serotonin syndrome**: Assess for nausea, vomiting, sedation, dizziness, diaphoresis (sweating), facial flushing, mental status changes, myoclonus, restlessness, shivering, and hypertension. If serotonin syndrome occurs, any serotonergic agents should be discontinued

### Patient/family education

• **Impulse control:** Teach patient that impulse control symptoms, (gambling, increased sexual urges, binge eating, intense urges to spend money, or other intense urges) may occur, to report to provider
• **Pregnancy/breastfeeding:** Teach patient to report if pregnancy is planned or suspected or if breastfeeding
• Advise patient not to drive or engage in hazardous activities until result of product is known, drowsiness may occur
• Advise patient to change position slowly to prevent orthostatic hypotension
• Teach patient to use product as prescribed, if discontinued abruptly, neuroleptic malignant syndrome-like symptoms may occur, taper gradually
• Advise patient to use physical activity to maintain mobility, lessen spasms

### Evaluation

**Positive therapeutic outcome**
• Decreased "off" periods in Parkinson's disease

**RARELY USED**

## secnidazole

**Solosec**
*Func. class.:* Antiinfective

**USES:** For the treatment of bacterial vaginosis

## DOSAGE AND ROUTES

**Adult: PO** 2 g PO as a single dose

**RARELY USED**

## semaglutide

**Ozempic**
*Func. class.:* Antidiabetic

**USES:** For the treatment of type 2 diabetes

## DOSAGE AND ROUTES

**For the treatment of type 2 diabetes mellitus in combination with diet and exercise**

**Adult: SUBCUT** Initially, 0.25 mg every 7 days (weekly), give at any time of day, with or without meals; after 4 wk increase the dose to 0.5 mg qwk

**⚠ HIGH ALERT**
**RARELY USED**

## sonidegib

**Odomzo**
*Func. class.:* Antineoplastic

**USES:** Locally advanced basal cell carcinoma that has recurred after surgery or radiation therapy or in those who are not candidates for surgery or radiation therapy

## CONTRAINDICATIONS

Hypersensitivity

### Precautions

**BLACK BOX WARNING:** Pregnancy, intrauterine fetal death, contraceptive requirement

## DOSAGE AND ROUTES

**Adult: PO** 200 mg qday until disease progression or unacceptable toxicity; take on an empty stomach ≥ 1 hr before or 2 hr after a meal. Avoid use with strong CYP3A inhibitors or strong and moderate CYP3A inducers

**Available forms: Cap 200 mg**

**⚠ HIGH ALERT**
**RARELY USED**

## tisagenlecleucel

(tid'-suh-jen-lek'-loo-sel)
**Kymriah**
*Func. class.:* Antineoplastic

**USES:** For the treatment of refractory B-cell precursor acute lymphoblastic leukemia

## DOSAGE AND ROUTES

**Adult: ≤ 25 yr, adolescent, child, infant, and neonate: IV** (> 50 kg), infuse a single dose of 0.1 to 2.5 × $10^8$ CAR-positive viable T-cells (non-weight based); (≤ 50 kg) infuse a single dose of 0.2 to 5 × $10^6$ CAR-positive viable T-cells per kg of body weight. Give at 2 to 14 days after the completion of lymphocyte depletion with fludarabine and cyclophosphamide

**RARELY USED**

## valbenazine

(val-ben′-a-zeen)
**Ingrezza**
*Func. class.:* CNS agent; monoamine depletor

**USES:** For the treatment of tardive dyskinesia

## DOSAGE AND ROUTES

Adult: **PO** Initially, 40 mg qday, after 1 wk, increase to 80 mg qday. Continuation of 40 mg qday may be considered for some patients

# Appendix B

**Visine L.R.**

**tetrahydrozoline (OTC)**
(tet-ra-hye-dro′zoe-leen)
**Visine Original**

**MISCELLANEOUS OPHTHALMICS**

**bimatoprost (Rx)**
(bih-mat′o-prost)
**Latisse, Lumigan**

**latanoprost (Rx)**
(la-tan′oh-prost)
**Xalatan**

**travoprost (Rx)**
(tra′voe-prost)
**Travatan**

**unoprostone (Rx)**
(yoo-noe-pros′tone)
**Rescula**

## β-ADRENERGIC BLOCKERS

**ACTION:** Reduces production of aqueous humor by unknown mechanism

**USES:** Ocular hypertension, chronic open angle glaucoma

## ANESTHETICS

**ACTION:** Decreases ion permeability by stabilizing neuronal membrane

**USES:** Cataract extraction, tonometry, gonioscopy, removal of foreign objects, corneal suture removal, glaucoma surgery (ophthalmic); pruritus, sunburn, toothache, sore throat, cold sores, oral pain, rectal pain and irritation, control of gagging (topical)

## ANTIINFECTIVES

**ACTION:** Inhibits folic acid synthesis by preventing PABA use, which is necessary for bacterial growth

**USES:** Conjunctivitis, superficial eye infections, corneal ulcers, prophylaxis against infection after removal of foreign matter from the eye

## ANTIINFLAMMATORIES

**ACTION:** Decreases inflammation, resulting in decreased pain, photophobia, hyperemia, cellular infiltration

**USES:** Inflammation of eye, eyelids, conjunctiva, cornea; uveitis, iridocyclitis, allergic conditions, burns, foreign bodies, postoperatively in cataract

## CARBONIC ANHYDRASE INHIBITOR

**ACTION:** Converted to EPINEPHrine, which decreases aqueous production and increases outflow

**USES:** Open angle glaucoma, ocular hypertension

## DIRECT-ACTING MIOTIC

**ACTION:** Acts directly on cholinergic receptor sites; induces miosis, spasm of accommodation, fall in intraocular pressure, caused by stimulation of ciliary, pupillary sphincter muscles, which leads to pulling away of iris from filtration angle, resulting in increased outflow of aqueous humor

**USES:** Primary glaucoma, early stages of wide angle glaucoma (less useful in advanced stages), chronic open angle glaucoma, acute closed angle glaucoma before emergency surgery; also neutralizes mydriatics used during eye exam; may be used alternately with mydriatics to break adhesions between iris and lens

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children, aphakia, hypersensitivity to carbonic anhydrase inhibitors, sulfonamides, thiazide diuretics, ocular inhibitors, renal/hepatic insufficiency

### Implementation

- Storage at room temperature away from light

## ADVERSE EFFECTS
**CNS:** Headache
**CV:** Hypertension, tachycardia, dysrhythmias
**EENT:** Burning, stinging
**GI:** Bitter taste

## NURSING CONSIDERATIONS
### Assessment
- Monitor ophthalmic exams and intraocular pressure readings
- Monitor blood counts; renal/hepatic function tests and serum electrolytes during long-term treatment

### Patient/family education
- Teach how to instill drops
- Advise patient that product may cause burning, itching, blurring, dryness of eye area

### Evaluation
**Positive therapeutic outcome**
- Absence of increased intraocular pressure

## *NASAL AGENTS*

**NASAL ANTIHISTAMINES**

**olopatadine (Rx)**
(oh-low-pat′uh-deen)
**Patanase**

**NASAL DECONGESTANTS**

**azelastine (Rx)**
(ay-zell′ah-steen)
**Astepro**

**EPINEPHrine (OTC)**
(ep-i-neff′rin)
**Adrenalin Nasal Solution**

**oxymetazoline (OTC)**
(ox-i-met-az′oh-leen)
**Afrin No Drip, Dristan 12-HR Nasal Spray, Mucinex Moisture, Mucinex Sinus-Max, Vicks Sinex, Vicks QlearQuil**

**phenylephrine (OTC)**
(fen-ill-eff′rin)
**4-Way Nasal Spray, Neo-Synephrine**

**tetrahydrozoline (OTC)**
(tet-ra-hye-dro′zoe-leen)
**Tyzine, Tyzine Pediatric**

**NASAL STEROIDS**

**beclomethasone (Rx)**
(be-kloe-meth′a-sone)
**Beconase AQ Nasal, Qnasl**

**budesonide (Rx)**
(byoo-des′oh-nide)
**Rhinocort Aqua**

**flunisolide (Rx)**
(floo-niss′oh-lide)

**fluticasone (Rx)**
(floo-tic′a-son)
**Veramyst**

**triamcinolone (Rx)**
(trye-am-sin′oh-lone)
**Allergy 24 HR Nasal Spray, Nasacort**

**NONSTEROIDAL ANTIINFLAMMATORY**

**ketorolac (Rx)**
(kee′toe-role-ak)
**Sprix**

**ACTION:** Produces vasoconstriction (rapid, long acting) of arterioles, thereby decreasing fluid exudation, mucosal engorgement by stimulation of α-adrenergic receptors in vascular smooth muscle

**Therapeutic outcome:** Absence of nasal congestion

**USES:** Nasal congestion

## CONTRAINDICATIONS
Hypersensitivity to sympathomimetic amines

**Precautions:** Pregnancy, children <6 yr, geriatric, diabetes, CV disease, hypertension, hyperthyroidism, increased ICP, prostatic hypertrophy, glaucoma

## DOSAGE AND ROUTES
### Implementation
- Have patient tilt head back, squeeze bulb to create a vacuum, and draw correct amount of sol into dropper; insert 2 gtt of sol into nostril; repeat in other nostril
- Store in light-resistant container; do not expose to high temperature or let sol come into contact with aluminum
- Give for <4 consecutive days
- Provide environmental humidification to decrease nasal congestion, dryness

## ADVERSE EFFECTS
**CNS:** Anxiety, restlessness, tremors, weakness, insomnia, dizziness, fever, headache
**EENT:** Irritation, burning, sneezing, stinging, dryness, rebound congestion
**GI:** Nausea, vomiting, anorexia
**INTEG:** Contact dermatitis

## NURSING CONSIDERATIONS
### Assessment
- Assess for redness, swelling, pain in nasal passages before, during treatment

• Assess for systemic absorption; hypertension, tachycardia; notify prescriber; systemic absorption occurs at high doses or after prolonged use

### Patient/family education

• Advise patient that stinging may occur for several applications; drying of mucosa may be decreased by environmental humidification
• Caution patient to notify prescriber if irregular pulse, insomnia, dizziness, or tremors occur
• Teach patient proper administration to avoid systemic absorption
• Advise patient to rinse dropper with very hot water to prevent contamination

### Evaluation

**Positive therapeutic outcome**
• Decreased nasal congestion

## TOPICAL GLUCOCORTICOIDS

**betamethasone (Rx)**
(bay-ta-meth'a-sone)
**Beben, Betacort, Betanate, Betnovate, Celestoderm, Del-Beta, Ectosone, Metaderm**

**betamethasone (augmented) (Rx)**
(bay-ta-meth'a-sone)
**Diprolene AF**

**clobetasol (Rx)**
(kloe-bay'ta-sol)
**Clobex, Cormax, Dermovate, Olux Topical Foam, Temovate**

**desonide (Rx)**
(dess'oh-nide)
**Desonate, DesOwen, LoKara, Verdeso Foam**

**desoximetasone (Rx)**
(dess-ox-i-met'a-sone)
**Topicort**

**fluocinolone (Rx)**
(floo-oh-sin'oh-lone)
**Derma-Smoothe/FS oil, Lidemol, Lyderm, Synalar, Topsyn**

**flurandrenolide (Rx)**
(flure-an-dren'oh-lide)
**Cordran, Drenison 1/4, Drenison Tape**

**fluticasone (Rx)**
(floo-tik'a-sone)
**Cutivate**

**halcinonide (Rx)**
(hal-sin'oh-nide)
**Halog**

**hydrocortisone (Rx)**
(hye-droe-kor'ti-sone)
**Barriere-HC, CaldeCORT Cortacet, Cortalo, Cortate, Cortef, Corticreme, Cortifoam, Cortoderm, Hyderm, Instacort, Neosporin Eczema Anti-Itch, Novo Hydrocort, Nutracort , Nuzon, Sarna HC, Unicort**

**triamcinolone (Rx)**
(trye-am-sin'oh-lone)
**Dermasorb TA, Kenalog, Pediaderm TA, Trianide, Triderm**

**ACTION:** Antipruritic, antiinflammatory

**Therapeutic outcome:** Decreased itching, inflammation

**USES:** Psoriasis, eczema, contact dermatitis, pruritus; usually reserved for severe dermatoses that have not responded to less potent formulation

### CONTRAINDICATIONS

Hypersensitivity, viral infections, fungal infections

**Precautions:** Pregnancy

### DOSAGE AND ROUTES

**Adult and child:** Apply to affected area

#### Implementation

• Apply only to affected areas; do not get in eyes
• Apply and leave site uncovered or lightly covered; occlusive dressing is not recommended—systemic absorption may occur
• Use only on dermatoses; do not use on weeping, denuded, or infected area
• Cleanse area before application of product
• Continue treatment for a few days after area has cleared
• Store at room temperature

### ADVERSE EFFECTS

**INTEG:** *Acne, atrophy, epidermal thinning, purpura, striae*

### NURSING CONSIDERATIONS

#### Assessment

• Monitor temp; if fever develops, product should be discontinued
• Monitor for systemic absorption, increased temp, inflammation, irritation

### Patient/family education
- Teach patient to avoid sunlight on affected area; burns may occur
- Teach patient to limit treatment to 14 days

### Evaluation
**Positive therapeutic outcome**
- Absence of severe itching, patches on skin, flaking

## TOPICAL ANTIFUNGALS

**clotrimazole (OTC)**
(kloe-trye′ma-zole)
**Canesten, Clotrimaderm, Cruex, Crux, Desenex, Lotrimin AF, Myclo, Neo-Zol**

**econazole (OTC)**
(ee-kon′a-zole)
**Ecoza**

**efinaconazole**
(ef′in-a-kon′a-zole)
**Jublia**

**ketoconazole (OTC)**
(kee-toe-kon′a-zole)
**Extina, Ketodan, Kuric, Xolegel**

**luliconazole**
(loo′li-kon′a-zole)
**Luzu**

**miconazole (OTC)**
(mye-kon′a-zole)
**Antifungal, Azolen, Baza, Cruex, Lotrimin AF, Micaderm, Novana, Triple Paste AF, Zeasorb-AF**

**nystatin (OTC)**
(nye-stat′in)
**Nodostine, Nyamyc, Nyaderm, Nystop, Pediaderm AF**

**selenium (OTC)**
(see-leen′ee-um)

**tavaborole**
(ta′va-bor′ole)
**Kerydin**

**terbinafine (OTC)**
(ter-bin′a-feen)
**LamISIL**

**tolnaftate (OTC)**
(tole-naf′tate)
**Absorbine Athlete's Foot Cream, Lamasil AF Topical Spray, Ting**

**undecylenic acid (OTC)**
(un-deh-sih-len′ik)

**ACTION:** Interferes with fungal cell membrane permeability

**Therapeutic outcome:** Absence of itching and white patches of the skin

**USES:** Tinea cruris, tinea pedis, diaper rash, minor skin irritations; amphotericin B is used for *Candida* infections

## CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children

## DOSAGE AND ROUTES
Massage into affected area, surrounding area daily or bid, continue for 7-14 days, max 4 wk

### Implementation
- Apply to affected area, surrounding area; do not cover with occlusive dressings
- Store below 30° C (86° F)

## ADVERSE EFFECTS
**INTEG:** Burning, stinging, dryness, itching, local irritation

## NURSING CONSIDERATIONS
### Assessment
- Assess skin for fungal infections: peeling, dryness, itching before, throughout treatment
- Assess for continuing infection; increased size, number of lesions

### Patient/family education
- Instruct to apply with glove to prevent further infection; not to cover with occlusive dressings
- Teach patient that long-term therapy may be needed to clear infection (2 wk-6 mo depending on organism); compliance is needed even after feeling better
- Teach patient proper hygiene: hand-washing technique, nail care, use of concomitant top agents if prescribed
- Caution patient to avoid use of OTC creams, ointments, lotions unless directed by prescriber
- Instruct patient to use medical asepsis (hand washing) before, after each application; to change socks and shoes once a day during treatment of tinea pedis
- Advise patient to report to health care prescriber if infection persists or recurs; if blisters, burning, oozing, swelling occur
- Caution patient to avoid alcohol because nausea, vomiting, hypertension may occur
- Caution patient to use sunscreen or avoid direct sunlight to prevent photosensitivity
- Advise patient to notify prescriber of sore throat, fever, skin rash, which may indicate overgrowth of organisms

### Evaluation

**Positive therapeutic outcome**
- Decrease in size, number of lesions

## TOPICAL ANTIINFECTIVES

**azelaic acid (Rx)**
(a-zuh-lay'ic)
**Azelex, Finacea**
**bacitracin (OTC)**
(bass-i-tray'sin)
**Bacitin**
**clindamycin (Rx)**
(klin-da-my'sin)
**Cleocin T, Clindacin ETZ, Clindacin PAC, Evocin**
**erythromycin (Rx, OTC)**
(er-ith-roe-mye'sin)
**Emgel, Emcin Clear, Ery, Erygel**
**gentamicin (Rx)**
(jen-ta-mye'sin)
**mafenide (Rx)**
(ma'fe-nide)
**Sulfamylon**
**metroNIDAZOLE (Rx)**
(met-roh-nye'da-zole)
**MetroGel, MetroCream, Noritate, Rosadan**
**mupirocin (Rx)**
(myoo-peer'oh-sin)
**Bactroban, Centany**
**retapamulin (Rx)**
(re-tap'a-mue'lin)
**Altabax**
**salicylic acid (Rx)**
(sal'i-sil'ik)
**Bensal HP, Demarest, Keralyt, Salacyn, Salvax, UltraSal-ER**
**silver sulfADIAZINE (Rx)**
(sul-fa-dye'a-zeen)
**Flamazine, Silvadene, SSD, Thermazene**
**tretinoin (Rx)**
(treh'tih-noyn)
**Atralin, Avita, Refissa, Retin-A, Rrnova, Tretin-X**

**ACTION:** Interferes with bacterial protein synthesis

**Therapeutic outcome:** Resolution of infection

**USES:** Skin infections, minor burns, wounds, skin grafts, primary pyodermas, otitis externa

### CONTRAINDICATIONS
Hypersensitivity, large areas, burns, ulcerations

**Precautions:** Pregnancy, breastfeeding, impaired renal function, external ear or perforated eardrum

### Implementation
- Apply enough medication to cover lesions completely
- Apply after cleansing with soap, water before each application; dry well
- Apply to less than 20% of body surface area when patient has impaired renal function
- Store at room temperature in dry place

### ADVERSE EFFECTS
**INTEG:** Rash, urticaria, scaling, redness

### NURSING CONSIDERATIONS
#### Assessment
- Assess for allergic reaction: burning, stinging, swelling, redness
- Assess for signs of nephrotoxicity or ototoxicity

### Evaluation

**Positive therapeutic outcome**
- Decrease in size, number of lesions

## TOPICAL ANTIVIRALS

**acyclovir (Rx)**
(ay-sye'kloe-ver)
**Zovirax Topical**
**penciclovir (Rx)**
(pen-sye'kloe-ver)
**Denavir**

**ACTION:** Interferes with viral DNA replication

**Therapeutic outcome:** Resolution of infection

**USES:** Simple mucocutaneous herpes simplex, in immunocompromised clients with initial herpes genitalis

### CONTRAINDICATIONS
Hypersensitivity

**Precautions:** Pregnancy, breastfeeding

### Implementation
- Apply with finger cot or rubber glove to prevent further infection
- Apply enough medication to cover lesions completely

• Apply after cleansing with soap, water before each application; dry well
• Store at room temperature in dry place

## ADVERSE EFFECTS

**INTEG:** Rash, urticaria, stinging, burning, pruritus, vulvitis

## NURSING CONSIDERATIONS

### Assessment

• Assess for allergic reaction: burning, stinging, swelling, redness, rash, vulvitis, pruritus
• Assess for signs of nephrotoxicity or ototoxicity

### Patient/family education

• Teach patient not to use in eyes or when there is no evidence of infection
• Advise patient to apply with glove to prevent further infection
• Advise patient to avoid use of OTC creams, ointments, lotions unless directed by prescriber
• Advise patient to use medical asepsis (hand washing) before, after each application and avoid contact with eyes
• Advise patient to adhere strictly to prescribed regimen to maximize successful treatment outcome
• Advise patient to begin using product when symptoms arise

### Evaluation

**Positive therapeutic outcome**
• Decrease in size, number of lesions

## TOPICAL ANESTHETICS

**benzocaine (OTC)**
(ben′zoe-kane)
**Americaine Anesthetic, Anbesol Maximum Strength, Boil-Ease, Orajel**

**dibucaine (OTC)**
(dye′byoo-kane)
**Nupercainal**

**lidocaine (Rx, OTC)**
(lye′doe-kane)
**EnovaRx, Glydo, Lidomar, LidoRx, LTA, Solarcaine, Zilactin-L**

**pramoxine (OTC)**
(pra-mox′een)
**Prax, Proctofoam**

**tetracaine (OTC, Rx)**
(tet′ra-cane)
**Pontocaine, Viractin**

**ACTION:** Inhibits conduction of nerve impulses from sensory nerves

**Therapeutic outcome:** Decreasing inflammation, itching, pain

**USES:** Oral irritation, sore throat, toothache, cold sore, canker sore, sunburn, minor cuts, insect bites, pain, itching

## CONTRAINDICATIONS

Hypersensitivity, infants <1 yr, application to large areas

**Precautions:** Pregnancy, children <6 yr, sepsis, denuded skin

## DOSAGE AND ROUTES

**Adult and child:** TOP apply qid as needed; RECT insert tid and after each BM

### Implementation

• Store in tight, light-resistant container; do not freeze, puncture, or incinerate aerosol container

## ADVERSE EFFECTS

**INTEG:** Rash, irritation, sensitization

## NURSING CONSIDERATIONS

### Assessment

• Assess pain: location, duration, characteristics before, after administration
• Assess for infection: redness, drainage, inflammation; this product should not be used until infection is treated

### Patient/family education

• Teach patient to avoid contact with eyes
• Teach patient not to use for prolonged periods: use for <1 wk; if condition remains, prescriber should be contacted

### Evaluation

**Positive therapeutic outcome**
• Decreased redness, swelling, pain

## TOPICAL MISCELLANEOUS

**docosanol (OTC)**
(doh-koh′sah-nohl)
**Abreva**

**pimecrolimus (Rx)**
(pim-eh-kroh-ly′mus)
**Elidel**

**oxymetazoline hydrochloride (Rx)**
(ox-EE-meh-taz-oh-lin)
**Rhofade**

**ACTION:** Docosanol unknown; pimecrolimus may bind with macrophilin and inhibit calcium-dependent phosphatase

**Therapeutic outcome:** Decreased redness, swelling, pain

**USES:** Docosanol applied to fever blisters to promote more rapid healing; pimecrolimus used to treat mild to moderate atopic dermatitis in nonimmunocompromised patients ≥2 yr who are unresponsive to other treatment

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, dermal infections

## DOSAGE AND ROUTES

### Docosanol

**Adult:** TOP rub into blisters 5 ×/day until healing occurs

### Pimecrolimus

**Adult and child ≥2 yr:** TOP apply thin layer 2 ×/day and rub in; use as long as needed

### Implementation

- Apply to skin, rub in gently

## ADVERSE EFFECTS

### Docosanol

NONE known

### Pimecrolimus

**INTEG:** Burning

## NURSING CONSIDERATIONS

### Assessment

- Assess skin condition (color, pain, inflammation) before, after administration
- Assess for signs and symptoms of skin infections (redness, draining lesions); if present, avoid use of product (pimecrolimus)

### Patient/family education

- Advise patient to avoid contact between medication and eyes
- Instruct patient to discontinue use of product when condition clears

### Evaluation

**Positive therapeutic outcome**

- Decreased inflammation, redness

# VAGINAL ANTIFUNGALS

**butoconazole (OTC)**
(byoo-toh-kone′ah-zole)
**Gynazol-1**
**clotrimazole (OTC)**
(kloe-trye′ma-zole)
**Canesten, Gyne-Lotrimin 3, Gyne-Lotrimin 7, Myclo**
**miconazole (OTC)**
(mye-kon′a-zole)
**Monistat 3, Monistat 7**
**terconazole (OTC)**
(ter-kone′ah-zole)
**Terazol 7, Tetrazol 3, Zazole**
**tioconazole (OTC)**
(tye-oh-kone′ah-zole)
**Gyne-Trosyd, Monistat 1, Vagistat-1**

**ACTION:** Interferes with fungal DNA replication; binds sterols in fungal cell membranes, which increases permeability, leaking of nutrients

**Therapeutic outcome:** Fungistatic/fungicidal against susceptible organisms: *Candida* only

**USES:** Vaginal, vulval, vulvovaginal candidiasis (moniliasis)

## CONTRAINDICATIONS

Hypersensitivity

**Precautions:** Pregnancy, breastfeeding, children <2 yr

### Implementation

**Topical route**

- Administer one full applicator every night high into the vagina
- Store at room temperature in dry place

## ADVERSE EFFECTS

**GU:** Vulvovaginal burning, itching, pelvic cramps
**INTEG:** Rash, urticaria, stinging, burning
**MISC:** *Headache,* body pain

## NURSING CONSIDERATIONS

### Assessment

- Assess for allergic reaction: burning, stinging, itching, discharge, soreness

### Patient/family education

- Instruct patient in asepsis (hand washing) before, after each application
- Teach patient to apply with applicator only; to avoid use of any other vaginal product unless directed by prescriber; sanitary napkin may prevent soiling of undergarments
- Instruct patient to abstain from sexual intercourse until treatment is completed; reinfection and irritation may occur
- Advise patient to notify prescriber if symptoms persist

### Evaluation

**Positive therapeutic outcome**
- Decrease in itching or white discharge (vaginal)

## OTIC ANTIINFECTIVES

### ciprofloxacin (Rx)

(sip′roe-flox′a-sin)
**Cetraxal, Ofloxacin, Otiprio**

**ACTION:** Inhibits protein synthesis in susceptible microorganisms

**USES:** Ear infection (external), short-term use

## CONTRAINDICATIONS

Hypersensitivity, perforated eardrum

**Precautions:** Pregnancy

### Implementation

- After removing impacted cerumen by irrigation
- After cleaning stopper with alcohol
- After restraining child if necessary
- After warming sol to body temp

## ADVERSE EFFECTS

**EENT:** Itching, irritation in ear
**INTEG:** Rash, urticaria

## NURSING CONSIDERATIONS

### Assessment

- Assess for redness, swelling, fever, pain in ear, which indicates superinfection

### Patient/family education

- Teach patient correct method of instillation using aseptic technique, including not touching dropper to ear
- Inform patient that dizziness may occur after instillation

### Evaluation

**Positive therapeutic outcome**
- Decreased ear pain

## Appendix C Vaccines and toxoids

| GENERIC NAME | TRADE NAME | USES | DOSAGE AND ROUTES | CONTRAINDICATIONS |
|---|---|---|---|---|
| anthrax vaccine | BioThrax | Pre-/postexposure prophylaxis | **Preexposure**<br>Adult: SUBCUT 0.5 ml at 0, 2, 4 wk, then 0.5 ml at 6, 12, 18 mo<br>**Postexposure**<br>Adult: SUBCUT 0.5 ml 0, 2, 4 wk, with antibiotics | Hypersensitivity |
| BCG vaccine | TICE BCG | TB exposure | Adult and child >1 mo: 0.2-0.3 ml<br>Child <1 mo: Reduce dose by 50% using 2 ml of sterile water after reconstituting | Hypersensitivity, hypogamma-globulinemia, positive TB test, burns |
| diphtheria and tetanus toxoids, adsorbed | Tenivac | Induces antitoxins to provide immunity to diphtheria and tetanus | Adult and child ≥7 yr: IM (adult strength) 0.5 ml q4-8wk × 2 doses, then 3rd dose 6-12 mo after 2nd dose, booster IM 0.5 ml q10yr<br>Child 1-6 yr: IM (pediatric strength) 0.5 ml q4wk × 2 doses, booster 6-12 mo after 2nd dose<br>Infant 6 wk-1 yr: IM (pediatric strength) 0.5 ml q4wk × 3 doses, booster 6-12 mo after 3rd dose | Hypersensitivity to mercury, thimerosal; immunocompromised patients; radiation; corticosteroids; acute illness |
| diphtheria and tetanus toxoids and whole-cell pertussis vaccine (DPT, DTP) | DTwP, Tr-Immunol | Prevention of diphtheria, tetanus, pertussis | Doses vary<br>Check product information | Hypersensitivity, active infection, poliomyelitis outbreak, immunosuppression, febrile illness |
| diphtheria and tetanus toxoids and acellular pertussis vaccine | Adacel, Boostrix, Daptacel, Infranrix | | | |
| diphtheria, tetanus, pertussis, haemophilus, polio IPV | Pentacel | Immunity to diphtheria, tetanus, pertussis, haemophilus, polio IPV | Infant >6 wk and child ≤5 yr: IM 0.5 ml at 2, 4, 6, and 15-18 mo | Hypersensitivity, polio outbreak, acute infection, immunosuppression |
| diphtheria, tetanus, pertussis, polio vaccine IPV | Kinrix, Quadracel | Immunity to diphtheria, tetanus, pertussis, polio vaccine IPV | Child: IM 0.5 ml | Hypersensitivity, polio outbreak, acute infection, immunosuppression |

*Continued*

## Appendix C Vaccines and toxoids—cont'd

| GENERIC NAME | TRADE NAME | USES | DOSAGE AND ROUTES | CONTRAINDICATIONS |
|---|---|---|---|---|
| H1N1 influenza A (swine flu) virus vaccine | Influenza A (H1N1) | Immunity to H1N1 | Adult <50 yr, adolescent, child ≥2 yr: Intranasal 1 dose (roughly 0.1 ml) into each nostril; child 2-9 repeat dose ≥4 wk later<br>Adult, adolescent, child ≥3 yr: IM 0.5 ml as a single dose; child 3-9 yr repeat dose ≥4 wk later (Sanofi) (CSL); child 4-9 yr repeat dose ≥4 wk later (Novartis); infants ≥6 mo, child <36 mo: IM 0.25 ml, repeat in 4 wk (Sanofi)<br>Adult: IM 0.5 ml as a single dose (GSK) | |
| haemophilus b conjugate vaccine, diphtheria $CRM_{197}$ protein conjugate (HbOC) | HibTITER | Polysaccharide immunization of children 2-6 yr against *H. influenzae* b, conjugate | **HibTITER (IM only)**<br>Child: IM 0.5 ml<br>Child 2-6 mo: 0.5 ml q2mo × 3 inj | Hypersensitivity, febrile illness, active infection |
| haemophilus b conjugate vaccine, meningococcal protein conjugate (PRP-OMP) | PedvaxHIB | Immunization of child 2, 4, 6 mo | Child 7-11 mo: Previously unvaccinated 0.5 ml q2mo inj<br>Child 12-14 mo: Previously unvaccinated 0.5 ml × 1 inj<br>**PedvaxHIB (IM only)**<br>Child 2-14 mo: 0.5 ml × 2 inj at 2, 4 mo of age (6 mo dose not needed), then booster at 12-18 mo against invasive disease<br>Child ≥15 mo: Previously unvaccinated 0.5 ml inj | |
| hepatitis A vaccine, inactivated | Havrix, VAQTA | Active immunization against hepatitis A virus | Adult: IM 1440 EL units (Havrix) or 50 units (VAQTA) as a single dose; booster dose is the same given at 6, 12 mo<br>Child 2-18 yr: IM 720 EL units (Havrix) or 25 units (VAQTA) as a single dose, booster dose is the same given at 6, 12 mo | Hypersensitivity |
| hepatitis B vaccine, recombinant | Engerix-B, Recombivax HB | Immunization against all subtypes of hepatitis B virus | Varies widely | Hypersensitivity to this vaccine or yeast |
| human papillomavirus recombinant vaccine, quadrivalent | Gardasil | Prevention of HPV types 6, 11, 16, 18, cervical cancer, genital warts, precancerous dysplastic lesions, anal cancer/anal intraepithelial neoplasia | Adult up to 26 yr and child >9 yr to 26 yr: IM give as 3 separate doses; 1st dose as elected; 2nd dose 2 mo after 1st dose; 3rd dose 6 mo after 1st dose | Child <9 yr, pregnancy, breastfeeding, geriatric, active disease, hypersensitivity |

| | | | | |
|---|---|---|---|---|
| influenza virus vaccine | Afluria, FluMist, Fluvirin, Fluzone | Prevention of seasonal influenza | Adult and child >12 yr: IM 0.5 ml in 1 dose<br>Adult 18-64 yr: ID 0.1 ml as a single dose<br>Child 3-12 yr: IM 0.5 ml, repeat in 1 mo (split) unless 1978-1985 vaccine was given; also given nasal<br>Child 6 mo to 3 yr: IM 0.25 ml, repeat in 1 mo (split) unless 1978-1985 vaccine was given; also given nasal child ≤2 yr | Hypersensitivity, active infection, chicken egg allergy, Guillain-Barré syndrome, active neurologic disorders |
| Japanese encephalitis virus vaccine, inactivated | Ixiaro | Active immunity against Japanese encephalitis (JE) | Adult/child >3 yr: IM 0.5 ml (deltoid), then 0.5 ml 28 days later. Give the second dose ≥1 wk before potential exposure<br>Child ≥2 mo to <3 yr: IM 0.25 ml (anterolateral aspect of the thigh or deltoid for children 1-2 yr with adequate muscle mass), then 0.25 ml 28 days later | Hypersensitivity to murine, thimerosal; allergic reactions to previous dose |
| measles, mumps, and rubella vaccine, live | M-M-R-II | Prevention of measles, mumps, rubella | Adult: SUBCUT 1 vial; 2 vials separated by 1 mo, in person born after 1957<br>Child >15 mo and adult: SUBCUT 0.5 ml | Hypersensitivity, blood dyscrasias, anemia, active infection, immunosuppression; egg, chicken allergy; pregnancy, febrile illness, neomycin allergy, neoplasms |
| measles, mumps, rubella, varicella | ProQuad | Immunity to measles, mumps, rubella, varicella | Child: SUBCUT 0.5 ml | Hypersensitivity to eggs, neomycin, cancer, radiation, corticosteroids, blood dyscrasias, active untreated TB |
| meningococcal polysaccharide vaccine | Menomune-A/C | Prophylaxis to meningococcal meningitis | Adult and child >2 yr: SUBCUT 0.5 ml | Hypersensitivity to thimerosal, pregnancy, acute illness |
| pneumococcal 7-valent conjugate vaccine | Prevnar | Immunity against *Streptococcus pneumoniae* | Child: IM 0.5 ml ×3 doses (7-11 mo); × 2 doses (12-23 mo); × 1 dose >2-9 yr | Hypersensitivity to diphtheria toxoid or this product |
| pneumococcal vaccine, polyvalent | Pneumovax 23 | Pneumococcal immunization | Adult and child >2 yr: IM/SUBCUT 0.5 ml | Hypersensitivity, Hodgkin's disease, ARDS |
| poliovirus vaccine (IPV) | IPOL | Prevention of polio | Adult and child >2 yr: PO 0.5 ml, given q8wk × 2 doses, then 0.5 ml ½-1 yr after dose 2<br>Infant: PO 0.5 ml at 2, 4, 18 mo; booster at 4-6 yr; may also be given: IPV at 2, 4 mo, then TOPV at 12-18 mo, booster at 4-6 yr | Hypersensitivity, active infection, allergy to neomycin/streptomycin, immunosuppression, vomiting, diarrhea |
| rabies vaccine, human diploid cell (HDCV) | Imovax, RabAvert | Active immunity to rabies | **Preexposure**<br>Adult and child: IM 1 ml day 0, 7, 21, or 28 (total 4 doses)<br>**Postexposure**<br>Adult and child: IM 1 ml on day 0, 3, 7, 14, 28 (total 5 doses) | No contraindications |

*Continued*

## Appendix C Vaccines and toxoids—cont'd

| GENERIC NAME | TRADE NAME | USES | DOSAGE AND ROUTES | CONTRAINDICATIONS |
|---|---|---|---|---|
| rotovirus | RotaTeq, Rotarix | Prevents rotovirus | Infant: PO 3 doses given between 6 and 32 wk of age; 1st dose between 6-12 wk of age; 2nd and 3rd doses q4-10wk | Hypersensitivity to this product or latex, immunocompromised, blood products given within 6 wk, lymphatic disorders |
| tetanus toxoid, adsorbed | No trade name | Tetanus toxoid: Used for prophylactic treatment of wounds | Adult and child: IM 0.5 ml q4-6wk × 2 doses, then 0.5 ml 1 yr after dose 2 (adsorbed); SUBCUT/IM 0.5 ml q4-8wk × 3 doses, then 0.5 ml ½-1 yr after dose 3, booster dose 0.5 ml q10yr | Hypersensitivity, active infection, poliomyelitis outbreak, immunosuppression |
| typhoid vaccine, parenteral<br>typhoid vaccine, oral | Typhim Vi<br>Vivotif Berna Vaccine | Active immunity to typhoid fever | Adult: PO 1 cap 1 hr before meals × 4 doses, booster q5yr<br>Adult and child >10 yr: SUBCUT 0.5 ml, repeat in 4 wk, booster q3yr<br>Child 6 mo-10 yr: SUBCUT 0.25 ml, repeat in 4 wk, booster q3yr | Parenteral: Systemic or allergic reaction, acute respiratory or other acute infection, intensive physical exercise in high temperatures<br>Oral: Hypersensitivity, acute febrile illness, suppressive or antibiotic products |
| typhoid Vi polysaccharide vaccine | Typhim Vi | Active immunity to typhoid fever | Adult and child ≥2 yr: IM 0.5 ml as a single dose, reimmunize q2yr 0.5 ml IM, if needed | Hypersensitivity, chronic typhoid carriers |
| Varicella-Zoster Virus Vaccine | Varivax, Zostavax | Prevention of varicella-zoster (chickenpox) | Adult and child ≥13 yr: SUBCUT 0.5 ml, 2nd dose SUBCUT 0.5 ml 4-8 wk later | Hypersensitivity to neomycin; blood dyscrasias, immunosuppression, active untreated TB, acute illness, pregnancy, diseases of lymphatic system |
| yellow fever vaccine | YF-Vax | Active immunity to yellow fever | Adult and child ≥9 mo: SUBCUT 0.5 ml deeply, booster q10yr<br>Child 6-9 mo: same as above if exposed | Hypersensitivity to egg or chicken embryo protein, pregnancy, child <6 mo, immunodeficiency |
| Zoster vaccine recombinant, adjuvanted | Shingrix | For the prevention of herpes zoster (shingles) | Adult: IM 2 doses (0.5 mL each) at 0 and 2 to 6 months | History of severe allergic reaction (e.g., anaphylaxis) to any component of the vaccine or after a previous dose |

# Appendix D

## Abbreviations

| | |
|---|---|
| **abd** | abdomen |
| **ABG** | arterial blood gas |
| **ac** | before meals |
| **ACE** | angiotensin-converting enzyme |
| **ACT** | activated clotting time |
| **ADA** | American Diabetes Association |
| **ADH** | antidiuretic hormone |
| **ALT** | alanine aminotransferase |
| **ANA** | antinuclear antibody |
| **AP** | anteroposterior |
| **APLA** | antiphospholipid antibody syndrome |
| **APTT** | activated partial thromboplastin time |
| **ASA** | acetylsalicylic acid, aspirin |
| **ASHD** | arteriosclerotic heart disease |
| **AST** | aspartate aminotransferase (SGOT) |
| **AV** | atrioventricular |
| **bid** | twice a day |
| **BM** | bowel movement |
| **BMR** | basal metabolic rate |
| **B/P** | blood pressure |
| **BPH** | benign prostatic hypertrophy |
| **BPM** | beats per minute |
| **BS** | blood sugar |
| **BUN** | blood urea nitrogen |
| **C** | Celsius (centigrade) |
| **CAD** | coronary artery disease |
| **cap** | capsule |
| **Cath** | catheterization or catheterize |
| **CBC** | complete blood cell count |
| **HF** | heart failure |
| **CHo** | carbohydrates |
| **cm** | centimeter |
| **CNS** | central nervous system |
| **$CO_2$** | carbon dioxide |
| **cont** | continuous |
| **COPD** | chronic obstructive pulmonary disease |
| **CPAP** | continuous positive airway pressure |
| **CPK** | creatinine phosphokinase |
| **CPR** | cardiopulmonary resuscitation |
| **CCr** | creatinine clearance |
| **C&S** | culture and sensitivity |
| **C sect** | cesarean section |
| **CSF** | cerebrospinal fluid |
| **CTCL** | cutaneous T-cell lymphoma |
| **CV** | cardiovascular |
| **CVA** | cerebrovascular accident |
| **CVP** | central venous pressure |
| **D&C** | dilatation and curettage |
| **dir inf** | direct infusion |
| **dr** | dram |
| **$D_5W$** | 5% glucose in distilled water |
| **DVT** | deep vein thrombosis |
| **ECG** | electrocardiogram (EKG) |
| **EDTA** | ethylenediamine tetraacetic acid |
| **EEG** | electroencephalogram |
| **EENT** | ear, eye, nose, and throat |
| **EPS** | extrapyramidal symptoms |
| **ESR** | erythrocyte sedimentation rate |
| **ext rel** | extended release |
| **FBS** | fasting blood sugar |
| **FHT** | fetal heart tones |
| **FSH** | follicle-stimulating hormone |
| **g** | gram |
| **GABA** | γ-aminobutyric acid |
| **GI** | gastrointestinal |
| **GPC** | giant papillary conjunctivitis |
| **gr** | grain |
| **GTT** | glucose tolerance test |
| **gtt** | drops |
| **GU** | genitourinary |
| **GVHD** | graft-versus-host disease |
| **$H_2$** | $histamine_2$ |
| **hCG** | human chorionic gonadotropin |
| **Hct** | hematocrit |
| **HDCV** | human diploid cell rabies vaccine |
| **Hgb** | hemoglobin |
| **H&H** | hematocrit and hemoglobin |
| **5-HIAA** | 5-hydroxyindoleacetic acid |
| **HIV** | human immunodeficiency virus (AIDS) |
| **$H_2O$** | water |
| **HOB** | head of bed |
| **HR** | heart rate |
| **hr** | hour |
| **IBD** | inflammatory bowel disease |
| **IC** | intracardiac |
| **ICP** | intracranial pressure |
| **ID** | intradermal |
| **IgG** | immunoglobulin G |
| **IM** | intramuscular |
| **inf** | infusion |
| **INH** | inhalation |
| **inj** | injection |
| **I&O** | intake and output |
| **IPPB** | intermittent positive-pressure breathing |
| **IT** | intrathecal |
| **ITP** | idiopathic thrombocytopenic purpura |
| **IUD** | intrauterine device |
| **IV** | intravenous |
| **IVP** | intravenous pyelogram |
| **K** | potassium |
| **kg** | kilogram |
| **L** | liter |
| **lb** | pound |
| **LDH** | lactic dehydrogenase |
| **LE** | lupus erythematosus |
| **LH** | luteinizing hormone |
| **LLQ** | left lower quadrant |
| **LMP** | last menstrual period |
| **LOC** | level of consciousness |
| **LR** | lactated Ringer's solution |
| **LUQ** | left upper quadrant |
| **M** | meter |
| **m** | minim |
| **$m^2$** | square meter |
| **MAOI** | monoamine oxidase inhibitor |
| **mcg** | microgram |
| **mEq** | milliequivalent |
| **mg** | milligram |
| **MI** | myocardial infarction |
| **min** | minute |
| **ml** | milliliter |
| **mm** | millimeter |
| **mo** | month |
| **Na** | sodium |
| **neg** | negative |
| **NGU** | nongonococcal urethritis |
| **NHL** | non-Hodgkin's lymphoma |
| **NPO** | nothing by mouth (Lat. *nulla per os*) |
| **NS** | normal saline |
| **$O_2$** | oxygen |

| | |
|---|---|
| **OBS** | organic brain syndrome |
| **OD** | right eye |
| **OR** | operating room |
| **OS** | left eye |
| **OTC** | over-the-counter |
| **OU** | each eye |
| **oz** | ounce |
| **p̄** | after |
| **P56** | Plasma-Lyte 56 |
| **$PaCO_2$** | arterial carbon dioxide tension (pressure) |
| **$PaO_2$** | arterial oxygen tension (pressure) |
| **PAT** | paroxysmal atrial tachycardia |
| **PBI** | protein-bound iodine |
| **pc** | after meals |
| **PCI** | percutaneous coronary intervention |
| **PCWP** | pulmonary capillary wedge pressure |
| **PEEP** | positive end-expiratory pressure |
| **PERRLA** | pupils equal, round, react to light and accommodation |
| **pH** | hydrogen ion concentration |
| **PO** | by mouth |
| **postop** | postoperative |
| **PP** | postprandial |
| **PPHN** | persistent pulmonary hypertension of the newborn |
| **preop** | preoperative |
| **prn** | as required |
| **PT** | prothrombin time |
| **PTT** | partial thromboplastin time |
| **PVC** | premature ventricular contraction |
| **q** | every |
| **qAM** | every morning |
| **qhr** | every hour |
| **q2hr** | every 2 hours |
| **q3hr** | every 3 hours |
| **q4hr** | every 4 hours |
| **q6hr** | every 6 hours |
| **q12hr** | every 12 hours |
| **qid** | four times daily |
| **qmo** | every month |
| **qPM** | every night |
| **qs** | sufficient quantity |
| **qt** | quart |
| **qwk** | every week |
| **R** | right |
| **RAIU** | radioactive iodine uptake |
| **RBC** | red blood count or cell |
| **RLQ** | right lower quadrant |
| **ROM** | range of motion |
| **RUQ** | right upper quadrant |
| **Rx** | prescription |
| **SARS** | severe acute respiratory syndrome |
| **SCr** | serum creatinine |
| **SIMV** | synchronous intermittent mandatory ventilation |
| **SL** | sublingual |
| **SLE** | systemic lupus erythematosus |
| **SOB** | shortness of breath |
| **sol** | solution |
| **sp gr** | specific gravity |
| **ss** | one half |
| **STD** | sexually transmitted disease |
| **SUBCUT** | subcutaneous |
| **supp** | suppository |
| **sus rel** | sustained release |
| **syr** | syrup |
| **T&A** | tonsillectomy and adenoidectomy |
| **tab** | tablet |
| **tbsp** | tablespoon |
| **TD** | transdermal |
| **temp** | temperature |
| **tid** | three times daily |
| **tinc** | tincture |
| **TPN** | total parenteral nutrition |
| **TOP** | topical |
| **TSH** | thyroid-stimulating hormone |
| **tsp** | teaspoon |
| **TT** | thrombin time |
| **UA** | urinalysis |
| **UTI** | urinary tract infection |
| **UV** | ultraviolet |
| **vag** | vaginal |
| **VMA** | vanillylmandelic acid |
| **vol** | volume |
| **VS** | vital sign |
| **WBC** | white blood cell count |
| **wk** | week |
| **wt** | weight |
| **yr** | year |
| **>** | greater than |
| **<** | less than |
| **=** | equal |
| **°** | degree |
| **%** | percent |
| **α** | alpha |
| **γ** | gamma |
| **β** | beta |

| Measles, Mumps, Rubella* | | | | | | MMR | | | | | MMR |
| Varicella* | | | | | | Varicella | | | | | Varicella |
| Hepatitis A* | | | | | | HepA (2 doses) | | | | HepA Series | |
| Meningococcal* | | | | | | | | | | MCV | |

Range of recommended ages

Certain high-risk groups

This schedule indicates the recommended ages for routine administration of currently licensed childhood vaccines, as of December 15, 2009, for children aged 0-6 years. Any dose not administered at the recommended age should be administered at any subsequent visit, when indicated and feasible. Additional vaccines may be licensed and recommended during the year. Licensed combination vaccines may be used whenever any components of the combination are indicated and other components of the vaccine are not contraindicated and if approved by the Food and Drug Administration for that dose of the series. **Providers should consult the respective Advisory Committee on Immunization Practices statement for detailed recommendations, including for high-risk conditions: http://www.cdc.gov/vaccines/pubs/ACIP-list.htm.** Clinically significant adverse events that follow immunization should be reported to the Vaccine Adverse Event Reporting System (VAERS). Guidance about how to obtain and complete a VAERS form is available at **http://www.vaers.hhs.gov** or by telephone, **800-822-7967**.

# Appendix F

## Standard Precautions

The following precautions are used in the care of all patients regardless of their diagnosis or disease. They are also applied when handling or cleaning equipment or supplies that are potentially contaminated.

1. Wear gloves any time that you may contact blood, any moist body fluid (except sweat), secretions, excretions, nonintact skin, or mucous membranes.
2. Remove your gloves, wash your hands, and reapply clean gloves if your gloves become soiled with infective material.
3. Even if you are wearing gloves, remove them, wash your hands, and apply clean gloves *immediately before* contact with mucous membranes or nonintact skin.
4. Wear a protective cover gown of waterproof material if your clothing is likely to have substantial contact with infective material or if splashing of body fluids is likely.
5. Wear a face shield or goggles to protect your eyes if splashing of secretions is likely.
6. Any time a face shield or goggles are worn, wear a surgical mask to protect the mucous membranes of your nose and mouth. A surgical mask may be worn during certain sterile procedures without protective eyewear. However, protective eyewear is *never* worn without a surgical mask.
7. Handle needles, razors, broken glass, and other sharp objects with care. Needles should never be recapped. All sharps should be disposed of in a puncture-resistant sharps container.
8. Wash your hands before and after each patient contact.
9. Wash your hands before you apply and after you remove gloves. Do not assume that hand washing is unnecessary because gloves were worn. Do not wash your hands with gloves on them.
10. Gloves are used for the care of one patient only, then discarded.
11. Follow your facility policy for disposal of gloves and other contaminated items. These items are generally not disposed of in open trash containers. Facilities have designated disposal sites for these biohazardous waste materials.
12. Use resuscitation barrier devices as an alternative to mouth-to-mouth resuscitation.
13. Linen should be handled in a manner that prevents contamination of the outside of the container. Linen from isolation rooms was previously double bagged. Double bagging is no longer recommended since all linen is handled as potentially infectious. Double bag linen only if the outside of the bag becomes contaminated during the bagging process.

# Appendix G

## Illustrated Mechanisms and Sites of Action

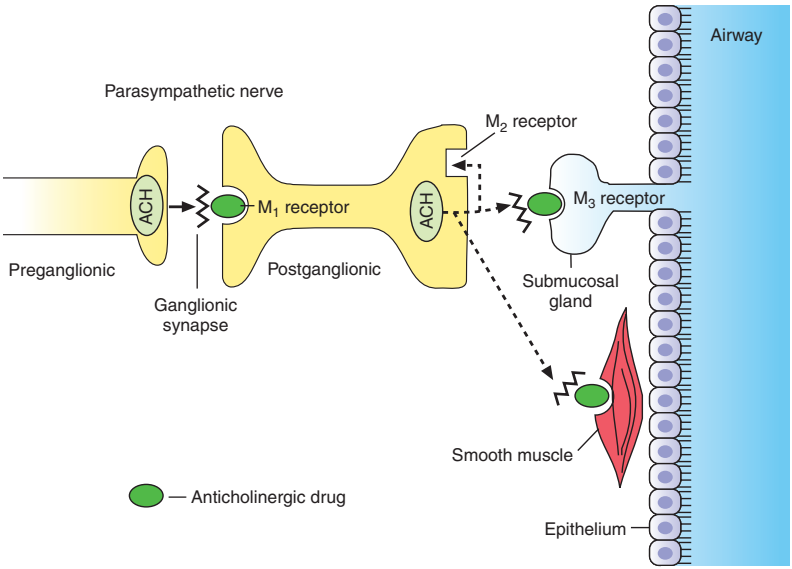

**Fig. G-1 Sites and Mechanisms of Action: Anticholinergic Bronchodilators:** Anticholinergic bronchodilators, such as ipratropium, work by blocking muscarinic-1 ($M_1$) receptors on postganglionic parasympathetic nerve endings and muscarinic-3 ($M_3$) receptors on the cell membranes of bronchial smooth muscles and submucosal glands. Normally, stimulation of the $M_1$ and $M_3$ receptors by acetylcholine (ACH) causes bronchoconstriction and mucus secretion from submucosal glands. Anticholinergic bronchodilators block these specific muscarinic receptors from the effects of acetylcholine, causing bronchial smooth muscle relaxation, bronchodilatation, and decreased mucus production. (From Gardenhire OS: *Rau's Respiratory Care Pharmacology,* ed 8, St. Louis, 2012, Mosby.)

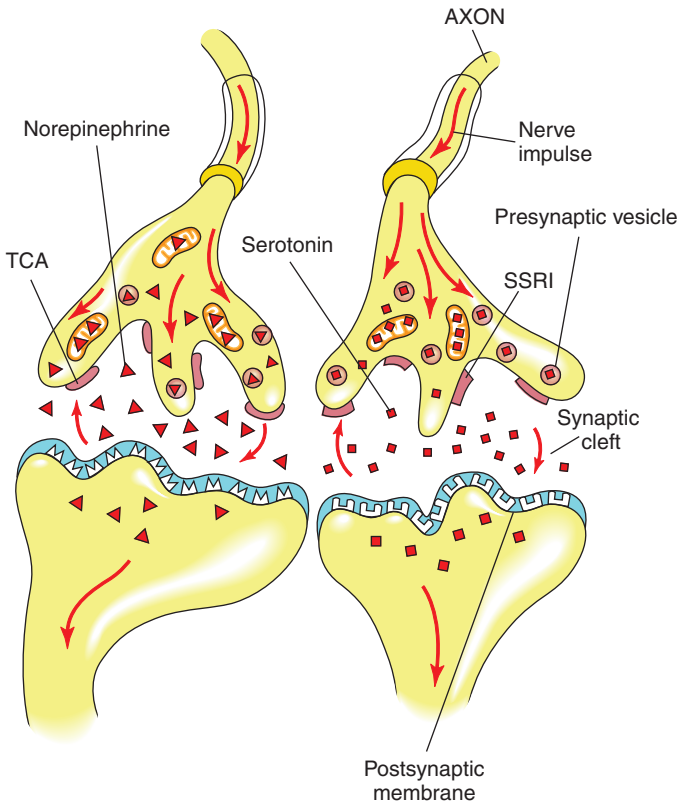

**Fig. G-2 Mechanisms of Action: Antidepressants.** Depression is thought to occur when levels of neurotransmitters, such as norepinephrine and serotonin, are reduced at postsynaptic receptor sites. These neurotransmitters affect a wide array of functions, including mood, obsessions, appetite, and anxiety. Antidepressants work by increasing the availability of these neurotransmitters at postsynaptic membranes and by enhancing and prolonging their effects. As a result, these agents improve mood, reduce anxiety, and minimize obsessions.

Antidepressants typically are classified as tricyclic antidepressants (TCAs), monoamine oxidase inhibitors (not shown), selective serotonin reuptake inhibitors (SSRIs), and atypical antidepressants (not shown). TCAs, such as amitriptyline and desipramine, primarily block norepinephrine reuptake at presynaptic membranes, thereby increasing the norepinephrine concentration at synapses and making more available at postsynaptic receptors.

SSRIs, such as FLUoxetine and PARoxetine, selectively inhibit serotonin uptake at presynaptic membranes. This action leads to increased serotonin availability at postsynaptic receptors. (From Gutierrez K: *Pharmacotherapeutics: Clinical Reasoning in Primary Care,* ed 2, Philadelphia, 2008, Saunders.)

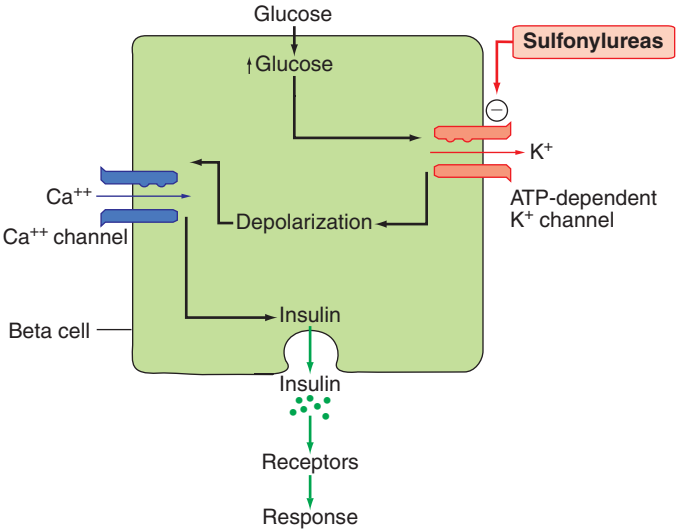

**Fig. G-3 Mechanisms of Action: Antidiabetic Agents.** Diabetes mellitus takes two forms: type 1 diabetes characterized by a complete lack of insulin and type 2 diabetes marked by insufficient insulin secretion, insulin resistance in peripheral tissues, or both. Normally, the beta cells in the pancreatic islets of Langerhans are responsible for secreting insulin. The rise of glucose levels in the beta cell triggers adenosine triphosphate (ATP)-dependent potassium ($K^+$) channels in the membranes of beta cells to close. Then the beta cells depolarize and calcium ($Ca^{++}$) enters the cell through $Ca^{++}$ channel, and insulin is released from the cell. When circulating insulin engages with insulin receptors on cell membranes, it facilitates the movement of glucose into the cell, among other actions.

Type 1 diabetes is treated with the use of exogenous insulin, which mimics natural insulin in the body. Insulin takes many forms with varying degrees of onset, peak, and duration, including rapid, regular, intermediate, and long acting.

Type 2 diabetes is usually treated with oral agents. Sulfonylureas, such as glyBURIDE, block ATP-dependent $K^+$ channels in the cell membranes of beta cells, ultimately resulting in the release of insulin. (From Taylor: *Mosby's Crash Course Pharmacology,* St. Louis, 1998, Mosby.)

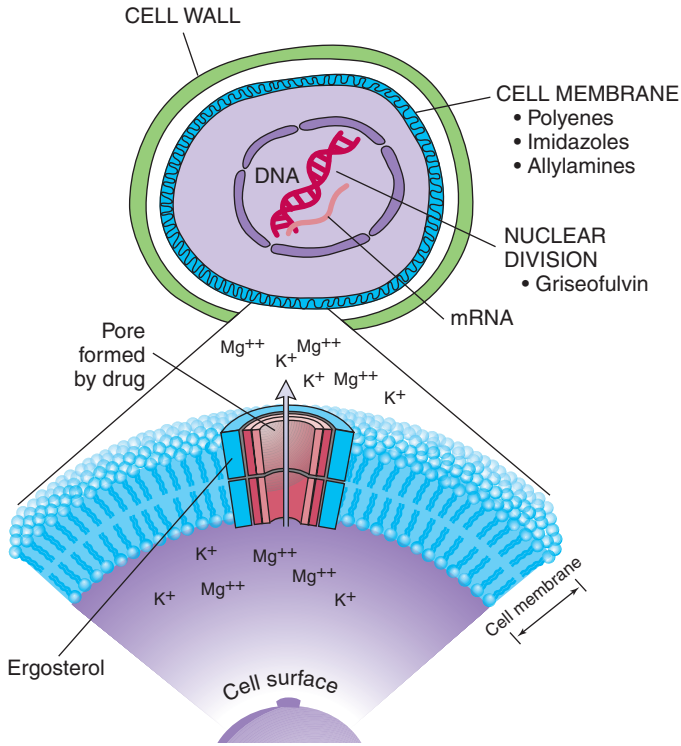

**Fig. G-4 Sites and Mechanisms of Action: Antifungal Agents.** Antifungal agents primarily affect fungi at one of two sites: the cell membrane or the cell nucleus. Most of these agents, such as polyene, imidazole, and allylamine antifungals, act on the fungal cell membrane. Polyene antifungals, such as amphotericin B, bind to ergosterol and increase cell membrane permeability. Imidazole antifungals, such as fluconazole and ketoconazole, interfere with ergosterol synthesis by inhibiting the cytochrome $P_{450}$ enzyme system, altering the cell membrane, and inhibiting fungal growth. Allylamine antifungals, such as terbinafine, inhibit the enzyme squalene epoxidase, which disrupts ergosterol production—and cell membrane integrity. When cell membrane permeability increases, cellular components, including potassium ($K^+$) and magnesium ($Mg^{++}$), leak out. Loss of these cellular components leads to cell death.

Another antifungal agent, griseofulvin, directly affects the fungal nucleus, interfering with mitosis. By binding to structures in the mitotic spindle, it prevents cells from dividing, which eventually leads to their death. (From Gutierrez K: *Pharmacotherapeutics: Clinical Reasoning in Primary Care,* ed 2, Philadelphia, 2008, Saunders.)

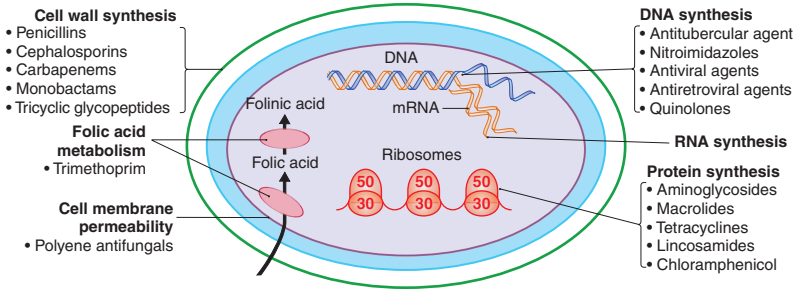

**Fig. G-5 Sites and Mechanisms of Action: Antiinfective Agents.** The goal of antiinfective therapy is to kill or inhibit the growth of microorganisms such as bacteria, viruses, and fungi. To achieve this goal, antiinfective agents must reach their targets, which usually occurs through absorption and distribution by the circulatory system. When the target is reached, a drug can kill or suppress microorganisms by:

- Inhibiting cell wall synthesis or activating enzymes that disrupt the cell wall, which leads to cellular weakening, lysis, and death. Penicillins (ampicillin), cephalosporins (ceFAZolin), carbapenems (imipenem), monobactams (aztreonam), and tricyclic glycopeptides (vancomycin) act in this way.
- Altering cell membrane permeability through direct action on the cell wall, which allows intracellular substances to leak out and destabilizes the cell. Polyene antifungals (amphotericin) work by this mechanism.
- Altering protein synthesis by binding to bacterial ribosomes (50/30) or affecting ribosomal function, which leads to cell death or slowed growth respectively. Aminoglycosides (gentamicin), macrolides (erythromycin), tetracyclines (doxycycline), lincosamides (clindamycin), and the miscellaneous antiinfective chloramphenicol use this action.
- Inhibiting DNA or RNA, including messenger RNA (mRNA), synthesis by binding to nucleic acids or interacting with enzymes required for their synthesis. Antitubercular agents (rifampin), nitroimidazoles (metroNIDAZOLE), antiviral agents (acyclovir), antiretroviral agents (stavudine), and quinolones (ciprofloxacin) act like this.
- Inhibiting the metabolism of folic acid and folinic acid or other cellular components that are essential for bacterial cell growth. The miscellaneous antiinfective trimethoprim employs this mechanism of action. (From Page C et al: *Integrated Pharmacology,* ed 3, St. Louis, 2006, Mosby.)

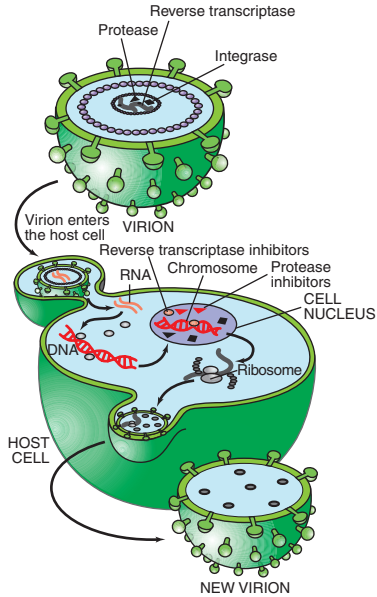

**Fig. G-6 Mechanisms and Sites of Action: Antiretroviral Agents.** When viruses reproduce, the infectious viral particle, or virion **(A),** enters the host cell. The virion attaches to the cell's surface and then inserts itself into the host cell **(B).** Once inside, the virion uncoats, and the enzyme reverse transcriptase makes two copies of the viral RNA: one copy is identical; the other is a mirror image. These two copies form double-stranded viral DNA that enters the host cell's nucleus, where it inserts itself into the host cell's DNA with the help of the enzyme integrase. Then viral DNA reprograms the host cell to produce additional viral RNA, which begins the process of forming new viruses. Specifically, messenger RNA (mRNA) instructs ribosomal RNA (rRNA) to produce a new chain of proteins and enzymes that are used to form new viruses. Protease cuts the chains, creating individual proteins. These combine with new RNA to create new virions, which bud and are released from the host cell **(C).**

Antiretroviral agents target specific enzymes during viral reproduction. Nucleoside reverse transcriptase inhibitors, such as stavudine, interfere with the action of reverse transcriptase by mimicking naturally occurring nucleosides. Nucleotide reverse transcriptase inhibitors, such as tenofovir, block reverse transcriptase by competing with the natural substrate deoxyadenosine triphosphate and by causing DNA chain termination. Nonnucleoside reverse transcriptase inhibitors, such as delavirdine, work by directly binding to reverse transcriptase. As a result, no viral DNA is available to insert itself into the host cell's DNA. Protease inhibitors, such as indinavir, bind to and interfere with the action of protease; thus, the new chain of proteins formed by rRNA cannot be cut into individual proteins to make new viruses. (From Gutierrez K: *Pharmacotherapeutics: Clinical Reasoning in Primary Care,* ed 2, Philadelphia, 2008, Saunders.)

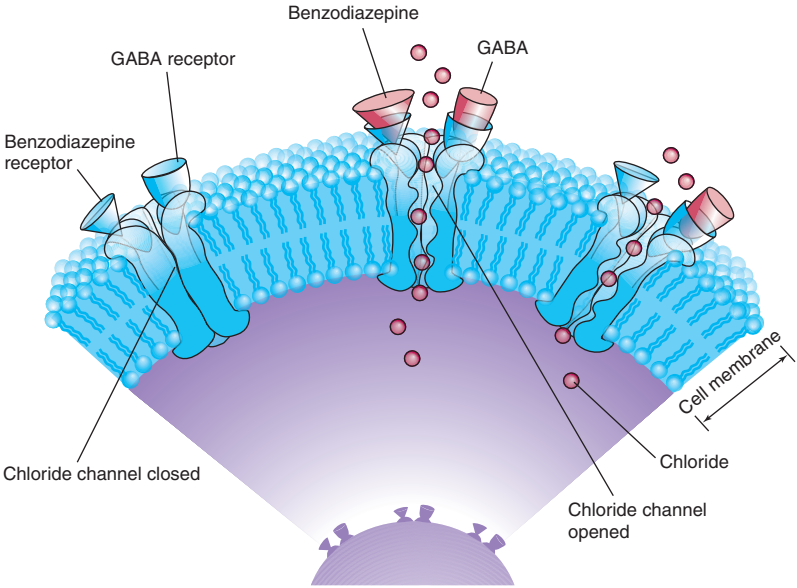

**Fig. G-7 Mechanisms of Action: Benzodiazepines.** Benzodiazepines reduce anxiety by stimulating the action of the inhibitory neurotransmitter, gamma-aminobutyric acid (GABA), in the limbic system. The limbic system plays an important role in the regulation of human behavior. Dysfunction of GABA neurotransmission in the limbic system may be linked to the development of certain anxiety disorders.

The limbic system contains a highly dense area of benzodiazepine receptors that may be linked to the antianxiety effects of benzodiazepines. These benzodiazepine receptors are located on the surface of neuronal cell membranes and are adjacent to GABA receptors. The binding of a benzodiazepine to its receptor enhances the affinity of a GABA receptor for GABA. In the absence of a benzodiazepine, the binding of GABA to its receptor causes the chloride channel in the cell membrane to open, which increases the influx of chloride into the cell. This influx of chloride results in hyperpolarization of the neuronal cell membrane and reduces the neuron's ability to fire, which is why GABA is considered an inhibitory neurotransmitter.

A benzodiazepine acts only in the presence of GABA. When it binds to a benzodiazepine receptor, it prolongs the time that the chloride channel remains open. This results in greater depression of neuronal function and a reduction in anxiety. (From Gutierrez K: *Pharmacotherapeutics: Clinical Reasoning in Primary Care,* ed 2, Philadelphia, 2008, Saunders.)

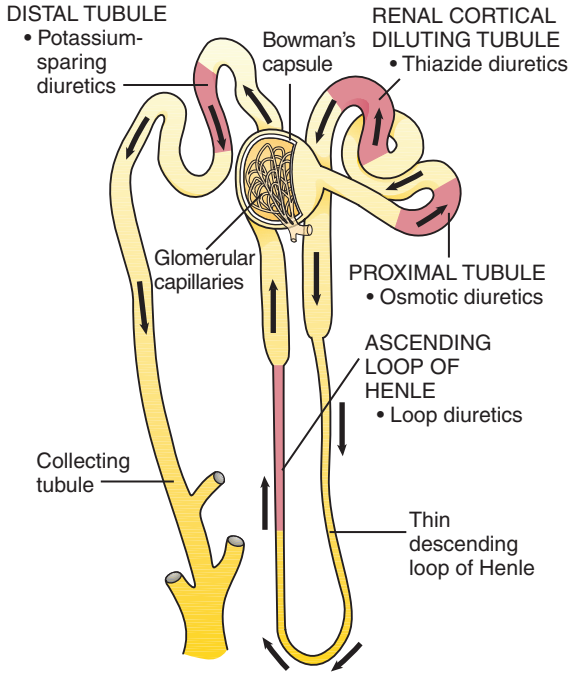

**Fig. G-8 Sites of Action: Diuretics.** Diuretics act primarily to increase water and sodium excretion by the kidneys, thereby increasing urine output. In the process, chloride, potassium, and other electrolytes may also be excreted. Most diuretics act by blocking sodium, water, and chloride reabsorption by peritubular capillaries in the nephrons. As a result, water and electrolytes remain in the convoluted tubules to be excreted as urine. The increased water and electrolyte excretion reduces blood volume—and ultimately blood pressure.

Diuretics belong to four major subclasses:

1. Thiazide diuretics, such as hydrochlorothiazide, act in the early portion of the distal convoluted tubule, called the cortical diluting segment. These drugs block sodium, chloride, and water reabsorption and promote their excretion along with potassium.
2. Loop diuretics, such as furosemide, act primarily in the thick ascending limb of the loop of Henle, blocking sodium, water, and chloride reabsorption. Then these substances are excreted along with potassium.
3. Potassium-sparing diuretics, such as spironolactone, act in the late portion of the distal convoluted tubule and collecting tubule. Here, they inhibit the action of aldosterone, leading to sodium excretion and potassium retention. Although triamterene and amiloride, two other potassium-sparing diuretics, act at the same site, they do not affect aldosterone. Instead, these drugs directly block the exchange of sodium and potassium, leading to decreased sodium reabsorption and decreased potassium excretion.
4. Osmotic diuretics, such as mannitol, work in the proximal convoluted tubule. As their name implies, these diuretics increase the osmotic pressure of the glomerular filtrate, inhibiting the passive reabsorption of water, sodium, and chloride. (From Gutierrez K: *Pharmacotherapeutics: Clinical Reasoning in Primary Care,* ed 2, Philadelphia, 2008, Saunders.)

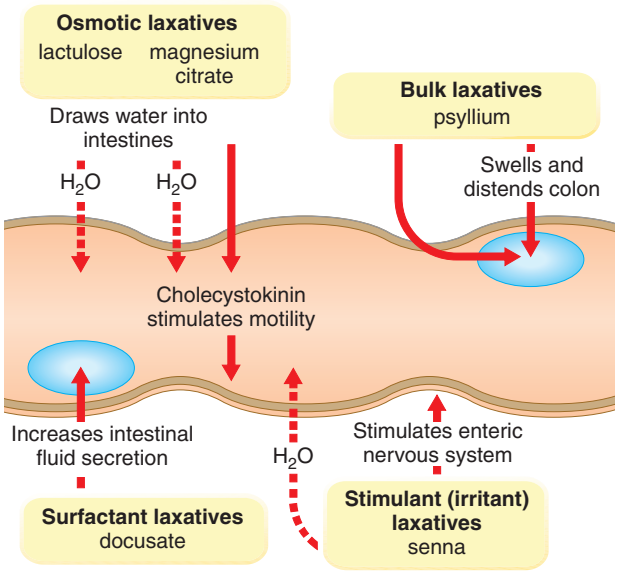

**Fig. G-9 Mechanisms of Action: Laxatives.** Laxatives ease or stimulate defecation. Typically, they are classified by their mechanism of action as bulk-forming, osmotic, stimulant, or surfactant laxatives.

Bulk-forming laxatives, such as psyllium, act in the small and large bowel. Because ingredients in these laxatives are undigestible, they remain within the stool and increase the fecal mass by drawing in water. These agents also enhance bacterial growth in the colon, further adding to the fecal mass.

Osmotic laxatives, such as lactulose, draw water into the intestinal lumen, causing the fecal mass to soften and swell. This osmotic action may be enhanced by the metabolism of colonic bacteria to lactate and other organic acids. These acids decrease colonic pH and increase colonic motility.

Stimulant (or irritant) laxatives, such as senna, act on the intestinal wall to increase water and electrolytes in the intestinal lumen. In addition, they directly irritate the colon, increasing motility.

Surfactant laxatives (or fecal softeners), such as docusate, reduce the surface tension of the stool, allowing water to enter it. These laxatives may also help to increase water and electrolyte excretion into the intestinal lumen, softening and increasing the fecal mass. (From Page C et al: *Integrated Pharmacology,* ed 3, St. Louis, 2006, Mosby.)

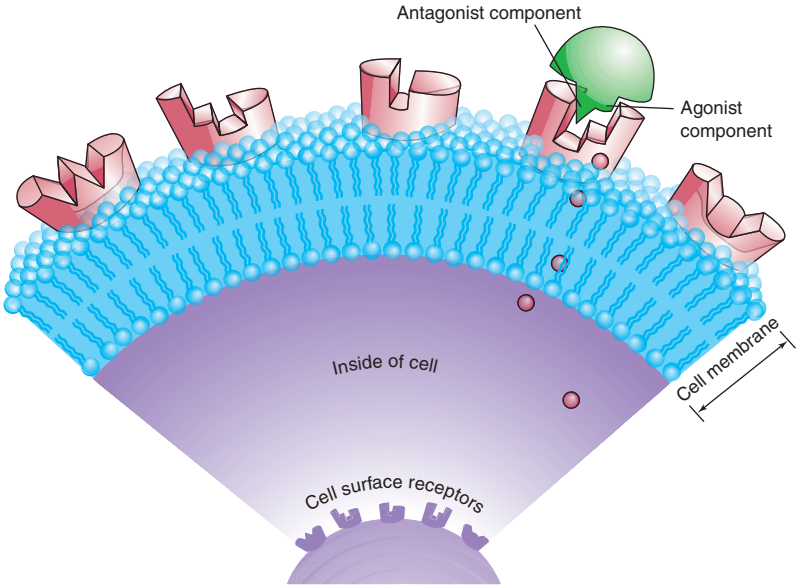

**Fig. G-10 Mechanisms of Action: Narcotic Agonist-Antagonist Analgesics.** Cell membranes have different types of opioid receptors, such as mu, kappa, and delta receptors. Opioid agonist-antagonists work by stimulating one type of receptor, while simultaneously blocking another type. As agonists, they work primarily by activating kappa receptors to produce analgesia and such other effects as CNS and respiratory depression, decreased GI motility, and euphoria. As antagonists, they compete with opioids at mu receptors, helping to reverse or block some of the other effects of agonists. (From Gutierrez K: *Pharmacotherapeutics: Clinical Reasoning in Primary Care,* ed 2, Philadelphia, 2008, Saunders.)

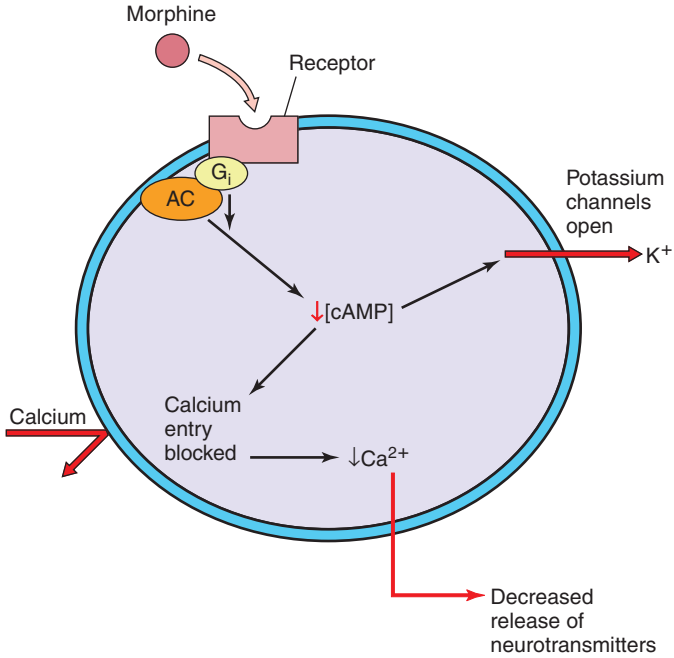

**Fig. G-11 Mechanisms of Action: Narcotic Analgesics.** Narcotic analgesics bind to three types of opioid receptors: mu, kappa, and delta receptors. They produce analgesia primarily by activating mu receptors. However, they also engage with and activate kappa and delta receptors, producing other effects, such as sedation and vasomotor stimulation.

When morphine or another narcotic analgesic binds to opioid receptors, activation occurs. The receptors send signals to the enzyme adenyl cyclase (AC) to slow activity by way of G proteins ($G_i$). Decreased adenyl cyclase activity causes reduced production of cyclic adenosine monophosphate (cAMP). A secondary messenger substance, cAMP is important for regulating cell membrane channels. A reduced cAMP level allows fewer potassium ions to leave the cell and blocks calcium ions from entering the cell. This ion imbalance—especially the reduced intracellular calcium level—ultimately decreases the release of neurotransmitters from the cell, thereby blocking or reducing pain impulse transmission. (From Minneman KP, Wecker L: *Brody's Human Pharmacology: Molecular to Clinical,* ed 4, St. Louis, 2005, Mosby.)

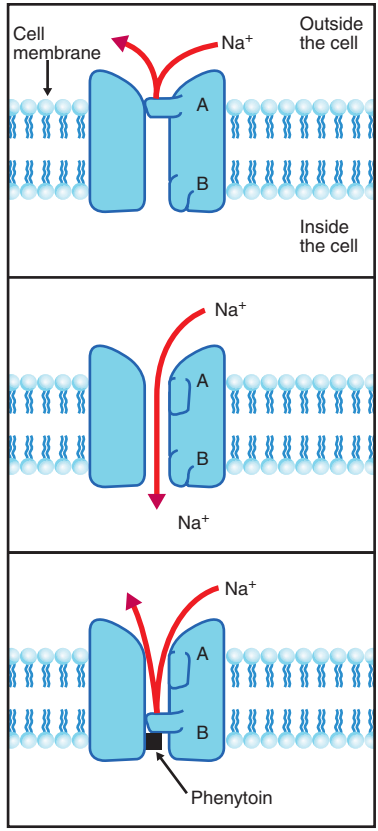

**Fig. G-12 Mechanisms of Action: Phenytoin.** Phenytoin, which is used to treat tonic-clonic seizures, acts in the motor cortex and brain stem, where the tonic phase of tonic-clonic seizures originates. By altering sodium transport across neuronal cell membranes, phenytoin stabilizes the cell membrane, reduces repetitive firing of the neurons, and halts or limits the spread of seizures. The first illustration shows a neuronal cell membrane in its resting state. The activation gate **(A)** of the sodium channel in the cell membrane is closed and blocks sodium ($Na^+$) from entering the cell. In the second illustration, a nerve impulse has caused depolarization and opening of the activation gate, allowing $Na^+$ to move into the cell. In the third illustration, depolarization continues and an inactivation gate **(B)** moves into the channel. This prevents $Na^+$ from moving into the cell. Phenytoin prolongs the inactivated state of the sodium channel by preventing reopening of the inactivation gate. By further preventing $Na^+$ from entering the cell, phenytoin slows impulse transmission, and thus slows the rate at which neurons fire. (From Minneman KP, Wecker L: *Brody's Human Pharmacology: Molecular to Clinical,* ed 4, St. Louis, 2005, Mosby.)

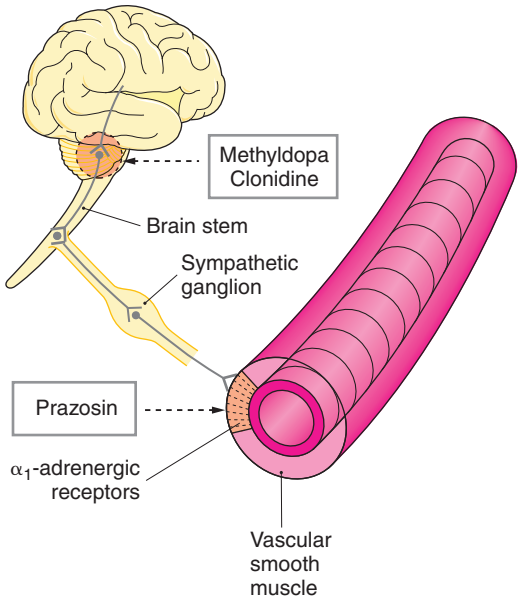

**Fig. G-13 Sites of Action: Sympatholytics.** Sympatholytics inhibit sympathetic nervous system (SNS) activity, which plays a major role in regulating B/P. Normally when the SNS is stimulated, nerve impulses travel from the cardiovascular center of the CNS to the sympathetic ganglia. From there, the impulses travel along postganglionic fibers to specific effector organs, such as the heart and blood vessels. SNS stimulation also triggers the release of norepinephrine, which acts primarily at alpha-adrenergic receptors.

Sympatholytics fall into two subclasses: central-acting $\alpha_2$ agonists and peripheral-acting $\alpha_1$-adrenergic antagonists. Central-acting $\alpha_2$ agonists, such as methyldopa and cloNIDine, stimulate $\alpha_2$-adrenergic receptors in the cardiovascular center of the CNS and reduce activity in the vasomotor center of the brain, interfering with sympathetic stimulation of the heart and blood vessels. This causes blood vessel dilatation and decreased cardiac output, which leads to reduced B/P.

Peripheral-acting $\alpha_1$-adrenergic antagonists, such as prazosin, inhibit the stimulation of $\alpha_1$-adrenergic receptors by norepinephrine in vascular smooth muscle, interfering with SNS-induced vasoconstriction. As a result, the blood vessels dilate, reducing peripheral vascular resistance and venous return to the heart. These effects, in turn, lead to decreased B/P. (From Prosser S, Worster B, Dewar K: *Applied Pharmacology for Nurses and Other Health Care Professionals,* St. Louis, 2000, Mosby.)

## Photo Atlas of Drug Administration

**Fig. H-1 Administering an Injection.** Cleanse site with antiseptic swab. Apply swab at center of site and rotate outward in circular direction for about 5 cm (2 in). (From Perry AG, Potter PA, and Elkin MK: *Nursing Interventions & Clinical Skills,* ed 5, St. Louis, 2012, Mosby.)

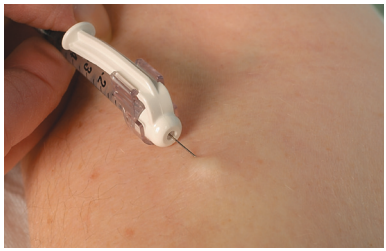

**Fig. H-2 Intradermal Injection.** For an intradermal injection, note formation of small bleb approximately 6 mm (¼ in) in diameter at injection site. (From Perry AG, Potter PA, and Elkin MK: *Nursing Interventions & Clinical Skills,* ed 5, St. Louis, 2012, Mosby.)

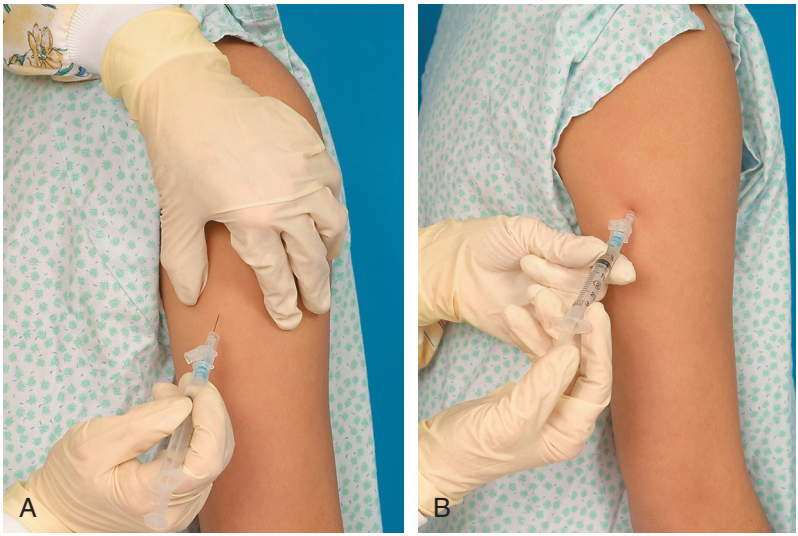

**Fig. H-3 Subcutaneous Injection. A,** For a subcutaneous injection, hold the syringe between the thumb and forefinger of the dominant hand as a dart, with the palm down. **B,** After injecting the needle at a 45- to 90-degree angle, grasp lower end of syringe barrel with nondominant hand to end of plunger. Avoid moving syringe while slowly pulling back on plunger to aspirate drug. If blood appears in syringe, remove needle, discard medication and syringe, and repeat procedure. *Exception:* Do not aspirate when giving heparin. (From Perry AG, Potter PA, and Elkin MK: *Nursing Interventions & Clinical Skills,* ed 5, St. Louis, 2012, Mosby.)

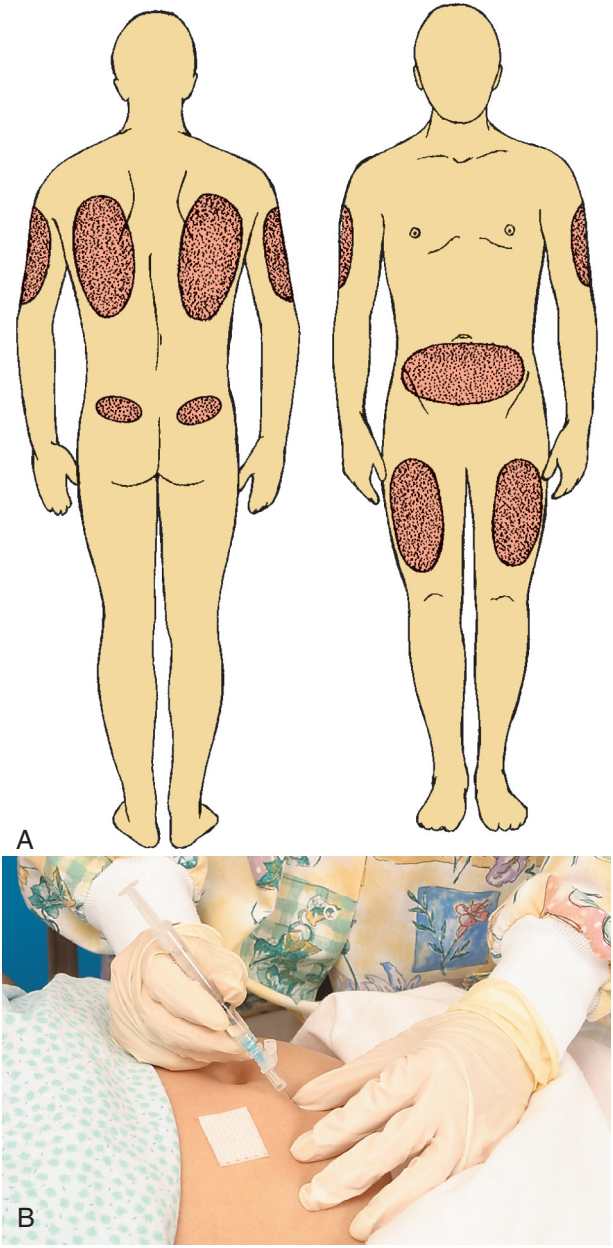

**Fig. H-4 Subcutaneous Injection. A,** Sites recommended for subcutaneous injections. **B,** Giving subcutaneous injection in the abdomen. (From Perry AG, Potter PA, and Elkin MK: *Nursing Interventions & Clinical Skills,* ed 5, St. Louis, 2012, Mosby.)

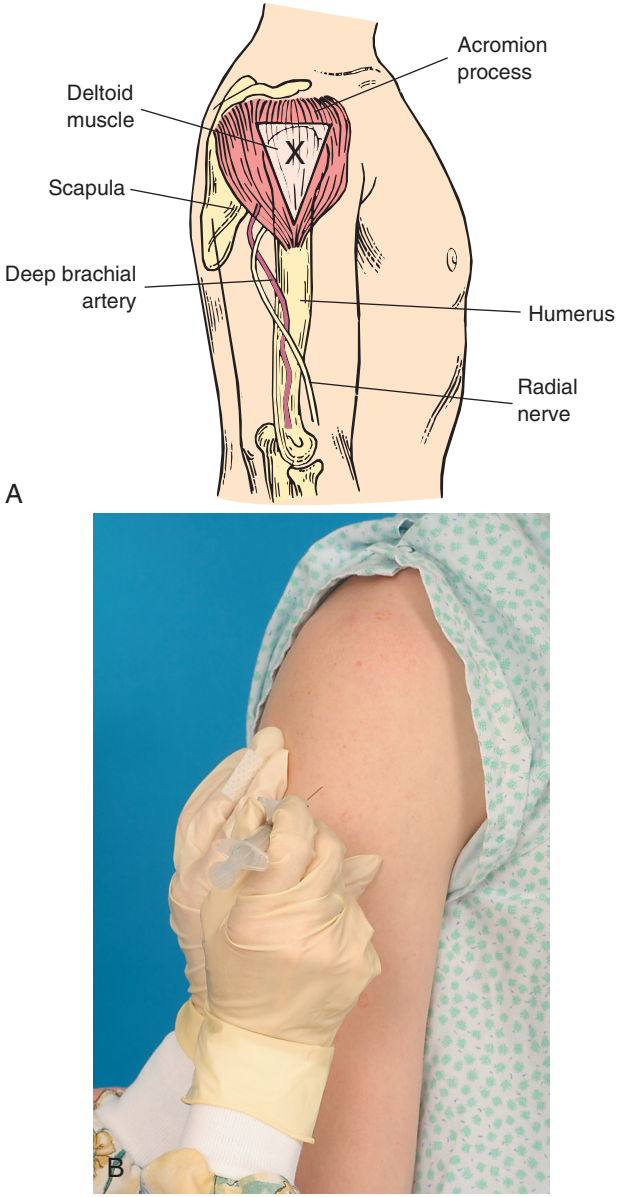

**Fig. H-5 Deltoid Intradermal Injection.** **A,** Landmarks for IM injection into the deltoid muscle. **B,** Giving IM injection in deltoid muscle. (From Perry AG, Potter PA, and Elkin MK: *Nursing Interventions & Clinical Skills,* ed 5, St. Louis, 2012, Mosby.)

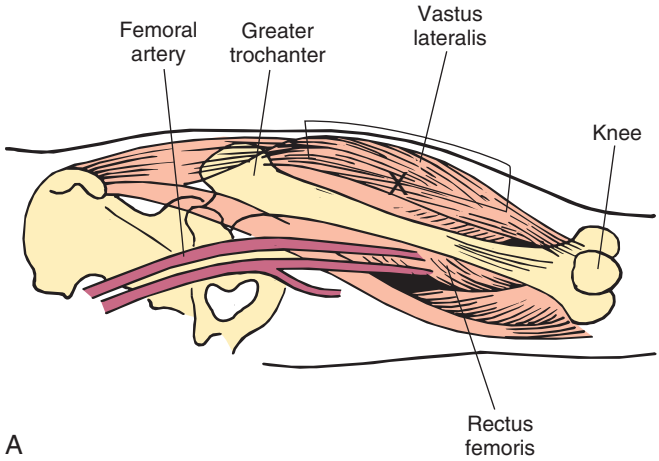

**Fig. H-6 Vastus Lateralis Intramuscular Injection. A,** Landmarks for IM injection in vastus lateralis. **B,** Giving IM injection in vastus lateralis site. (From Perry AG, Potter PA, and Elkin MK: *Nursing Interventions & Clinical Skills,* ed 5, St. Louis, 2012, Mosby.)

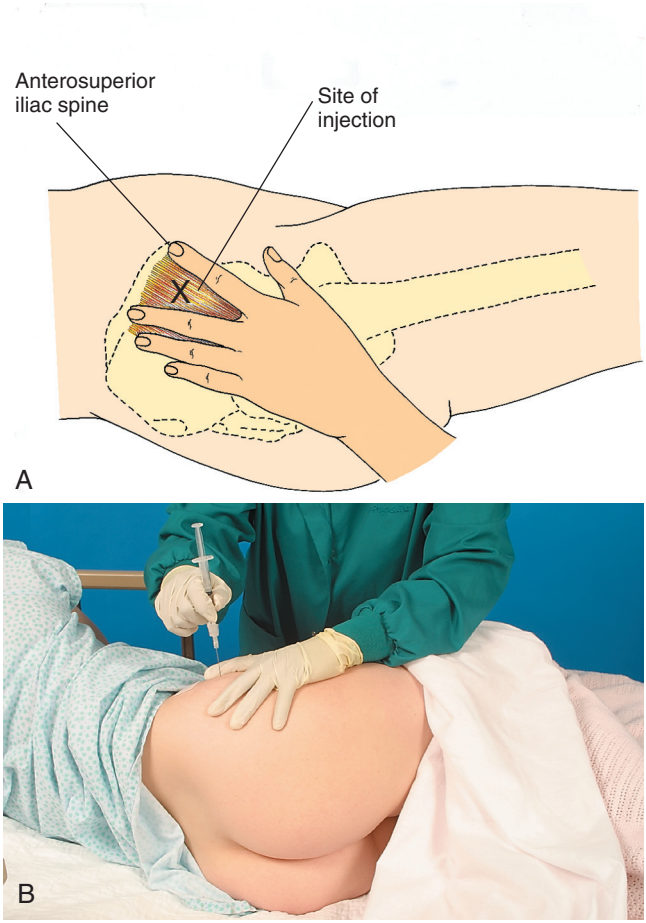

**Fig. H-7 Ventrogluteal Intramuscular Injection. A,** Anatomical view of ventrogluteal site. **B,** Giving IM injection into ventrogluteal muscle to avoid major nerves and blood vessels. (From Perry AG, Potter PA, and Elkin MK: *Nursing Interventions & Clinical Skills,* ed 5, St. Louis, 2012, Mosby.)

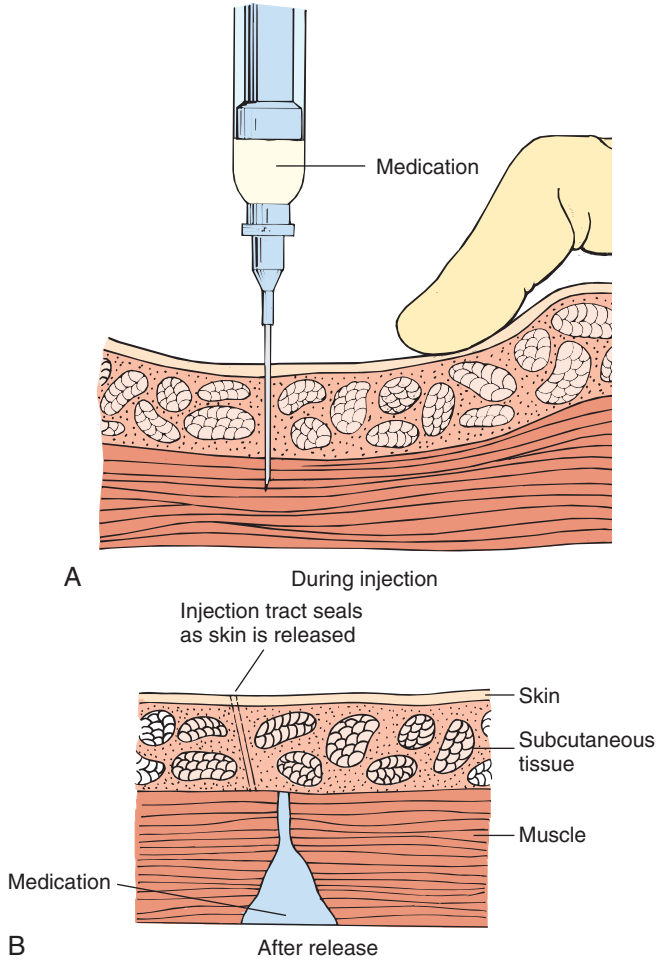

**Fig. H-8 Z-Track Method of Injection.** **A,** Pulling on overlying skin during IM injection moves tissues to prevent later tracking. **B,** The Z-track left after injection prevents the deposit of medication through sensitive tissue. (From Perry AG, Potter PA, and Elkin MK: *Nursing Interventions & Clinical Skills,* ed 5, St. Louis, 2012, Mosby.)

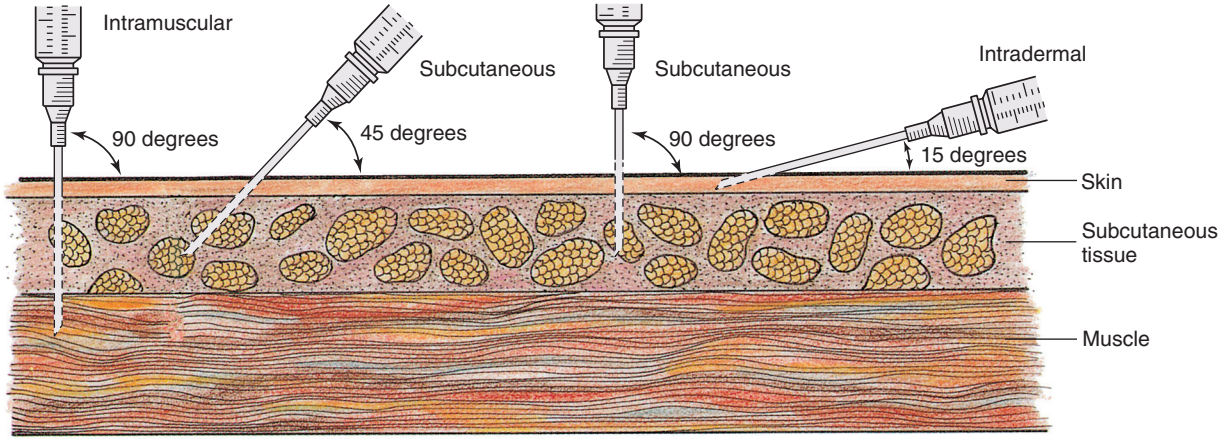

**Fig. H-9 Comparison of Needle Angles.** Comparison of angles of insertion for IM (90 degrees), SUBCUT (45 degrees and 90 degrees), and ID (15 degrees) injections. (From Potter PA, Perry AG: *Fundamentals of Nursing,* ed 7, St. Louis, 2009, Mosby.)

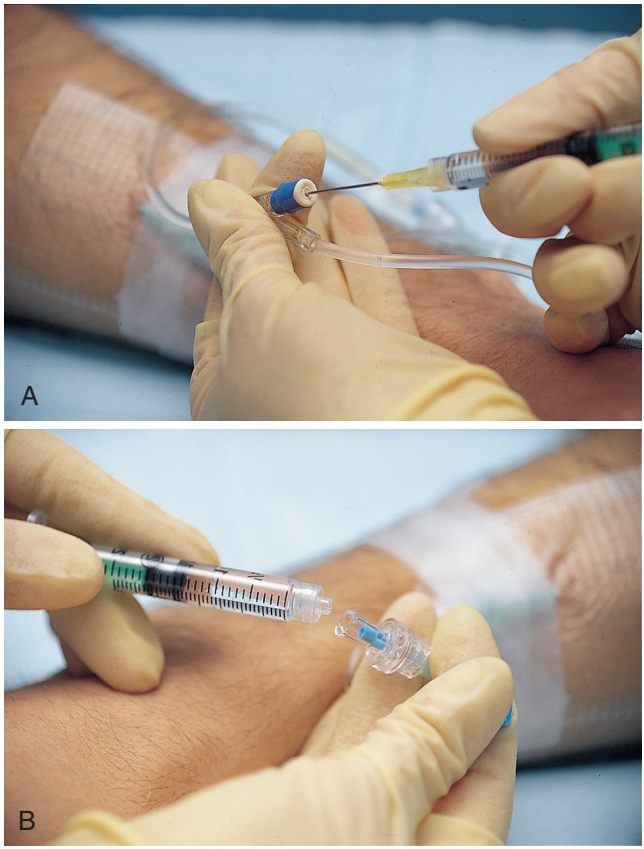

**Fig. H-10 Administering Medication by IV Bolus (push). A,** Needle system: Insert small-gauge needle of syringe containing prepared drug through center of injection port. **B,**Needleless system: Remove cap of needleless injection port. Connect tip of syringe directly. (From Potter PA, Perry AG: *Fundamentals of Nursing,* ed 6, St. Louis, 2005, Mosby.)

*Continued*

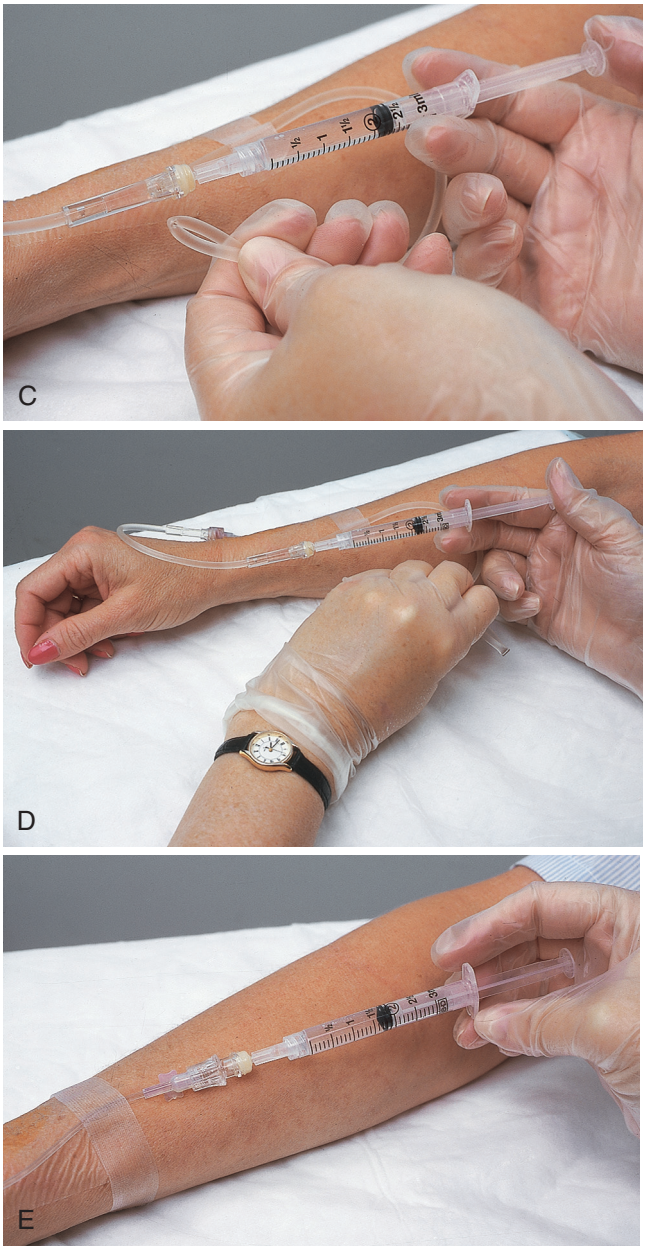

**Fig. H-10, cont'd C,** Occlude **IV** line by pinching tubing just above injection port. Pull back gently on syringe's plunger to aspirate blood return. **D,** After noting blood return, continue to occlude tubing and inject medication slowly over several minutes (read directions on drug package). Use watch to time administration. **E, IV** lock: Insert needle of syringe containing prepared drug through center of diaphragm. (From Potter PA, Perry AG: *Fundamentals of Nursing,* ed 6, St. Louis, 2005, Mosby.)

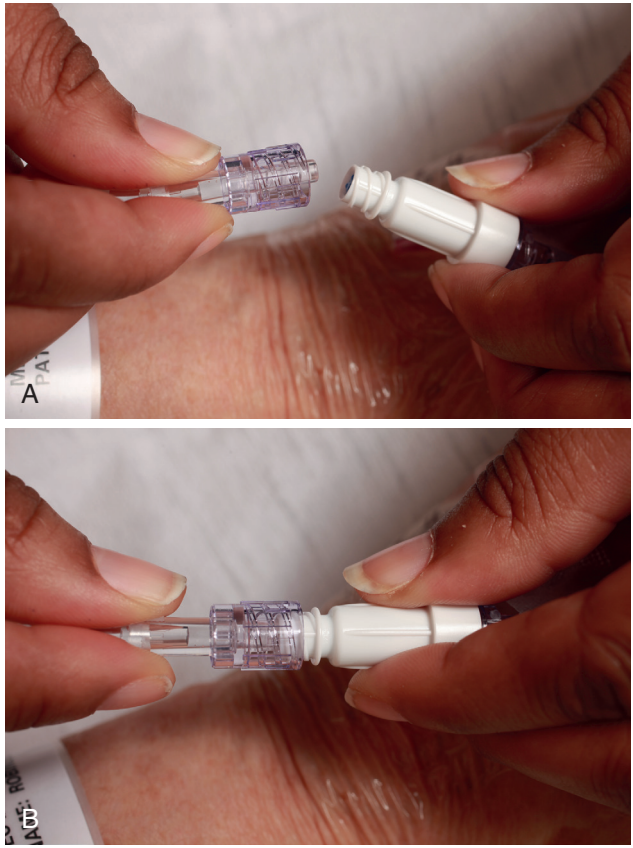

**Fig. H-11 Administering IV Medication by Piggyback, Volume Administration Sets of Miniinfusors (Syringe Pump).** Use needle-lock device to secure needle of secondary piggyback line through injection port of main line. (From Perry AG, Potter PA, and Elkin MK: *Nursing Interventions & Clinical Skills,* ed 5, St. Louis, 2012, Mosby.)

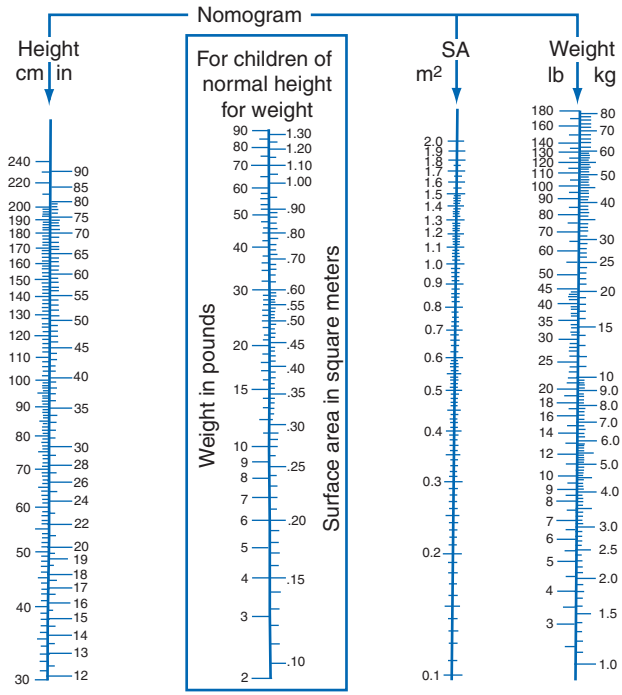
- Does the patient have any allergies?
- Is the patient NPO?
- Is the patient taking any other medication and/or herbal supplements that may interact with this drug?
- Are there any vital signs that I need to check before administering the drug?
- Do I need to check any lab values (i.e., glucose)?
- Are there any other assessments that I need to make before giving this drug?

## The 5 rights of medication administration



Always adhere to the 5 rights of medication administration when transcribing, preparing, administering, and documenting medications:

1. **Right patient:** Compare the patient's armband with the medication administration record. Compare the patient's name on the medication administration record (MAR) with that on the medication drawer or computerized equipment.
2. **Right drug:** Verify the correct medication by comparing the name on the label on the drug container with that written on the MAR.
3. **Right route:** Check the ordered route by reading the medication order, and verify the appropriateness of the route based on knowledge of the patient's condition.
4. **Right dose:** Always independently double-check dosages of medications with the pharmacy's calculations or with a second nurse. The nurse must also be aware of therapeutic dosages for each medication and question an order that is not within that range.
5. **Right time:** All medications should be administered within 30 minutes of the scheduled time. The medications must also be prepared to correlate appropriately with meal times and to avoid drug interactions.

Following appropriate drug administration, assess the patient for the expected therapeutic outcome and/or potential side effects.

## Nomogram for Calculation of Body Surface Area

Place a straight edge from the patient's height in the left column to his or her weight in the right column. The point of intersection on the body surface area column indicates the body surface area (BSA). (Reproduced in Behrman RE, Kliegman RM, Jenson HB: *Nelson Textbook of Pediatrics,* ed 18, Philadelphia, 2007, WB Saunders; nomogram modified from data of E. Boyd by CD West.)

Alternative (Mosteller's formula):

$$\text{Surface area } (m^2) = \sqrt{\frac{\text{Height (cm)} \times \text{Weight (kg)}}{3600}}$$

Surface area rule:

$$\text{Child dose} = \frac{\text{Surface area } (m^2)}{1.73\ m^2} \times \text{Adult dose}$$

BMI formula:

$$\text{BMI} = \frac{\text{Weight (kg)}}{\text{Height } (m^2)}$$

Parenteral compatibility occurs when two or more drugs are successfully mixed without liquefaction, deliquescence, or precipitation.
